069Y **Remark 7.1.7.13.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets which is both locally cartesian and locally cocartesian, and fix a vertex $C \in \mathcal{C}$. Example 7.1.7.12 asserts that every colimit diagram $\bar{q} : K^\triangleright \rightarrow \mathcal{E}_C$ is an edgewise U -colimit diagram. Combining this observation with Example 7.1.7.12, we see that for every edge $e : C \rightarrow C'$ of $\mathcal{C}$, the covariant transport functor $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ preserves K -indexed colimits. This is a special case of Corollary 7.1.4.23, since the functor $e_!$ admits a right adjoint (given by contravariant transport along e : see Proposition 6.2.5.4).

Proposition 7.1.7.14. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories, let $C \in \mathcal{C}$ be an object, and let $\bar{q} : K^\triangleright \rightarrow \mathcal{E}_C$ be a diagram. Then $\bar{q}$ is a U -colimit diagram (in the sense of Definition 7.1.6.1) if and only if it is an edgewise U -colimit diagram (in the sense of Definition 7.1.7.9).* 05J6

Proof. Set $q = \bar{q}_K$. By virtue of Proposition 7.1.6.17, $\bar{q}$ is a U -colimit diagram if and only if for every object $X \in \mathcal{E}$, the diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Hom}_{\mathrm{Fun}(K^\triangleright, \mathcal{E})}(\bar{q}, \underline{X}) & \xrightarrow{\quad\quad\quad} & \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{E})}(q, \underline{X}|_K) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\mathrm{Fun}(K^\triangleright, \mathcal{C})}(U \circ \bar{q}, U \circ \underline{X}) & \xrightarrow{\quad\quad\quad} & \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{C})}(U \circ q, U \circ \underline{X}|_K) \end{array} \quad (7.4) \quad 05J7$$

is a homotopy pullback square, where $\underline{X} \in \mathrm{Fun}(K^\triangleright, \mathcal{E})$ denotes the constant diagram taking the value X . Since U is an inner fibration, the vertical maps in (7.4) are Kan fibrations (Proposition 4.6.1.21 and Corollary 4.1.4.3). Using the criterion of Example 3.4.1.4, we see that (7.4) is a homotopy pullback square if and only if, for every vertex $u \in \mathrm{Hom}_{\mathrm{Fun}(K^\triangleright, \mathcal{C})}(U \circ \bar{q}, U \circ \underline{X})$, the induced map

$$\begin{array}{c} \{u\} \times_{\mathrm{Hom}_{\mathrm{Fun}(K^\triangleright, \mathcal{C})}(U \circ \bar{q}, U \circ \underline{X})} \mathrm{Hom}_{\mathrm{Fun}(K^\triangleright, \mathcal{E})}(\bar{q}, \underline{X}) \\ \downarrow \theta_u \\ \{u|_K\} \times_{\mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{C})}(U \circ q, U \circ \underline{X}|_K)} \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{E})}(q, \underline{X}|_K) \end{array}$$

is a homotopy equivalence of Kan complexes. Set $C' = U(X)$, so that u can be identified with a morphism of simplicial sets $K^\triangleright \rightarrow \mathrm{Hom}_{\mathcal{C}}(C, C')$ and the condition that θ_u is a homotopy equivalence depends only on the homotopy class of u . Since the simplicial set $K^\triangleright$ is weakly contractible (Example 4.3.7.11), it suffices to check that θ_u is a homotopy equivalence in the special case where u is the constant morphism taking the value e , for some morphism $e : C \rightarrow C'$ in the ∞ -category $\mathcal{C}$. The desired result is now a reformulation of Remark 7.1.7.11. $\square$

Corollary 7.1.7.15. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cartesian fibration of ∞ -categories, let $C \in \mathcal{C}$ be an object, and let $\bar{q} : K^\triangleright \rightarrow \mathcal{E}_C$ be a morphism of simplicial sets. Then $\bar{q}$ is a U -colimit diagram in the ∞ -category $\mathcal{E}$ if and only if it is a colimit diagram in the ∞ -category $\mathcal{E}_C$.* 069Z

Proof. Combine Proposition 7.1.7.14 with Example 7.1.7.10. $\square$

06A0 **Corollary 7.1.7.16.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cocartesian fibration of ∞ -categories, let $C \in \mathcal{C}$ be an object, and let $\bar{q} : K^\triangleright \rightarrow \mathcal{E}_C$ be a morphism of simplicial sets. Then $\bar{q}$ is a U -colimit diagram in the ∞ -category $\mathcal{E}$ if and only if it is a colimit diagram in the ∞ -category $\mathcal{E}_C$ which is preserved by the covariant transport functor $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$, for every morphism $e : C \rightarrow C'$ of $\mathcal{C}$.*

Proof. Combine Proposition 7.1.7.14 with Example 7.1.7.12. $\square$

06A1 **Remark 7.1.7.17.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. In §7.3.9, we will see that questions about general U -colimit diagrams $\bar{q} : K^\triangleright \rightarrow \mathcal{E}$ can often be reduced to the special case where $U \circ \bar{q}$ is a constant diagram in $\mathcal{C}$ (see Proposition 7.3.9.3) which can then be studied using the criterion of Corollary 7.1.7.16.

We close this section by recording a variant of Corollary 7.1.7.15 which will be useful later.

02X6 **Proposition 7.1.7.18.** *Suppose we are given a commutative diagram of ∞ -categories*

02X7

$$\begin{array}{ccc}
 \mathcal{E}' & \xrightarrow{F'} & \mathcal{D}' \\
 \downarrow G & \searrow V' & \swarrow \\
 & \mathcal{C}' & \\
 \downarrow & & \downarrow \\
 \mathcal{E} & \xrightarrow{F} & \mathcal{D} \\
 \searrow V & & \swarrow U \\
 & \mathcal{C} &
 \end{array}
 \tag{7.5}$$

where each square is a pullback and the diagonal maps are inner fibrations. Let $\bar{f} : K^\triangleright \rightarrow \mathcal{E}'$ be a morphism of simplicial sets. Then:

- (1) If $G \circ \bar{f}$ is an F -colimit diagram in the ∞ -category $\mathcal{E}$, then $\bar{f}$ is an F' -colimit diagram in the ∞ -category $\mathcal{E}'$.
- (2) Assume that U and V are cartesian fibrations, and that the functor F carries V -cartesian morphisms of $\mathcal{E}$ to U -cartesian morphisms of $\mathcal{D}$. If $\bar{f}$ is an F' -colimit diagram in the ∞ -category $\mathcal{E}'$, then $G \circ \bar{f}$ is an F -colimit diagram in the ∞ -category $\mathcal{E}$.

Proof. Set $f = \bar{f}|_K$. By virtue of Corollary 4.3.6.10 and Proposition 5.1.4.20, we can replace (7.5) by the commutative diagram

$$\begin{array}{ccccc}
 \mathcal{E}'_{f/} & \xrightarrow{\quad} & \mathcal{D}'_{(F' \circ f)/} & & \\
 & \searrow & \swarrow & & \\
 & \mathcal{C}'_{(V' \circ f)/} & & & \\
 & \downarrow & & & \\
 \mathcal{E}_{(G \circ f)/} & \xrightarrow{\quad} & \mathcal{D}_{(F \circ G \circ f)/} & & \\
 & \searrow & \swarrow & & \\
 & \mathcal{C}_{(V \circ G \circ f)/} & & &
 \end{array}$$

and thereby reduce to the special case $K = \emptyset$. In this case, the desired result follows from Proposition 7.1.5.19. $\square$

7.1.8 Limits and Colimits in Diagram ∞ -Categories

Let $\mathcal{C}$ be an ∞ -category and let B be a simplicial set. In this section, we study limits and colimits in the ∞ -category of diagrams $\mathrm{Fun}(B, \mathcal{C})$. Our main result is that, under some mild assumptions, these can be computed levelwise: that is, they are preserved by the evaluation functors $\mathrm{ev}_b : \mathrm{Fun}(B, \mathcal{C}) \rightarrow \mathrm{Fun}(\{b\}, \mathcal{C}) \simeq \mathcal{C}$ for $b \in B$. 02X8

Definition 7.1.8.1. Let $\mathcal{C}$ be an ∞ -category, let B and K be simplicial sets, and suppose we are given a diagram $\bar{f} : K^\triangleright \rightarrow \mathrm{Fun}(B, \mathcal{C})$. We say that $\bar{f}$ is a *levelwise colimit diagram* if, for every vertex $b \in B$, the composite map 05QF

$$K^\triangleright \xrightarrow{\bar{f}} \mathrm{Fun}(B, \mathcal{C}) \xrightarrow{\mathrm{ev}_b} \mathrm{Fun}(\{b\}, \mathcal{C}) \simeq \mathcal{C}$$

is a colimit diagram in $\mathcal{C}$. Similarly, we say that a diagram $\bar{g} : K^\triangleright \rightarrow \mathrm{Fun}(B, \mathcal{C})$ is a *levelwise limit diagram* if, for every vertex $b \in B$, the composition $\mathrm{ev}_b \circ \bar{g}$ is a limit diagram in $\mathcal{C}$.

We can now formulate our main result:

Proposition 7.1.8.2. *Let K be a simplicial set and let $\mathcal{C}$ be an ∞ -category which admits K -indexed colimits. Then, for every simplicial set B , the ∞ -category $\mathrm{Fun}(B, \mathcal{C})$ also admits* 05QG

K-indexed colimits. Moreover, a morphism of simplicial sets $\bar{f} : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ is a colimit diagram if and only if it is a levelwise colimit diagram (Definition 7.1.8.1). In particular, for every vertex $b \in B$, the evaluation functor $\text{ev}_b : \text{Fun}(K, \mathcal{C}) \rightarrow \mathcal{C}$ preserves *K-indexed colimits*.

We will deduce Proposition 7.1.8.2 from a more precise assertion, which does not require $\mathcal{C}$ to admit all *K-indexed colimits*.

02X9 Proposition 7.1.8.3. *Let $\mathcal{C}$ be an ∞ -category, let B be a simplicial set, and let $f : K \rightarrow \text{Fun}(B, \mathcal{C})$ be a diagram. Assume that, for every vertex $b \in B$, the composite diagram*

$$K \xrightarrow{f} \text{Fun}(B, \mathcal{C}) \xrightarrow{\text{ev}_b} \mathcal{C}$$

admits a colimit in the ∞ -category $\mathcal{C}$. Then:

- (1) *The diagram f admits a colimit in $\text{Fun}(B, \mathcal{C})$.*
- (2) *Let $\bar{f} : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ be an extension of f . Then $\bar{f}$ is a colimit diagram if and only if it is a levelwise colimit diagram.*

06A2 Corollary 7.1.8.4 (Fubini's Theorem for Colimits). *Let $\mathcal{C}$ be an ∞ -category, let B and K be simplicial sets, and let $F : B \times K \rightarrow \mathcal{C}$ be a diagram. Assume that, for each object $b \in B$, the diagram $F(b, \bullet) : K \rightarrow \mathcal{C}$ admits a colimit. Then:*

- (1) *The diagram*

$$f : K \rightarrow \text{Fun}(B, \mathcal{C}) \quad k \mapsto F(\bullet, k)$$

admits a colimit in the ∞ -category $\text{Fun}(K, \mathcal{C})$.

- (2) *Let G be an object of $\text{Fun}(B, \mathcal{C})$ and let $\alpha : f \rightarrow \underline{G}_K$ be a natural transformation from f to the constant diagram $\underline{G}_K : K \rightarrow \text{Fun}(B, \mathcal{C})$. Then α exhibits G as a colimit of f in the ∞ -category $\text{Fun}(B, \mathcal{C})$ if and only if, for every vertex $b \in B$, the induced map $\alpha_b : F(b, \bullet) \rightarrow \underline{G}(b)_K$ exhibits $G(b)$ as a colimit of the diagram $F(b, \bullet) : K \rightarrow \mathcal{C}$.*
- (3) *Let $G \in \text{Fun}(B, \mathcal{C})$ be a colimit of f . Then an object $C \in \mathcal{C}$ is a colimit of G if and only if it is a colimit of F .*

Proof. Assertions (1) and (2) are a reformulation of Proposition 7.1.8.2 (see Remarks 7.1.3.6 and 7.1.3.7). To prove (3), fix a diagram $G : B \rightarrow \mathcal{C}$ and a natural transformation $\beta : F' \rightarrow \underline{G}_K$ satisfying the condition described in (2) (so that G is given on objects by the formula $G(b) = \varinjlim_{k \in K} (F(b, k))$). Fix an object $C \in \mathcal{C}$, and let $\beta : G \rightarrow \underline{C}_B$ be a natural transformation from G to the constant functor $\underline{C}_B : B \rightarrow \mathcal{C}$. Applying the diagonal embedding $\text{Fun}(B, \mathcal{C}) \rightarrow \text{Fun}(B \times K, \mathcal{C})$, we obtain a natural transformation

$\beta_K : \underline{G}_K \rightarrow \underline{C}_{B \times K}$. Let $\gamma : F \rightarrow \underline{C}_{B \times K}$ be a composition of β with α . Then, for every object $D \in \mathcal{C}$, we have a homotopy commutative diagram of Kan complexes

$$\begin{array}{ccc} & \mathrm{Hom}_{\mathrm{Fun}(B, \mathcal{C})}(G, \underline{D}_B) & \\ \circ[\beta] \nearrow & & \searrow \circ[\alpha] \\ \mathrm{Hom}_{\mathcal{C}}(C, D) & \xrightarrow{\circ[\gamma]} & \mathrm{Hom}_{\mathrm{Fun}(B \times K, \mathcal{C})}(F, \underline{D}_{B \times K}), \end{array}$$

where the diagonal map on the right is a homotopy equivalence. Allowing the object D to vary, we conclude that β exhibits C as a colimit of G if and only if γ exhibits C as a colimit of F . In particular, if the object C is a colimit of G , then it is also a colimit of F . The converse follows from the observation that every natural transformation $\gamma : F \rightarrow \underline{C}_{B \times K}$ can be obtained in this way (since precomposition with α induces a homotopy equivalence $\mathrm{Hom}_{\mathrm{Fun}(B, \mathcal{C})}(G, \underline{C}_B) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(B \times K, \mathcal{C})}(F, \underline{C}_{B \times K})$). $\square$

Remark 7.1.8.5. Let B and K be simplicial sets, and let $\mathcal{C}$ be an ∞ -category which admits both B -indexed colimits and K -indexed colimits. Stated more informally, Corollary 7.1.8.4 asserts that the colimit of a $F : B \times K \rightarrow \mathcal{C}$ can be computed “one variable at a time”: that is, there are (canonical) isomorphisms 06A3

$$\varinjlim_{b \in B} (\varinjlim_{k \in K} F(b, k)) \simeq \varinjlim (F) \simeq \varinjlim_{k \in K} (\varinjlim_{b \in B} F(b, k)).$$

In particular, the formation of (K -indexed) colimits in $\mathcal{C}$ is preserved by the formation of (B -indexed) colimits (see Corollary 7.3.8.7 for a closely related result). This can also be deduced from Corollary 7.1.4.23: the formation of K -indexed colimits is left adjoint to the diagonal map $\mathcal{C} \rightarrow \mathrm{Fun}(K, \mathcal{C})$ (see Proposition 7.1.1.18), and therefore preserves B -indexed colimits (which are computed levelwise, by virtue of Proposition 7.1.8.2).

Beware that the formation of (K -indexed) colimits in $\mathcal{C}$ is usually not preserved by (B -indexed) limits: we will return to this point in §7.7.7.

Corollary 7.1.8.6. Let B and K be simplicial sets and let $\mathcal{C}$ be an ∞ -category. If $\mathcal{C}$ admits B -indexed colimits and $\mathcal{C}$ admits K -indexed colimits, then $\mathcal{C}$ admits $(B \times K)$ -indexed colimits. 06A4

We will give a proof of Proposition 7.1.8.3 at the end of this section. Our strategy is to deduce Proposition 7.1.8.3 from a pair of more general results which apply to *relative* colimit diagrams (Corollaries 7.1.8.8 and 7.1.8.14). The increased flexibility of the relative setting will allow us to reduce to the case $K = \emptyset$.

Proposition 7.1.8.7. Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of ∞ -categories, let B and K be simplicial sets, and let $A \subseteq B$ be a simplicial subset which contains every vertex of B . 06A5

Suppose we are given a lifting problem

$$\begin{array}{ccc}
 (B \times K) \amalg_{(A \times K)} (A \times K^\triangleright) & \xrightarrow{f} & \mathcal{C} \\
 \downarrow & \nearrow \bar{f} & \downarrow U \\
 B \times K^\triangleright & \xrightarrow{\quad} & \mathcal{D}
 \end{array} \tag{7.6}$$

which satisfies the following condition:

(*) Let $\sigma : \Delta^n \rightarrow B$ be an n -simplex which does not belong to A , and let $a = \sigma(0)$ be the initial vertex. Then the restriction

$$f_a = f|_{\{a\} \times K^\triangleright} : K^\triangleright \rightarrow \mathcal{C}$$

is a U -colimit diagram.

Then the lifting problem (7.6) admits a solution $\bar{f} : B \times K^\triangleright \rightarrow \mathcal{C}$.

Proof. Set $\mathcal{C}' = \text{Fun}(K^\triangleright, \mathcal{C})$ and $\mathcal{D}' = \text{Fun}(K, \mathcal{C}) \times_{\text{Fun}(K, \mathcal{D})} \text{Fun}(K^\triangleright, \mathcal{D})$, so that U induces an inner fibration $U' : \mathcal{C}' \rightarrow \mathcal{D}'$ (Proposition 4.1.4.1). We can then rewrite (7.6) as a lifting problem

$$\begin{array}{ccc}
 A & \xrightarrow{g} & \mathcal{C}' \\
 \downarrow & \nearrow & \downarrow U' \\
 B & \xrightarrow{g_0} & \mathcal{D}'
 \end{array}$$

Let P be the partially ordered set of pairs (A', g') , where $A' \subseteq B$ is a simplicial subset containing A , and $g' : A' \rightarrow \mathcal{C}'$ is a morphism satisfying $g'|_A = g$ and $U' \circ g' = g_0|_{A'}$. The partially ordered set P satisfies the hypotheses of Zorn's lemma and therefore contains a maximal element $(A_{\max}, g_{\max})$. To complete the proof, it will suffice to show that $A_{\max} = B$. Assume otherwise: then there exists some n -simplex $\sigma : \Delta^n \rightarrow B$ which is not contained in $A_{\max}$. Choose n as small as possible, so that σ carries the boundary $\partial\Delta^n$ into $A_{\max}$. Since every vertex of A is contained in B , we must have $n > 0$. Moreover, it follows from (*) together with Proposition 7.1.6.13 that the vertex $a = \sigma(0)$ is a U' -initial object of $\mathcal{C}'$. Applying Corollary 7.1.5.17, we deduce that the lifting problem

$$\begin{array}{ccc}
 \partial\Delta^n & \xrightarrow{g_{\max} \circ \sigma} & \mathcal{C}' \\
 \downarrow & \nearrow & \downarrow U' \\
 \Delta^n & \xrightarrow{g_0 \circ \sigma} & \mathcal{D}'
 \end{array}$$

has a solution, which contradicts the maximality of $(A_{\max}, g_{\max})$. $\square$

Corollary 7.1.8.8. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of ∞ -categories, let B and K be simplicial sets, and suppose we are given a lifting problem*

$$\begin{array}{ccc} B \times K & \xrightarrow{f} & \mathcal{C} \\ \downarrow & \nearrow \bar{f} & \downarrow U \\ B \times K^{\triangleright} & \xrightarrow{\bar{g}} & \mathcal{D} \end{array} \quad (7.7) \quad \text{02XH}$$

Assume that, for each vertex $b \in B$, the restriction $f|_{\{b\} \times K}$ can be extended to a U -colimit diagram $\bar{f}_b : K^{\triangleright} \rightarrow \mathcal{C}$ satisfying $U \circ \bar{f}_b = \bar{g}|_{\{b\} \times K^{\triangleright}}$. Then the lifting problem (7.7) admits a solution $\bar{f} : B \times K^{\triangleright} \rightarrow \mathcal{C}$ satisfying $\bar{f}|_{\{b\} \times K^{\triangleright}} = \bar{f}_b$ for each $b \in B$.

Proof. Apply Proposition 7.1.8.7 in the special case where $A = \text{sk}_0(B)$ is the 0-skeleton of B . $\square$

We can now prove a weak form of Proposition 7.1.8.3:

Corollary 7.1.8.9. *Let $\mathcal{C}$ be an ∞ -category, let B be a simplicial set, and let $f : K \rightarrow \text{Fun}(B, \mathcal{C})$ be a diagram. Assume that, for every vertex $b \in B$, the diagram*

$$K \xrightarrow{f} \text{Fun}(B, \mathcal{C}) \xrightarrow{\text{ev}_b} \mathcal{C}$$

has a colimit in $\mathcal{C}$. Then f can be extended to a levelwise colimit diagram $\bar{f} : K^{\triangleright} \rightarrow \text{Fun}(B, \mathcal{C})$.

Proof. Apply Corollary 7.1.8.8 in the special case $\mathcal{D} = \Delta^0$. $\square$

To complete the proof of Proposition 7.1.8.3, we must show that every levelwise colimit diagram in $\text{Fun}(B, \mathcal{C})$ is a colimit diagram. As above, it will be convenient to deduce this from a stronger assertion about relative colimit diagrams.

Proposition 7.1.8.10. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Let B be a simplicial set and let A be a simplicial subset, so that F induces a functor*

$$F' : \text{Fun}(B, \mathcal{C}) \rightarrow \text{Fun}(A, \mathcal{C}) \times_{\text{Fun}(A, \mathcal{D})} \text{Fun}(B, \mathcal{D}).$$

Suppose we are given a diagram $\bar{f} : K^{\triangleright} \rightarrow \text{Fun}(B, \mathcal{C})$ satisfying the following condition:

- (*) Let $\sigma : \Delta^n \rightarrow B$ be an n -simplex of B which is not contained in A and set $b = \sigma(0)$. Then the composite map $K^{\triangleright} \xrightarrow{\bar{f}} \text{Fun}(B, \mathcal{C}) \xrightarrow{\text{ev}_b} \mathcal{C}$ is an F -colimit diagram in the ∞ -category $\mathcal{C}$.

Then $\bar{f}$ is an F' -colimit diagram in the ∞ -category $\mathrm{Fun}(B, \mathcal{C})$.

Proof. As in the proof of Proposition 7.1.8.7, we can replace F by the restriction functor

$$\mathrm{Fun}(K^\triangleright, \mathcal{C}) \rightarrow \mathrm{Fun}(K, \mathcal{C}) \times_{\mathrm{Fun}(K, \mathcal{D})} \mathrm{Fun}(K^\triangleright, \mathcal{D})$$

and thereby reduce to the special case $K = \emptyset$ (Proposition 7.1.6.13). In this case, we view $\bar{f}$ as an object of the ∞ -category $\mathrm{Fun}(B, \mathcal{C})$, and we wish to show that this object is F' -initial.

Using Proposition 4.1.3.2, we can factor F as a composition $\mathcal{C} \xrightarrow{G} \mathcal{E} \xrightarrow{U} \mathcal{D}$, where U is an inner fibration (so that $\mathcal{E}$ is an ∞ -category) and G is inner anodyne (and therefore an equivalence of ∞ -categories). Note that we have a commutative diagram

$$\begin{array}{ccccc} \mathrm{Fun}(B, \mathcal{C}) & \xrightarrow{F'} & \mathrm{Fun}(A, \mathcal{C}) \times_{\mathrm{Fun}(A, \mathcal{D})} \mathrm{Fun}(B, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(A, \mathcal{C}) \\ \downarrow G \circ & & \downarrow & & \downarrow G \circ \\ \mathrm{Fun}(B, \mathcal{E}) & \xrightarrow{U'} & \mathrm{Fun}(A, \mathcal{E}) \times_{\mathrm{Fun}(A, \mathcal{D})} \mathrm{Fun}(B, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(A, \mathcal{E}), \end{array}$$

where the vertical maps on the left and right are equivalences of ∞ -categories (Remark 4.5.1.16). Since the square on the right is a pullback diagram and the right horizontal maps are isofibrations (Corollary 4.4.5.3), it follows that the vertical map in the middle is also an equivalence of ∞ -categories (Corollary 4.5.2.30). Consequently, to show that $\bar{f}$ is F' -initial, it will suffice to show that $G \circ \bar{f}$ is U' -initial when viewed as an object of $\mathrm{Fun}(B, \mathcal{E})$ (Remark 7.1.5.9). Since U' is an inner fibration (Proposition 4.1.4.1), it will suffice to verify that $\bar{f}$ satisfies the criterion of Corollary 7.1.5.17: every lifting problem

02XL

$$\begin{array}{ccc} \partial\Delta^n & \xrightarrow{\sigma_0} & \mathrm{Fun}(B, \mathcal{E}) \\ \downarrow & \nearrow & \downarrow U' \\ \Delta^n & \longrightarrow & \mathrm{Fun}(A, \mathcal{E}) \times_{\mathrm{Fun}(A, \mathcal{D})} \mathrm{Fun}(B, \mathcal{D}) \end{array} \quad (7.8)$$

has a solution, provided that $n > 0$ and $\sigma_0(0) = \bar{f}$. Unwinding the definitions, we can rewrite (7.8) as a lifting problem

$$\begin{array}{ccc} (\partial\Delta^n \times B) \amalg_{(\partial\Delta^n \times A)} (\Delta^n \times B) & \xrightarrow{g} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \Delta^n \times B & \longrightarrow & \mathcal{D}. \end{array}$$

Since $n > 0$, every vertex of the simplicial set $\Delta^n \times B$ is contained in $\partial\Delta^n \times B$. Moreover, if $\tau : \Delta^m \rightarrow \Delta^n \times B$ is an m -simplex which does not belong to $(\partial\Delta^n \times B) \coprod_{(\partial\Delta^n \times A)} (\Delta^n \times B)$, then condition $(*)$ (and Remark 7.1.5.9) guarantee that g carries $\tau(0)$ to a U' -initial vertex of $\mathcal{E}$. The existence of the desired solution now follows from Proposition 7.1.8.7 (applied in the special case $K = \emptyset$). $\square$

Corollary 7.1.8.11. *Let $\mathcal{C}$ be an ∞ -category, let B be a simplicial set, let $A \subseteq B$ be a simplicial subset, and let $U : \text{Fun}(B, \mathcal{C}) \rightarrow \text{Fun}(A, \mathcal{C})$ be the restriction functor. Let $\bar{f} : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ be a diagram satisfying the following condition:* 02XM

- $(*)$ *Let $\sigma : \Delta^n \rightarrow B$ be an n -simplex of B which is not contained in A and set $b = \sigma(0)$. Then the composite map $K^\triangleright \xrightarrow{\bar{f}} \text{Fun}(B, \mathcal{C}) \xrightarrow{\text{ev}_b} \mathcal{C}$ is a colimit diagram in the ∞ -category $\mathcal{C}$.*

Then $\bar{f}$ is a U -colimit diagram in the ∞ -category $\text{Fun}(B, \mathcal{C})$.

Proof. Apply Proposition 7.1.8.10 in the special case $\mathcal{D} = \Delta^0$. $\square$

Example 7.1.8.12. Let $\mathcal{C}$ be an ∞ -category and let $\text{ev}_0, \text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ be the evaluation functors. Suppose we are given a diagram $\bar{f} : K^\triangleright \rightarrow \text{Fun}(\Delta^1, \mathcal{C})$. If $\text{ev}_0 \circ \bar{f}$ is a colimit diagram in the ∞ -category $\mathcal{C}$, then $\bar{f}$ is an ev_1 -colimit diagram in the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$. This follows by applying Corollary 7.1.8.11 in the special case $B = \Delta^1$ and $A = \{1\}$. In this case, $\bar{f}$ is also a U -colimit, where $U = (\text{ev}_0, \text{ev}_1)$ is the restriction map 06A6

$$\text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \text{Fun}(\partial\Delta^1, \mathcal{C}) \simeq \mathcal{C} \times \mathcal{C}.$$

Definition 7.1.8.13. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let K and B be simplicial sets. We say that a diagram $\bar{f} : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ is a *levelwise F -colimit diagram* if, for each vertex $b \in B$, the composition $(\text{ev}_b \circ \bar{f}) : K^\triangleright \rightarrow \mathcal{C}$ is an F -colimit diagram in the ∞ -category $\mathcal{C}$. 06A7

Corollary 7.1.8.14. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let B be a simplicial set, and let $F^B : \text{Fun}(B, \mathcal{C}) \rightarrow \text{Fun}(B, \mathcal{D})$ be given by composition with F . If $\bar{f} : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ is a levelwise F -colimit diagram (in the sense of Definition 7.1.8.13), then it is an F^B -colimit diagram.* 02XN

Proof. Apply Proposition 7.1.8.10 in the special case $A = \emptyset$. $\square$

Corollary 7.1.8.15. *Let $\mathcal{C}$ be an ∞ -category, let B be a simplicial set, and let $\bar{f} : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ be a levelwise colimit diagram. Then $\bar{f}$ is a colimit diagram in $\text{Fun}(B, \mathcal{C})$.* 02XP

Proof. Apply Corollary 7.1.8.14 in the special case $\mathcal{D} = \Delta^0$ (or Corollary 7.1.8.11) in the special case $A = \emptyset$. $\square$

05QK **Warning 7.1.8.16.** The converse of Corollary 7.1.8.15 is false in general. If the ∞ -category $\mathcal{C}$ is not assumed to admit K -indexed colimits, then it is possible to have a colimit diagram $K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ which is not a levelwise colimit diagram.

Proof of Proposition 7.1.8.3. Let $\mathcal{C}$ be an ∞ -category, let B be a simplicial set, and let $f : K \rightarrow \text{Fun}(B, \mathcal{C})$ be a diagram. Assume that, for every vertex $b \in B$, the composite diagram

$$K \xrightarrow{f} \text{Fun}(B, \mathcal{C}) \xrightarrow{\text{ev}_b} \mathcal{C}$$

admits a colimit in the ∞ -category $\mathcal{C}$. Applying Corollary 7.1.8.9, we see that f can be extended to a levelwise colimit diagram $\bar{f} : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$. Applying Corollary 7.1.8.15, we see any such extension is a colimit diagram in $\text{Fun}(B, \mathcal{C})$. To complete the proof, it will suffice to show the converse: if $\bar{f}' : K^\triangleright \rightarrow \text{Fun}(B, \mathcal{C})$ is any colimit diagram extending f and $b \in B$ is a vertex, then $\text{ev}_b \circ \bar{f}'$ is also a colimit diagram in $\mathcal{C}$. In this case, the extension $\bar{f}'$ is isomorphic to $\bar{f}$ as an object of the ∞ -category $\text{Fun}(K^\triangleright, \text{Fun}(B, \mathcal{C}))$. It follows that $\text{ev}_b \circ \bar{f}'$ is isomorphic to $\text{ev}_b \circ \bar{f}$ as an object of the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{C})$ and therefore a colimit diagram by virtue of Corollary 7.1.3.15. $\square$

7.1.9 Colimits and Categorical Pullback Squares

06A8 Suppose we are given a categorical pullback diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C}_{01} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow \\ \mathcal{C}_1 & \longrightarrow & \mathcal{C}. \end{array} \quad (7.9)$$

In this section, we study assumptions which guarantee that colimits in the ∞ -category $\mathcal{C}_{01}$ can be computed “componentwise”. We can state our main result as follows:

06AA **Proposition 7.1.9.1.** *Let K be a simplicial set, and suppose we are given a categorical pullback square of ∞ -categories*

$$\begin{array}{ccc} \mathcal{C}_{01} & \xrightarrow{G_0} & \mathcal{C}_0 \\ \downarrow G_1 & & \downarrow F_0 \\ \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C}. \end{array} \quad (7.10)$$

Assume that the ∞ -categories $\mathcal{C}_0$ and $\mathcal{C}_1$ admit K -indexed colimits and that the functors F_0 and F_1 preserve K -indexed colimits. Then:

- The ∞ -category $\mathcal{C}$ admits K -indexed colimits.
- A morphism $\bar{q} : K^\triangleright \rightarrow \mathcal{C}_{01}$ is a limit diagram if and only if $G_0 \circ \bar{q}$ and $G_1 \circ \bar{q}$ are colimit diagrams (in the ∞ -categories $\mathcal{C}_0$ and $\mathcal{C}_1$, respectively).

In particular, the functors G_0 and G_1 preserve K -indexed colimits.

In the situation of Proposition 7.1.7.6, the hypothesis that (7.10) is a categorical pullback square is equivalent to the requirement that it induces an equivalence from $\mathcal{C}_{01}$ to the homotopy fiber product $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$. Recall that $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ can be identified with a full subcategory of the *oriented* fiber product $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ introduced in Definition 4.6.4.1. Our starting point is the following:

Lemma 7.1.9.2. *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories, let $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ 06AC denote the oriented fiber product of Definition 4.6.4.1, and consider the projection maps*

$$\mathcal{C}_0 \xleftarrow{\text{ev}_0} \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1 \xrightarrow{\text{ev}_1} \mathcal{C}_1.$$

Suppose we are given a diagram $\bar{q} : K^\triangleright \rightarrow \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ such that $F_0 \circ \text{ev}_0 \circ \bar{q}$ is a colimit diagram in the ∞ -category $\mathcal{C}$. Then $\bar{q}$ is an $(\text{ev}_0, \text{ev}_1)$ -colimit diagram in $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$.

Proof. By construction, we have a pullback diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1 & \xrightarrow{G} & \text{Fun}(\Delta^1, \mathcal{C}) \\ \downarrow (\text{ev}_0, \text{ev}_1) & & \downarrow U \\ \mathcal{C}_0 \times \mathcal{C}_1 & \longrightarrow & \text{Fun}(\partial\Delta^1, \mathcal{C}) \end{array}$$

where the vertical maps are isofibrations. By virtue of Proposition 7.1.7.6, it will suffice to show that $G \circ \bar{q}$ is a U -colimit diagram in the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$, which is a special case of Example 7.1.8.12. $\square$

Lemma 7.1.9.3 (Colimits in Oriented Fiber Products: Recognition). *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and 06AD $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories and let $\bar{q} : K^\triangleright \rightarrow \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ be a diagram satisfying the following conditions:*

- The composition $(\text{ev}_0 \circ \bar{q}) : K^\triangleright \rightarrow \mathcal{C}_0$ is a colimit diagram in $\mathcal{C}_0$.
- The composition $(\text{ev}_1 \circ \bar{q}) : K^\triangleright \rightarrow \mathcal{C}_1$ is a colimit diagram in $\mathcal{C}_1$.
- The composition $(F_0 \circ \text{ev}_0 \circ \bar{q}) : K^\triangleright \rightarrow \mathcal{C}$ is a colimit diagram in $\mathcal{C}$.

Then $\bar{q}$ is a colimit diagram in the ∞ -category $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$.

Proof. Combine Lemma 7.1.9.2, Corollary 7.1.6.11, and Example 7.1.3.11. $\square$

06AE Proposition 7.1.9.4 (Colimits in Oriented Fiber Products: Existence). *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories and let $q : K \rightarrow \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ be a diagram satisfying the following conditions:*

- *The diagram $(\text{ev}_0 \circ q) : K \rightarrow \mathcal{C}_0$ admits a colimit in the ∞ -category $\mathcal{C}_0$ which is preserved by the functor F_0 .*
- *The diagram $(\text{ev}_1 \circ q) : K \rightarrow \mathcal{C}_1$ admits a colimit in the ∞ -category $\mathcal{C}_1$.*

Then q admits a colimit in the ∞ -category $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$. Moreover, an extension $\bar{q} : K^{\triangleright} \rightarrow \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ is a colimit diagram if and only if $\text{ev}_0 \circ \bar{q}$ and $\text{ev}_1 \circ \bar{q}$ are colimit diagrams in the ∞ -categories $\mathcal{C}_0$ and $\mathcal{C}_1$, respectively.

Proof. Let us identify q with a triple (q_0, q_1, α) , where $q_0 = \text{ev}_0 \circ q$ is a diagram in $\mathcal{C}_0$, $q_1 = \text{ev}_1 \circ q$ is a diagram in $\mathcal{C}_1$, and $\alpha : F_0 \circ q_0 \rightarrow F_1 \circ q_1$ is a natural transformation between K -indexed diagrams in $\mathcal{C}$. By assumption, we can extend q_0 and q_1 to colimit diagrams $\bar{q}_0 : K^{\triangleright} \rightarrow \mathcal{C}_0$ and $\bar{q}_1 : K^{\triangleright} \rightarrow \mathcal{C}_1$, respectively. Moreover, the composition $F_0 \circ \bar{q}_0$ is a colimit diagram in the ∞ -category $\mathcal{C}$, so the restriction map

$$\text{Hom}_{\text{Fun}(K^{\triangleright}, \mathcal{C})}(F_0 \circ \bar{q}_0, F_1 \circ \bar{q}_1) \rightarrow \text{Hom}_{\text{Fun}(K, \mathcal{C})}(F_0 \circ q_0, F_1 \circ q_1)$$

is a trivial Kan fibration (Corollary 7.1.6.18). It follows that α can be extended to a natural transformation $\bar{\alpha} : F_0 \circ \bar{q}_0 \rightarrow F_1 \circ \bar{q}_1$ between $K^{\triangleright}$ -indexed diagrams in $\mathcal{C}$. The triple $(\bar{q}_0, \bar{q}_1, \bar{\alpha})$ can be identified with a diagram $\bar{q} : K^{\triangleright} \rightarrow \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ having the property that $\text{ev}_0 \circ \bar{q}$ and $\text{ev}_1 \circ \bar{q}$ are colimit diagrams in $\mathcal{C}_0$ and $\mathcal{C}_1$, respectively. It follows from Lemma 7.1.9.3 that any such extension is a colimit diagram in the ∞ -category $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$. Conversely, if $\bar{q}' : K^{\triangleright} \rightarrow \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ is a colimit diagram satisfying $\bar{q}'|_K = q$, then $\bar{q}'$ is isomorphic to $\bar{q}$ (as an object of the ∞ -category $\text{Fun}(K^{\triangleright}, \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1)$), so that $\text{ev}_0 \circ \bar{q}'$ and $\text{ev}_1 \circ \bar{q}'$ are colimit diagrams in $\mathcal{C}_0$ and $\mathcal{C}_1$. $\square$

06AF Corollary 7.1.9.5. *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories and let K be a simplicial set satisfying the following conditions:*

- *The ∞ -category $\mathcal{C}_0$ admits K -indexed colimits, which are preserved by the functor F_0 .*
- *The ∞ -category $\mathcal{C}_1$ admits K -indexed colimits.*

Then the oriented fiber product $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ also admits K -indexed colimits. Moreover, a morphism of simplicial sets $\bar{q} : K^{\triangleright} \rightarrow \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ is a colimit diagram if and only if its images in $\mathcal{C}_0$ and $\mathcal{C}_1$ are colimit diagrams.

Remark 7.1.9.6. In the situation of Proposition 7.1.9.4, suppose that the diagram q factors through the homotopy fiber product 06AG

$$\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \subseteq \mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1;$$

that is, it corresponds to a triple (q_0, q_1, α) where $\alpha : F_0 \circ q_0 \rightarrow F_1 \circ q_1$ is an isomorphism of K -indexed diagrams in $\mathcal{C}$. In this case, the following conditions are equivalent:

- The colimit of q (formed in the ∞ -category $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$) also belongs to the homotopy fiber product $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$.
- The natural transformation $\bar{\alpha} : F_0 \circ \bar{q}_0 \rightarrow F_1 \circ \bar{q}_1$ appearing in the proof of Proposition 7.1.9.4 is an isomorphism.
- The composition $F_1 \circ \bar{q}_1$ is a colimit diagram in $\mathcal{C}$: that is, the functor $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ preserves the colimit of the diagram q_1 .

See Proposition 7.1.3.14.

Corollary 7.1.9.7 (Colimits in Homotopy Fiber Products: Existence). *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories and let $q : K \rightarrow \mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ be a diagram satisfying the following conditions:* 06AH

- *The diagram $(\text{ev}_0 \circ q) : K \rightarrow \mathcal{C}_0$ admits a colimit in the ∞ -category $\mathcal{C}_0$ which is preserved by the functor F_0 .*
- *The diagram $(\text{ev}_1 \circ q) : K \rightarrow \mathcal{C}_1$ admits a colimit in the ∞ -category $\mathcal{C}_1$ which is preserved by the functor F_1 .*

Then q admits a colimit in the ∞ -category $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$. Moreover, an extension $\bar{q} : K^{\triangleright} \rightarrow \mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ is a colimit diagram if and only if $\text{ev}_0 \circ \bar{q}$ and $\text{ev}_1 \circ \bar{q}$ are colimit diagrams in the ∞ -categories $\mathcal{C}_0$ and $\mathcal{C}_1$, respectively.

Proof. Combine Proposition 7.1.9.4 with Remark 7.1.9.6. □

Proposition 7.1.9.1 is an immediate consequence of the following more precise assertion:

Proposition 7.1.9.8. *Suppose we are given a categorical pullback square of ∞ -categories* 06AJ

$$\begin{array}{ccc} \mathcal{C}_{01} & \xrightarrow{G_0} & \mathcal{C}_0 \\ \downarrow G_1 & & \downarrow F_0 \\ \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C}, \end{array} \quad (7.11) \quad \text{06AK}$$

and let $q : K \rightarrow \mathcal{C}$ be a diagram with the following properties:

- The diagram $q_0 = G_0 \circ q$ admits a colimit in the ∞ -category $\mathcal{C}_0$, which is preserved by the functor F_0 .
- The diagram $q_1 = G_1 \circ q$ admits a colimit in the ∞ -category $\mathcal{C}_1$, which is preserved by the functor F_1 .

Then q admits a colimit in the ∞ -category $\mathcal{C}_{01}$. Moreover, an extension $\bar{q} : K^\triangleright \rightarrow \mathcal{C}$ is a colimit diagram if and only if it satisfies the following condition:

- (*) The compositions $G_0 \circ \bar{q}$ and $G_1 \circ \bar{q}$ are colimit diagrams (in the ∞ -categories $\mathcal{C}_0$ and $\mathcal{C}_1$, respectively).

Proof. Since (7.11) is a categorical pullback square, it induces an equivalence from $\mathcal{C}_{01}$ to the homotopy fiber product $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$. The desired result now follows from Corollary 7.1.9.7. $\square$

The preceding results have counterparts for other inverse limit constructions. We consider here the case of sequential inverse limits (see Propositions 7.4.4.15 and 7.4.4.16 for a more systematic discussion).

06AL Proposition 7.1.9.9. *Suppose we are given a tower of ∞ -categories*

$$\cdots \rightarrow \mathcal{C}_3 \xrightarrow{F_2} \mathcal{C}_2 \xrightarrow{F_1} \mathcal{C}_1 \xrightarrow{F_0} \mathcal{C}_0,$$

where each of the functors F_n is an isofibration. Let $q : K \rightarrow \varprojlim_n \mathcal{C}_n$ be a diagram, which we identify with a compatible sequence of diagrams $\{q_n : K \rightarrow \mathcal{C}_n\}_{n \geq 0}$. Assume that:

- For each $n \geq 0$, the diagram q_n admits a colimit in the ∞ -category $\mathcal{C}_n$.
- For each $n \geq 0$, the functor $F_n : \mathcal{C}_{n+1} \rightarrow \mathcal{C}_n$ preserves the colimit of the diagram q_{n+1} .

Then q admits a colimit in the ∞ -category $\varprojlim_n \mathcal{C}_n$. Moreover, an extension $\bar{q} : K^\triangleright \rightarrow \varprojlim_n \mathcal{C}_n$ is a colimit diagram if and only if its image in each $\mathcal{C}_n$ is a colimit diagram.

Proof. Set $\mathcal{C} = \prod_{n \geq 0} \mathcal{C}_n$ and let $S : \mathcal{C} \rightarrow \mathcal{C}$ be the shift functor (given on objects by the construction $\{C_n\}_{n \geq 0} \mapsto \{F_n(C_{n+1})\}_{n \geq 0}$). It follows from Corollary 4.5.6.19 that the commutative diagram

$$\begin{array}{ccc} \varprojlim_n \mathcal{C}_n & \xrightarrow{\quad} & \mathcal{C} \\ \downarrow & & \downarrow (\text{id}, \text{id}) \\ \mathcal{C} & \xrightarrow{(\text{id}, S)} & \mathcal{C} \times \mathcal{C} \end{array}$$

is a categorical pullback square. The desired result now follows by combining Proposition 7.1.9.8 with Example 7.1.3.11. $\square$

Corollary 7.1.9.10. *Let K be a simplicial set and suppose we are given a tower of ∞ -categories*

$$\cdots \rightarrow \mathcal{C}_3 \xrightarrow{F_2} \mathcal{C}_2 \xrightarrow{F_1} \mathcal{C}_1 \xrightarrow{F_0} \mathcal{C}_0.$$

Assume that each of the ∞ -categories $\mathcal{C}_n$ admits K -indexed colimits and that each of the functors F_n is an isofibration which preserves K -indexed colimits. Then:

- *The ∞ -category $\varprojlim_n \mathcal{C}_n$ admits K -indexed colimits.*
- *A morphism $\bar{q} : K^\triangleright \rightarrow \varprojlim_n \mathcal{C}_n$ is a colimit diagram if and only if its image in each $\mathcal{C}_n$ is a colimit diagram.*

7.1.10 Colimits in ∞ -Categories of Sections

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. The goal of this section is to study colimits in the ∞ -category of sections $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$. Our main result can be stated as follows:

Proposition 7.1.10.1. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets and suppose we are given a diagram $q : K \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ with the following property:*

(*) *For each vertex $C \in \mathcal{C}$, the composition*

$$K \xrightarrow{q} \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\{C\}, \mathcal{E}) = \mathcal{E}_C$$

can be extended to a colimit diagram in the ∞ -category $\mathcal{E}_C$, which is also an edgewise U -colimit diagram (see Definition 7.1.7.9).

Then q admits a colimit in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$. Moreover, an extension $\bar{q} : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ of q is a colimit diagram if and only if, for each vertex $C \in \mathcal{C}$, the induced map $\bar{q}_C : K^\triangleright \rightarrow \mathcal{E}_C$ is a colimit diagram in the ∞ -category $\mathcal{E}_C$.

We will give the proof of Proposition 7.1.10.1 at the end of this section. First, let us record some consequences.

Corollary 7.1.10.2. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cartesian fibration of simplicial sets and suppose we are given a diagram $q : K \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ having the property that, for each vertex $C \in \mathcal{C}$, the induced map $q_C : K \rightarrow \mathcal{E}_C$ admits a colimit in the ∞ -category $\mathcal{E}_C$. Then:*

- *The diagram q admits a colimit in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$.*
- *An extension $\bar{q} : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ of q is a colimit diagram if and only if, for each vertex $C \in \mathcal{C}$, the induced map $\bar{q}_C : K^\triangleright \rightarrow \mathcal{E}_C$ is a colimit diagram in the ∞ -category $\mathcal{E}_C$.*

Proof. Combine Proposition 7.1.10.1 with Example 7.1.7.10. □

06AR Corollary 7.1.10.3. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cocartesian fibration of simplicial sets and suppose we are given a diagram $q : K \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ having the property that, for each vertex $C \in \mathcal{C}$, the induced map $q_C : K \rightarrow \mathcal{E}_C$ admits a colimit in the ∞ -category $\mathcal{E}_C$. Assume further that, for each edge $f : C \rightarrow C'$ of $\mathcal{C}$, the covariant transport functor $f_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ preserves the colimit of the diagram q_C . Then:*

- *The diagram q admits a colimit in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$.*
- *An extension $\bar{q} : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ of q is a colimit diagram if and only if, for each vertex $C \in \mathcal{C}$, the induced map $\bar{q}_C : K^\triangleright \rightarrow \mathcal{E}_C$ is a colimit diagram in the ∞ -category $\mathcal{E}_C$.*

Proof. Combine Proposition 7.1.10.1 with Corollary 7.1.7.16. □

06AS Corollary 7.1.10.4. *Let K be a simplicial set and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets satisfying the following condition:*

- (*) *For each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ admits K -indexed colimits. Moreover, every colimit diagram $K^\triangleright \rightarrow \mathcal{E}_C$ is an edgewise U -colimit diagram in $\mathcal{E}$.*

Then the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ admits K -indexed colimits. Moreover, a morphism $\bar{q} : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a colimit diagram if and only if, for each vertex $C \in \mathcal{C}$, the induced map $\bar{q}_C : K^\triangleright \rightarrow \mathcal{E}_C$ is a colimit diagram in the ∞ -category $\mathcal{E}_C$.

Proof. Apply Proposition 7.1.10.1 to every diagram $q : K \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$. □

06AT Corollary 7.1.10.5. *Let K be a simplicial set and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cartesian fibration of simplicial sets. Assume that, for every vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ admits K -indexed colimits. Then the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ admits K -indexed colimits. Moreover, a morphism $\bar{q} : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a colimit diagram if and only if, for each vertex $C \in \mathcal{C}$, the induced map $\bar{q}_C : K^\triangleright \rightarrow \mathcal{E}_C$ is a colimit diagram in the ∞ -category $\mathcal{E}_C$.*

06AU Example 7.1.10.6. Let B and K be simplicial sets, and let $\mathcal{C}$ be an ∞ -category which admits K -indexed colimits. Applying Corollary 7.1.10.5 to the cartesian fibration $U : \mathcal{C} \times B \rightarrow B$, we recover the assertion that the ∞ -category

$$\mathrm{Fun}(B, \mathcal{C}) \simeq \mathrm{Fun}_{/B}(B, \mathcal{C} \times B)$$

admits K -indexed colimits, which are computed levelwise (see Proposition 7.1.8.2).

06AV Corollary 7.1.10.7. *Let K be a simplicial set and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cocartesian fibration of simplicial sets satisfying the following conditions:*

- For every vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ admits K -indexed colimits.
- For every edge $f : C \rightarrow C'$ of $\mathcal{C}$, the covariant transport functor $f_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ preserves K -indexed colimits.

Then the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ admits K -indexed colimits. Moreover, a morphism $\bar{q} : K^{\triangleright} \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a colimit diagram if and only if, for each vertex $C \in \mathcal{C}$, the induced map $\bar{q}_C : K^{\triangleright} \rightarrow \mathcal{E}_C$ is a colimit diagram in the ∞ -category $\mathcal{E}_C$.

We now turn to the proof of Proposition 7.1.10.1. The main content is contained in the following recognition principle:

Lemma 7.1.10.8. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets and suppose we are given a diagram $\bar{q} : K^{\triangleright} \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ with the following property:* 06AW

(*) For each vertex $C \in \mathcal{C}$, evaluation at C carries $\bar{q}$ to a map

$$\bar{q}_C : K^{\triangleright} \rightarrow \mathcal{E}_C \hookrightarrow \mathcal{E}$$

which is an edgewise U -colimit diagram (Definition 7.1.7.9).

Then $\bar{q}$ is a colimit diagram in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$.

Proof. We first consider the case where $\mathcal{C}$ is an ∞ -category. In this case, we can use Proposition 7.1.7.14 to reformulate condition (*) as follows:

(*') For each object $C \in \mathcal{C}$, the diagram

$$\bar{q}_C : K^{\triangleright} \rightarrow \mathcal{E}_C \hookrightarrow \mathcal{E}$$

is a U -colimit diagram in the ∞ -category $\mathcal{E}$.

Applying Corollary 7.1.8.14, we see that $\bar{q}$ is a $U^{\mathcal{C}}$ -colimit diagram, where $U^{\mathcal{C}} : \mathrm{Fun}(\mathcal{C}, \mathcal{E}) \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{C})$ is the functor given by composition with U . The desired result now follows by applying Corollary 7.1.7.8 to the pullback square

$$\begin{array}{ccc} \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) & \xrightarrow{\quad} & \mathrm{Fun}(\mathcal{C}, \mathcal{E}) \\ \downarrow & & \downarrow U^{\mathcal{C}} \\ \{\mathrm{id}_{\mathcal{C}}\} & \xrightarrow{\quad} & \mathrm{Fun}(\mathcal{C}, \mathcal{C}). \end{array}$$

We now treat the general case. For every morphism of simplicial sets $\mathcal{C}' \rightarrow \mathcal{C}$, let $\bar{q}_{\mathcal{C}'}$ denote the composition of $\bar{q}$ with the restriction functor

$$\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E}) \simeq \mathrm{Fun}_{/\mathcal{C}'}(\mathcal{C}', \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}).$$

Let us say that $\mathcal{C}'$ is *good* if $\bar{q}_{\mathcal{C}'}$ is a colimit diagram in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E})$. We wish to show that the simplicial set $\mathcal{C}$ is good. Note that $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ can be realized as the inverse limit of a tower of ∞ -categories

$$\cdots \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_2(\mathcal{C}), \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_1(\mathcal{C}), \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_0(\mathcal{C}), \mathcal{E}),$$

where the transition maps are isofibrations (Corollary 4.4.5.12). By virtue of Proposition 7.1.9.9, it will suffice to show each skeleton $\mathrm{sk}_n(\mathcal{C})$ is good. We may therefore replace $\mathcal{C}$ by $\mathrm{sk}_n(\mathcal{C})$ and thereby reduce to the case where the simplicial set $\mathcal{C}$ has dimension $\leq n$, for some integer $n \geq -1$.

We now proceed by induction on n . If $n = -1$, then the simplicial set $\mathcal{C}$ is empty and there is nothing to prove. Otherwise, let $\mathcal{C}' = \mathrm{sk}_{n-1}(\mathcal{C})$ be the $(n-1)$ -skeleton of $\mathcal{C}$ and let S be the collection of all nondegenerate n -simplices of $\mathcal{C}$. Applying Proposition 1.1.4.12, we obtain a pullback diagram of ∞ -categories

$$\begin{array}{ccc} \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) & \xrightarrow{\quad} & \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E}) \\ \downarrow & & \downarrow \\ \mathrm{Fun}_{/\mathcal{C}}(\coprod_{\sigma \in S} \partial \Delta^n, \mathcal{E}) & \xrightarrow{\quad} & \mathrm{Fun}_{/\mathcal{C}}(\coprod_{\sigma \in S} \Delta^n, \mathcal{E}). \end{array}$$

Since the vertical maps in this diagram are isofibrations (Corollary 4.4.5.12), it is also a categorical pullback square (Corollary 4.5.2.28). Our inductive hypothesis guarantees that the simplicial sets $\mathcal{C}'$ and $\coprod_{\sigma \in S} \partial \Delta^n$ are good. By virtue of Proposition 7.1.9.8, to show that $\mathcal{C}$ is good, it will suffice to show that the coproduct $\coprod_{\sigma \in S} \Delta^n$ is good. This follows from the first part of the proof, since the disjoint union $\coprod_{\sigma \in S} \Delta^n$ is an ∞ -category. $\square$

Proof of Proposition 7.1.10.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets and let $q : K \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ be a diagram. Assume that, for every vertex $C \in \mathcal{C}$, the induced map $q_C : K \rightarrow \mathcal{E}_C$ can be extended to a colimit diagram $K^\triangleright \rightarrow \mathcal{E}_C$, which is also an edgewise U -colimit diagram in $\mathcal{E}$. We will show that q admits an extension $\bar{q} : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ having the property that, for each vertex $C \in \mathcal{C}$, the induced map $\bar{q}_C : K^\triangleright \rightarrow \mathcal{E}_C$ is a colimit diagram in the ∞ -category $\mathcal{E}_C$. Lemma 7.1.10.8 guarantees that the extension $\bar{q}$ is automatically a colimit diagram in the $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$. It then follows that any other extension of q to a colimit diagram $\bar{q}' : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is isomorphic to $\bar{q}$, and therefore also induces colimit diagrams $\bar{q}'_C : K^\triangleright \rightarrow \mathcal{E}_C$ for each $C \in \mathcal{C}$.

We proceed as in the proof of Lemma 7.1.10.8. For every morphism of simplicial sets $\mathcal{C}' \rightarrow \mathcal{C}$, let $q_{\mathcal{C}'}$ denote the composition of q with the restriction functor

$$\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E}) \simeq \mathrm{Fun}_{/\mathcal{C}'}(\mathcal{C}', \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}).$$

Let us say that $\mathcal{C}'$ is *good* if $q_{\mathcal{C}'}$ admits a colimit in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E})$ which is preserved by the evaluation functors

$$\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\{C\}, \mathcal{E}) \simeq \mathcal{E}_C$$

for each vertex $C \in \mathcal{C}'$. If this condition is satisfied, then Lemma 7.1.10.8 guarantees that the colimit of $q_{\mathcal{C}'}$ is preserved by the restriction functor

$$\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}'', \mathcal{C})$$

associated to any morphism of simplicial sets $\mathcal{C}'' \rightarrow \mathcal{C}'$.

We wish to show that the simplicial set $\mathcal{C}$ is good. Note that $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ can be realized as the inverse limit of a tower of ∞ -categories

$$\cdots \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_2(\mathcal{C}), \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_1(\mathcal{C}), \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_0(\mathcal{C}), \mathcal{E}),$$

where the transition maps are isofibrations (Corollary 4.4.5.12). By virtue of Proposition 7.1.9.9, it will suffice to show each skeleton $\mathrm{sk}_n(\mathcal{C})$ is good. We may therefore replace $\mathcal{C}$ by $\mathrm{sk}_n(\mathcal{C})$ and thereby reduce to the case where the simplicial set $\mathcal{C}$ has dimension $\leq n$, for some integer $n \geq 0$.

We now proceed by induction on n . If $n = 0$, then $\mathcal{C}$ is discrete and the desired result follows from our assumption that each of the diagrams q_C admits a colimit in the ∞ -category $\mathcal{E}_C$. Otherwise, let $\mathcal{C}' = \mathrm{sk}_{n-1}(\mathcal{C})$ be the $(n-1)$ -skeleton of $\mathcal{C}$ and let S be the collection of all nondegenerate n -simplices of $\mathcal{C}$. Applying Proposition 1.1.4.12, we obtain a pullback diagram of ∞ -categories

$$\begin{array}{ccc} \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}', \mathcal{E}) \\ \downarrow & & \downarrow \\ \mathrm{Fun}_{/\mathcal{C}}(\coprod_{\sigma \in S} \partial \Delta^n, \mathcal{C}) & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}(\coprod_{\sigma \in S} \Delta^n, \mathcal{C}). \end{array}$$

Since the vertical maps in this diagram are isofibrations (Corollary 4.4.5.12), it is also a categorical pullback square Corollary 4.5.2.28. Our inductive hypothesis guarantees that the simplicial sets $\mathcal{C}'$ and $\coprod_{\sigma \in S} \partial \Delta^n$ are good. Using Proposition 7.1.9.8, we can replace $\mathcal{C}$ by $\coprod_{\sigma \in S} \Delta^n$ and thereby reduce to the case where $\mathcal{C}$ is a disjoint union of simplices. Decomposing $\mathcal{C}$ into connected components, we may further assume that $\mathcal{C} = \Delta^n$ is a standard simplex.

Let $\mathrm{Spine}[n]$ denote the spine of the standard n -simplex, so that the inclusion map $\mathrm{Spine}[n] \hookrightarrow \Delta^n$ is inner anodyne (Example 1.5.7.7). It follows that the restriction map

$$\mathrm{Fun}_{/\mathcal{C}}(\Delta^n, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Spine}[n], \mathcal{E})$$

is a trivial Kan fibration. Consequently, to show that Δ^n is good, it will suffice to show that $\text{Spine}[n]$ is good. If $n \geq 2$, this follows from our inductive hypothesis. We may therefore assume that $n = 1$. Since $U : \mathcal{E} \rightarrow \mathcal{C} = \Delta^1$ is an inner fibration, the simplicial set $\mathcal{E}$ is an ∞ -category.

Let $\mathcal{E}_0 = \{0\} \times_{\mathcal{C}} \mathcal{E}$ and $\mathcal{E}_1 = \{1\} \times_{\mathcal{C}} \mathcal{E}$ denote the fibers of U , so we can identify q with a pair of diagrams $q_0 : K \rightarrow \mathcal{E}_0$ and $q_1 : K \rightarrow \mathcal{E}_1$ together with a natural transformation $\alpha : q_0 \rightarrow q_1$ between K -indexed diagrams in $\mathcal{E}$. Invoking assumption $(*)$, we deduce that q_0 and q_1 can be extended to colimit diagrams $\bar{q}_0 : K^\triangleright \rightarrow \mathcal{E}_0$ and $\bar{q}_1 : K^\triangleright \rightarrow \mathcal{E}_1$, respectively. Moreover, the extension $\bar{q}_0$ is also a colimit diagram in the ∞ -category $\mathcal{E}$. Applying Corollary 7.1.6.18, we deduce that the restriction map

$$\text{Hom}_{\text{Fun}(K^\triangleright, \mathcal{E})}(\bar{q}_0, \bar{q}_1) \rightarrow \text{Hom}_{\text{Fun}(K, \mathcal{E})}(q_0, q_1)$$

is a trivial Kan fibration. It follows that α can be extended to a natural transformation $\bar{\alpha} : \bar{q}_0 \rightarrow \bar{q}_1$ of $K^\triangleright$ -indexed diagrams in $\mathcal{E}$. The triple $(\bar{q}_0, \bar{q}_1, \bar{\alpha})$ then determines an extension of q to a diagram $\bar{q} : K^\triangleright \rightarrow \text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ having the desired properties. $\square$

7.2 Cofinality

02MZ Let $\mathcal{C}$ be an ∞ -category and let $f : B \rightarrow \mathcal{C}$ be a diagram in $\mathcal{C}$ indexed by a simplicial set B . In §7.1, we introduced the definition of a *limit* $\varprojlim(f)$ and *colimit* $\varinjlim(f)$ of the diagram f (Definition 7.1.1.11). In practice, it is often convenient to replace f by a simpler diagram having the same limit (or colimit). The primary goal of this section is to introduce a general formalism which will allow us to make replacements of this sort.

We begin in §7.2.1 by introducing the notions of *left cofinal* and *right cofinal* morphisms of simplicial sets (Definition 7.2.1.1). Roughly speaking, one can regard left cofinality as a homotopy-invariant replacement for the notion of left anodyne morphism introduced in Definition 4.2.4.1. More precisely, the collection of left cofinal morphisms of simplicial sets is uniquely determined by the following assertions:

- A monomorphism of simplicial sets $f : A \hookrightarrow B$ is left cofinal if and only if it is left anodyne (Proposition 7.2.1.3).
- Suppose we are given a commutative diagram of simplicial sets

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ \downarrow & & \downarrow \\ A' & \xrightarrow{f'} & B' \end{array},$$

where the vertical maps are categorical equivalences. Then f is left cofinal if and only if f' is left cofinal (Corollary 7.2.1.22).

In §7.2.2, we connect the notion of cofinality with the theory of limits and colimits developed in §7.1. Let $\mathcal{C}$ be an ∞ -category, and let $g : B \rightarrow \mathcal{C}$ be a diagram in $\mathcal{C}$. We will show that if $f : A \rightarrow B$ is a left cofinal morphism of simplicial sets, then the limit of the diagram g (if it exists) can be identified with the limit of the composite diagram $(g \circ f) : A \rightarrow \mathcal{C}$ (Corollary 7.2.2.11). Similarly, if f is right cofinal, then the colimit of g can be identified with the colimit of $g \circ f$. Consequently, cofinality is a very useful tool for computing (or verifying the existence of) limits and colimits.

In §7.2.3, we specialize to the study of cofinal functors between ∞ -categories. Our main result asserts that a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is right cofinal if and only if, for every object $D \in \mathcal{D}$, the ∞ -category $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{D/}$ is weakly contractible (Theorem 7.2.3.1). In particular, the weak contractibility of each slice $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{D/}$ guarantees that F is a weak homotopy equivalence of simplicial sets: this is an ∞ -categorical generalization of Quillen’s “Theorem A” (see Example 7.2.3.3). We will deduce Theorem 7.2.3.1 from a general fact about the stability of right cofinality with respect to pullback along cocartesian fibrations (Proposition 7.2.3.12), which is of independent interest.

7.2.1 Cofinal Morphisms of Simplicial Sets

Recall that a morphism of simplicial sets $f : A \rightarrow B$ is *left anodyne* if, for every left fibration $q : X \rightarrow S$, every lifting problem

$$\begin{array}{ccc} A & \xrightarrow{\quad} & X \\ \downarrow f & \nearrow \text{---} & \downarrow q \\ B & \xrightarrow{\quad} & S \end{array}$$

admits a solution (Proposition 4.2.4.5). Beware that this condition can only be satisfied if f is a monomorphism of simplicial sets, and is therefore not invariant under categorical equivalence. Our goal in this section is to introduce an enlargement of the collection of left anodyne morphisms which does not suffer from this defect.

Definition 7.2.1.1 (Joyal). Let $f : A \rightarrow B$ be a morphism of simplicial sets. We say that f is *left cofinal* if, for every left fibration $q : \tilde{B} \rightarrow B$, precomposition with f induces a homotopy equivalence of Kan complexes $\mathrm{Fun}_{/B}(B, \tilde{B}) \rightarrow \mathrm{Fun}_{/B}(A, \tilde{B})$ (see Corollary 4.4.2.5). We say that f is *right cofinal* if, for every right fibration $q : \tilde{B} \rightarrow B$, precomposition with f induces a homotopy equivalence of Kan complexes $\mathrm{Fun}_{/B}(B, \tilde{B}) \rightarrow \mathrm{Fun}_{/B}(A, \tilde{B})$.

02N2 **Remark 7.2.1.2.** Let $f : A \rightarrow B$ be a morphism of simplicial sets. Then f is left cofinal if and only if the opposite morphism $f^{\text{op}} : A^{\text{op}} \rightarrow B^{\text{op}}$ is right cofinal.

02N3 **Proposition 7.2.1.3.** Let $f : A \rightarrow B$ be a morphism of simplicial sets. Then f is left anodyne if and only if it is a left cofinal monomorphism. Similarly, f is right anodyne if and only if it is a right cofinal monomorphism.

Proof. We will prove the first assertion; the second follows by a similar argument. Assume first that f is left anodyne. Then f is a monomorphism (Remark 4.2.4.4). For every left fibration of simplicial sets $\tilde{B} \rightarrow B$, the restriction map $\theta : \text{Fun}_{/B}(B, \tilde{B}) \rightarrow \text{Fun}_{/B}(A, \tilde{B})$ is a pullback of the map

$$\text{Fun}(B, \tilde{B}) \rightarrow \text{Fun}(B, B) \times_{\text{Fun}(A, B)} \text{Fun}(A, \tilde{B}),$$

and is therefore a trivial Kan fibration (Proposition 4.2.5.4). In particular, u is a homotopy equivalence (Proposition 3.1.6.10). Allowing $\tilde{B}$ to vary, we conclude that f is left cofinal.

We now prove the converse. Assume that f is a left cofinal monomorphism; we wish to show that f is left anodyne. By virtue of Proposition 4.2.4.5, it will suffice to show that every lifting problem

02N4

$$\begin{array}{ccc} A & \xrightarrow{\quad} & X \\ \downarrow f & \nearrow \text{---} & \downarrow q \\ B & \xrightarrow{g} & S \end{array} \quad (7.12)$$

admits a solution, provided that q is a left fibration of simplicial sets. Let us regard the morphism g as fixed, and consider the restriction map

$$\theta : \text{Fun}_{/B}(B, X \times_S B) \rightarrow \text{Fun}_{/B}(A, X \times_S B).$$

Since f is a monomorphism, the morphism θ is a left fibration (Proposition 4.2.5.1). Since the target simplicial set $\text{Fun}_{/B}(A, X \times_S B)$ is a Kan complex (Corollary 4.4.2.5), it follows that θ is a Kan fibration (Corollary 4.4.3.8). Our assumption that f is left cofinal guarantees that θ is a homotopy equivalence, and therefore a trivial Kan fibration (Proposition 3.2.7.2). In particular, it is surjective at the level of vertices, which guarantees that (7.12) admits a solution. $\square$

03LQ **Example 7.2.1.4.** Let $\mathcal{C}$ be an ∞ -category and let X be an object of $\mathcal{C}$. Then the inclusion map $\{X\} \hookrightarrow \mathcal{C}$ is right cofinal if and only if X is a final object of $\mathcal{C}$. This follows by combining Proposition 7.2.1.3 with Corollary 4.6.7.25. Similarly, the inclusion map $\{X\} \hookrightarrow \mathcal{C}$ is left cofinal if and only if X is an initial object of $\mathcal{C}$.

02N5 **Proposition 7.2.1.5.** Let $f : A \rightarrow B$ be a morphism of simplicial sets. Then:

- (1) If f is either left cofinal or right cofinal, then it is a weak homotopy equivalence.
- (2) If f is a weak homotopy equivalence and B is a Kan complex, then f is left and right cofinal.

Proof. We first prove (1). Let X be a Kan complex. Then the projection map $X \times B \rightarrow B$ is a Kan fibration (Remark 3.1.1.6), and therefore both a left and a right fibration (Example 4.2.1.5). Consequently, if f is either left cofinal or right cofinal, the induced map

$$\mathrm{Fun}(B, X) \simeq \mathrm{Fun}_B(B, X \times B) \rightarrow \mathrm{Fun}_B(A, X \times B) \simeq \mathrm{Fun}(A, X)$$

is a homotopy equivalence of Kan complexes. Allowing X to vary, we conclude that f is a weak homotopy equivalence.

We now prove (2). Assume that B is a Kan complex and that f is a weak homotopy equivalence; we will show that f is left cofinal (the proof that f is right cofinal is similar). Let $q : \tilde{B} \rightarrow B$ be a left fibration. Since B is a Kan complex, q is a Kan fibration (Corollary 4.4.3.8); in particular, $\tilde{B}$ is a Kan complex. Applying Corollary 3.1.3.4, we obtain a commutative diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Fun}(B, \tilde{B}) & \xrightarrow{\circ f} & \mathrm{Fun}(A, \tilde{B}) \\ \downarrow q \circ & & \downarrow q \circ \\ \mathrm{Fun}(B, B) & \xrightarrow{\circ f} & \mathrm{Fun}(A, B), \end{array}$$

where the vertical maps are Kan fibrations (Corollary 3.1.3.2). Our assumption that f is a weak homotopy equivalence guarantees that the horizontal maps are homotopy equivalences (Proposition 3.1.6.17). Applying Proposition 3.2.8.1, we deduce that the map $\mathrm{Fun}_B(B, \tilde{B}) \rightarrow \mathrm{Fun}_B(A, \tilde{B})$ is also a homotopy equivalence. $\square$

Proposition 7.2.1.6. *Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be morphisms of simplicial sets, 02N6 and suppose that f is left cofinal. Then g is left cofinal if and only if the composite map $g \circ f$ is left cofinal. In particular, the collection of left cofinal morphisms is closed under composition.*

Proof. Let $q : \tilde{C} \rightarrow C$ be a left fibration of simplicial sets, and let

$$\mathrm{Fun}_C(C, \tilde{C}) \xrightarrow{g^*} \mathrm{Fun}_C(B, \tilde{C}) \xrightarrow{f^*} \mathrm{Fun}_C(A, \tilde{C})$$

be the morphisms given by precomposition with g and f . Our assumption that f is left cofinal guarantees that f^* is a homotopy equivalence. It follows that g^* is a homotopy equivalence if and only if $f^* \circ g^*$ is a homotopy equivalence (Remark 3.1.6.7). $\square$

02N7 **Corollary 7.2.1.7.** *Let $f : A \hookrightarrow B$ and $g : B \hookrightarrow C$ be monomorphisms of simplicial sets. If both f and $g \circ f$ are left anodyne, then g is left anodyne. If f and $g \circ f$ are right anodyne, then g is right anodyne.*

Proof. Combine Propositions 7.2.1.6 and 7.2.1.3. $\square$

02N8 **Warning 7.2.1.8.** Let $g : \Delta^1 \rightarrow \Delta^0$ be the projection map and let $f : \{1\} \hookrightarrow \Delta^1$ be the inclusion. Then g and $g \circ f$ are left cofinal (Proposition 7.2.1.5). However, the morphism f is *not* left cofinal, since it is not left anodyne (see Example 4.2.4.6). Consequently, the collection of left cofinal morphisms does not satisfy the two-out-of-three property.

043E **Corollary 7.2.1.9.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let X be an initial object of $\mathcal{C}$. Then F is left cofinal if and only if $F(X)$ is an initial object of $\mathcal{D}$.*

Proof. Combine Proposition 7.2.1.6 with Example 7.2.1.4. $\square$

02N9 **Proposition 7.2.1.10.** *Let A be a simplicial set, let W be a collection of edges of A , and let $f : A \rightarrow B$ be a morphism of simplicial sets which exhibits B as a localization of A with respect to W (see Definition 6.3.1.9). Then f is both left and right cofinal.*

Proof. We will show that f is left cofinal; the proof that f is right cofinal is similar. Let $q : \tilde{B} \rightarrow B$ be a left fibration; we wish to show that composition with f induces a homotopy equivalence $f^* : \text{Fun}_{/B}(B, \tilde{B}) \rightarrow \text{Fun}_{/B}(A, \tilde{B})$. Applying Corollary 5.6.7.3 (and Remark 5.6.7.4), we deduce that there exists a pullback diagram of simplicial sets

$$\begin{array}{ccc} \tilde{B} & \xrightarrow{\quad} & \tilde{C} \\ q \downarrow & & \downarrow Q \\ B & \xrightarrow{\quad g \quad} & C, \end{array}$$

where Q is a left fibration of ∞ -categories. Let $\text{Fun}(A[W^{-1}], \mathcal{C})$ denote the full subcategory of $\text{Fun}(A, \mathcal{C})$ spanned by those diagrams which carry each edge of W to an isomorphism in $\mathcal{C}$ (Notation 6.3.1.1), and define $\text{Fun}(A[W^{-1}], \tilde{\mathcal{C}})$ similarly. We have a commutative diagram of ∞ -categories

$$\begin{array}{ccccc} \text{Fun}(B, \tilde{\mathcal{C}}) & \xrightarrow{\circ f} & \text{Fun}(A[W^{-1}], \tilde{\mathcal{C}}) & \xrightarrow{\quad} & \text{Fun}(A, \tilde{\mathcal{C}}) \\ \downarrow Q \circ & & \downarrow Q \circ & & \downarrow Q \circ \\ \text{Fun}(B, \mathcal{C}) & \xrightarrow{\circ f} & \text{Fun}(A[W^{-1}], \mathcal{C}) & \xrightarrow{\quad} & \text{Fun}(A, \mathcal{C}), \end{array}$$

where the vertical maps on both sides are left fibrations (Corollary 4.2.5.2). Since Q is a left fibration of ∞ -categories, it is conservative (Proposition 4.4.2.11), so the right side of the diagram is a pullback square. In particular, the vertical map in the middle is also a left fibration. Our assumption that f exhibits B as a localization of A with respect to W guarantees that the left horizontal maps are equivalences of ∞ -categories. Applying Corollary 4.5.2.33, we conclude that the map of fibers

$$\begin{aligned} \mathrm{Fun}_{/B}(B, \tilde{B}) &\simeq \{g\} \times_{\mathrm{Fun}(B, \mathcal{C})} \mathrm{Fun}(B, \tilde{\mathcal{C}}) \rightarrow \{g \circ f\} \times_{\mathrm{Fun}(A[W^{-1}], \mathcal{C})} \mathrm{Fun}(A[W^{-1}], \tilde{\mathcal{C}}) \\ &= \{g \circ f\} \times_{\mathrm{Fun}(A, \mathcal{C})} \mathrm{Fun}(A, \tilde{\mathcal{C}}) \\ &\simeq \mathrm{Fun}_{/B}(A, \tilde{B}) \end{aligned}$$

is an equivalence of ∞ -categories, and therefore a homotopy equivalence of Kan complexes (Example 4.5.1.13). $\square$

Corollary 7.2.1.11. *Let $f : A \rightarrow B$ be a universally localizing morphism of simplicial sets (see Definition 6.3.5.1). Then f is both left and right cofinal.* 02NA

Corollary 7.2.1.12. *Let $\mathcal{C}$ be a simplicial set. Then there exists a partially ordered set $(A, \leq)$ and a morphism of simplicial sets $F : N_{\bullet}(A) \rightarrow \mathcal{C}$ which is both left and right cofinal. Moreover, if the simplicial set $\mathcal{C}$ is finite, then we can arrange that the partially ordered set $(A, \leq)$ is finite.* 02NB

Proof. Combine Theorem 6.3.6.1 (and Variant 6.3.6.17) with Corollary 7.2.1.11. $\square$

Corollary 7.2.1.13. *Let $f : A \rightarrow B$ be a categorical equivalence of simplicial sets. Then f is left cofinal and right cofinal.* 02NC

Proof. Combine Proposition 7.2.1.10 with Example 6.3.1.12. $\square$

Corollary 7.2.1.14. *Let $q : X \rightarrow S$ be a morphism of simplicial sets. The following conditions are equivalent:* 02ND

- (1) *The morphism q is left cofinal and a left fibration.*
- (2) *The morphism q is right cofinal and a right fibration.*
- (3) *The morphism q is a trivial Kan fibration.*

Proof. If q is a trivial Kan fibration, then it is both a left fibration and a right fibration (Example 4.2.1.5). Moreover, q is also a categorical equivalence of simplicial sets (Proposition 4.5.3.11), hence left and right cofinal by virtue of Corollary 7.2.1.13. This proves the implications (3) $\Rightarrow$ (1) and (3) $\Rightarrow$ (2).

We will complete the proof by showing that (1) $\Rightarrow$ (3) (the proof of the implication (2) $\Rightarrow$ (3) is similar). Assume that q is a left cofinal left fibration. Then composition with q induces a homotopy equivalence of Kan complexes $\text{Fun}_{/S}(S, X) \rightarrow \text{Fun}_{/S}(X, X)$. In particular, the morphism q admits a section $f : S \rightarrow X$ such that id_X and $f \circ q$ belong to the same connected component of $\text{Fun}_{/S}(X, X)$. For each vertex $s \in S$, let $X_s = \{s\} \times_S X$ be the fiber of q over s . Then the identity map $\text{id} : X_s \rightarrow X_s$ is homotopic to the constant map $X_s \rightarrow \{f(s)\} \hookrightarrow X_s$. It follows that the Kan complex X_s is contractible. Allowing s to vary, we conclude that the left fibration q is a trivial Kan fibration (Proposition 4.4.2.14). $\square$

02NE Corollary 7.2.1.15. *Let $f : X \rightarrow Z$ be a morphism of simplicial sets. Then f is left cofinal if and only if it factors as a composition $X \xrightarrow{f'} Y \xrightarrow{f''} Z$, where f' is left anodyne and f'' is a trivial Kan fibration.*

Proof. Suppose first that we can write $f = f'' \circ f'$, where f' is left anodyne and f'' is a trivial Kan fibration. Proposition 7.2.1.3 guarantees that f' is left cofinal, and Proposition 7.2.1.5 guarantees that f'' is left cofinal. Applying Proposition 7.2.1.6, we conclude that f is also left cofinal.

We now prove the converse. Assume that $f : X \rightarrow Z$ is left cofinal. Applying Proposition 4.2.4.7, we can write f as a composition $X \xrightarrow{f'} Y \xrightarrow{f''} Z$, where f' is left anodyne and f'' is a left fibration. Then f' is also left cofinal (Proposition 7.2.1.3). Applying Proposition 7.2.1.6, we deduce that f'' is left cofinal. It then follows from Corollary 7.2.1.14 that f'' is a trivial Kan fibration. $\square$

02NF Corollary 7.2.1.16. *Suppose we are given a categorical pushout diagram of simplicial sets*

02NG

$$\begin{array}{ccc} X & \xrightarrow{f} & Z \\ \downarrow & & \downarrow \\ X' & \xrightarrow{f'} & Z'. \end{array} \quad (7.13)$$

If f is left cofinal, then f' is also left cofinal.

Proof. By virtue of Corollary 7.2.1.15, we may assume that f factors as a composition $X \xrightarrow{g} Y \xrightarrow{h} Z$, where g is left anodyne and h is a trivial Kan fibration. Setting $Y' = Y \amalg_X X'$, we can expand (7.13) to a commutative diagram

$$\begin{array}{ccccc} X & \xrightarrow{g} & Y & \xrightarrow{h} & Z \\ \downarrow & & \downarrow & & \downarrow \\ X' & \xrightarrow{g'} & Y' & \xrightarrow{h'} & Z'. \end{array}$$

Note that the square on the left is a pushout diagram in which the horizontal maps are monomorphisms, and therefore a categorical pushout diagram (Example 4.5.4.12). Applying Proposition 4.5.4.8, we deduce that the square on the right is also a categorical pushout diagram. Since h is a categorical equivalence (Proposition 4.5.3.11), it follows that h' is also a categorical equivalence (Proposition 4.5.4.10). In particular, h' is left cofinal (Corollary 7.2.1.13). The morphism g' is left anodyne (since it is a pushout of g), and is therefore also left cofinal (Proposition 7.2.1.3). Applying Proposition 7.2.1.6, we deduce that $f' = h' \circ g'$ is also left cofinal. $\square$

Corollary 7.2.1.17. *The collection of left cofinal morphisms of simplicial sets is closed 02NH under the formation of filtered colimits (when regarded as a full subcategory of the arrow category $\text{Fun}([1], \text{Set}_\Delta)$).*

Proof. For every morphism of simplicial sets $f : X \rightarrow Z$, let $X \xrightarrow{f'} Q(f) \xrightarrow{f''} Y$ be the factorization of Proposition 4.2.4.7, so that f' is left anodyne, f'' is a left fibration, and the construction $f \mapsto Q(f)$ is a functor which commutes with filtered colimits. Using Propositions 7.2.1.5, 7.2.1.6, and Corollary 7.2.1.14, we see that f is left cofinal if and only if the morphism $f'' : Q(f) \rightarrow Z$ is a trivial Kan fibration. Since the collection of trivial Kan fibrations is closed under filtered colimits (Remark 1.5.5.3), it follows that the collection of left cofinal morphisms is also closed under filtered colimits. $\square$

Corollary 7.2.1.18. *The collection of left anodyne morphisms of simplicial sets is closed 02NJ under the formation of filtered colimits (when regarded as a full subcategory of the arrow category $\text{Fun}([1], \text{Set}_\Delta)$).*

Proof. Combine Corollary 7.2.1.17 with Proposition 7.2.1.3. $\square$

Corollary 7.2.1.19. *Let $f : X \rightarrow Z$ be a left cofinal morphism of simplicial sets. Then, for 02NK every simplicial set K , the product map $(f \times \text{id}_K) : X \times K \rightarrow Z \times K$ is left cofinal.*

Proof. By virtue of Corollary 7.2.1.15, the morphism f factors as a composition $X \xrightarrow{f'} Y \xrightarrow{f''} Z$, where f' is left anodyne and f'' is a trivial Kan fibration. It follows that $f \times \text{id}_K$ factors as a composition

$$X \times K \xrightarrow{f' \times \text{id}_K} Y \times K \xrightarrow{f'' \times \text{id}_K} Z \times K.$$

We now note that $f' \times \text{id}_K$ is left anodyne (Proposition 4.2.5.3) and $f'' \times \text{id}_K$ is a trivial Kan fibration (Remark 1.5.5.2). Applying Corollary 7.2.1.15, we deduce that $f \times \text{id}_K$ is left cofinal. $\square$

Corollary 7.2.1.20. *Let $f : X \rightarrow Y$ and $f' : X' \rightarrow Y'$ be left cofinal morphisms of simplicial 02NL sets. Then the product map $(f \times f') : X \times X' \rightarrow Y \times Y'$ is left cofinal.*

Proof. Factoring $f \times f'$ as a composition

$$X \times X' \xrightarrow{f \times \text{id}_{X'}} Y \times X' \xrightarrow{\text{id}_Y \times f'} Y \times Y',$$

the desired result follows by combining Corollary 7.2.1.19 with Proposition 7.2.1.6. $\square$

We now prove that cofinality is invariant under categorical equivalence.

02NM Proposition 7.2.1.21. *Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be morphisms of simplicial sets, and suppose that g is a categorical equivalence. Then f is left cofinal if and only if $g \circ f$ is left cofinal.*

Proof. Since g is a categorical equivalence, the construction $\tilde{C} \mapsto B \times_C \tilde{C}$ induces a bijection from equivalence classes of left fibrations over C to equivalence classes of left fibrations over B (Corollary 5.6.0.6). It follows that f is left cofinal if and only if it satisfies the following condition:

(*) For every left fibration $q : \tilde{C} \rightarrow C$, the restriction map $f^* : \text{Fun}_/C(B, \tilde{C}) \rightarrow \text{Fun}_/C(A, \tilde{C})$ is a homotopy equivalence of Kan complexes.

It will therefore suffice to show that, for every left fibration $q : \tilde{C} \rightarrow C$, the restriction map $f^* : \text{Fun}_/C(B, \tilde{C}) \rightarrow \text{Fun}_/C(A, \tilde{C})$ is a homotopy equivalence if and only if the restriction map $(g \circ f)^* : \text{Fun}_/C(C, \tilde{C}) \rightarrow \text{Fun}_/C(A, \tilde{C})$ is a homotopy equivalence. This is clear, since our assumption that g is a categorical equivalence guarantees that the restriction map $g^* : \text{Fun}_/C(C, \tilde{C}) \rightarrow \text{Fun}_/C(B, \tilde{C})$ is a homotopy equivalence (Corollary 7.2.1.13). $\square$

02NN Corollary 7.2.1.22. *Suppose we are given a commutative diagram of simplicial sets*

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ \downarrow g & & \downarrow g' \\ A' & \xrightarrow{f'} & B', \end{array}$$

where g and g' are categorical equivalences. Then f is left cofinal if and only if f' is left cofinal.

Proof. By virtue of Proposition 7.2.1.21, the morphism f is left cofinal if and only if the composite morphism $g' \circ f$ is left cofinal. Similarly, Proposition 7.2.1.6 guarantees that f' is left cofinal if and only if $f' \circ g$ is left cofinal. We conclude by observing that $g' \circ f = f' \circ g$. $\square$

02NP Corollary 7.2.1.23. *Let $\mathcal{C}$ be an ∞ -category and suppose we are given a pair of diagrams $f_0, f_1 : K \rightarrow \mathcal{C}$ indexed by a simplicial set K . Suppose that f_0 and f_1 are isomorphic as objects of the ∞ -category $\text{Fun}(K, \mathcal{C})$. Then f_0 is left cofinal if and only if f_1 is left cofinal.*

Proof. Let $\text{Isom}(\mathcal{C}) \subseteq \text{Fun}(\Delta^1, \mathcal{C})$ be the full subcategory spanned by the isomorphisms of $\mathcal{C}$ (see Example 4.4.1.14). Let $\text{ev}_0, \text{ev}_1 : \text{Isom}(\mathcal{C}) \rightarrow \mathcal{C}$ be the morphisms given by evaluation at the vertices $0, 1 \in \Delta^1$, so that ev_0 and ev_1 are trivial Kan fibrations (Corollary 4.4.5.10). Fix an isomorphism of f_0 with f_1 , which we identify with a diagram $F : K \rightarrow \text{Isom}(\mathcal{C})$ satisfying $\text{ev}_0 \circ F = f_0$ and $\text{ev}_1 \circ F = f_1$. Applying Corollary 7.2.1.22 to the diagram

$$\begin{array}{ccc} K & \xrightarrow{F} & \text{Isom}(\mathcal{C}) \\ \downarrow \text{id} & & \downarrow \text{ev}_0 \\ K & \xrightarrow{f_0} & \mathcal{C}, \end{array}$$

we deduce that f_0 is left cofinal if and only if F is left cofinal. By the same reasoning, this is equivalent to the condition that f_1 is left cofinal. $\square$

7.2.2 Cofinality and Limits

Let $\mathcal{C}$ be an ∞ -category. In §7.1.3, we introduced the notion of a *limit* $\varprojlim(G)$ and *colimit* $\varinjlim(G)$ for a diagram $G : B \rightarrow \mathcal{C}$ (Definition 7.1.1.11). Our goal in this section is to show that, if $F : A \rightarrow B$ is a left cofinal morphism of simplicial sets, then the limit $\varprojlim(G)$ (if it exists) can be identified with the limit $\varprojlim(G \circ F)$. Similarly, if $F : A \rightarrow B$ is right cofinal, then the colimit $\varinjlim(G)$ (if it exists) can be identified with the colimit $\varinjlim(G \circ F)$. Our proof is based on the following characterization of (left) cofinality:

Proposition 7.2.2.1. *Let $F : A \rightarrow B$ be a morphism of simplicial sets. The following conditions are equivalent:*

- (1) *The morphism F is left cofinal (in the sense of Definition 7.2.1.1).*
- (2) *The diagram*

$$\begin{array}{ccc} A & \xrightarrow{\quad} & A^\triangleleft \\ \downarrow F & & \downarrow F^\triangleleft \\ B & \xrightarrow{\quad} & B^\triangleleft \end{array}$$

04K0
(7.14)

is a categorical pushout square of simplicial sets.

(3) *The diagram*

04K1

$$\begin{array}{ccc} A & \longrightarrow & \Delta^0 \diamond A \\ \downarrow F & & \downarrow \\ B & \longrightarrow & \Delta^0 \diamond B \end{array} \quad (7.15)$$

is a categorical pushout square (here $\diamond$ denotes the blunt join introduced in Notation 4.5.8.3).

(4) *For every ∞ -category $\mathcal{C}$ and every diagram $G : B \rightarrow \mathcal{C}$, composition with F induces an equivalence of ∞ -categories*

$$\mathcal{C} \tilde{\times}_{\mathrm{Fun}(B, \mathcal{C})} \{G\} \rightarrow \mathcal{C} \tilde{\times}_{\mathrm{Fun}(A, \mathcal{C})} \{G \circ F\}.$$

(5) *For every ∞ -category $\mathcal{C}$ and every diagram $G : B \rightarrow \mathcal{C}$, the restriction map $\mathcal{C}_{/G} \rightarrow \mathcal{C}_{/(G \circ F)}$ is an equivalence of ∞ -categories.*

(6) *For every ∞ -category $\mathcal{C}$, every diagram $G : B \rightarrow \mathcal{C}$, and every object $X \in \mathcal{C}$, precomposition with F induces a homotopy equivalence of Kan complexes*

$$\mathrm{Hom}_{\mathrm{Fun}(B, \mathcal{C})}(\underline{X}, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(A, \mathcal{C})}(\underline{X} \circ F, G \circ F);$$

here $\underline{X} : B \rightarrow \mathcal{C}$ denotes the constant diagram taking the value X .

(7) *For every ∞ -category $\mathcal{C}$, every diagram $G : B \rightarrow \mathcal{C}$, and every object $X \in \mathcal{C}$, precomposition with F induces a homotopy equivalence of Kan complexes*

$$\mathrm{Fun}_{/\mathcal{C}}(B, \mathcal{C}_{X/}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(A, \mathcal{C}_{X/}).$$

Proof. We first show that (1) implies (2). Let $F : A \rightarrow B$ be a left cofinal morphism of simplicial sets; we wish to show that the diagram (7.14) is a categorical pushout square. By virtue of Corollary 7.2.1.15 (and Proposition 4.5.4.8), we may assume that F is either left anodyne or a trivial Kan fibration. In the second case, the vertical morphisms in the diagram (7.14) are categorical equivalences (see Corollary 4.5.8.9), so the desired result is a special case of Proposition 4.5.4.10. In the second case, Example 4.3.6.5 guarantees that the induced map $B \coprod_A A^\triangleleft \hookrightarrow B^\triangleleft$ is inner anodyne, so the desired result follows from Proposition 4.5.4.11.

Notation 4.5.8.3 supplies a comparison map from the diagram (7.15) to the diagram (7.14), which is a levelwise categorical equivalence by virtue of Theorem 4.5.8.8. The equivalence (2) $\Leftrightarrow$ (3) now follows from Proposition 4.5.4.9.

We next show that (3) implies (4). Let $\mathcal{C}$ be an ∞ -category and let $G : B \rightarrow \mathcal{C}$ be a diagram. If condition (3) is satisfied, then the diagram of ∞ -categories

$$\begin{array}{ccc} \mathrm{Fun}(\Delta^0 \diamond B, \mathcal{C}) & \longrightarrow & \mathrm{Fun}(\Delta^0 \diamond A, \mathcal{C}) \\ \downarrow & & \downarrow \\ \mathrm{Fun}(B, \mathcal{C}) & \xrightarrow{\circ F} & \mathrm{Fun}(A, \mathcal{C}) \end{array}$$

is a categorical pullback square. Corollary 4.4.5.3 guarantees that the vertical maps in this diagram are isofibrations. Invoking Corollary 4.5.2.32 (together with the definition of the blunt join), we deduce that the induced map

$$\begin{aligned} \mathcal{C} \tilde{\times}_{\mathrm{Fun}(B, \mathcal{C})} \{G\} &\simeq \mathrm{Fun}(\Delta^0 \diamond B, \mathcal{C}) \times_{\mathrm{Fun}(B, \mathcal{C})} \{G\} \\ &\rightarrow \mathrm{Fun}(\Delta^0 \diamond A, \mathcal{C}) \times_{\mathrm{Fun}(A, \mathcal{C})} \{G \circ F\} \\ &\simeq \mathcal{C} \tilde{\times}_{\mathrm{Fun}(A, \mathcal{C})} \{G \circ F\} \end{aligned}$$

is an equivalence of ∞ -categories.

We next prove the equivalences (4) $\Leftrightarrow$ (5) $\Leftrightarrow$ (6) $\Leftrightarrow$ (7). Let $G : B \rightarrow \mathcal{C}$ be as above. Applying Construction 4.6.4.15, we obtain a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C}_{/G} & \longrightarrow & \mathcal{C} \tilde{\times}_{\mathrm{Fun}(B, \mathcal{C})} \{G\} \\ \downarrow \theta & & \downarrow \theta' \\ \mathcal{C}_{/(G \circ F)} & \longrightarrow & \mathcal{C} \tilde{\times}_{\mathrm{Fun}(A, \mathcal{C})} \{G \circ F\}, \end{array}$$

where the horizontal maps are equivalences of ∞ -categories (Theorem 4.6.4.19). It follows that θ is an equivalence of ∞ -categories if and only if θ' is an equivalence of ∞ -categories. This proves the equivalence (4) $\Leftrightarrow$ (5). Note that the functor θ' fits into a commutative diagram

$$\begin{array}{ccc} \mathcal{C} \tilde{\times}_{\mathrm{Fun}(B, \mathcal{C})} \{G\} & \xrightarrow{\theta'} & \mathcal{C} \tilde{\times}_{\mathrm{Fun}(A, \mathcal{C})} \{G \circ F\} \\ & \searrow & \swarrow \\ & \mathcal{C}, & \end{array}$$

where the vertical maps are right fibrations (Corollary 4.6.4.14). Applying Corollary 5.1.7.16 and Proposition 5.1.7.5, we see that θ' is an equivalence of ∞ -categories if and only if it

induces a homotopy equivalence

$$\theta'_X : \{\underline{X}\} \tilde{\times}_{\text{Fun}(B, \mathcal{C})} \{G\} \rightarrow \{\underline{X} \circ F\} \tilde{\times}_{\text{Fun}(A, \mathcal{C})} \{G \circ F\}$$

for each object $X \in \mathcal{C}$, which proves the equivalence (4) $\Leftrightarrow$ (6). Unwinding the definitions, we can identify θ' with the lower horizontal map appearing in the diagram

$$\begin{array}{ccc} \text{Fun}_{/\mathcal{C}}(B, \mathcal{C}_{X/}) & \xrightarrow{\theta''_X} & \text{Fun}_{/\mathcal{C}}(A, \mathcal{C}_{X/}) \\ \downarrow & & \downarrow \\ \text{Fun}_{/\mathcal{C}}(B, \{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C}) & \xrightarrow{\theta'_X} & \text{Fun}_{/\mathcal{C}}(A, \{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C}), \end{array}$$

where the vertical maps are given by postcomposition with the coslice diagonal morphism $\rho : \mathcal{C}_{X/} \rightarrow \{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C}$. Theorem 4.6.4.19 guarantees that ρ is an equivalence of ∞ -categories. It is therefore also an equivalence of left fibrations over $\mathcal{C}$ (Proposition 5.1.7.5), so that the vertical maps are homotopy equivalences. It follows that θ'_X is a homotopy equivalence if and only if θ''_X is a homotopy equivalence, which proves the equivalence (6) $\Leftrightarrow$ (7).

We now complete the proof by showing that (7) implies (1). Assume that condition (7) is satisfied; we wish to show that F is left cofinal. Let $q : \tilde{B} \rightarrow B$ be a left fibration; we must show that composition with F induces a homotopy equivalence $\text{Fun}_{/B}(B, \tilde{B}) \rightarrow \text{Fun}_{/B}(A, \tilde{B})$. To prove this, we are free to replace $q : \tilde{B} \rightarrow B$ by any other left fibration which is equivalent to it (in the sense of Definition 5.1.7.1). We may therefore assume without loss of generality that there exists a pullback diagram of simplicial sets

$$\begin{array}{ccc} \tilde{B} & \xrightarrow{\quad} & \mathcal{S}_* \\ \downarrow q & & \downarrow q_{\text{univ}} \\ B & \xrightarrow{G} & \mathcal{S}, \end{array}$$

where $q_{\text{univ}} : \mathcal{S}_* \rightarrow \mathcal{S}$ is the universal left fibration of Corollary 5.6.0.6. We are then reduced to proving that F induces a homotopy equivalence $\text{Fun}_{/\mathcal{S}}(B, \mathcal{S}_*) \rightarrow \text{Fun}_{/\mathcal{S}}(A, \mathcal{S}_*)$, which is a special case of (7) (applied to the ∞ -category $\mathcal{C} = \mathcal{S}$ and the object $X = \Delta^0$). $\square$

Corollary 7.2.2.2. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $e : A \rightarrow B$ be a left cofinal morphism of simplicial sets. Then a morphism of simplicial sets $\bar{f} : B^\triangleleft \rightarrow \mathcal{C}$ is a U -limit diagram if and only if the composite map*

$$A^\triangleleft \xrightarrow{e^\triangleleft} B^\triangleleft \xrightarrow{\bar{f}} \mathcal{C}$$

is a U -limit diagram.

Proof. Set $f = \bar{f}|_B$ and apply Remark 7.1.5.9 to the commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C}/f & \xrightarrow{\quad} & \mathcal{C}/(f \circ e) \\ \downarrow & & \downarrow \\ \mathcal{D}/(U \circ f) & \xrightarrow{\quad} & \mathcal{D}/(U \circ f \circ e), \end{array}$$

noting that the horizontal maps are equivalences by virtue of Proposition 7.2.2.1. $\square$

Corollary 7.2.2.3. *Let $\mathcal{C}$ be an ∞ -category and let $e : A \rightarrow B$ be a left cofinal morphism of simplicial sets. Then a morphism of simplicial sets $\bar{f} : B^\triangleleft \rightarrow \mathcal{C}$ is a limit diagram if and only if the composite map*

$$A^\triangleleft \xrightarrow{e^\triangleleft} B^\triangleleft \xrightarrow{\bar{f}} \mathcal{C}$$

is a limit diagram.

Proof. Apply Corollary 7.2.2.2 in the special case $\mathcal{D} = \Delta^0$ (see Example 7.1.6.3). $\square$

Remark 7.2.2.4. The converse of Corollary 7.2.2.3 is also true: if $e : A \rightarrow B$ is a morphism of simplicial sets having the property that precomposition with the induced map $e^\triangleleft : A^\triangleleft \rightarrow B^\triangleleft$ carries limit diagrams to limit diagrams, then e is left cofinal. Moreover, it suffices check this condition for diagrams in the ∞ -category $\mathcal{S}$ of spaces (see Corollary 7.4.3.12). 02XR

Corollary 7.2.2.5. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an inner fibration of ∞ -categories and let $\mathcal{C}$ be an ∞ -category containing an object Y . Then:* 02XV

- *If Y is an initial object of $\mathcal{C}$, then a diagram $\mathcal{C}^\triangleleft \rightarrow \mathcal{D}$ is a U -limit diagram if and only if it carries $\{Y\}^\triangleleft \simeq \Delta^1$ to a U -cartesian morphism of $\mathcal{D}$.*
- *If Y is a final object of $\mathcal{C}$, then a diagram $\mathcal{C}^\triangleleft \rightarrow \mathcal{D}$ is a U -colimit diagram if and only if it carries $\{Y\}^\triangleright \simeq \Delta^1$ to a U -cocartesian morphism of $\mathcal{D}$.*

Proof. If Y is an initial object of $\mathcal{C}$, then the inclusion map $\{Y\} \hookrightarrow \mathcal{C}$ is left cofinal (Corollary 4.6.7.25). The first assertion now follows by combining Corollary 7.2.2.2 with Example 7.1.7.2. The second assertion follows by a similar argument. $\square$

Corollary 7.2.2.6. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories. Then:* 02XW

- *If $\mathcal{C}$ has an initial object Y , then a functor $\mathcal{C}^\triangleleft \rightarrow \mathcal{D}$ is a limit diagram if and only if it carries $\{Y\}^\triangleleft \simeq \Delta^1$ to an isomorphism in the ∞ -category $\mathcal{D}$.*
- *If $\mathcal{C}$ has a final object Y , then a functor $\mathcal{C}^\triangleright \rightarrow \mathcal{D}$ is a colimit diagram if and only if it carries $\{Y\}^\triangleright \simeq \Delta^1$ to an isomorphism in the ∞ -category $\mathcal{D}$.*

Proof. Apply Corollary 7.2.2.5 in the special case $\mathcal{E} = \Delta^0$ (and use Example 5.1.1.4). $\square$

02XS **Corollary 7.2.2.7.** *Let $\mathcal{C}$ be an ∞ -category containing an object $C \in \mathcal{C}$ and let $e : A \rightarrow B$ be a left cofinal morphism of simplicial sets. Suppose we are given a diagram $f : B \rightarrow \mathcal{C}$ and a natural transformation $\alpha : \underline{C} \rightarrow f$, where $\underline{C} \in \text{Fun}(B, \mathcal{C})$ denotes the constant diagram taking the value C . Then α exhibits C as a limit of f (in the sense of Definition 7.1.1.1) if and only if the induced natural transformation $\alpha|_A : \underline{C}|_A \rightarrow f|_A$ exhibits C as a limit of the diagram $f|_A$.*

Proof. By virtue of Remark 7.1.1.7, we are free to modify the natural transformation α by a homotopy and may therefore assume that it corresponds to a morphism of simplicial sets $\Delta^0 \diamond B \rightarrow \mathcal{C}$ which factors through the categorical equivalence $\Delta^0 \diamond B \rightarrow \Delta^0 \star B$ of Theorem 4.5.8.8. In this case, the desired result follows from Corollary 7.2.2.3 and Remark 7.1.3.6. $\square$

02NV **Corollary 7.2.2.8.** *Let $e : A \rightarrow B$ be a morphism of simplicial sets and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. If e is left cofinal and the functor F preserves A -indexed limits, then F preserves B -indexed limits. If e is right cofinal and the functor F preserves A -indexed colimits, then the functor F preserves B -indexed colimits.*

02XT **Proposition 7.2.2.9.** *Suppose we are given a commutative diagram of simplicial sets*

$$\begin{array}{ccc} B & \xrightarrow{f} & C \\ \downarrow & & \downarrow U \\ B^\triangleleft & \xrightarrow{\bar{g}} & \mathcal{D}, \end{array}$$

where U is an inner fibration of ∞ -categories. Let $e : A \rightarrow B$ be a left cofinal morphism of simplicial sets. The following conditions are equivalent:

- (1) *There exists a U -limit diagram $\bar{f} : B^\triangleleft \rightarrow \mathcal{C}$ satisfying $\bar{f}|_B = f$ and $U \circ \bar{f} = \bar{g}$.*
- (2) *There exists a U -limit diagram $\bar{f}_0 : A^\triangleleft \rightarrow \mathcal{C}$ satisfying $\bar{f}_0|_A = f \circ e$ and $U \circ \bar{f}_0 = \bar{g} \circ e^\triangleleft$.*

Proof. The implication (1) $\Rightarrow$ (2) follows by observing that if $\bar{f} : B^\triangleleft \rightarrow \mathcal{C}$ is a U -limit diagram, then the left cofinality of e guarantees that $\bar{f} \circ e^\triangleleft$ is also a U -limit diagram (Corollary 7.2.2.2). We will complete the proof by showing that (2) implies (1). By virtue of Corollary 7.2.1.15, we can assume that the morphism e is either left anodyne or a trivial Kan fibration. We first treat the case where e is a trivial Kan fibration. Let $s : B \rightarrow A$ be a section of e , and let $\bar{f}_0 : A^\triangleleft \rightarrow \mathcal{C}$ satisfy the requirements of (2). Let $\bar{f}$ denote the composite map

$$B^\triangleleft \xrightarrow{s^\triangleleft} A^\triangleleft \xrightarrow{\bar{f}_0} \mathcal{C}.$$

It follows immediately from the construction that $\bar{f}|_B = f$ and $U \circ \bar{f} = \bar{g}$. Moreover, the composition $\bar{f} \circ e^\triangleleft$ is isomorphic to $\bar{f}_0$ (as an object of the ∞ -category $\text{Fun}(B^\triangleleft, \mathcal{C})$), and is therefore also a U -limit diagram (Proposition 7.1.6.9). Since e is left cofinal, it follows that $\bar{f}$ is also a U -limit diagram (Corollary 7.2.2.2).

We now treat the case where e is left anodyne. In this case, the induced map $A^\triangleleft \coprod_A B \hookrightarrow B^\triangleleft$ is inner anodyne. Since U is an inner fibration, we can extend f to a morphism $\bar{f} : B^\triangleleft \rightarrow \mathcal{C}$ satisfying $U \circ \bar{f} = \bar{g}$ and $\bar{f} \circ e^\triangleleft = \bar{f}_0$. Since e is left cofinal, the morphism $\bar{f}$ is automatically a U -limit diagram (Corollary 7.2.2.2). $\square$

Corollary 7.2.2.10. *Let $\mathcal{C}$ be an ∞ -category and let $e : A \rightarrow B$ be a left cofinal morphism of simplicial sets. Then a diagram $f : B \rightarrow \mathcal{C}$ has a limit if and only if the composite diagram $(f \circ e) : A \rightarrow \mathcal{C}$ has a limit.* 02NS

Proof. If $\bar{f} : B^\triangleleft \rightarrow \mathcal{C}$ is a colimit diagram extending f , then Corollary 7.2.2.3 guarantees that $\bar{f} \circ e^\triangleleft : A^\triangleleft \rightarrow \mathcal{C}$ is a colimit diagram extending $f \circ e$. Conversely, if $f \circ e$ can be extended to a colimit diagram, then Proposition 7.2.2.9 (applied in the special case $\mathcal{D} = \Delta^0$) guarantees that f can also be extended to a colimit diagram. $\square$

Corollary 7.2.2.11. *Let $\mathcal{C}$ be an ∞ -category, let $e : A \rightarrow B$ be a left cofinal morphism of simplicial sets, and let $f : B \rightarrow \mathcal{C}$ be a diagram. Then an object $X \in \mathcal{C}$ is a limit of f if and only if it is a limit of the diagram $(f \circ e) : A \rightarrow \mathcal{C}$.* 02XU

Proof. If an object $X \in \mathcal{C}$ is a limit of f , then we can choose a limit diagram $\bar{f} : B^\triangleleft \rightarrow \mathcal{C}$ carrying the cone point of $f^\triangleleft$ to the object X . Applying Corollary 7.2.2.10, we deduce that $\bar{f} \circ e^\triangleleft$ exhibits X as a limit of the diagram $f \circ e$. Conversely, if X is a limit of the diagram $f \circ e$, then Corollary 7.2.2.10 guarantees that the diagram f admits a limit $Y \in \mathcal{C}$. The preceding argument shows that Y is also a limit of the diagram $f \circ e$. Applying Proposition 7.1.1.12, we deduce that Y is isomorphic to X , so that X is also a limit of the diagram f . $\square$

Corollary 7.2.2.12. *Let $e : A \rightarrow B$ be a morphism of simplicial sets and let $\mathcal{C}$ be an ∞ -category. If e is left cofinal and $\mathcal{C}$ admits A -indexed limits, then $\mathcal{C}$ also admits B -indexed limits. If e is right cofinal and $\mathcal{C}$ admits A -indexed colimits, then $\mathcal{C}$ also admits B -indexed colimits.* 02NU

Corollary 7.2.2.13. *Let $e : A \rightarrow B$ be a morphism of simplicial sets and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. If e is left cofinal and the functor F creates A -indexed limits, then F creates B -indexed limits. If e is right cofinal and the functor F creates A -indexed colimits, then the functor F creates B -indexed colimits.* 02NW

039B **Corollary 7.2.2.14.** *Suppose we are given lifting problem*

039C

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{f} & \mathcal{D} \\ \downarrow & \nearrow \bar{f} & \downarrow U \\ \mathcal{C}^\triangleleft & \xrightarrow{\quad} & \mathcal{E}, \end{array}$$

(7.16)

where $\mathcal{C}$ is an ∞ -category and U is a cartesian fibration of ∞ -categories. If $\mathcal{C}$ has a final object C , then (7.16) admits a solution $\bar{f} : \mathcal{C}^\triangleleft \rightarrow \mathcal{D}$ which is a U -limit diagram.

Proof. Using Proposition 7.2.2.9 and Corollary 4.6.7.25, we can replace $\mathcal{C}$ by the simplicial set $\{C\} \simeq \Delta^0$, in which case the desired result follows from our assumption that U is a cartesian fibration (see Example 7.1.7.2). $\square$

7.2.3 Quillen's Theorem A for ∞ -Categories

02NX The following result provides a concrete criterion for establishing the cofinality of a functor between ∞ -categories.

02NY **Theorem 7.2.3.1** (Joyal). *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets, where $\mathcal{D}$ is an ∞ -category. Then:*

- (1) *The morphism F is left cofinal if and only if, for every object $X \in \mathcal{D}$, the simplicial set $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X}$ is weakly contractible.*
- (2) *The morphism F is right cofinal if and only if, for every object $X \in \mathcal{D}$, the simplicial set $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/}$ is weakly contractible.*

02NZ **Remark 7.2.3.2.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets, where $\mathcal{D}$ is an ∞ -category. For every object $X \in \mathcal{D}$, the slice and coslice diagonal morphisms of Construction 4.6.4.15 induce categorical equivalences

$$\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X} \hookrightarrow \mathcal{C} \tilde{\times}_{\mathcal{D}} \{X\} \quad \mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/} \hookrightarrow \{X\} \tilde{\times}_{\mathcal{D}} \mathcal{C}$$

(Example 5.1.7.7). We can therefore reformulate Theorem 7.2.3.1 as follows:

- (1') The morphism F is left cofinal if and only if, for every object $X \in \mathcal{D}$, the simplicial set $\mathcal{C} \tilde{\times}_{\mathcal{D}} \{X\}$ is weakly contractible.
- (2') The morphism F is right cofinal if and only if, for every object $X \in \mathcal{D}$, the simplicial set $\{X\} \tilde{\times}_{\mathcal{D}} \mathcal{C}$ is weakly contractible.

Example 7.2.3.3 (Quillen’s Theorem A). Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. 02P0 Suppose that, for every object $X \in \mathcal{D}$, the category $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/}$ has weakly contractible nerve. Applying Theorem 7.2.3.1, we deduce that the induced morphism of simplicial sets $N_{\bullet}(F) : N_{\bullet}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{D})$ is right cofinal. In particular, it is a weak homotopy equivalence (Proposition 7.2.1.5). This recovers a classical result of Quillen (see [49]).

Corollary 7.2.3.4. *Let $(S, \leq)$ and $(T, \leq)$ be linearly ordered sets, and let $f : S \rightarrow T$ be a 03U2 nondecreasing function. The following conditions are equivalent:*

- (1) *The function $f : S \rightarrow T$ is cofinal in the sense of Definition 4.7.1.26. That is, for every element $t \in T$, there exists an element $s \in S$ satisfying $t \leq f(s)$.*
- (2) *The induced morphism of simplicial sets $N_{\bullet}(S) \rightarrow N_{\bullet}(T)$ is right cofinal, in the sense of Definition 7.2.1.1.*

See Corollary 9.1.4.9 for a more general form of this result.

Proof of Corollary 7.2.3.4. For each $t \in T$, set $S_{\geq t} = \{s \in S : t \leq f(s)\}$, which we regard as a linearly ordered subset of S . Using Theorem 7.2.3.1, we can rewrite conditions (1) and (2) as follows:

- (1') For each element $t \in T$, the linearly ordered set $S_{\geq t}$ is nonempty.
- (2') For each element $t \in T$, the linearly ordered set $S_{\geq t}$ has weakly contractible nerve.

The implication $(2') \Rightarrow (1')$ is immediate, and the reverse implication follows from Corollary 3.2.8.5. $\square$

Corollary 7.2.3.5. *Let $\mathcal{C}$ be an ∞ -category and let $\bar{f} : A^{\triangleleft} \rightarrow \mathcal{C}$ be a diagram, where A is a 02XX weakly contractible simplicial set. The following conditions are equivalent:*

- (1) *The diagram $\bar{f}$ carries each edge of $A^{\triangleleft}$ to an isomorphism in $\mathcal{C}$.*
- (2) *The restriction $f = \bar{f}|_A$ carries each edge of A to an isomorphism in $\mathcal{C}$, and $\bar{f}$ is a limit diagram.*

Proof. Without loss of generality, we may assume that f carries each edge of A to an isomorphism in $\mathcal{C}$. Under this assumption, we can restate (1) and (2) as follows:

- (1') For every vertex $a \in A$, the edge

$$\Delta^1 \simeq \{a\}^{\triangleleft} \hookrightarrow A^{\triangleleft} \xrightarrow{\bar{f}} \mathcal{C}$$

is an isomorphism in the ∞ -category $\mathcal{C}$.

(2') The morphism $\bar{f}$ is a limit diagram.

Using Corollary 3.1.7.2, we can choose an anodyne morphism $i : A \hookrightarrow B$, where B is a Kan complex. Note that f can be regarded as a morphism from A to the core $\mathcal{C}^\simeq$, which is also a Kan complex (Corollary 4.4.3.11). We can therefore extend f to a morphism of Kan complexes $g : B \rightarrow \mathcal{C}^\simeq$. Moreover, the morphism i is left cofinal (Proposition 7.2.1.5) and therefore left anodyne (Proposition 7.2.1.3). It follows that the induced map $B \coprod_A A^\triangleleft \hookrightarrow B^\triangleleft$ is inner anodyne (Example 4.3.6.5), so that we can choose a functor $\bar{g} : B^\triangleleft \rightarrow \mathcal{C}$ satisfying $\bar{g}|_B = g$ and $\bar{g}|_{A^\triangleleft} = \bar{f}$.

It follows from Corollary 7.2.2.3 that $\bar{f}$ is a limit diagram if and only if $\bar{g}$ is a limit diagram. Since A is weakly contractible, the Kan complex B is contractible. In particular, every vertex $a \in A$ can be regarded as a final object of B . The equivalence of (1') and (2') now follows from Corollary 7.2.2.6. $\square$

02XY Corollary 7.2.3.6. *Let $\mathcal{C}$ be an ∞ -category and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories. Then:*

- *If $\mathcal{C}$ has an initial object Y and $\bar{F} : \mathcal{C}^\triangleleft \rightarrow \mathcal{D}$ is a functor which carries $\{Y\}^\triangleleft \simeq \Delta^1$ to an isomorphism in $\mathcal{D}$, then $\bar{F}$ is a U -limit diagram.*
- *If $\mathcal{C}$ has a final object Y and $\bar{F} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ is a functor which carries $\{Y\}^\triangleright \simeq \Delta^1$ to an isomorphism in $\mathcal{D}$, then $\bar{F}$ is a U -colimit diagram.*

Proof. Combine Corollary 7.2.2.6 with Proposition 7.1.6.10. $\square$

02P3 Corollary 7.2.3.7. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then:*

- (1) *If F is a left adjoint, then it is left cofinal.*
- (2) *If F is a right adjoint, then it is right cofinal.*

Proof. We will prove (1); the proof of (2) is similar. Suppose that F admits a right $G : \mathcal{D} \rightarrow \mathcal{C}$. For every object $X \in \mathcal{D}$, Corollary 6.2.6.2 guarantees that the ∞ -category $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X}$ has a final object. In particular, the ∞ -category $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X}$ is weakly contractible (Corollary 4.6.7.26). Allowing X to vary and applying Theorem 7.2.3.1, we conclude that F is left cofinal. $\square$

03J7 Example 7.2.3.8. Let $\mathcal{C}$ be an ∞ -category. If $\mathcal{C}_0 \subseteq \mathcal{C}$ is a reflective subcategory (Definition 6.2.2.6), then the inclusion map $\iota : \mathcal{C}_0 \hookrightarrow \mathcal{C}$ is right cofinal (this is a special case of Corollary 7.2.3.7, since Proposition 6.2.2.18 guarantees that ι has a left adjoint). Similarly, if $\mathcal{C}_0$ is a coreflective subcategory of $\mathcal{C}$, then the inclusion ι is left cofinal.

02P4 Corollary 7.2.3.9. *Let $\mathcal{C}$ be an ∞ -category and let K be a simplicial set. The following conditions are equivalent:*

(1) The diagonal map $\delta : \mathcal{C} \rightarrow \text{Fun}(K, \mathcal{C})$ is right cofinal.

(2) For every diagram $f : K \rightarrow \mathcal{C}$, the coslice ∞ -category $\mathcal{C}_{f/}$ is weakly contractible.

Proof. By virtue of Remark 7.2.3.2, condition (1) is equivalent to the requirement that for every diagram $f : K \rightarrow \mathcal{C}$, the oriented fiber product $\{f\} \tilde{\times}_{\text{Fun}(K, \mathcal{C})} \mathcal{C}$ is weakly contractible. The equivalence of (1) and (2) now follows from Theorem 4.6.4.19. $\square$

Our proof of Theorem 7.2.3.1 will require some preliminaries.

Lemma 7.2.3.10. *Let $\mathcal{C}$ be a category and let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets indexed by $\mathcal{C}$. Suppose we are given morphisms of simplicial sets $A \xrightarrow{f} B \xrightarrow{g} N_\bullet(\mathcal{C})$, where f is right anodyne. Then the induced map $A \times_{N_\bullet(\mathcal{C})} \text{holim}(\mathcal{F}) \rightarrow B \times_{N_\bullet(\mathcal{C})} \text{holim}(\mathcal{F})$ is right anodyne.* 039D

Proof. Without loss of generality, we may assume that f is the inclusion map $\Lambda_i^n \hookrightarrow \Delta^n$ for some $0 < i \leq n$. Using Remark 5.3.2.3, we can reduce to the case where $\mathcal{C}$ is the linearly ordered set $[n] = \{0 < 1 < \cdots < n\}$ and g is the identity map. In this case, Remark 5.3.2.12 supplies a pushout diagram of simplicial sets

$$\begin{array}{ccc} \Lambda_i^n \times \mathcal{F}(0) & \longrightarrow & \Lambda_i^n \times_{\Delta^n} \text{holim}(\mathcal{F}) \\ \downarrow & & \downarrow \\ \Delta^n \times \mathcal{F}(0) & \longrightarrow & \text{holim}(\mathcal{F}). \end{array}$$

It will therefore suffice to show that the left vertical map is right anodyne, which follows from Proposition 4.2.5.3. $\square$

Example 7.2.3.11. Let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets, and suppose that the category $\mathcal{C}$ contains a final object C . Combining Lemma 7.2.3.10 with Corollary 4.6.7.25, we deduce that the inclusion map 039E

$$\mathcal{F}(C) \simeq \{C\} \times_{N_\bullet(\mathcal{C})} \text{holim}(\mathcal{F}) \hookrightarrow \text{holim}(\mathcal{F})$$

is right anodyne.

Proposition 7.2.3.12. *Suppose we are given a pullback diagram of simplicial sets* 02P6

$$\begin{array}{ccc} \mathcal{C}' & \xrightarrow{F} & \mathcal{C} \\ \downarrow & & \downarrow \pi \\ \mathcal{D}' & \xrightarrow{\bar{F}} & \mathcal{D}. \end{array}$$

If π is a cocartesian fibration and $\overline{F}$ is right cofinal, then F is right cofinal.

Proof. By virtue of Corollary 7.2.1.15, it will suffice to prove Proposition 7.2.3.12 in the special case where $\overline{F}$ is right anodyne. Let S be the collection of all morphisms of simplicial sets $\overline{F} : \mathcal{D}' \rightarrow \mathcal{D}$ having the property that, for every cocartesian fibration $\pi : \mathcal{C} \rightarrow \mathcal{D}$, the induced map $F : \mathcal{D}' \times_{\mathcal{D}} \mathcal{C} \rightarrow \mathcal{C}$ is right anodyne. We wish to show that every right anodyne morphism belongs to S . It follows immediately from the definitions that S is weakly saturated, in the sense of Definition 1.5.4.13. It will therefore suffice to show that S contains every horn inclusion $\Lambda_i^n \hookrightarrow \Delta^n$ for $0 < i \leq n$. In other words, we are reduced to proving Proposition 7.2.3.12 in the special case where $\mathcal{D} = \Delta^n$ is a standard simplex and $\overline{F}$ is the inclusion of the horn $\Lambda_i^n \subseteq \Delta^n$.

Applying Corollary 5.3.4.9, we deduce that there exists a diagram of ∞ -categories $\mathcal{G} : [n] \rightarrow \mathbf{QCat}$ and a scaffold $\lambda : \overrightarrow{\mathrm{holim}}(\mathcal{G}) \rightarrow \mathcal{C}$ for the cocartesian fibration π . We then have a commutative diagram of simplicial sets

$$\begin{array}{ccc} \Lambda_i^n \times_{\Delta^n} \overrightarrow{\mathrm{holim}}(\mathcal{G}) & \xrightarrow{\quad} & \Lambda_i^n \times_{\Delta^n} \mathcal{C} \\ \downarrow F' & & \downarrow F \\ \overrightarrow{\mathrm{holim}}(\mathcal{G}) & \xrightarrow{\quad \lambda \quad} & \mathcal{C}, \end{array}$$

where F' is right anodyne (Lemma 7.2.3.10) and therefore right cofinal (Proposition 7.2.1.3). Lemma 5.3.6.4 guarantees that horizontal maps are categorical equivalences, so that F is also right cofinal (Corollary 7.2.1.22). $\square$

02P7 **Corollary 7.2.3.13.** Suppose we are given a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{C}' & \xrightarrow{F} & \mathcal{C} \\ \downarrow & & \downarrow \pi \\ \mathcal{D}' & \xrightarrow{\overline{F}} & \mathcal{D}. \end{array}$$

If π is a cocartesian fibration and $\overline{F}$ is right anodyne, then F is right anodyne.

Proof. Combine Propositions 7.2.3.12 and 7.2.1.3. $\square$

03J8 **Example 7.2.3.14.** Let $\pi : \mathcal{C} \rightarrow \mathcal{D}$ be a cocartesian fibration of ∞ -categories, let X be an object of $\mathcal{D}$, and set $\mathcal{C}_X = \{X\} \times_{\mathcal{D}} \mathcal{C}$. If X is a final object of $\mathcal{D}$, then the inclusion map $\mathcal{C}_X \hookrightarrow \mathcal{C}$ is right anodyne, and therefore right cofinal. This follows by combining Corollaries 7.2.3.13 and 4.6.7.25.

Proof of Theorem 7.2.3.1. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets, where $\mathcal{D}$ is an ∞ -category. We will show that F is right cofinal if and only if, for every object $X \in \mathcal{D}$, the simplicial set $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/}$ is weakly contractible; the analogous characterization of left cofinal morphisms follows by a similar argument.

Suppose first that F is right cofinal. For every object $X \in \mathcal{D}$, the projection map $\mathcal{D}_{X/} \rightarrow \mathcal{D}$ is a left fibration (Proposition 4.3.6.1), and therefore a cocartesian fibration (Proposition 5.1.4.15). Applying Proposition 7.2.3.12, we conclude that the projection map $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/} \rightarrow \mathcal{D}_{X/}$ is also right cofinal. In particular, it is a weak homotopy equivalence (Proposition 7.2.1.5). Since the ∞ -category $\mathcal{D}_{X/}$ has an initial object (Proposition 4.6.7.23), it is weakly contractible, so that the fiber product $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/}$ is also weakly contractible.

We now prove the converse. Assume that, for every object $X \in \mathcal{D}$, the simplicial set $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/}$ is weakly contractible. We wish to show that F is right cofinal. Using Proposition 4.1.3.2, we can factor F as a composition

$$\mathcal{C} \xrightarrow{F'} \mathcal{C}' \xrightarrow{F''} \mathcal{D},$$

where F' is inner anodyne and F'' is an inner fibration. Since F' is right cofinal (Proposition 7.2.1.3), it will suffice to show that F'' is right cofinal (Proposition 7.2.1.6). For every object $X \in \mathcal{D}$, Proposition 5.3.6.1 guarantees that the induced map $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/} \hookrightarrow \mathcal{C}' \times_{\mathcal{D}} \mathcal{D}_{X/}$ is a categorical equivalence. In particular, it is a weak homotopy equivalence (Remark 4.5.3.4), so that $\mathcal{C}' \times_{\mathcal{D}} \mathcal{D}_{X/}$ is also weakly contractible. We may therefore replace $\mathcal{C}$ by $\mathcal{C}'$ and thereby reduce to the case where $F : \mathcal{C} \rightarrow \mathcal{D}$ is an inner fibration, so that $\mathcal{C}$ is also an ∞ -category (Remark 4.1.1.9).

Let $\text{ev}_0, \text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{D}) \rightarrow \mathcal{D}$ denote the functors given by evaluation at the vertices $0, 1 \in \Delta^1$, and let $\delta : \mathcal{D} \hookrightarrow \text{Fun}(\Delta^1, \mathcal{D})$ be the diagonal map. Note that there is a unique natural transformation from id_{Δ^1} to the constant map $\Delta^1 \rightarrow \{1\} \hookrightarrow \Delta^1$, which induces a natural transformation $h : \text{id}_{\text{Fun}(\Delta^1, \mathcal{D})} \rightarrow \delta \circ \text{ev}_1$. Let $\mathcal{M}$ denote the oriented fiber product $\mathcal{D} \tilde{\times}_{\mathcal{D}} \mathcal{C} = \text{Fun}(\Delta^1, \mathcal{D}) \times_{\text{Fun}(\{1\}, \mathcal{D})} \text{Fun}(\{1\}, \mathcal{C})$ of Construction 4.6.4.1, so that ev_0 and ev_1 lift to functors

$$\mathcal{D} \xleftarrow{\tilde{\text{ev}}_0} \mathcal{M} \xrightarrow{\tilde{\text{ev}}_1} \mathcal{C},$$

the diagonal map δ lifts to a functor $\tilde{\delta} : \mathcal{C} \hookrightarrow \mathcal{M}$, and h lifts to a natural transformation $\tilde{h} : \text{id}_{\mathcal{M}} \rightarrow \tilde{\delta} \circ \tilde{\text{ev}}_1$. Note that $\tilde{h}$ can be identified with a morphism of simplicial sets $\Delta^1 \times \mathcal{M} \rightarrow \mathcal{M}$ which fits into a commutative diagram

$$\begin{array}{ccccc} \{0\} \times \mathcal{C} & \longrightarrow & (\Delta^1 \times \mathcal{C}) \amalg_{(\{1\} \times \mathcal{C})} (\{1\} \times \mathcal{M}) & \longrightarrow & \mathcal{C} \\ \downarrow \tilde{\delta} & & \downarrow \iota & & \downarrow \tilde{\delta} \\ \{0\} \times \mathcal{M} & \longrightarrow & \Delta^1 \times \mathcal{M} & \xrightarrow{\tilde{h}} & \mathcal{M}, \end{array}$$

where the horizontal compositions are the identity. It follows that $\tilde{\delta}$ is a retract of ι . Since ι is right anodyne (Proposition 4.2.5.3), $\tilde{\delta}$ is also right anodyne, and therefore right cofinal (Proposition 7.2.1.3).

The functor $\tilde{\mathrm{ev}}_0 : \mathcal{M} \rightarrow \mathcal{D}$ is a cartesian fibration (Corollary 5.3.7.3). Moreover, for each object $X \in \mathcal{D}$, the fiber $\tilde{\mathrm{ev}}_0^{-1}\{X\} \simeq \{X\} \tilde{\times}_{\mathcal{D}} \mathcal{C}$ is equivalent to the ∞ -category $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{X/}$ (Example 5.1.7.7), and is therefore weakly contractible. Applying Corollary 6.3.4.3, we deduce that the functor $\tilde{\mathrm{ev}}_1$ exhibits $\mathcal{D}$ as a localization of $\mathcal{D} \tilde{\times}_{\mathcal{D}} \mathcal{C}$, and is therefore right cofinal (Proposition 7.2.1.10). We now observe that the functor $F : \mathcal{C} \rightarrow \mathcal{D}$ factors as a composition

$$\mathcal{C} \xrightarrow{\tilde{\delta}} \mathcal{M} \xrightarrow{\tilde{\mathrm{ev}}_1} \mathcal{D},$$

and is therefore also right cofinal (Proposition 7.2.1.6). $\square$

05ZU **Corollary 7.2.3.15.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. The following conditions are equivalent:*

- (1) *The morphism F is right cofinal.*
- (2) *For every cocartesian fibration $\tilde{\mathcal{D}} \rightarrow \mathcal{D}$, the projection map $\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}} \rightarrow \tilde{\mathcal{D}}$ is right cofinal.*
- (3) *For every left fibration $\tilde{\mathcal{D}} \rightarrow \mathcal{D}$, the projection map $\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}} \rightarrow \tilde{\mathcal{D}}$ is a weak homotopy equivalence.*
- (4) *For every left fibration $\tilde{\mathcal{D}} \rightarrow \mathcal{D}$, if $\tilde{\mathcal{D}}$ is weakly contractible, then $\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}}$ is weakly contractible.*

Proof. The implication (1) $\Rightarrow$ (2) follows from Proposition 7.2.3.12, the implication (2) $\Rightarrow$ (3) from Propositions 7.2.1.5 and 5.1.4.15, and the implication (3) $\Rightarrow$ (4) is immediate. We will complete the proof by showing that (4) implies (1). Assume that condition (4) is satisfied; we wish to prove that F is right cofinal. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $G : \mathcal{D} \rightarrow \mathcal{E}$, where $\mathcal{E}$ is an ∞ -category. Note that G is right cofinal, and therefore satisfies condition (4) (Corollary 7.2.1.13). For each object $X \in \mathcal{E}$, the ∞ -category $\mathcal{E}_{X/}$ has an initial object and is therefore weakly contractible (Corollary 4.6.7.26). Since both F and G satisfy condition (4), it follows that the fiber product $\mathcal{C} \times_{\mathcal{E}} \mathcal{E}_{X/}$ is also weakly contractible. Allowing the object X to vary, we see that $(G \circ F) : \mathcal{C} \rightarrow \mathcal{E}$ is right cofinal (Theorem 7.2.3.1). Applying Proposition 7.2.1.21, we conclude that F is also right cofinal. $\square$

Combining Theorem 7.2.3.1 with Proposition 7.2.3.12, we obtain the following:

Corollary 7.2.3.16 (Fiberwise Cofinality Criterion). *Suppose we are given a commutative diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{F} & \mathcal{E} \\ & \searrow U' \quad \swarrow U & \\ & \mathcal{C} & \end{array}$$

where U and U' are cartesian fibrations, and the morphism F carries U' -cartesian edges of $\mathcal{E}'$ to U -cartesian edges of $\mathcal{E}$. The following conditions are equivalent:

- (1) *The morphism F is right cofinal.*
- (2) *For every vertex $C \in \mathcal{C}$, the induced map of fibers $F_C : \mathcal{E}'_C \rightarrow \mathcal{E}_C$ is right cofinal.*

Proof. We first reduce to the case where $\mathcal{C}$ is an ∞ -category. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $\iota : \mathcal{C} \hookrightarrow \bar{\mathcal{C}}$, where $\bar{\mathcal{C}}$ is an ∞ -category. Using Proposition 5.6.7.2, we can extend U and U' to cocartesian fibrations of ∞ -categories $\bar{U} : \bar{\mathcal{E}} \rightarrow \bar{\mathcal{C}}$ and $\bar{U}' : \bar{\mathcal{E}}' \rightarrow \bar{\mathcal{C}}$. Then the inclusion maps $\mathcal{E} \hookrightarrow \bar{\mathcal{E}}$ and $\mathcal{E}' \hookrightarrow \bar{\mathcal{E}}'$ are categorical equivalences (Lemma 5.3.6.5). Since $\bar{U}$ is an isofibration (Proposition 5.1.4.9), we can extend F to a functor $\bar{F} : \bar{\mathcal{E}}' \rightarrow \bar{\mathcal{E}}$ satisfying $\bar{U} \circ \bar{F} = \bar{U}'$ (Proposition 4.5.5.1). It follows from Remark 5.3.1.12 that the functor $\bar{F}$ carries $\bar{U}'$ -cartesian morphisms of $\bar{\mathcal{E}}'$ to $\bar{U}$ -cartesian morphisms of $\bar{\mathcal{E}}$. Moreover, the morphism F is right cofinal if and only if $\bar{F}$ is right cofinal (Corollary 7.2.1.22). Consequently, we can replace $\mathcal{C}$ by $\bar{\mathcal{C}}$ and thereby reduce to proving Corollary 7.2.3.16 in the case where $\mathcal{C}$ is an ∞ -category.

Fix an object $X \in \mathcal{E}$, let $C = U(X)$ denote its image in $\mathcal{C}$, and let $\mathcal{E}_C$ and $\mathcal{E}'_C$ denote the fibers $\{C\} \times_{\mathcal{C}} \mathcal{E}$ and $\{C\} \times_{\mathcal{C}} \mathcal{E}'$, respectively. We will prove that the following conditions are equivalent:

- (1_X) The ∞ -category $\mathcal{E}' \times_{\mathcal{E}} \mathcal{E}_{X/}$ is weakly contractible.
- (2_X) The ∞ -category $\mathcal{E}'_C \times_{\mathcal{E}_C} (\mathcal{E}_C)_{X/}$ is weakly contractible.

Corollary 7.2.3.16 will then follow by allowing the object X to vary and applying the criterion of Theorem 7.2.3.1.

To complete the proof, it will suffice to show that the inclusion map

$$\mathcal{E}'_C \times_{\mathcal{E}_C} (\mathcal{E}_C)_{X/} \hookrightarrow \mathcal{E}' \times_{\mathcal{E}} \mathcal{E}_{X/}$$

is a weak homotopy equivalence. In fact, we will show that it is left anodyne. Unwinding

the definitions, we have a pullback diagram

$$\begin{array}{ccc} \mathcal{E}'_C \times_{\mathcal{E}_C} (\mathcal{E}_C)_{X/} & \longrightarrow & \mathcal{E}' \times_{\mathcal{E}} \mathcal{E}_{X/} \\ \downarrow & & \downarrow \\ \{\mathrm{id}_C\} & \longrightarrow & \mathcal{C}_{C/}, \end{array}$$

where the right vertical map is a cartesian fibration (Corollary 5.1.4.22). By virtue of Proposition 7.2.3.12, we are reduced to showing that the inclusion map $\{\mathrm{id}_C\} \hookrightarrow \mathcal{C}_{C/}$ is left anodyne, or equivalently that $\{\mathrm{id}_C\}$ is an initial object of the ∞ -category $\mathcal{C}_{C/}$ (Corollary 4.6.7.24). This is a special case of Proposition 4.6.7.23. $\square$

7.3 Kan Extensions

02Y1 Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. In practice, it is often possible to reconstruct the functor F (at least up to isomorphism) from its restriction to a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. To make this more precise, it will be convenient to introduce some terminology.

02Y2 **Definition 7.3.0.1.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. We say that F is *left Kan extended from $\mathcal{C}^0$* if, for every object $C \in \mathcal{C}$, the collection of morphisms $\{F(u) : F(C_0) \rightarrow F(C)\}_{u:C_0 \rightarrow C}$ exhibits $F(C)$ as a colimit of the diagram

$$(\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}) \rightarrow \mathcal{C}^0 \hookrightarrow \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

The central features of Definition 7.3.0.1 can be summarized as follows:

02Y3 **Exercise 7.3.0.2** (Uniqueness of Kan Extensions). Let $F, G : \mathcal{C} \rightarrow \mathcal{D}$ be functors between categories, and suppose that F is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Show that the restriction map

$$\begin{array}{c} \{\text{Natural transformations from } F \text{ to } G\} \\ \downarrow \\ \{\text{Natural transformations from } F|_{\mathcal{C}^0} \text{ to } G|_{\mathcal{C}^0}\} \end{array}$$

is a bijection. In particular, the functor F can be recovered (up to canonical isomorphism) from the restriction $F|_{\mathcal{C}^0}$.

Exercise 7.3.0.3 (Existence of Kan Extensions). Let $\mathcal{C}$ be a category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$ be a functor between categories. Show that the following conditions are equivalent;

- (1) There exists a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ which is left Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$.
- (2) For every object $C \in \mathcal{C}$, the diagram

$$(\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}) \rightarrow \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D} \quad (7.17) \quad 02Y5$$

has a colimit in $\mathcal{D}$.

Stated more informally, if the diagram (7.17) has a colimit in $\mathcal{D}$, then that colimit depends functorially on the object $C \in \mathcal{C}$.

In this section, we adapt the theory of Kan extensions to the ∞ -categorical setting. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. We will say that F is *left Kan extended from $\mathcal{C}^0$* if it satisfies an ∞ -categorical analogue of the condition appearing in Definition 7.3.0.1, which we formulate in §7.3.2 (see Definition 7.3.2.1). Our main results are ∞ -categorical counterparts of Exercises 7.3.0.2 and 7.3.0.3, which we prove in §7.3.6 and §7.3.5, respectively (see Corollary 7.3.6.9 and Corollary 7.3.5.8).

For many applications, it will be useful to consider a different generalization of Definition 7.3.0.1, where we replace the inclusion map $\mathcal{C}^0 \hookrightarrow \mathcal{C}$ by an arbitrary functor $\delta : \mathcal{K} \rightarrow \mathcal{C}$. Suppose we are given functors $F : \mathcal{C} \rightarrow \mathcal{D}$, $\delta : \mathcal{K} \rightarrow \mathcal{C}$, and $F_0 : \mathcal{K} \rightarrow \mathcal{D}$, together with a natural transformation $\beta : F_0 \rightarrow F \circ \delta$, as indicated in the diagram

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & & \searrow F \\ \mathcal{K} & \xrightarrow{F_0} & \mathcal{D} \end{array} \quad \begin{array}{c} \uparrow \beta \\ \uparrow \beta \end{array}$$

We will say that β *exhibits F as a left Kan extension of F_0 along δ* if, for every object $C \in \mathcal{C}$, the collection of morphisms $\{(F(u) \circ \beta_X) : F_0(X) \rightarrow F(C)\}_{u : \delta(X) \rightarrow C}$ exhibits $F(C)$ as a colimit of the diagram $\mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C} \rightarrow \mathcal{K} \xrightarrow{F_0} \mathcal{D}$. This notion also has an ∞ -categorical generalization which we introduce in §7.3.1 (Variant 7.3.1.5), for which we have counterparts of Exercises 7.3.0.2 and 7.3.0.3 (see Propositions 7.3.6.1 and 7.3.5.1). In the special case where $\mathcal{K} = \mathcal{C}^0$ is a full subcategory of $\mathcal{C}$ and δ is the inclusion map, the Kan extension condition guarantees that β is an isomorphism, and therefore essentially reduces to the notion of Kan extension introduced in Definition 7.3.0.1 (see Corollary 7.3.2.7 for a precise

statement). In §7.3.4 we study a different extreme, where the functor δ is assumed to be a cocartesian fibration: in this case, the left Kan extension F of a functor $F_0 : \mathcal{K} \rightarrow \mathcal{D}$ along δ is given concretely by the formula

$$F(C) = \varinjlim_{\delta(X)=C} (F_0(X))$$

where the colimit is taken over the *fiber* $\mathcal{K}_C = \mathcal{K} \times_{\mathcal{C}} \{C\}$ (see Proposition 7.3.4.1 and Corollary 7.3.4.2).

In §7.3.3 we consider another variant of Definition 7.3.0.1, where we replace colimits in $\mathcal{D}$ by the more general notion of U -colimit for an auxiliary functor $U : \mathcal{D} \rightarrow \mathcal{E}$ (see §7.1.6). The extra generality afforded by the relative setting is quite convenient in practice: for example, in §7.3.6 we show that relative Kan extensions satisfy a universal property (Proposition 7.3.6.7, analogous to Exercise 7.3.0.2) which can be formally deduced from an existence criterion (Proposition 7.3.5.5, analogous to Exercise 7.3.0.3).

In §7.3.8, we study the transitivity properties of Kan extensions. Let $\overline{F} : \overline{\mathcal{C}} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and suppose we are given full subcategories $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$ such that $F = \overline{F}|_{\mathcal{C}}$ is left Kan extended from $\mathcal{C}_0$. We will show that $\overline{F}$ is left Kan extended from $\mathcal{C}$ if and only if it is left Kan extended from $\mathcal{C}^0$ (Corollary 7.3.8.13). Moreover, we prove analogous statements for relative left Kan extensions (Proposition 7.3.8.11) and for Kan extensions along more general functors (Proposition 7.3.8.23). In §7.3.9, we apply these ideas to give a characterization of U -colimit diagrams in the special case where $U : \mathcal{D} \rightarrow \mathcal{E}$ is a cocartesian fibration of ∞ -categories.

02Y6 **Remark 7.3.0.4.** In the summary above, we considered only the notion of *left* Kan extensions. There is also a dual theory of *right* Kan extensions, which can be obtained from the theory of left Kan extensions by passing to opposite categories.

7.3.1 Kan Extensions along General Functors

02Y7 We begin by introducing some notation.

02Y8 **Notation 7.3.1.1.** Let $\mathcal{C}$ be an ∞ -category and let $\delta : K \rightarrow \mathcal{C}$ be a diagram. For each object $C \in \mathcal{C}$, we let $K_{/C}$ denote the fiber product $K \times_{\mathcal{C}} \mathcal{C}_{/C}$. Note that the slice diagonal of Construction 4.6.4.15 determines a map $K_{/C} \rightarrow K \tilde{\times}_{\mathcal{C}} \{C\}$, which we can identify with a natural transformation of diagrams $\gamma : \delta|_{K_{/C}} \rightarrow \underline{C}$; here $\delta|_{K_{/C}}$ denotes the composition $K_{/C} \rightarrow K \xrightarrow{\delta} \mathcal{C}$, while $\underline{C}$ denotes the constant diagram $K_{/C} \rightarrow \mathcal{C}$ taking the value C . Similarly, we let $K_{C/}$ denote the fiber product $\mathcal{C}_{C/} \times_{\mathcal{C}} K$, so that the coslice diagonal of Construction 4.6.4.15 determines a natural transformation $\gamma' : \underline{C} \rightarrow \delta|_{K_{C/}}$.

02Y9 **Definition 7.3.1.2** (Right Kan Extensions). Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Suppose we are given a simplicial set K together with diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$

and a natural transformation $\alpha : F \circ \delta \rightarrow F_0$, as indicated in the diagram

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & & \searrow F \\ K & \xrightarrow{F_0} & \mathcal{D}. \end{array}$$

$\Downarrow \alpha$

We will say that α *exhibits F as a right Kan extension of F_0 along δ* if, for every object $C \in \mathcal{C}$, the following condition is satisfied:

($*_C$) Let α_C denote a composition of the natural transformations

$$\underline{F(C)} \xrightarrow{F(\gamma')} (F \circ \delta)|_{K_{C/}} \xrightarrow{\alpha} F_0|_{K_{C/}}$$

(formed in the ∞ -category $\text{Fun}(K_{C/}, \mathcal{D})$), where $\gamma' : \underline{C} \rightarrow \delta|_{K_{C/}}$ is defined in Notation 7.3.1.1. Then α_C exhibits $F(C)$ as a limit of the diagram

$$K_{C/} = \mathcal{C}_{C/} \times_{\mathcal{C}} K \rightarrow K \xrightarrow{F_0} \mathcal{D},$$

in the sense of Definition 7.1.1.1.

Remark 7.3.1.3. Stated more informally, a diagram

02YA

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & & \searrow F \\ K & \xrightarrow{F_0} & \mathcal{D}. \end{array}$$

$\Downarrow \alpha$

exhibits F as a right Kan extension of F_0 along δ if, for every object $C \in \mathcal{C}$, we can calculate the value $F(C) \in \mathcal{D}$ as a limit of the diagram

$$K_{C/} = \mathcal{C}_{C/} \times_{\mathcal{C}} K \rightarrow K \xrightarrow{F_0} \mathcal{D}.$$

Note that this requirement characterizes the object $F(C) \in \mathcal{D}$ up to isomorphism (see Proposition 7.1.1.12). We will later prove a stronger assertion: if the diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$ are fixed, then a right Kan extension of F_0 along δ is uniquely determined (up to isomorphism) as an object of the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$ (Remark 7.3.6.6).

Warning 7.3.1.4. In the situation of Definition 7.3.1.2, the natural transformation α_C 02YB appearing in condition ($*_C$) is defined as a composition of morphisms in the ∞ -category $\text{Fun}(K_{C/}, \mathcal{D})$, which is only well-defined up to homotopy. However, the condition that α_C exhibits $F(C)$ as a colimit of the diagram $F_0|_{K_{C/}}$ depends only on the homotopy class $[\beta_C]$ (Remark 7.1.1.7).

02YC **Variant 7.3.1.5** (Left Kan Extensions). Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Suppose we are given a simplicial set K together with diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$ and a natural transformation $\beta : F_0 \rightarrow F \circ \delta$, as indicated in the diagram

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & & \searrow F \\ K & \xrightarrow{F_0} & \mathcal{D} \end{array}$$

β

We will say that β exhibits F as a left Kan extension of F_0 along δ if, for every object $C \in \mathcal{C}$, the following condition is satisfied:

(*_C) Let β_C denote a composition of the natural transformations

$$F_0|_{K/C} \xrightarrow{\beta} (F \circ \delta)|_{K/C} \xrightarrow{F(\gamma)} \underline{F(C)}$$

(formed in the ∞ -category $\text{Fun}(K/C, \mathcal{D})$), where $\gamma : \delta|_{K/C} \rightarrow \underline{C}$ is defined in Notation 7.3.1.1. Then β_C exhibits $F(C)$ as a colimit of the diagram

$$K/C = K \times_{\mathcal{C}} \mathcal{C}/C \rightarrow K \xrightarrow{F_0} \mathcal{D},$$

in the sense of Definition 7.1.1.1.

02YD **Remark 7.3.1.6.** In the situation of Variant 7.3.1.5, the natural transformation $\beta : F_0 \rightarrow F \circ \delta$ exhibits F as a left Kan extension of F_0 along δ if and only if it exhibits F^{op} as a right Kan extension of F_0^{op} along δ^{op} , when regarded as a morphism in the ∞ -category $\text{Fun}(K^{\text{op}}, \mathcal{D}^{\text{op}}) \simeq \text{Fun}(K, \mathcal{D})^{\text{op}}$.

02YE **Example 7.3.1.7.** Let $\mathcal{D}$ be an ∞ -category, let $F_0 : K \rightarrow \mathcal{D}$ be a diagram. Let $\delta : K \rightarrow \Delta^0$ be the projection map and let $F : \Delta^0 \rightarrow \mathcal{D}$ be the functor corresponding to an object $Y \in \mathcal{D}$. Then:

- A natural transformation $\alpha : \underline{Y} = (F \circ \delta) \rightarrow F_0$ exhibits Y as a limit of F_0 (in the sense of Definition 7.1.1.1) if and only if it exhibits F as a right Kan extension of F_0 along δ (in the sense of Definition 7.3.1.2).
- A natural transformation $\beta : F_0 \rightarrow (F \circ \delta) = \underline{Y}$ exhibits Y as a colimit of F_0 (in the sense of Definition 7.1.1.1) if and only if it exhibits F as a left Kan extension of F_0 along δ (in the sense of Variant 7.3.1.5).

02YF **Example 7.3.1.8.** Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories, and let $\alpha : F \rightarrow G$ be a morphism in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$. The following conditions are equivalent:

- (1) The natural transformation α is an isomorphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$.
- (2) The natural transformation α exhibits F as a right Kan extension of G along the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$.
- (3) The natural transformation α exhibits G as a left Kan extension of F along the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$.

To prove the equivalence of (1) and (2), fix an object $C \in \mathcal{C}$. Since the identity morphism id_C is an initial object of the ∞ -category $\mathcal{C}_{C/}$ (Proposition 4.6.7.23), the natural transformation α satisfies condition $(*_C)$ of Definition 7.3.1.2 if and only if the induced map $\alpha_C : F(C) \rightarrow G(C)$ is an isomorphism in $\mathcal{D}$ (Corollary 7.2.2.6). The equivalence (1) $\Leftrightarrow$ (2) now follows from the criterion of Theorem 4.4.4.4. The equivalence (1) $\Leftrightarrow$ (3) follows by a similar argument.

Example 7.3.1.9 (Cofinality and Kan Extensions). Let $\mathcal{C}$ be a locally small ∞ -category 05QL and let $\delta : K \rightarrow \mathcal{C}$ be a diagram, where K is a small simplicial set. The following conditions are equivalent:

- (1) The morphism δ is left cofinal.
- (2) The identity transformation $\mathrm{id} : \underline{\Delta}_K^0 \rightarrow \underline{\Delta}_{\mathcal{C}}^0 \circ \delta$ exhibits the constant functor $\underline{\Delta}_{\mathcal{C}}^0 : \mathcal{C} \rightarrow \mathcal{S}$ as a left Kan extension of the constant diagram $\underline{\Delta}_K^0 : K \rightarrow \mathcal{S}$ along δ .

By virtue of Theorem 7.2.3.1 and Example 7.1.2.10, both conditions are equivalent to the requirement that, for every object $C \in \mathcal{C}$, the simplicial set $K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C}$ is weakly contractible.

Remark 7.3.1.10. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\delta : K \rightarrow \mathcal{C}$ and 02YG $F_0 : K \rightarrow \mathcal{D}$ be diagrams. Then:

- The condition that a natural transformation $\alpha : F \circ \delta \rightarrow F_0$ exhibits F as a right Kan extension of F_0 along δ depends only on the homotopy class $[\alpha]$ (as a morphism in the ∞ -category $\mathrm{Fun}(K, \mathcal{D})$).
- The condition that a natural transformation $\beta : F_0 \rightarrow F \circ \delta$ exhibits F as a left Kan extension of F_0 along δ depends only on the homotopy class $[\beta]$ (as a morphism in the ∞ -category $\mathrm{Fun}(K, \mathcal{D})$).

See Remark 7.1.1.7.

Remark 7.3.1.11. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $\delta : K \rightarrow \mathcal{C}$ be a diagram, 02YH and let $\rho : F_0 \rightarrow F'_0$ be an isomorphism in the ∞ -category $\mathrm{Fun}(K, \mathcal{D})$. Then:

- A natural transformation $\alpha : F \circ \delta \rightarrow F_0$ exhibits F as a right Kan extension of F_0 along δ if and only if the composite natural transformation

$$F \circ \delta \xrightarrow{\alpha} F_0 \xrightarrow{\rho} F'_0$$

exhibits F as a right Kan extension of F'_0 along δ (note that this condition is independent of the composition chosen, by virtue of Remark 7.3.1.10).

- A natural transformation $\beta : F'_0 \rightarrow F \circ \delta$ exhibits F as a left Kan extension of F'_0 along δ if and only if the composite natural transformation

$$F_0 \xrightarrow{\rho} F'_0 \xrightarrow{\beta} F \circ \delta$$

exhibits F as a left Kan extension of F_0 along δ .

See Remark 7.1.1.8.

03J9 **Remark 7.3.1.12.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $F_0 : K \rightarrow \mathcal{D}$ be a diagram, and let $\rho : \delta' \rightarrow \delta$ be an isomorphism in the ∞ -category $\text{Fun}(K, \mathcal{C})$. Then:

- A natural transformation $\alpha : F \circ \delta \rightarrow F_0$ exhibits F as a right Kan extension of F_0 along δ if and only if the composite natural transformation

$$F \circ \delta' \xrightarrow{\rho} F \circ \delta \xrightarrow{\alpha} F_0$$

exhibits F as a right Kan extension of F_0 along δ' (note that this condition is independent of the composition chosen, by virtue of Remark 7.3.1.10).

- A natural transformation $\beta : F_0 \rightarrow F \circ \delta'$ exhibits F as a left Kan extension of F_0 along δ' if and only if the composite natural transformation

$$F_0 \xrightarrow{\beta} F \circ \delta' \xrightarrow{\rho} F \circ \delta$$

exhibits F as a left Kan extension of F_0 along δ .

See Remark 7.1.1.8.

02YJ **Remark 7.3.1.13.** Suppose we are given a diagram

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & & \searrow F \\ K & \xrightarrow{F_0} & \mathcal{D} \end{array}$$

$\Downarrow \alpha$

as in Definition 7.3.1.2. Let $\rho : F' \rightarrow F$ be a morphism in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$. Then any two of the following conditions imply the third:

- The natural transformation α exhibits F as a right Kan extension of F_0 along δ .
- The composite natural transformation

$$\delta \circ F' \xrightarrow{\rho} \delta \circ F \xrightarrow{\alpha} F_0$$

exhibits F' as a right Kan extension of F_0 along δ (note that this condition does not depend on the composition chosen, by virtue of Remark 7.3.1.10).

- The morphism ρ is an isomorphism in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$.

This follows by combining Remark 7.1.1.9 with Theorem 4.4.4.4.

Remark 7.3.1.14 (Change of Target). Suppose we are given a diagram

02YK

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & & \searrow F \\ K & \xrightarrow{F_0} & \mathcal{D} \end{array}$$

$\Downarrow \alpha$

as in Definition 7.3.1.2, and let $G : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories. Then:

- If G is fully faithful and $G(\alpha) : (G \circ F) \circ \delta \rightarrow G \circ F_0$ exhibits $G \circ F$ as a right Kan extension of $G \circ F_0$ along δ , then α exhibits F as a right Kan extension of F_0 along δ .
- If G is an equivalence of ∞ -categories and α exhibits F as a right Kan extension of F_0 along δ , then $G(\alpha)$ exhibits $G \circ F$ as a right Kan extension of $G \circ F_0$ along δ .

See Remark 7.1.1.10.

Proposition 7.3.1.15 (Change of Diagram). *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$ be diagrams, and let $\epsilon : K' \rightarrow K$ be a categorical equivalence of simplicial sets. Then:*

- (1) *A natural transformation $\alpha : F \circ \delta \rightarrow F_0$ exhibits F as a right Kan extension of F_0 along δ if and only if the induced transformation $\alpha' : F \circ (\delta \circ \epsilon) \rightarrow F_0 \circ \epsilon$ exhibits F as a right Kan extension of $F_0 \circ \epsilon$ along $\delta \circ \epsilon$.*
- (2) *A natural transformation $\beta : F_0 \rightarrow F \circ \delta$ exhibits F as a left Kan extension of F_0 along δ if and only if the induced transformation $\beta' : F_0 \circ \epsilon \rightarrow F \circ (\delta \circ \epsilon)$ exhibits F as a left Kan extension of $F_0 \circ \epsilon$ along $\delta \circ \epsilon$.*

Proof. We will prove (1); the proof of (2) is similar. Fix an object $C \in \mathcal{C}$. Since ϵ is a categorical equivalence and the projection map $\mathcal{C}_{C/} \rightarrow \mathcal{C}$ is a left fibration (Proposition 4.3.6.1), it follows that the induced map $\epsilon_{C/} : K' \times_{\mathcal{C}} \mathcal{C}_{C/} \rightarrow K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is also a categorical equivalence of simplicial sets (Corollary 5.6.7.6). In particular, $\epsilon_{C/}$ is left cofinal (Corollary 7.2.1.13). Applying Corollary 7.2.2.3, we see that the natural transformation α satisfies condition $(*_C)$ of Definition 7.3.1.2 if and only if α' satisfies condition $(*_C)$. The desired result now follows by allowing the object $C \in \mathcal{C}$ to vary. $\square$

02YM Proposition 7.3.1.16. *Suppose we are given a diagram*

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & \Downarrow \alpha & \searrow F \\ K & \xrightarrow{F_0} & \mathcal{D} \end{array}$$

as in Definition 7.3.1.2, where δ factors as a composition

$$K \xrightarrow{\delta^0} \mathcal{C}^0 \xrightarrow{G} \mathcal{C}$$

for some ∞ -category $\mathcal{C}^0$. Then:

- (1) *If G is fully faithful and α exhibits F as a right Kan extension of F_0 along δ , then it also exhibits $F \circ G$ as a right Kan extension of F_0 along δ^0 .*
- (2) *If G is an equivalence of ∞ -categories and α exhibits $F \circ G$ as a right Kan extension of F_0 along δ^0 , then it exhibits F as a right Kan extension of F_0 along δ .*

Proof. Assume that G is fully faithful. Then, for every pair of objects $X, Y \in \mathcal{C}^0$, the induced map of left-pinched morphism spaces

$$\mathcal{C}_{X/}^0 \times_{\mathcal{C}} \{Y\} = \mathrm{Hom}_{\mathcal{C}^0}^L(X, Y) \rightarrow \mathrm{Hom}_{\mathcal{C}}^L(G(X), G(Y)) = \mathcal{C}_{G(X)/} \times_{\mathcal{C}} \{G(Y)\}$$

is a homotopy equivalence. Allowing Y to vary and applying Corollary 5.1.7.16, we see that the natural map $\mathcal{C}_{X/}^0 \rightarrow \mathcal{C}_{G(X)/} \times_{\mathcal{C}} \mathcal{C}^0$ is an equivalence of left fibrations over $\mathcal{C}^0$. It follows that the induced map

$$\mathcal{C}_{X/}^0 \times_{\mathcal{C}^0} K \rightarrow \mathcal{C}_{G(X)/} \times_{\mathcal{C}} K$$

is an equivalence of left fibrations over K . In particular it is a categorical equivalence of simplicial sets (Proposition 5.1.7.5) and therefore left cofinal (Corollary 7.2.1.13). Applying Corollary 7.2.2.3, we see that the natural transformation α satisfies condition $(*_X)$ of Definition 7.3.1.2 if and only if it satisfies condition $(*_G(X))$. Assertion (1) now follows by allowing the object $X \in \mathcal{C}^0$ to vary.

We now prove (2). Assume that G is an equivalence of ∞ -categories and that α exhibits $F \circ G$ as a right Kan extension of F_0 along δ^0 ; we wish to show that α exhibits F as a right Kan extension of F_0 along δ . Let $H : \mathcal{C} \rightarrow \mathcal{C}^0$ be a homotopy inverse of G . Then H is left adjoint to G , so we can choose natural transformations

$$\eta : \mathrm{id}_{\mathcal{C}} \rightarrow G \circ H \quad \epsilon : H \circ G \rightarrow \mathrm{id}_{\mathcal{C}^0}$$

which are compatible up to homotopy in the sense of Definition 6.2.1.1. Note that η and ϵ are isomorphisms (Proposition 6.1.4.1). Let α' denote a composition of the natural transformations

$$F \circ G \circ H \circ G \circ \delta^0 \xrightarrow{\epsilon} F \circ G \circ \delta^0 \xrightarrow{\alpha} F_0.$$

Using Remark 7.3.1.12, we see that α' exhibits $F \circ G$ as a right Kan extension of F_0 along $H \circ G \circ \delta^0 = H \circ \delta$. Applying assertion (1) to the fully faithful functor $H : \mathcal{C} \rightarrow \mathcal{C}^0$, we deduce that α' also exhibits δ as a right Kan extension of F_0 along $F \circ G \circ H$. The compatibility of η and ϵ guarantees that α is a composition of the natural transformations

$$F \circ \delta \xrightarrow{\eta} F \circ G \circ H \circ \delta \xrightarrow{\alpha'} F_0.$$

Applying Remark 7.3.1.13, we conclude that α exhibits F as a right Kan extension of F_0 along δ , as desired. $\square$

Corollary 7.3.1.17. *Let $G : \mathcal{C}^0 \rightarrow \mathcal{C}$, $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$, and $F : \mathcal{C} \rightarrow \mathcal{D}$ be functors of ∞ -categories, where G is fully faithful. Then:*

- *If $\alpha : F \circ G \rightarrow F_0$ is a natural transformation which exhibits F as a right Kan extension of F_0 along G , then α is an isomorphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$.*
- *If $\beta : F_0 \rightarrow F \circ G$ is a natural transformation which exhibits F as a left Kan extension of F_0 along G , then β is an isomorphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$.*

Proof. Let $\alpha : F \circ G \rightarrow F_0$ be a natural transformation which exhibits F as a right Kan extension of F_0 along G . Applying Proposition (in the special case where $K = \mathcal{C}^0$), we deduce that α also exhibits $F \circ G$ as a right Kan extension of F_0 along the identity functor $\mathrm{id}_{\mathcal{C}^0} : \mathcal{C}^0 \rightarrow \mathcal{C}^0$. Invoking Example 7.3.1.8, we see that α is an isomorphism. This proves the first assertion; the second follows by a similar argument. $\square$

Proposition 7.3.1.18. *Suppose we are given a diagram*

039N

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & \Downarrow \alpha & \searrow F \\ K & \xrightarrow{F_0} & \mathcal{D} \end{array}$$

as in Definition 7.3.1.2. Assume that δ exhibits $\mathcal{C}$ as a localization of K (with respect to some collection of edges of K) and that α is an isomorphism in the ∞ -category $\mathrm{Fun}(K, \mathcal{D})$. Then α exhibits F as a right Kan extension of F_0 along δ .

Proof. Fix an object $C \in \mathcal{C}$. Since α is an isomorphism, it will suffice to show that the tautological map $\underline{F(C)} \rightarrow (F \circ \delta)|_{K_{C/}}$ exhibits $F(C)$ as a limit of the diagram $(F \circ \delta)|_{K_{C/}}$. Since the projection map $\mathcal{C}_{C/} \rightarrow \mathcal{C}$ is a left fibration (Proposition 4.3.6.1), the map $\delta_{C/} : K_{C/} \rightarrow \mathcal{C}_{C/}$ exhibits the ∞ -category $\mathcal{C}_{C/}$ as a localization of the simplicial set $K_{C/}$ (Corollary 6.3.4.5). In particular, $\delta_{C/}$ is left cofinal (Proposition 7.2.1.10). We can therefore replace K by $\mathcal{C}$ (Corollary 7.2.2.7), in which case the desired result follows from the criterion of Corollary 7.2.2.6. $\square$

7.3.2 Kan Extensions along Inclusions

02YQ Let $\mathcal{C}$ be an ∞ -category and let $\delta : K \rightarrow \mathcal{C}$ be a diagram. In §7.3.1, we introduced the notion of a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ being a left Kan extension of another diagram $F_0 : K \rightarrow \mathcal{D}$ along δ (Variant 7.3.1.5). Beware that this terminology is potentially misleading: if F is a left Kan extension of F_0 along δ , then the composition $F \circ \delta$ need not be equal to F_0 . Instead, it is equipped with a natural transformation $\beta : F_0 \rightarrow F \circ \delta$ satisfying a certain universal property. In this section, we specialize to the case where $K = \mathcal{C}^0$ is a full subcategory of $\mathcal{C}$ and $\delta : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ is the inclusion map. In this case, the natural transformation β is necessarily an isomorphism (Corollary 7.3.1.17). Consequently, the Kan extension condition can be substantially simplified: it can be regarded as a *property* of the functor F , which can be formulated without reference to the diagram F_0 or the natural transformation β .

02YQ **Definition 7.3.2.1.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Fix an object $C \in \mathcal{C}$. We will say that F is *left Kan extended from $\mathcal{C}^0$ at C* if the composite map

$$(\mathcal{C}_{/C}^0)^\triangleright \hookrightarrow (\mathcal{C}_{/C})^\triangleright \xrightarrow{c} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a colimit diagram in the ∞ -category $\mathcal{D}$. Here $\mathcal{C}_{/C}^0$ denotes the fiber product $\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}$ (Notation 7.3.1.1), and c is the slice contraction morphism of Construction 4.3.5.12. Similarly, we say that F is *right Kan extended from $\mathcal{C}^0$ at C* if the composite map

$$(\mathcal{C}_{C/}^0)^\triangleleft \hookrightarrow (\mathcal{C}_{C/})^\triangleleft \xrightarrow{c'} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a limit diagram in $\mathcal{D}$. We say that F is *left Kan extended from $\mathcal{C}^0$* if it is left Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$. We say that F is *right Kan extended from $\mathcal{C}^0$* if it is right Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$.

02YR **Remark 7.3.2.2.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is right Kan extended from $\mathcal{C}^0$ if and only if the opposite functor $F^{\mathrm{op}} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{D}^{\mathrm{op}}$ is left Kan extended from $\mathcal{C}^0$.

Exercise 7.3.2.3. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Show that, for every object $C \in \mathcal{C}^0$, the functor F is both left and right Kan extended from $\mathcal{C}^0$ at C . For a more general statement, see Proposition 7.3.3.7. 02YS

Remark 7.3.2.4. Let $F : \mathcal{B} \star \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and set $G = F|_{\mathcal{B}}$, so that F can be identified with a functor $f : \mathcal{C} \rightarrow \mathcal{D}_{G/}$. If $\mathcal{C}^0$ is a full subcategory of $\mathcal{C}$, then f is left Kan extended from $\mathcal{C}^0$ at an object $C \in \mathcal{C}$ if and only if F is left Kan extended from $\mathcal{B} \star \mathcal{C}^0$ at C (see Remark 7.1.3.12). Combining this observation with Exercise 7.3.2.3, we see that f is left Kan extended from $\mathcal{C}^0$ if and only if F is left Kan extended from $\mathcal{B} \star \mathcal{C}^0$. 04K2

Example 7.3.2.5. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ordinary categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.0.1) if and only if the induced functor of ∞ -categories $N_{\bullet}(F) : N_{\bullet}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{D})$ is left Kan extended from $N_{\bullet}(\mathcal{C}^0)$ (in the sense of Definition 7.3.2.1). 02YT

We now show that Definition 7.3.2.1 can be regarded as a special case of the notions introduced in §7.3.1:

Proposition 7.3.2.6. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let F_0 denote the restriction of F to a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$, and let $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ denote the inclusion functor. Then:* 02YU

- *The functor F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1) if and only if the identity transformation $\text{id} : F_0 \rightarrow F \circ \iota$ exhibits F as a left Kan extension of F_0 along ι (in the sense of Variant 7.3.1.5).*
- *The functor F is right Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1) if and only if the identity transformation $\text{id}_{F_0} : F \circ \iota \rightarrow F_0$ exhibits F as a right Kan extension of F_0 along ι (in the sense of Definition 7.3.1.2).*

Proof. Fix an object $C \in \mathcal{C}$. It follows from Remark 7.1.3.6 that the composition

$$(\mathcal{C}^0_{/C})^{\triangleright} \hookrightarrow (\mathcal{C}_{/C})^{\triangleright} \rightarrow \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a colimit diagram in $\mathcal{D}$ if and only if the natural transformation id_{F_0} satisfies condition $(*_C)$ of Variant 7.3.1.5. The first assertion follows by allowing the object C to vary, and the second follows by a similar argument. □

Corollary 7.3.2.7. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $\beta : F_0 \rightarrow F|_{\mathcal{C}^0}$ be a natural transformation of functors from $\mathcal{C}^0$ to $\mathcal{D}$. Then β exhibits F as a left Kan extension of F_0 along the inclusion map $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ (in the sense of Variant 7.3.1.5) if and only if the following pair of conditions is satisfied:* 02YV

- (1) The functor F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1).
- (2) The natural transformation β is an isomorphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$.

Proof. By virtue of Corollary 7.3.1.17, we may assume that condition (2) is satisfied. Using Remark 7.3.1.11, we can reduce further to the special case where $F_0 = F|_{\mathcal{C}^0}$ and β is the identity transformation, in which case the desired result is a restatement of Proposition 7.3.2.6. $\square$

02YW Corollary 7.3.2.8. Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$ be a functor of ∞ -categories. The following conditions are equivalent:

- (1) There exists a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ and a natural transformation $\beta : F_0 \rightarrow F|_{\mathcal{C}^0}$ which exhibits F as a left Kan extension of F_0 along the inclusion functor $\mathcal{C}^0 \hookrightarrow \mathcal{C}$.
- (2) There exists a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ which is left Kan extended from $\mathcal{C}^0$ and satisfies $F_0 = F|_{\mathcal{C}^0}$.

Proof. We will show that (1) implies (2); the converse is an immediate consequence of Proposition 7.3.2.6. Let $\beta : F_0 \rightarrow F|_{\mathcal{C}^0}$ exhibit F as a left Kan extension of F_0 along the inclusion functor $\mathcal{C}^0 \hookrightarrow \mathcal{C}$. Then β is an isomorphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$ (Corollary 7.3.1.17). Using Corollary 4.4.5.9, we can lift β to an isomorphism $\tilde{\beta} : F \rightarrow F'$ in the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$, where F' satisfies $F'|_{\mathcal{C}^0} = F_0$. Applying Remark 7.3.1.13, we deduce that the identity transformation id_{F_0} exhibits F' as a left Kan extension of F_0 along the inclusion map $\mathcal{C}^0 \hookrightarrow \mathcal{C}$. Invoking Proposition 7.3.2.6, we conclude that F' is left Kan extended from $\mathcal{C}^0$. $\square$

02YX Definition 7.3.2.9. Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and suppose we are given functors $F : \mathcal{C} \rightarrow \mathcal{D}$ and $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$. We will say that F is a *left Kan extension of F_0* if F is left Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$. We will say that F is a *right Kan extension of F_0* if F is right Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$.

02YY Warning 7.3.2.10. Let $\mathcal{C}$ be an ∞ -category, let $\iota : \mathcal{C}^0 \hookrightarrow \mathcal{C}$ be the inclusion of a full subcategory, and let $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$ be a functor. We have given two definitions for the notion of Kan extension:

- (a) A functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is a left Kan extension of F_0 if it is left Kan extended from $\mathcal{C}^0$ and satisfies $F|_{\mathcal{C}^0} = F_0$ (Definition 7.3.2.9).
- (b) A functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is a left Kan extension of F_0 along ι if there exists a natural transformation $\beta : F_0 \rightarrow F|_{\mathcal{C}^0}$ which exhibits F as a left Kan extension of F_0 along ι , in the sense of Variant 7.3.1.5.

These definitions are not quite equivalent. By virtue of Proposition 7.3.2.6, a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ satisfies condition (a) if and only if it satisfies a stronger version of condition (b), where β is required to be an identity natural transformation. In particular, condition (a) implies condition (b). However, the converse is false: if F is a left Kan extension of F_0 along ι , then the restriction $F|_{\mathcal{C}^0}$ need not be *equal* to F_0 . However, it is necessarily isomorphic to F_0 , by virtue of Corollary 7.3.2.7.

Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a functor of ∞ -categories. The preceding results show that, if δ is an isomorphism from $\mathcal{K}$ to a full subcategory of $\mathcal{C}$, then the theory of Kan extensions along δ (in the sense of §7.3.1) can be reformulated in terms of Definition 7.3.2.1. We now extend this observation to the case of a general functor, by identifying $\mathcal{K}$ with a full subcategory of the relative join $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ of Construction 5.2.3.1.

Proposition 7.3.2.11. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a functor of ∞ -categories, let $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ be another functor having restrictions $F_0 = F|_{\mathcal{K}}$ and $F_1 = F|_{\mathcal{C}}$, so that the composition*

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

determines a natural transformation $\beta : F_0 \rightarrow F_1 \circ \delta$. The following conditions are equivalent:

- (1) *The functor F is left Kan extended from the full subcategory $\mathcal{K} \subseteq \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ (in the sense of Definition 7.3.2.1).*
- (2) *The natural transformation β exhibits F_1 as a left Kan extension of F_0 along δ (in the sense of Variant 7.3.1.5).*

Proof. By virtue of Exercise 7.3.2.3, it will suffice to show that for every object $C \in \mathcal{C}$, the following conditions are equivalent:

- (1_C) *The functor F is left Kan extended from $\mathcal{K}$ at C (in the sense of Definition 7.3.2.1).*
- (2_C) *The natural transformation β satisfies condition $(*_C)$ of Variant 7.3.1.5.*

For the remainder of the proof, let us regard the object $C \in \mathcal{C}$ as fixed, and set $\mathcal{K}_{/C} = \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$. Let $\pi : \Delta^2 \times \mathcal{K}_{/C} \rightarrow (\Delta^1 \times \mathcal{K}_{/C})^{\triangleright}$ be the functor which is the identity on $\Delta^1 \times \mathcal{K}_{/C}$ and carries $\{2\} \times \mathcal{K}_{/C}$ to the cone point of $(\Delta^1 \times \mathcal{K}_{/C})^{\triangleright}$. Let σ denote the composite map

$$\begin{aligned} \Delta^2 \times \mathcal{K}_{/C} &\xrightarrow{\pi} (\Delta^1 \times \mathcal{K}_{/C})^{\triangleright} \\ &\simeq ((\mathcal{K} \times \Delta^1) \times_{\mathcal{K} \star_{\mathcal{C}} \mathcal{C}} (\mathcal{K} \star_{\mathcal{C}} \mathcal{C}))_{/C}^{\triangleright} \\ &\rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \\ &\xrightarrow{F} \mathcal{D}. \end{aligned}$$

We will regard σ as a 2-simplex in the ∞ -category $\text{Fun}(\mathcal{K}_{/C}, \mathcal{D})$, which we display as a diagram

$$\begin{array}{ccc} & (F_1 \circ \delta)|_{\mathcal{K}_{/C}} & \\ \nearrow & & \searrow \\ F_0|_{\mathcal{K}_{/C}} & \xrightarrow{\quad} & \underline{F_1(C)} \end{array}$$

which witnesses the bottom horizontal map as the natural transformation β_C appearing in condition $(*_C)$. By construction, this natural transformation β_C is given by the composite map

$$\mathbf{N}_\bullet(\{0 < 2\}) \times \mathcal{K}_{/C} \rightarrow (\mathcal{K}_{/C})^\triangleright \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D},$$

so the equivalence $(1_C) \Leftrightarrow (2_C)$ is a special case of Remark 7.1.3.6. $\square$

02Z0 **Warning 7.3.2.12.** For a general diagram

$$\begin{array}{ccc} & \mathcal{C} & \\ \delta \nearrow & & \searrow F_1 \\ \mathcal{K} & \xrightarrow{F_0} & \mathcal{D}, \end{array} \quad \begin{array}{c} \uparrow \beta \\ \parallel \end{array}$$

we cannot always arrange that there exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ satisfying the requirements of Proposition 7.3.2.11. However, we can always find a functor $F' : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ which satisfies $F'|_{\mathcal{K}} = F_0$, $F'|_{\mathcal{C}} = F_1$, and the map

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F'} \mathcal{D}$$

determines a natural transformation $\beta' : F_0 \rightarrow F_1 \circ \delta$ which is homotopic to β . To see this, set $M = (\Delta^1 \times \mathcal{K}) \amalg_{(\{1\} \times \mathcal{K})} \mathcal{C}$, so that the pair (β, F_1) determines a morphism of simplicial sets $f : M \rightarrow \mathcal{D}$. Proposition 5.2.4.5 supplies a categorical equivalence of simplicial sets $\theta : M \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, so the induced map

$$\text{Fun}_{\mathcal{K} \amalg_{\mathcal{C}} /}(\mathcal{K} \star_{\mathcal{C}} \mathcal{C}, \mathcal{D}) \xrightarrow{\circ \theta} \text{Fun}_{\mathcal{K} \amalg_{\mathcal{C}} /}(M, \mathcal{D})$$

is an equivalence of ∞ -categories (Corollary 4.5.4.5). It follows that there exists a functor $F' : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ such that $F'|_{\mathcal{K}} = F_0$, $F'|_{\mathcal{C}} = F_1$, and $F' \circ \theta$ is isomorphic to f as an object of the ∞ -category $\text{Fun}_{\mathcal{K} \amalg_{\mathcal{C}} /}(M, \mathcal{D})$. The last requirement is a reformulation of the condition that $\beta' = F'|_{\Delta^1 \times \mathcal{K}}$ is homotopic to β .

Corollary 7.3.2.13. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$, $F_0 : \mathcal{K} \rightarrow \mathcal{D}$, and $F_1 : \mathcal{C} \rightarrow \mathcal{D}$ be functors of ∞ -categories. The following conditions are equivalent:*

- (1) *There exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ which is left Kan extended from $\mathcal{K}$ which satisfies $F_0 = F|_{\mathcal{K}}$ and $F_1 = F|_{\mathcal{C}}$.*
- (2) *There exists a natural transformation $\beta : F_0 \rightarrow F_1 \circ \delta$ which exhibits F_1 as a left Kan extension of F_0 along δ .*

Proof. The implication (1) $\Leftrightarrow$ (2) follows immediately from Proposition 7.3.2.11. Conversely, suppose that there exists a natural transformation $\beta : F_0 \rightarrow F_1 \circ \delta$ which exhibits F_1 as a left Kan extension of F_0 along δ . By virtue of Remark 7.3.1.10, we can modify β by a homotopy and thereby arrange that there exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ satisfying $F|_{\mathcal{K}} = F_0$, $F|_{\mathcal{C}} = F_1$ and for which the induced map

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

coincides with β (Warning 7.3.2.12). Applying Proposition 7.3.2.11, we see that F is left Kan extended from $\mathcal{K}$. $\square$

For later use, we record a slightly more general version of Proposition 7.3.2.11.

Corollary 7.3.2.14. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let $U : \mathcal{C} \rightarrow \Delta^1$ be a cocartesian fibration having fibers $\mathcal{C}_0 = \{0\} \times_{\Delta^1} \mathcal{C}$ and $\mathcal{C}_1 = \{1\} \times_{\Delta^1} \mathcal{C}$. Choose a functor $G : \mathcal{C}_0 \rightarrow \mathcal{C}_1$ and a natural transformation $\beta : \text{id}_{\mathcal{C}_0} \rightarrow G$ which exhibits G as given by covariant transport along the nondegenerate edge of Δ^1 (see Definition 5.2.2.4). The following conditions are equivalent:*

- (1) *The functor F is left Kan extended from $\mathcal{C}_0$.*
- (2) *The natural transformation $F(\beta) : F|_{\mathcal{C}_0} \rightarrow F|_{\mathcal{C}_1} \circ G$ exhibits $F|_{\mathcal{C}_1}$ as a left Kan extension of $F|_{\mathcal{C}_0}$ along G .*

Proof. Let us regard the functor G as fixed. Let $M = (\Delta^1 \times \mathcal{C}_0) \amalg_{(\{1\} \times \mathcal{C}_0)} \mathcal{C}_1$ be the mapping cylinder of G , and let us abuse notation by identifying $\mathcal{C}_0 \simeq \{0\} \times \mathcal{C}_0$ and $\mathcal{C}_1$ with (disjoint) simplicial subsets of M . We can then identify α with a morphism of simplicial sets $\mu : M \rightarrow \mathcal{C}$ which is the identity when restricted to $\mathcal{C}_0$ and $\mathcal{C}_1$.

Note that the tautological map

$$\Delta^1 \times \mathcal{C}_0 \simeq \mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \rightarrow \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1$$

extends to a morphism of simplicial sets $\lambda : M \rightarrow \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1$ which is the identity on $\mathcal{C}_1$; moreover, λ is a categorical equivalence (Proposition 5.2.4.5). It follows that precomposition with λ induces an equivalence of ∞ -categories

$$\text{Fun}_{\mathcal{C}_0} \amalg_{\mathcal{C}_1} (\mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1, \mathcal{C}) \rightarrow \text{Fun}_{\mathcal{C}_0} \amalg_{\mathcal{C}_1} (M, \mathcal{C}).$$

We can therefore choose a functor $G : \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1 \rightarrow \mathcal{C}$ satisfying $G|_{\mathcal{C}_0} = \text{id}_{\mathcal{C}_0}$ and $G|_{\mathcal{C}_1} = \text{id}_{\mathcal{C}_1}$, where $G \circ \lambda$ is isomorphic to μ as an object of the ∞ -category $\text{Fun}_{\mathcal{C}_0} \coprod_{\mathcal{C}_1} (M, \mathcal{C})$. Since condition (2) depends only on the homotopy class of the natural transformation β (Remark 7.3.1.10), we are free to modify β and may therefore assume that $G \circ \lambda = \mu$. In this case, Proposition 7.3.2.11 allows us to reformulate condition (2) as follows:

(2') The functor $(F \circ G) : \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1 \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}_0$.

Since λ and μ are categorical equivalences of simplicial sets (Proposition 5.2.4.5), the functor G is an equivalence of ∞ -categories (Remark 4.5.3.5). The equivalence of (1) and (2') is now a special case of Proposition 7.3.3.18. $\square$

7.3.3 Relative Kan Extensions

02Z2 For many applications, it will be convenient to work with a generalization of Definition 7.3.2.1. In what follows, we assume that the reader is familiar with the theory of relative (co)limit diagrams introduced in §7.1.6.

02Z3 **Definition 7.3.3.1** (Relative Kan Extensions). Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. For each object $C \in \mathcal{C}$, we will say that F is *U-left Kan extended from $\mathcal{C}^0$ at C* if the composite map

$$(\mathcal{C}_{/C}^0)^\triangleright \hookrightarrow (\mathcal{C}_{/C})^\triangleright \xrightarrow{c} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U -colimit diagram in the ∞ -category $\mathcal{D}$. We say that F is *U-right Kan extended from $\mathcal{C}^0$ at C* if the composite map

$$(\mathcal{C}_{C/}^0)^\triangleleft \hookrightarrow (\mathcal{C}_{C/})^\triangleleft \xrightarrow{c'} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U -limit diagram in $\mathcal{D}$. Here c and c' denote the slice and coslice contraction morphisms of Construction 4.3.5.12. We say that F is *U-left Kan extended from $\mathcal{C}^0$* if it is U -left Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$. We say that F is *U-right Kan extended from $\mathcal{C}^0$* if it is U -right Kan extended from $\mathcal{C}^0$ at every object $C \in \mathcal{C}$.

02Z4 **Remark 7.3.3.2.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.2.1) if and only if it is U -left Kan extended from $\mathcal{C}^0$ (in the sense of Definition 7.3.3.1), where $U : \mathcal{D} \rightarrow \Delta^0$ is the projection map. Similarly, F is right Kan extended from $\mathcal{C}^0$ if and only if it is U -right Kan extended from $\mathcal{C}^0$. See Example 7.1.6.3.

03Y2 **Remark 7.3.3.3.** Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories. Consider the evaluation functor

$$\text{ev} : \mathcal{C} \times \text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{D} \quad (C, F) \mapsto F(C).$$

For every object $C \in \mathcal{C}$ and every functor $F : \mathcal{C} \rightarrow \mathcal{D}$, the following conditions are equivalent:

- (a) The functor F is U -left Kan extended from $\mathcal{C}^0$ at C .
 (b) The evaluation functor ev is U -left Kan extended from $\mathcal{C}^0 \times \text{Fun}(\mathcal{C}, \mathcal{D})$ at (C, F) .

To prove this, it will suffice to show that the inclusion map

$$\mathcal{C}_{/C}^0 \times \{\text{id}_F\} \hookrightarrow \mathcal{C}_{/C}^0 \times \text{Fun}(\mathcal{C}, \mathcal{D})_{/F}$$

is right cofinal (Corollary 7.2.2.2). This follows from Corollary 7.2.1.19, since the inclusion map $\{\text{id}_F\} \hookrightarrow \text{Fun}(\mathcal{C}, \mathcal{D})_{/F}$ is right cofinal (the identity morphism id_F is an isomorphism in $\text{Fun}(\mathcal{C}, \mathcal{D})$, and therefore final when regarded as an object of the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})_{/F}$ by virtue of Proposition 4.6.7.23).

Remark 7.3.3.4. In the situation of Definition 7.3.3.1, the morphism $F : \mathcal{C} \rightarrow \mathcal{D}$ is U -right Kan extended from $\mathcal{C}^0$ if and only if the opposite functor $F^{\text{op}} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{D}^{\text{op}}$ is U^{op} -left Kan extended from $(\mathcal{C}^0)^{\text{op}}$. 02Z5

Example 7.3.3.5. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories. If U is fully faithful, then F is U -left Kan extended and U -right Kan extended from any full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$ (see Example 7.1.6.4). 02Z7

Example 7.3.3.6. Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories. Then a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is U -left Kan extended from the empty subcategory $\emptyset \subseteq \mathcal{C}$ if and only if it carries each object of $\mathcal{C}$ to a U -initial object of $\mathcal{D}$. Similarly, F is U -right Kan extended from the empty subcategory if and only if it carries each object of $\mathcal{C}$ to a U -final object of $\mathcal{D}$. 043F

To verify the Kan extension conditions of Definition 7.3.3.1, it suffices to consider objects C which do *not* belong to the full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$.

Proposition 7.3.3.7. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories. Let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory and let $C \in \mathcal{C}$ be an object which is isomorphic to an object of $\mathcal{C}^0$. Then F is both U -left Kan extended from $\mathcal{C}^0$ and U -right Kan extended from $\mathcal{C}^0$ at C . 02Z8

Proof. We will show that F is U -left Kan extended from $\mathcal{C}^0$ at C ; the analogous statement for the right Kan extension condition follows by a similar argument. Let $c : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \mathcal{C}$ be the slice contraction morphism; we wish to show that the composition $(F \circ c) : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \mathcal{D}$ is a U -colimit diagram. Choose an object $C' \in \mathcal{C}^0$ and an isomorphism $u : C' \rightarrow C$ in the ∞ -category $\mathcal{C}$. Our assumption that u is an isomorphism guarantees that it is final when viewed as an object of the slice ∞ -category $\mathcal{C}_{/C}$ (Proposition 4.6.7.23), and therefore also when viewed as an object of the ∞ -category $\mathcal{C}_{/C}^0$. The desired result now follows from Corollary 7.2.3.6, since $F(u)$ is an isomorphism in the ∞ -category $\mathcal{D}$. □

Example 7.3.3.8. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories. Then F is U -left Kan extended and U -right Kan extended from the full subcategory $\mathcal{C} \subseteq \mathcal{C}$. 03U4

02Z9 **Example 7.3.3.9.** Let $\overline{F} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, and set $F = \overline{F}|_{\mathcal{C}}$. Then F is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$ if and only if $\overline{F}$ is U -left Kan extended from the cone $(\mathcal{C}^0)^\triangleright \subseteq \mathcal{C}^\triangleright$. To prove this, it suffices (by virtue of Proposition 7.3.3.7) to show that F is U -left Kan extended from $\mathcal{C}^0$ at an object $C \in \mathcal{C}$ if and only if $\overline{F}$ is U -left Kan extended from $(\mathcal{C}^0)^\triangleright$ at C , which follows immediately from the definition.

02ZA **Example 7.3.3.10.** Let $\mathcal{C}$ be an ∞ -category and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories. It follows from Proposition 7.3.3.7 that a functor $\overline{F} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram (in the sense of Definition 7.1.6.1) if and only if it is U -left Kan extended from $\mathcal{C}$.

039R **Proposition 7.3.3.11.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an inner fibration of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a coreflective subcategory of $\mathcal{C}$. The following conditions are equivalent:

- (1) The functor F is U -left Kan extended from $\mathcal{C}^0$.
- (2) Let $e : X \rightarrow Y$ be a morphism in $\mathcal{C}$ which exhibits X as a $\mathcal{C}^0$ -coreflection of Y (Definition 6.2.2.6). Then $F(e)$ is a U -cocartesian morphism of $\mathcal{D}$.
- (3) Let $T : \mathcal{C} \rightarrow \mathcal{C}_0$ be a right adjoint to the inclusion. If e is a morphism in $\mathcal{C}$ and $T(e)$ is an isomorphism in $\mathcal{C}_0$, then $F(e)$ is a U -cocartesian morphism of $\mathcal{D}$.

Proof. Let Y be an object of $\mathcal{C}$. By assumption, there exists an object $X \in \mathcal{C}^0$ and a morphism $e : X \rightarrow Y$ which exhibits X as a $\mathcal{C}^0$ -coreflection of Y . Then e is final when viewed as an object of the ∞ -category $\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/Y}$. It follows that F is U -left Kan extended from $\mathcal{C}^0$ at Y if and only if $F(e)$ is U -cocartesian morphism of $\mathcal{D}$; in particular, this condition is independent of the choice of e . Allowing the object Y to vary, we deduce the equivalence (1) $\Leftrightarrow$ (2).

Using Lemma 6.2.2.22, we can choose a functor $T : \mathcal{C} \rightarrow \mathcal{C}^0$ and a natural transformation $\epsilon : T \rightarrow \text{id}_{\mathcal{C}}$ which exhibits T as a $\mathcal{C}^0$ -coreflection functor, so that T is right adjoint to the inclusion of $\mathcal{C}^0$ into $\mathcal{C}$ (Proposition 6.2.2.23). Let $e : X \rightarrow Y$ be a morphism in $\mathcal{C}$. If e exhibits X as a $\mathcal{C}^0$ -coreflection of Y , then $T(e)$ is an isomorphism in $\mathcal{C}^0$, which shows immediately that (3) implies (2). Conversely, suppose that (2) is satisfied and that $T(e)$ is an isomorphism in $\mathcal{C}^0$. We then have a commutative diagram

$$\begin{array}{ccc}
 (F \circ T)(X) & \xrightarrow{(F \circ T)(e)} & (F \circ T)(Y) \\
 \downarrow F(\epsilon_X) & & \downarrow F(\epsilon_Y) \\
 F(X) & \xrightarrow{F(e)} & F(Y)
 \end{array}$$

in the ∞ -category $\mathcal{D}$, where the upper horizontal map is an isomorphism and the vertical maps are U -cocartesian. Using Corollary 5.1.2.4, we see that $F(e)$ is also U -cocartesian. $\square$

Corollary 7.3.3.12. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a 039S coreflective subcategory. The following conditions are equivalent:*

- (1) *The functor F is left Kan extended from $\mathcal{C}^0$.*
- (2) *Let $e : X \rightarrow Y$ be a morphism in $\mathcal{C}$ which exhibits X as a $\mathcal{C}^0$ -coreflection of Y (Definition 6.2.2.6). Then $F(e)$ is an isomorphism in $\mathcal{D}$.*
- (3) *Let $T : \mathcal{C} \rightarrow \mathcal{C}_0$ be a right adjoint to the inclusion. If e is a morphism in $\mathcal{C}$ and $T(e)$ is an isomorphism in $\mathcal{C}_0$, then $F(e)$ is an isomorphism in $\mathcal{D}$.*

Proof. Combine Proposition 7.3.3.11 with Example 5.1.1.4 (for a closely related statement, see Proposition 7.3.1.18). $\square$

Corollary 7.3.3.13. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an 043G inner fibration of ∞ -categories, and suppose that $\mathcal{C}$ contains an initial object. The following conditions are equivalent:*

- (1) *The functor F is U -left Kan extended from the full subcategory $\mathcal{C}^{\text{init}} \subseteq \mathcal{C}$ spanned by the initial objects.*
- (2) *The functor F carries every morphism of $\mathcal{C}$ to a U -cocartesian morphism of $\mathcal{D}$.*

Proof. Combine Proposition 7.3.3.11 with Example 6.2.2.10. $\square$

Corollary 7.3.3.14 (Constant Diagrams). *Let $\mathcal{C}$ be an ∞ -category which contains an initial 05E0 object, and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. The following conditions are equivalent:*

- (1) *The functor F is left Kan extended from the full subcategory $\mathcal{C}^{\text{init}} \subseteq \mathcal{C}$ spanned by the initial objects.*
- (2) *The functor F carries each morphism in $\mathcal{C}$ to an isomorphism in the ∞ -category $\mathcal{D}$.*
- (3) *The functor F is isomorphic to a constant functor.*

Proof. The equivalence (1) $\Leftrightarrow$ (2) follows from Corollary 7.3.3.13 by taking $\mathcal{E} = \Delta^0$, and the implication (3) $\Rightarrow$ (2) is immediate. To prove the converse, we observe that condition (2) guarantees that F can be regarded as a morphism from $\mathcal{C}$ to the Kan complex $\mathcal{D}^\simeq$. Since $\mathcal{C}$ has an initial object, it is weakly contractible (Corollary 4.6.7.26), so this morphism is automatically nullhomotopic (Remark 3.2.4.19). $\square$

We now record some basic stability properties enjoyed by the class of relative Kan extensions, which follow easily from the analogous stability properties of relative (co)limit diagrams.

02ZB **Remark 7.3.3.15.** Suppose we are given a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{G} & \mathcal{D}' \\ \downarrow U & & \downarrow U' \\ \mathcal{E} & \longrightarrow & \mathcal{E}', \end{array}$$

where the horizontal functors are equivalence of ∞ -categories. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is U -left Kan extended from $\mathcal{C}^0$ if and only if $G \circ F$ is U' -left Kan extended from $\mathcal{C}^0$ (see Remark 7.1.6.6). Similarly, F is U -right Kan extended from $\mathcal{C}^0$ if and only if $G \circ F$ is U' -right Kan extended from $\mathcal{C}^0$.

02ZC **Remark 7.3.3.16.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Let $V : \mathcal{D} \rightarrow \mathcal{E}$ be a functor which is isomorphic to U (as an object of the ∞ -category $\text{Fun}(\mathcal{D}, \mathcal{E})$). Then F is U -left Kan extended from $\mathcal{C}^0$ if and only if it is V -left Kan extended from $\mathcal{C}^0$ (see Remark 7.1.6.7). Similarly, F is U -right Kan extended from $\mathcal{C}^0$ if and only if it is V -right Kan extended from $\mathcal{C}^0$.

02ZD **Remark 7.3.3.17.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, let $G : \mathcal{C} \rightarrow \mathcal{D}$ be a functor which is isomorphic to F (as an object of the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$), and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then F is U -left Kan extended from $\mathcal{C}^0$ if and only if G is U -left Kan extended from $\mathcal{C}^0$ (see Proposition 7.1.6.9). Similarly, F is U -right Kan extended from $\mathcal{C}^0$ if and only if G is U -right Kan extended from $\mathcal{C}^0$.

03U5 **Proposition 7.3.3.18** (Change of Source). *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a replete full subcategory. Let $G : \mathcal{B} \rightarrow \mathcal{C}$ be an equivalence of ∞ -categories, and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. Then F is U -left Kan extended from $\mathcal{C}^0$ if and only if $F \circ G$ is U -left Kan extended from $\mathcal{B}^0$.*

Proof. Assume first that F is U -left Kan extended from $\mathcal{C}^0$; we will show that $F \circ G$ is U -left Kan extended from $\mathcal{B}^0$. Fix an object $B \in \mathcal{B}$ and set $\mathcal{B}_{/B}^0 = \mathcal{B}^0 \times_{\mathcal{B}} \mathcal{B}_{/B}$; we wish to show that the composite map

$$\theta : (\mathcal{B}_{/B}^0)^{\triangleright} \hookrightarrow \mathcal{B}_{/B}^{\triangleright} \rightarrow \mathcal{B} \xrightarrow{F \circ G} \mathcal{D}$$

is a U -colimit diagram. Set $\mathcal{C} = G(\mathcal{B})$ and $\mathcal{C}_{/C}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}$. Since G is an equivalence of ∞ -categories, the induced map $G_{/B} : \mathcal{B}_{/B} \rightarrow \mathcal{C}_{/C}$ is also an equivalence of ∞ -categories

(Corollary 4.6.4.21). Our assumption that $\mathcal{C}^0$ is a replete subcategory of $\mathcal{C}$ guarantees that $\mathcal{C}_{/C}^0$ is a replete subcategory of $\mathcal{C}_{/C}$. In particular, the inclusion map $\mathcal{C}_{/C}^0 \hookrightarrow \mathcal{C}_{/C}$ is an isofibration, so that $G_{/B}$ restricts to an equivalence of ∞ -categories $G_{/B}^0 : \mathcal{B}_{/B}^0 \rightarrow \mathcal{C}_{/C}^0$. By construction, the morphism θ is the composition of $(G_{/B}^0)^\triangleright$ with the map

$$\theta' : (\mathcal{C}_{/C}^0)^\triangleright \hookrightarrow \mathcal{C}_{/C}^\triangleright \rightarrow \mathcal{C} \xrightarrow{F} \mathcal{D},$$

which is a U -colimit diagram by virtue of our assumption that F is U -left Kan extended from $\mathcal{C}^0$. Applying Corollary 7.2.2.2, we deduce that θ is also a U -colimit diagram.

We now prove the converse. Assume that $F \circ G$ is U -left Kan extended from $\mathcal{B}^0$; we wish to show that F is U -left Kan extended from $\mathcal{C}^0$. Let $H : \mathcal{C} \rightarrow \mathcal{B}$ be a homotopy inverse to G , so that $(G \circ H) : \mathcal{C} \rightarrow \mathcal{C}$ is isomorphic to the identity functor $\text{id}_{\mathcal{C}}$. Since $\mathcal{C}^0 \subseteq \mathcal{C}$ is replete, it coincides with the inverse image $(G \circ H)^{-1} \mathcal{C}^0 = H^{-1} \mathcal{B}^0$. Applying the first part of the proof, we deduce that the functor $(F \circ G \circ H) : \mathcal{C} \rightarrow \mathcal{D}$ is U -left Kan extended from $\mathcal{C}^0$. The functor F is isomorphic to $F \circ G \circ H$, and is therefore also U -left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.17). $\square$

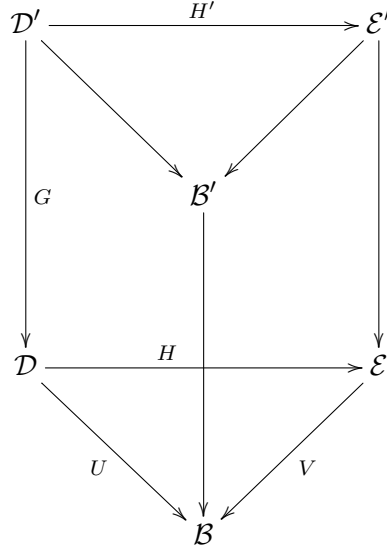

Remark 7.3.3.19 (Transitivity). Let $F : \mathcal{C} \rightarrow \mathcal{D}$, $U : \mathcal{D} \rightarrow \mathcal{E}$, and $V : \mathcal{E} \rightarrow \mathcal{E}'$ be functors of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that $U \circ F$ is V -left Kan extended from $\mathcal{C}^0$. Then F is U -left Kan extended from $\mathcal{C}^0$ if and only if it is $(V \circ U)$ -left Kan extended from $\mathcal{C}^0$ (see Proposition 7.1.6.10). Similarly, if $U \circ F$ is V -right Kan extended from $\mathcal{C}^0$, then F is U -right Kan extended from $\mathcal{C}^0$ if and only if it is $(V \circ U)$ -right Kan extended from $\mathcal{C}^0$. 02ZE

Remark 7.3.3.20. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that $U \circ F$ is left Kan extended from $\mathcal{C}^0$. Then F is left Kan extended from $\mathcal{C}^0$ if and only if it is U -left Kan extended from $\mathcal{C}^0$; this follows by applying Remark 7.3.3.19 in the special case $\mathcal{E}' = \Delta^0$. Similarly, if $U \circ F$ is right Kan extended from $\mathcal{C}^0$, then F is right Kan extended from $\mathcal{C}^0$ if and only if it is U -right Kan extended from $\mathcal{C}^0$. 02ZF

Proposition 7.3.3.21 (Base Change). Suppose we are given a commutative diagram of 02ZG

∞ -categories

02ZH

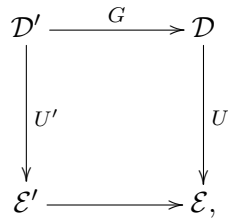

(7.18)

where each square is a pullback and the diagonal maps are inner fibrations. Let $F : \mathcal{C} \rightarrow \mathcal{D}'$ be a functor of ∞ -categories and $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Then:

- (1) If $G \circ F$ is H -left Kan extended from $\mathcal{C}^0$, then F is H' -left Kan extended from $\mathcal{C}^0$.
- (2) Assume that U and V are cartesian fibrations and that the functor G carries U -cartesian morphisms of $\mathcal{D}$ to V -cartesian morphisms of $\mathcal{E}$. If F is H' -left Kan extended from $\mathcal{C}^0$, then $G \circ F$ is an H -left Kan extended from $\mathcal{C}^0$.

Proof. Use Proposition 7.1.7.18. □

02ZJ **Corollary 7.3.3.22.** Suppose we are given a pullback diagram of ∞ -categories

where the vertical maps are inner fibrations. Let $F : \mathcal{C} \rightarrow \mathcal{D}'$ be a functor of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. If $G \circ F$ is U -left Kan extended from $\mathcal{C}^0$, then F is U' -left Kan extended from $\mathcal{C}^0$. The converse holds if U is a cartesian fibration.

Proof. Apply Proposition 7.3.3.21 in the special case $\mathcal{B} = \mathcal{E}$. □

Corollary 7.3.3.23. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an inner fibration of ∞ -categories, let $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$ be the fiber of U over an object $E \in \mathcal{E}$, let $F : \mathcal{C} \rightarrow \mathcal{D}_E$ be a functor of ∞ -categories, and $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. If F is U -left Kan extended from $\mathcal{C}^0$ (when regarded as a functor from $\mathcal{C}$ to $\mathcal{D}$), then it is left Kan extended from $\mathcal{C}^0$ (when regarded as a functor from $\mathcal{C}$ to $\mathcal{D}_E$). The converse holds if U is a cartesian fibration.* 02ZK

Proof. Apply Corollary 7.3.3.22 in the special case $\mathcal{E}' = \{E\}$. $\square$

Remark 7.3.3.24. In the situation of Corollary 7.3.3.23, the functor F is U -left Kan extended from $\mathcal{C}^0$ if and only if, for every morphism $f : E \rightarrow E'$ in the ∞ -category $\mathcal{E}$, the composite map 05J9

$$\mathcal{C} \xrightarrow{F} \{E\} \times_{\mathcal{E}} \mathcal{D} \hookrightarrow \Delta^1 \times_{\mathcal{E}} \mathcal{D}$$

is left Kan extended from the full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. See Proposition 7.1.7.14.

7.3.4 Kan Extensions along Fibrations

In this section, we study the formation of left Kan extension along cocartesian fibrations. We can state a preliminary version of our main result as follows: 02ZL

Proposition 7.3.4.1. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Suppose we are given functors of ∞ -categories $F_0 : \mathcal{K} \rightarrow \mathcal{D}$ and $F : \mathcal{C} \rightarrow \mathcal{D}$ and a natural transformation $\beta : F_0 \rightarrow F \circ \delta$. The following conditions are equivalent:* 02ZM

- (1) *The natural transformation β exhibits F as a left Kan extension of F_0 along δ .*
- (2) *For each object $C \in \mathcal{C}$, the restriction of β to the fiber $\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K}$ determines a natural transformation $F_0|_{\mathcal{K}_C} \rightarrow \underline{F(C)}$ which exhibits $F(C)$ as a colimit of the diagram $F_0|_{\mathcal{K}_C}$ in the ∞ -category $\mathcal{D}$.*

Proof. By virtue of Corollary 7.2.2.7, it will suffice to show that for each object $C \in \mathcal{C}$, the tautological map

$$\mathcal{K}_C = \mathcal{K} \times_{\mathcal{C}} \{C\} \hookrightarrow \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$$

is right cofinal. Since δ is a cocartesian fibration, it will suffice to show that the inclusion map $\{\text{id}_C\} \hookrightarrow \mathcal{C}_{/C}$ is right cofinal (Proposition 7.2.3.12). This follows from Corollary 4.6.7.25, since id_C is a final object of the ∞ -category $\mathcal{C}_{/C}$ (Proposition 4.6.7.23). $\square$

Corollary 7.3.4.2. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. The following conditions are equivalent:* 02ZN

- (1) *The functor F is left Kan extended from $\mathcal{K}$.*

(2) For every object $C \in \mathcal{C}$, the functor

$$F_C : \mathcal{K}_C^{\triangleright} \simeq \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a colimit diagram.

Proof. Combine Propositions 7.3.4.1 and 7.3.2.11. $\square$

Corollary 7.3.4.2 generalizes to the setting of relative Kan extensions:

02ZP Proposition 7.3.4.3. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors. The following conditions are equivalent:*

(1) The functor F is U -left Kan extended from $\mathcal{K}$.

(2) For every object $C \in \mathcal{C}$, the functor

$$F_C : \mathcal{K}_C^{\triangleright} \simeq \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U -colimit diagram.

Proof. By virtue of Proposition 7.3.3.7, it will suffice to show that for each object $C \in \mathcal{C}$, the following conditions are equivalent:

(1_C) The functor F is U -left Kan extended from $\mathcal{K}$ at C .

(2_C) The functor F_C is a U -colimit diagram.

This follows from Corollary 7.2.2.3, since the tautological map

$$\mathcal{K}_C \simeq \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} \mathcal{K}_{/C} \hookrightarrow \mathcal{K}_{/C}$$

is right cofinal (as noted in the proof of Proposition 7.3.4.1). $\square$

Our next goal is establish a companion to Proposition 7.3.4.1, which provides necessary and sufficient conditions for the *existence* of a left Kan extension.

02ZQ Proposition 7.3.4.4. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let $F_0 : \mathcal{K} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. The following conditions are equivalent:*

(1) The functor F_0 admits a left Kan extension along δ .

(2) For every object $C \in \mathcal{C}$, the induced diagram

$$\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K} \hookrightarrow \mathcal{K} \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞ -category $\mathcal{D}$.

Note that the implication (1) $\Rightarrow$ (2) of Proposition 7.3.4.4 follows immediately from Proposition 7.3.4.1. To prove the converse, it will be convenient to again translate to a question about the inclusion map $\mathcal{K} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, which we will address in a more general form. First, we need a variant of Proposition 7.1.8.7.

Lemma 7.3.4.5. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories, let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a simplicial subset which contains every vertex of $\mathcal{C}$, and set $\mathcal{K}_0 = \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{K}$. Suppose we are given a lifting problem*

$$\begin{array}{ccc} \mathcal{K} \amalg_{\mathcal{K}_0} (\mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) & \xrightarrow{F_0} & \mathcal{D} \\ \downarrow & \nearrow \text{dashed} & \downarrow U \\ \mathcal{K} \star_{\mathcal{C}} \mathcal{C} & \xrightarrow{\quad} & \mathcal{E} \end{array} \quad (7.19) \quad \text{02ZS}$$

which satisfies the following condition:

(*) Let $\sigma : \Delta^n \rightarrow \mathcal{C}$ be an n -simplex which is not contained in $\mathcal{C}_0$ and set $C = \sigma(0)$. Then the composite map

$$\mathcal{K}_C^{\triangleright} \simeq \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \xrightarrow{F_0} \mathcal{D}$$

is a U -colimit diagram in the ∞ -category $\mathcal{D}$.

Then the lifting problem (7.19) admits a solution.

Proof. Without loss of generality, we may assume that $\mathcal{C}$ is an ∞ -category (working one simplex at a time, we could even assume that $\mathcal{C} = \Delta^m$ is a standard simplex and that $\mathcal{C}_0 = \partial\Delta^m$ is its boundary). Set $\overline{\mathcal{K}} = \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, so that δ extends to a map

$$\overline{\delta} : \overline{\mathcal{K}} = \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \simeq \Delta^1 \times \mathcal{C} \rightarrow \mathcal{C}.$$

Since δ is a cocartesian fibration, Lemma 5.2.3.17 guarantees that $\overline{\delta}$ is also a cocartesian fibration. Applying Corollary 5.3.6.8, we obtain a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \text{Fun}(\overline{\mathcal{K}}/\mathcal{C}, \mathcal{D}) & \xrightarrow{\quad} & \text{Fun}(\mathcal{K}/\mathcal{C}, \mathcal{D}) \\ \downarrow U_{\circ} & \searrow T & \swarrow \\ & \mathcal{C} & \\ \swarrow & \uparrow & \searrow \\ \text{Fun}(\overline{\mathcal{K}}/\mathcal{C}, \mathcal{E}) & \xrightarrow{\quad} & \text{Fun}(\mathcal{K}/\mathcal{C}, \mathcal{E}), \end{array} \quad (7.20) \quad \text{02ZT}$$

where the diagonal arrows are cartesian fibrations and the morphisms on the outside of the diagram preserve cartesian morphisms. Applying Proposition 5.1.4.21, we see that the induced map

$$T' : \text{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{E})} \text{Fun}(\overline{\mathcal{K}} / \mathcal{C}, \mathcal{E}) \rightarrow \mathcal{C}$$

is also a cartesian fibration, and that the outer square of the diagram (7.20) determines a functor

$$V : \text{Fun}(\overline{\mathcal{K}} / \mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{E})} \text{Fun}(\overline{\mathcal{K}} / \mathcal{C}, \mathcal{E}) \rightarrow \mathcal{C}$$

which carries T -cartesian morphisms to T' -cartesian morphisms.

We next claim that V is an isofibration. Fix a monomorphism of simplicial sets $i : A \hookrightarrow B$ which is also a categorical equivalence; we wish to show that every diagram

$$\begin{array}{ccc} A & \xrightarrow{\quad} & \text{Fun}(\overline{\mathcal{K}} / \mathcal{C}, \mathcal{D}) \\ \downarrow & \nearrow \text{dashed} & \downarrow V \\ B & \xrightarrow{\quad} & \text{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{K} / \mathcal{C}, \mathcal{E})} \text{Fun}(\overline{\mathcal{K}} / \mathcal{C}, \mathcal{E}) \end{array}$$

admits a solution. Note that this lifting problem determines a morphism of simplicial sets $B \rightarrow \mathcal{C}$. Invoking the universal property of Proposition 4.5.9.5, we can rewrite this as a lifting problem

$$\begin{array}{ccc} (A \times_{\mathcal{C}} \overline{\mathcal{K}}) \amalg_{(A \times_{\mathcal{C}} \mathcal{K})} (B \times_{\mathcal{C}} \mathcal{K}) & \xrightarrow{\quad} & \mathcal{D} \\ \downarrow & \nearrow \text{dashed} & \downarrow U \\ B \times_{\mathcal{C}} \overline{\mathcal{K}} & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

Since U is an isofibration, it will suffice to show that the left vertical map is a categorical equivalence of simplicial sets, or equivalently that the diagram

$$\begin{array}{ccc} A \times_{\mathcal{C}} \mathcal{K} & \xrightarrow{\quad} & B \times_{\mathcal{C}} \mathcal{K} \\ \downarrow & & \downarrow \\ A \times_{\mathcal{C}} \overline{\mathcal{K}} & \xrightarrow{\quad} & B \times_{\mathcal{C}} \overline{\mathcal{K}} \end{array}$$

is a categorical pushout square (Proposition 4.5.4.11). This follows from Proposition 4.5.4.10, since the horizontal maps are categorical equivalences (Corollary 5.6.7.6).

Unwinding the definitions, we can rewrite (7.19) as a lifting problem

$$\begin{array}{ccc}
 \mathcal{C}_0 & \xrightarrow{G_0} & \mathrm{Fun}(\overline{\mathcal{K}}/\mathcal{C}, \mathcal{D}) \\
 \downarrow & \nearrow \text{dashed} & \downarrow V \\
 \mathcal{C} & \xrightarrow{\quad} & \mathrm{Fun}(\mathcal{K}/\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{K}/\mathcal{C}, \mathcal{E})} \mathrm{Fun}(\overline{\mathcal{K}}/\mathcal{C}, \mathcal{E}).
 \end{array}$$

By virtue of Proposition 7.1.8.7, to show that this lifting problem admits a solution, it will suffice to verify the following:

- (*) Let $\sigma : \Delta^n \rightarrow \mathcal{C}$ be an n -simplex which is not contained in $\mathcal{C}_0$ and set $C = \sigma(0)$. Then $G_0(C)$ is a V -initial object of the ∞ -category $\mathrm{Fun}(\overline{\mathcal{K}}/\mathcal{C}, \mathcal{D})$.

Unwinding the definitions, we see that the functor $T^{-1}\{C\} \rightarrow T'^{-1}\{C\}$ induced by V can be identified with the restriction map

$$V_C : \mathrm{Fun}(\mathcal{K}_C^\triangleright, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{K}_C, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{K}_C, \mathcal{E})} \mathrm{Fun}(\mathcal{K}_C^\triangleright, \mathcal{E}).$$

Combining assumption (*) with Proposition 7.1.6.13, we see that $G_0(C)$ is a V_C -initial object of the ∞ -category $\mathrm{Fun}(\mathcal{K}_C^\triangleright, \mathcal{D})$. Proposition 7.1.5.19 then guarantees that $G_0(C)$ is also V -initial when regarded as an object of the ∞ -category $\mathrm{Fun}(\overline{\mathcal{K}}/\mathcal{C}, \mathcal{D})$. $\square$

Lemma 7.3.4.6. *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories, and suppose we are given a lifting problem*

$$\begin{array}{ccc}
 \mathcal{K} & \xrightarrow{F_0} & \mathcal{D} \\
 \downarrow & \nearrow F \text{ dashed} & \downarrow U \\
 \mathcal{K} \star_{\mathcal{C}} \mathcal{C} & \xrightarrow{G} & \mathcal{E}
 \end{array} \tag{7.21}$$

with the following property:

- (*) For each vertex $C \in \mathcal{C}$, the induced lifting problem

$$\begin{array}{ccc}
 \mathcal{K}_C & \xrightarrow{\quad} & \mathcal{D} \\
 \downarrow & \nearrow F_C \text{ dashed} & \downarrow U \\
 \mathcal{K}_C \star_{\{C\}} \{C\} & \xrightarrow{\quad} & \mathcal{E}
 \end{array}$$

admits a solution $F_C : \mathcal{K}_C^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram.

Then (7.21) admits a solution $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ satisfying $F|_{X_C^{\triangleright}} = F_C$ for each vertex $C \in \mathcal{C}$.

Proof. Let $\mathcal{C}_0 = \text{sk}_0(\mathcal{C})$ be the 0-skeleton of $\mathcal{C}$ and set $\mathcal{K}_0 = \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{K} = \coprod_{C \in \mathcal{C}} \mathcal{K}_C$, so that we can amalgamate F_0 with the morphisms $\{F_C\}_{C \in \mathcal{C}}$ to obtain a map $F_1 : \mathcal{K} \amalg_{\mathcal{K}_0} (\mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) \rightarrow \mathcal{D}$. To prove Lemma 7.3.4.6, we must show that the lifting problem

$$\begin{array}{ccc} \mathcal{K} \amalg_{\mathcal{K}_0} (\mathcal{K}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) & \xrightarrow{F_1} & \mathcal{D} \\ \downarrow & \nearrow \text{dashed} & \downarrow U \\ \mathcal{C} \star_{\mathcal{C}} \mathcal{C} & \xrightarrow{G} & \mathcal{E} \end{array}$$

has a solution, which is a special case of Lemma 7.3.4.5. $\square$

02ZW **Proposition 7.3.4.7.** *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories, and suppose we are given a lifting problem*

02ZX

$$\begin{array}{ccc} \mathcal{K} & \xrightarrow{F_0} & \mathcal{D} \\ \downarrow & \nearrow \text{dashed } F & \downarrow U \\ \mathcal{K} \star_{\mathcal{C}} \mathcal{C} & \longrightarrow & \mathcal{E}. \end{array} \quad (7.22)$$

The following conditions are equivalent:

- (1) The lifting problem (7.22) has a solution $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{K}$.
- (2) For every object $C \in \mathcal{C}$, the associated lifting problem

$$\begin{array}{ccc} \mathcal{K}_C & \longrightarrow & \mathcal{D} \\ \downarrow & \nearrow \text{dashed} & \downarrow U \\ \mathcal{K}_C^{\triangleright} & \longrightarrow & \mathcal{E} \end{array}$$

has a solution $\mathcal{K}_C^{\triangleright} \rightarrow \mathcal{D}$ which is a U -colimit diagram.

Proof. Combine Lemma 7.3.4.6 with Proposition 7.3.4.3. $\square$

02ZY **Corollary 7.3.4.8.** *Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let $F_0 : \mathcal{K} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. The following conditions are equivalent:*

- (1) *There exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ which is left Kan extended from $\mathcal{K}$ and satisfies $F|_{\mathcal{K}} = F_0$.*
- (2) *For every object $C \in \mathcal{C}$, the diagram*

$$\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K} \hookrightarrow \mathcal{K} \xrightarrow{F_0} \mathcal{D}$$

admits a colimit in the ∞ -category $\mathcal{D}$.

Proof of Proposition 7.3.4.4. Let $\delta : \mathcal{K} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let $F_0 : \mathcal{K} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Suppose that, for every object $C \in \mathcal{C}$, the diagram

$$\mathcal{K}_C = \{C\} \times_{\mathcal{C}} \mathcal{K} \hookrightarrow \mathcal{K} \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞ -category $\mathcal{D}$. Applying Corollary 7.3.4.8, we deduce that there exists a functor $F : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ which is left Kan extended from $\mathcal{K}$ and satisfies $F|_{\mathcal{K}} = F_0$. Applying Proposition 7.3.1.16, we see that the restriction $F|_{\mathcal{C}}$ is a left Kan extension of F_0 along δ . $\square$

7.3.5 Existence of Kan Extensions

Our goal in this section is to establish the following existence criterion for Kan extensions: 02ZZ

Proposition 7.3.5.1. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories, and suppose we are given diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$. Then:* 0300

- *The diagram F_0 admits a left Kan extension along δ if and only if, for every object $C \in \mathcal{C}$, the diagram*

$$K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C} \rightarrow K \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞ -category $\mathcal{D}$.

- *The diagram F_0 admits a right Kan extension along δ if and only if, for every object $C \in \mathcal{C}$, the diagram*

$$K_{C/} = K \times_{\mathcal{C}} \mathcal{C}_{C/} \rightarrow K \xrightarrow{F_0} \mathcal{D}$$

has a limit in the ∞ -category $\mathcal{D}$.

Corollary 7.3.5.2. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories and let $\delta : K \rightarrow \mathcal{C}$ be a diagram. Assume that, for every object $C \in \mathcal{C}$, the ∞ -category $\mathcal{D}$ admits $K_{/C}$ -indexed colimits. Then every diagram $F_0 : K \rightarrow \mathcal{D}$ admits a left Kan extension along δ .* 0301

Corollary 7.3.5.3. *Let $\mathcal{C}$ be a category, let $\mathcal{G} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$ be a diagram of simplicial sets, let $\mathcal{D}$ be an ∞ -category, and let $F_0 : \varinjlim(\mathcal{G}) \rightarrow \mathcal{D}$ be a diagram. The following conditions are equivalent:* 039T

(1) The diagram F_0 admits a left Kan extension along the projection map $U : \underline{\text{holim}}(\mathcal{G}) \rightarrow \mathbf{N}_\bullet(\mathcal{C})$.

(2) For every object $C \in \mathcal{C}$, the diagram

$$\mathcal{G}(C) \simeq \{C\} \times_{\mathbf{N}_\bullet(\mathcal{C})} \underline{\text{holim}}(\mathcal{G}) \hookrightarrow \underline{\text{holim}}(\mathcal{G}) \xrightarrow{F_0} \mathcal{D}$$

admits a colimit in the ∞ -category $\mathcal{D}$.

Proof. For each object $C \in \mathcal{C}$, the inclusion map

$$\mathcal{G}(C) \hookrightarrow \mathbf{N}_\bullet(\mathcal{C}/_C) \times_{\mathbf{N}_\bullet(\mathcal{C})} \underline{\text{holim}}(\mathcal{G}) \simeq \underline{\text{holim}}(\mathcal{G}|_{\mathcal{C}/_C})$$

is right anodyne (Example 7.2.3.11), and therefore right cofinal. The desired result now follows by combining Proposition 7.3.5.1 with Corollary 7.2.2.10. $\square$

039U **Remark 7.3.5.4.** In the situation of Corollary 7.3.5.3, suppose we are given a functor $F : \mathbf{N}_\bullet(\mathcal{C}) \rightarrow \mathcal{D}$ and a natural transformation $\beta : F_0 \rightarrow F \circ U$. Then β exhibits F as a left Kan extension of F_0 along U if and only if, for every object $C \in \mathcal{C}$, the induced natural transformation $\beta_C : F_0|_{\mathcal{G}(C)} \rightarrow \underline{F(C)}$ exhibits $F(C)$ as a colimit of the diagram $F_0|_{\mathcal{G}(C)}$

In the special case where δ is a cocartesian fibration, Proposition 7.3.5.1 is essentially a reformulation of Proposition 7.3.4.4. We will proceed in general by reducing to this special case (see [56] for a similar approach). With an eye toward future applications, we first consider a variant of Proposition 7.3.5.1 in the setting of *relative* Kan extensions.

0302 **Proposition 7.3.5.5.** Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories, and suppose we are given a lifting problem

0303

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F_0} & \mathcal{D} \\ \downarrow & \nearrow F & \downarrow U \\ \mathcal{C} & \xrightarrow{G} & \mathcal{E} \end{array} \quad (7.23)$$

Then (7.23) admits a solution $F : \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}^0$ if and only if, for every object $C \in \mathcal{C}$, the following condition is satisfied:

($\ast_C$) The induced lifting problem

0304

$$\begin{array}{ccc} \mathcal{C}^0/_C & \xrightarrow{\quad} & \mathcal{D} \\ \downarrow & \nearrow F_C & \downarrow U \\ (\mathcal{C}^0/_C)^\triangleright & \xrightarrow{\quad} \mathcal{C} \xrightarrow{G} & \mathcal{E} \end{array} \quad (7.24)$$

admits a solution $F_C : (\mathcal{C}_{/C}^0)^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram.

Proof. Assume that condition $(*_C)$ is satisfied for every object $C \in \mathcal{C}$; we will show that the lifting problem (7.23) admits a solution $F : \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}^0$ (the converse follows immediately from the definitions). Let $\mathcal{K}$ denote the oriented fiber product $\mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \mathcal{C}$: that is, the full subcategory of $\text{Fun}(\Delta^1, \mathcal{C})$ spanned by those morphisms $e : X \rightarrow Y$ of $\mathcal{C}$ such that X belongs to the subcategory $\mathcal{C}^0$. Let $\pi : \mathcal{K} \rightarrow \mathcal{C}^0$ and $\pi' : \mathcal{K} \rightarrow \mathcal{C}$ be the evaluation maps, given on objects by $\pi(e) = X$ and $\pi'(e) = Y$, respectively. We then have a natural transformation $\alpha : \pi \rightarrow \pi'$ (which carries each morphism $e : X \rightarrow Y$ to itself). Regarding $\mathcal{K}$ as an object of $(\text{Set}_\Delta)_{/C}$ via the functor π' , let $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ denote the relative join of Construction 5.2.3.1. We will write $\iota_{\mathcal{K}} : \mathcal{K} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ and $\iota_{\mathcal{C}} : \mathcal{C} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ for the inclusion maps, and $\iota_{\mathcal{C}^0}$ for the restriction of $\iota_{\mathcal{C}}$ to the full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. The natural transformation α then determines a functor $S : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{C}$ satisfying $S \circ \iota_{\mathcal{K}} = \pi$ and $S \circ \iota_{\mathcal{C}} = \text{id}_{\mathcal{C}}$. Consider the lifting problem

$$\begin{array}{ccc}
 \mathcal{K} & \xrightarrow{F_0 \circ \pi} & \mathcal{D} \\
 \downarrow & \nearrow \bar{F} & \downarrow U \\
 \mathcal{K} \star_{\mathcal{C}} \mathcal{C} & \xrightarrow{S} \mathcal{C} \xrightarrow{G} & \mathcal{E}.
 \end{array} \tag{7.25}$$

For each object $C \in \mathcal{C}$, write $\mathcal{K}_C$ for the fiber $\pi'^{-1}\{C\}$, so that (7.25) restricts to a lifting problem

$$\begin{array}{ccc}
 \mathcal{K}_C & \xrightarrow{\quad} & \mathcal{D} \\
 \downarrow & \nearrow \bar{F}_C & \downarrow U \\
 \mathcal{K}_C \star_{\{C\}} \{C\} & \xrightarrow{\quad} & \mathcal{E}.
 \end{array} \tag{7.26}$$

Note that $\mathcal{K}_C$ can be identified with the oriented fiber product $\mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \{C\}$. Moreover, after precomposing with the slice diagonal equivalence $\mathcal{C}_{/C}^0 \rightarrow \mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \{C\}$ of Theorem 4.6.4.19, (7.26) recovers the lifting problem (7.24). Combining assumption $(*_C)$ with Proposition 7.2.2.9, we deduce that the lifting problem (7.26) admits a solution $\bar{F}_C : \mathcal{K}_C^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram. Since $\pi' : \mathcal{K} \rightarrow \mathcal{C}$ is a cocartesian fibration (Corollary 5.3.7.3), Proposition 7.3.4.7 guarantees that the lifting problem (7.25) admits a solution $\bar{F} : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{K}$.

Note that the diagonal inclusion $\mathcal{C} \hookrightarrow \text{Fun}(\Delta^1, \mathcal{C})$ restricts to a map $\delta : \mathcal{C}^0 \hookrightarrow \mathcal{K}$. Let β denote the composite map

$$\Delta^1 \times \mathcal{C}^0 \simeq \mathcal{C}^0 \star_{\mathcal{C}^0} \mathcal{C}^0 \xrightarrow{\delta \star \text{id}} \mathcal{K} \star_{\mathcal{C}} \mathcal{C},$$

which we regard as a natural transformation from $\iota_{\mathcal{K}} \circ \delta$ to $\iota_{\mathcal{C}^0}$. This natural transformation carries each object $X \in \mathcal{C}^0$ to a morphism $\beta_X : \iota_{\mathcal{K}}(\text{id}_X) \rightarrow \iota_{\mathcal{C}}(X)$ in the ∞ -category $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$. Since id_X is a final object of the ∞ -category $\mathcal{K}_X \simeq \mathcal{C}^0 \tilde{\times}_{\mathcal{C}^0} \{X\}$ (Proposition 4.6.7.23) and $\overline{F}|_{\mathcal{K}_X^{\triangleright}}$ is a U -colimit diagram (Proposition 7.3.4.3), the image $\overline{F}(\beta_X)$ is a U -cocartesian morphism of $\mathcal{D}$ (Corollary 7.2.2.5). Since $U(\overline{F}(\beta_X)) = \text{id}_{G(X)}$ is an isomorphism in $\mathcal{E}$, we conclude that $\overline{F}(\beta_X)$ is an isomorphism in $\mathcal{D}$. Applying Corollary 4.4.5.9, we deduce that $\overline{F}(\beta)$ can be lifted to an isomorphism $F \rightarrow \overline{F} \circ \iota_{\mathcal{C}}$ in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$, where $F : \mathcal{C} \rightarrow \mathcal{D}$ is a solution to the lifting problem (7.23). We will show $\overline{F} \circ \iota_{\mathcal{C}}$ is U -left Kan extended from $\mathcal{C}^0$, so that F is also U -left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.17).

Fix an object $C \in \mathcal{C}$, let $c : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \mathcal{C}$ be the slice contraction map and set $T^+ = \iota_{\mathcal{C}} \circ c$; we wish to show that $T^+ : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \mathcal{D}$ is a U -colimit diagram. Let $\psi : \mathcal{C}_{/C} \hookrightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\}$ be the slice diagonal of Construction 4.6.4.15. Note that ψ is an equivalence of right fibrations over $\mathcal{C}$ (Theorem 4.6.4.19 and Proposition 5.1.7.5), and therefore restricts to an equivalence of full subcategories $\psi_0 : \mathcal{C}_{/C}^0 \rightarrow \mathcal{C}^0 \tilde{\times}_{\mathcal{C}} \{C\} = \mathcal{K}_C$. Let T^- denote the composite functor

$$(\mathcal{C}_{/C}^0)^{\triangleright} \xrightarrow{\psi_0^{\triangleright}} \mathcal{K}_C^{\triangleright} = \mathcal{K}_C \star_{\{C\}} \{C\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}.$$

Because $\overline{F}$ is U -left Kan extended from $\mathcal{K}$, the $\overline{F}|_{\mathcal{K}_C^{\triangleright}}$ is a U -colimit diagram in $\mathcal{D}$ (Proposition 7.3.4.3). Since the functor ψ_0 is right cofinal (Corollary 7.2.1.13), the functor $\overline{F} \circ T^-$ is also a U -colimit diagram (Corollary 7.2.2.2). Beware that the functors $T^-, T^+ : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ are not isomorphic: if $\tilde{X}$ is an object of the ∞ -category $\mathcal{C}_{/C}$ given by a morphism $e : X \rightarrow C$ in $\mathcal{C}$, then we have $T^+(\tilde{X}) = \iota_{\mathcal{C}}(X)$ and $T^-(\tilde{X}) = \iota_{\mathcal{K}}(e)$. However, we will show that the functors $\overline{F} \circ T^-$ and $\overline{F} \circ T^+$ are isomorphic when regarded as objects of the ∞ -category $\text{Fun}((\mathcal{C}_{/C}^0)^{\triangleright}, \mathcal{D})$, so that $\overline{F} \circ G^+$ is a U -colimit diagram by virtue of Proposition 7.1.6.9.

Let $b : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \Delta^1$ be the map carrying $\mathcal{C}_{/C}^0$ to the vertex $0 \in \Delta^1$ and the cone point of $(\mathcal{C}_{/C}^0)^{\triangleright}$ to the vertex $1 \in \Delta^1$. Note that the map $(b, c) : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \Delta^1 \times \mathcal{C}$ factors through the full subcategory

$$\mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C} \subseteq \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \subseteq \Delta^1 \times \mathcal{C}.$$

We let $T : (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$ denote the composite functor

$$(\mathcal{C}_{/C}^0)^{\triangleright} \xrightarrow{(b, c)} \mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C} \xrightarrow{\delta \star \text{id}} \mathcal{K} \star_{\mathcal{C}} \mathcal{C}.$$

Concretely, the functor T carries the cone point of $(\mathcal{C}_{/C}^0)^{\triangleright}$ to the object $\iota_{\mathcal{C}}(C) \in \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, and carries an object $(e : X \rightarrow C)$ of $\mathcal{C}_{/C}^0$ to the object $\iota_{\mathcal{K}}(\text{id}_X) \in \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$. We will complete the proof by verifying the following:

- (a) There exists a natural transformation of functors $\gamma^+ : T \rightarrow T^+$, which carries the cone point of $(\mathcal{C}_{/C}^0)^{\triangleright}$ to the identity morphism $\iota_{\mathcal{C}}(\text{id}_C)$, and carries each object $(e : X \rightarrow C) \in \mathcal{C}_{/C}^0$ to the morphism β_X .

- (b) There exists a natural transformation of functors $\gamma^- : T \rightarrow T^-$, which carries the cone point of $(\mathcal{C}_{/C}^0)^\triangleright$ to the identity morphism $\iota_C(\text{id}_C)$ and carries each object $(e : X \rightarrow C)$ to the morphism of $\mathcal{K} \subseteq \text{Fun}(\Delta^1, \mathcal{C})$ given by a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{\text{id}_X} & X \\ \downarrow \text{id}_X & & \downarrow e \\ X & \xrightarrow{e} & C \end{array}$$

in the ∞ -category $\mathcal{C}$.

Assuming this has been done, we observe that the natural transformations $\overline{F}(\gamma^-)$ and $\overline{F}(\gamma^+)$ carry each object of $(\mathcal{C}_{/C}^0)^\triangleright$ to an isomorphism in the ∞ -category $\mathcal{D}$ and therefore supply isomorphisms $\overline{F} \circ T^- \xleftarrow{\sim} \overline{F} \circ T \xrightarrow{\text{sim}} \overline{F} \circ T^+$ in the ∞ -category $\text{Fun}((\mathcal{C}_{/C}^0)^\triangleright, \mathcal{D})$.

We begin by constructing the natural transformation γ^+ . Let $b' : (\mathcal{C}_{/C}^0)^\triangleright \rightarrow \Delta^1$ be the constant map taking the value 1, so that there is a unique natural transformation $\xi : b \rightarrow b'$. Note that ξ induces a natural transformation from (b, c) to (b', c) in the ∞ -category $\text{Fun}((\mathcal{C}_{/C}^0)^\triangleright, \mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C})$. Composing with the map $(\delta \star \text{id}) : \mathcal{C}^0 \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C}$, we obtain a natural transformation $\gamma^+ : T \rightarrow T^+$ satisfying the requirements of (a).

We now construct the natural transformation γ^- . Note that T and T_- both carry $\mathcal{C}_{/C}^0$ into $\mathcal{K}$ and the cone point of $(\mathcal{C}_{/C}^0)^\triangleright$ to the object $\iota_C(C)$ and can therefore be identified with functors $T_0, T_0^- : \mathcal{C}_{/C}^0 \rightarrow \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$. Let σ be an n -simplex of the product $\Delta^1 \times \mathcal{C}_{/C}^0$, which we identify with a pair (ϵ, τ) where $\epsilon : [n] \rightarrow [1]$ is a nondecreasing function and $\tau : \Delta^{n+1} \rightarrow \mathcal{C}$ has the property that $\tau|_{\Delta^n}$ factors through $\mathcal{C}^0$ and $\tau(n+1) = C$. Let $\rho : \Delta^1 \times \Delta^n \rightarrow \Delta^{n+1}$ and $\rho' : \Delta^{n+1} \rightarrow \Delta^{n+1}$ denote the maps given on vertices by the formulae

$$\rho(i, j) = \begin{cases} n+1 & \text{if } i = 1 = \epsilon(j) \\ j & \text{otherwise} \end{cases} \quad \rho'(j) = \begin{cases} j & \text{if } j \leq n \text{ and } \epsilon(j) = 0 \\ n+1 & \text{otherwise.} \end{cases}$$

Then $(\rho \circ \tau) : \Delta^1 \times \Delta^n \rightarrow \mathcal{C}$ can be identified with an n -simplex of the simplicial set $\mathcal{K} \subseteq \text{Fun}(\Delta^1, \mathcal{C})$, so that $(\rho \circ \tau, \rho' \circ \tau)$ is an n -simplex of $\mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$. The construction $\sigma \mapsto (\rho \circ \tau, \rho' \circ \tau)$ depends functorially on $[n]$, and therefore determines a morphism of simplicial sets

$$\Delta^1 \times \mathcal{C}_{/C}^0 \rightarrow \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$$

We can identify this map with a natural transformation $\gamma_0^- : T_0 \rightarrow T_0^-$, which then determines a natural transformation $\gamma^- : T \rightarrow T^-$ satisfying the requirements of (b). $\square$

Example 7.3.5.6. Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories and let $G : \mathcal{C} \rightarrow \mathcal{E}$ be 043H a functor. Suppose that, for every object $C \in \mathcal{C}$, the image $G(C) \in \mathcal{E}$ can be lifted to a

U -initial object of $\mathcal{D}$. Applying Proposition 7.3.5.5 (in the special case $\mathcal{C}^0 = \emptyset$), we deduce that G can be lifted to a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ which carries each object of $\mathcal{C}$ to a U -initial object of $\mathcal{D}$ (see Example 7.3.3.6).

043J **Corollary 7.3.5.7.** *Let $U : \mathcal{D} \rightarrow \mathcal{C}$ be a cartesian fibration of ∞ -categories. Suppose that, for every object $C \in \mathcal{C}$, the fiber $\mathcal{D}_C = \{C\} \times_{\mathcal{C}} \mathcal{D}$ has an initial object. Then the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ has an initial object. Moreover, an object $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$ is initial if and only if it satisfies the following condition:*

(*) *For each object $C \in \mathcal{C}$, the image $F(C)$ is an initial object of $\mathcal{D}_C$.*

Proof. Since U is a cartesian fibration, an object $D \in \mathcal{D}$ is U -initial if and only if it is initial when viewed as an object of the ∞ -category $\mathcal{D}_C$ for $C = U(D)$ (Corollary 7.1.5.21). It follows from Example 7.3.5.6 that there exists a functor $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$ which satisfies condition (*). Proposition 7.1.8.10 then guarantees that F is an initial object of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$. Any other initial object of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{D})$ is isomorphic to F , and therefore also satisfies condition (*). $\square$

0307 **Corollary 7.3.5.8.** *Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, let $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then:*

- *The functor F_0 admits a left Kan extension $F : \mathcal{C} \rightarrow \mathcal{D}$ if and only if, for every object $C \in \mathcal{C}$, the diagram*

$$\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C} \rightarrow \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞ -category $\mathcal{D}$.

- *The functor F_0 admits a right Kan extension $F : \mathcal{C} \rightarrow \mathcal{D}$ if and only if, for every object $C \in \mathcal{C}$, the diagram*

$$\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{C/} \rightarrow \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D}$$

has a limit in the ∞ -category $\mathcal{D}$.

Proof. The first assertion follows by applying the criterion of Proposition 7.3.5.5 in the special case $\mathcal{E} = \Delta^0$, and the second assertion follows by a similar argument. $\square$

047U **Corollary 7.3.5.9.** *Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a coreflective full subcategory and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories. Suppose we are given a lifting problem*

039W

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F_0} & \mathcal{D} \\ \downarrow & \nearrow F & \downarrow U \\ \mathcal{C} & \xrightarrow{G} & \mathcal{E} \end{array} \quad (7.27)$$

The following conditions are equivalent:

- (1) The lifting problem (7.27) admits a solution F which is U -left Kan extended from $\mathcal{C}^0$.
- (2) For every morphism $u : C' \rightarrow C$ of $\mathcal{C}$ which exhibits C' as a $\mathcal{C}^0$ -coreflection of $\mathcal{C}$, the image $G(u)$ can be lifted to a U -cocartesian morphism $F_0(C') \rightarrow D$ of $\mathcal{D}$.

Proof. Fix an object $C \in \mathcal{C}$, and choose a morphism $u : C' \rightarrow C$ which exhibits C' as a $\mathcal{C}^0$ -coreflection of $\mathcal{C}$. By virtue of Proposition 7.3.5.5, it will suffice to show that the lifting problem

$$\begin{array}{ccc}
 \mathcal{C}_{/C}^0 & \xrightarrow{\quad} & \mathcal{D} \\
 \downarrow & \nearrow F_C \text{ (dashed)} & \downarrow U \\
 (\mathcal{C}_{/C}^0)^\triangleright & \xrightarrow{\quad} \mathcal{C} \xrightarrow{G} & \mathcal{E}
 \end{array}$$

admits a solution which is a U -colimit diagram if and only if $G(u)$ can be lifted to a U -cocartesian morphism $F_0(C') \rightarrow D$. This follows from Corollary 7.2.2.14, since u is final when viewed as an object of the ∞ -category $\mathcal{C}_{/C}^0$. $\square$

Corollary 7.3.5.10. *Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a coreflective full subcategory, 039V and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a cocartesian fibration of ∞ -categories. Then every lifting problem*

$$\begin{array}{ccc}
 \mathcal{C}^0 & \xrightarrow{F_0} & \mathcal{D} \\
 \downarrow & \nearrow F \text{ (dashed)} & \downarrow U \\
 \mathcal{C} & \xrightarrow{G} & \mathcal{E}
 \end{array}$$

admits a solution $F : \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}^0$.

Corollary 7.3.5.11. *Let $\mathcal{C}$ be an ∞ -category which has an initial object and let $U : \mathcal{D} \rightarrow \mathcal{E}$ 043K be a cocartesian fibration of ∞ -categories. Then every lifting problem*

$$\begin{array}{ccc}
 \mathcal{C}^{\text{init}} & \xrightarrow{F_0} & \mathcal{D} \\
 \downarrow & \nearrow F \text{ (dashed)} & \downarrow U \\
 \mathcal{C} & \xrightarrow{G} & \mathcal{E}
 \end{array}$$

admits a solution $F : \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from the full subcategory $\mathcal{C}^{\text{init}} \subseteq \mathcal{C}$ spanned by the initial objects.

Proof. Combine Corollary 7.3.5.10 with Example 6.2.2.10. $\square$

Proof of Proposition 7.3.5.1. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories, and suppose we are given diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$ with the property that, for every object $C \in \mathcal{C}$, the composite map

$$K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C} \rightarrow K \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞ -category $\mathcal{D}$. We wish to show that F_0 has a left Kan extension along δ (the converse assertion is immediate from the definitions, and the analogous assertion for right Kan extensions will follow by a similar argument). Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $\iota : K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞ -category. Since $\mathcal{C}$ and $\mathcal{D}$ are ∞ -categories, we can extend δ and F_0 to functors $\bar{\delta} : \mathcal{K} \rightarrow \mathcal{C}$ and $\bar{F}_0 : \mathcal{K} \rightarrow \mathcal{D}$, respectively (Proposition 4.1.3.1). For every object $C \in \mathcal{C}$, the induced map $K \times_{\mathcal{C}} \mathcal{C}_{/C} \hookrightarrow \mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C}$ is a categorical equivalence (Corollary 5.6.7.6), and therefore right cofinal (Corollary 7.2.1.13). Applying Proposition 7.2.2.9, we deduce that the composite map

$$\mathcal{K} \times_{\mathcal{C}} \mathcal{C}_{/C} \rightarrow \mathcal{K} \xrightarrow{\bar{F}_0} \mathcal{D}$$

has a colimit in $\mathcal{D}$. Corollary 7.3.5.8 now guarantees that the functor $\bar{F}_0$ admits a left Kan extension $\bar{F} : \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{D}$. Set $F = \bar{F}|_{\mathcal{C}}$. Applying Proposition 7.3.2.11, we obtain a natural transformation $\bar{\beta} : \bar{F}_0 \rightarrow F \circ \bar{\delta}$ which exhibits F as a left Kan extension of $\bar{F}_0$ along $\bar{\delta}$. Since ι is a categorical equivalence, it follows that $\bar{\beta}$ restricts to a natural transformation $F_0 \rightarrow F \circ \delta$ which exhibits F as a left Kan extension of F_0 along δ (Proposition 7.3.1.15). $\square$

7.3.6 The Universal Property of Kan Extensions

0308 The goal of this section is to show that Kan extensions (when they exist) can be characterized by a universal mapping property.

0309 **Proposition 7.3.6.1.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$ be diagrams, and let $\beta : F_0 \rightarrow F \circ \delta$ be a natural transformation which exhibits F as a left Kan extension of F_0 along δ . Then, for every functor $G : \mathcal{C} \rightarrow \mathcal{D}$, the composite map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(F \circ \delta, G \circ \delta) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(F_0, G \circ \delta)$$

is a homotopy equivalence of Kan complexes.

We will give the proof of Proposition 7.3.6.1 at the end of this section.

030A **Warning 7.3.6.2.** In classical category theory, some authors take the universal property of Proposition 7.3.6.1 as the definition of a Kan extension. Beware that this is a slightly

different notion in general: it is possible for a natural transformation $\beta : F_0 \rightarrow F \circ \delta$ to satisfy the universal property of Proposition 7.3.6.1 without exhibiting F as a left Kan extension of F_0 along δ (in which case F_0 cannot admit any other left Kan extension along δ ; see Corollary 7.3.6.5).

Corollary 7.3.6.3. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories, and let $\delta : K \rightarrow \mathcal{C}$ be a diagram. Suppose that every diagram $F_0 : K \rightarrow \mathcal{D}$ has a left Kan extension along δ . Then the restriction functor* 030B

$$\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\circ\delta} \mathrm{Fun}(K, \mathcal{D})$$

has a left adjoint, which carries each diagram $F_0 : K \rightarrow \mathcal{D}$ to a left Kan extension of F_0 along δ .

Proof. Combine Propositions 7.3.6.1 and 6.2.6.1. □

Corollary 7.3.6.4. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories and let $\delta : K \rightarrow \mathcal{C}$ be a diagram. Suppose that, for every object $C \in \mathcal{C}$, the ∞ -category $\mathcal{D}$ admits colimits indexed by the simplicial set $K_{/C} = K \times_{\mathcal{C}} \mathcal{C}_{/C}$. Then the restriction functor* 030C

$$\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\circ\delta} \mathrm{Fun}(K, \mathcal{D})$$

has a left adjoint, which carries each diagram $F_0 : K \rightarrow \mathcal{D}$ to a left Kan extension of F_0 along δ .

Proof. Combine Corollaries 7.3.6.3 and 7.3.5.2. □

Corollary 7.3.6.5. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories equipped with diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$, and suppose that F_0 admits a left Kan extension along δ . Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor and let $\beta : F_0 \rightarrow F \circ \delta$ be a natural transformation. The following conditions are equivalent:* 030D

- (1) *The natural transformation β exhibits F as a left Kan extension of F_0 along δ .*
- (2) *For every functor $G : \mathcal{C} \rightarrow \mathcal{D}$, the composite map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(F \circ \delta, G \circ \delta) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(F_0, G \circ \delta)$$

is a homotopy equivalence of Kan complexes.

- (3) *For every functor $G : \mathcal{C} \rightarrow \mathcal{D}$, the composite map*

$$\mathrm{Hom}_{\mathrm{hFun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{hFun}(K, \mathcal{D})}(F \circ \delta, G \circ \delta) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{hFun}(K, \mathcal{D})}(F_0, G \circ \delta)$$

is a bijection of sets.

Proof. The implication (1) $\Rightarrow$ (2) follows from Proposition 7.3.6.1 and the implication (2) $\Rightarrow$ (3) is immediate. We will complete the proof by showing that (3) $\Rightarrow$ (1). By assumption, there exists a functor $F' : \mathcal{C} \rightarrow \mathcal{D}$ and a natural transformation $\beta' : F_0 \rightarrow F' \circ \delta$ which exhibits F' as a left Kan extension of F along δ . Applying Proposition 7.3.6.1, we deduce that there exists a natural transformation $\gamma : F' \rightarrow F$ for which β is a composition of β' with the induced transformation $\gamma|_K : (F' \circ \delta) \rightarrow (F \circ \delta)$. For each object $G \in \text{Fun}(\mathcal{C}, \mathcal{D})$, we have a commutative diagram

$$\begin{array}{ccc} \text{Hom}_{\text{hFun}(\mathcal{C}, \mathcal{D})}(F, G) & \xrightarrow{\circ[\gamma]} & \text{Hom}_{\text{hFun}(\mathcal{C}, \mathcal{D})}(F', G) \\ & \searrow & \swarrow \\ & \text{Hom}_{\text{hFun}(K, \mathcal{D})}(F_0, G \circ \delta), & \end{array}$$

where the right vertical map is bijective. If condition (3) is satisfied, then the left vertical map is also bijective. Allowing the functor G to vary, it follows that the homotopy class $[\gamma]$ is an isomorphism in the homotopy category $\text{hFun}(\mathcal{C}, \mathcal{D})$, so that γ is an isomorphism in $\text{Fun}(\mathcal{C}, \mathcal{D})$. Invoking Remark 7.3.1.13, we conclude that β exhibits F as a left Kan extension of F_0 along δ . $\square$

030E Remark 7.3.6.6. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories equipped with diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$. It follows from Corollary 7.3.6.5 that if F_0 admits a left Kan extension $F : \mathcal{C} \rightarrow \mathcal{D}$ along δ , then the isomorphism class of the functor F is uniquely determined: it is characterized by the requirement that it corepresents the functor

$$\text{hFun}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Set} \quad G \mapsto \text{Hom}_{\text{hFun}(K, \mathcal{D})}(F_0, G \circ \delta).$$

We will deduce Proposition 7.3.6.1 from a more general statement about *relative* Kan extensions.

030F Proposition 7.3.6.7. Let $\mathcal{C}$ be an ∞ -category, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Let $F, G : \mathcal{C} \rightarrow \mathcal{D}$ be functors having restrictions $F_0 = F|_{\mathcal{C}^0}$ and $G_0 = G|_{\mathcal{C}^0}$, so that we have a commutative diagram of Kan complexes

$$\begin{array}{ccc} \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{D})}(F, G) & \xrightarrow{\quad} & \text{Hom}_{\text{Fun}(\mathcal{C}^0, \mathcal{D})}(F_0, G_0) \\ \downarrow & & \downarrow \\ \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{E})}(U \circ F, U \circ G) & \xrightarrow{\quad} & \text{Hom}_{\text{Fun}(\mathcal{C}^0, \mathcal{E})}(U \circ F_0, U \circ G_0). \end{array} \tag{7.28}$$

030G

If F is U -left Kan extended from $\mathcal{C}^0$ or G is U -right Kan extended from $\mathcal{C}^0$, then (7.28) is a homotopy pullback square.

Remark 7.3.6.8. In the situation of Proposition 7.3.6.7, the horizontal maps in the diagram (7.28) are Kan fibrations (Corollary 4.1.4.2 and Proposition 4.6.1.21). Consequently, the diagram (7.28) is a homotopy pullback square if and only if the induced map

$$\begin{array}{c} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \\ \downarrow \theta \\ \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})}(F_0, G_0) \times_{\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})}(UF_0, UG_0)} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{E})}(UF, UG) \end{array}$$

is a homotopy equivalence (Example 3.4.1.3). Writing $\mathcal{M}$ for the fiber product

$$\mathrm{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})} \mathrm{Fun}(\mathcal{C}, \mathcal{E})$$

and $V : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{M}$ for the functor given by $V(H) = (H|_{\mathcal{C}^0}, U \circ H)$, we can identify θ with the map $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathcal{M}}(V(F), V(G))$ determined by V . We can therefore restate Proposition 7.3.6.7 as follows:

- If the functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is U -left Kan extended from $\mathcal{C}^0 \subseteq \mathcal{C}$, then it is V -initial when viewed as an object of the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$.
- If the functor $G : \mathcal{C} \rightarrow \mathcal{D}$ is U -right Kan extended from $\mathcal{C}^0 \subseteq \mathcal{C}$, then it is V -final when viewed as an object of the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Proof of Proposition 7.3.6.7. We will assume that the functor F is U -left Kan extended from $\mathcal{C}^0$ (the proof in the case where G is U -right Kan extended from $\mathcal{C}^0$ is similar). Using Corollary 4.5.2.24, we can factor the functor U as a composition $\mathcal{D} \xrightarrow{T} \mathcal{D}' \xrightarrow{U'} \mathcal{E}$, where U' is an isofibration and T is an equivalence of ∞ -categories. Note that the functor $T \circ F$ is U' -left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.15), and that the natural maps

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}')} (T \circ F, T \circ G)$$

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})}(F_0, G_0) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D}')} (T \circ F_0, T \circ G_0)$$

are homotopy equivalences. Consequently, we can replace $\mathcal{D}$ by $\mathcal{D}'$ and thereby reduce to proving Proposition 7.3.6.7 in the special case where the functor $U : \mathcal{D} \rightarrow \mathcal{E}$ is an isofibration of ∞ -categories.

Let $V : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})} \mathrm{Fun}(\mathcal{C}, \mathcal{E})$ be as in Remark 7.3.6.8; we wish to show that F is a V -initial object of the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. Note that V is also an

isofibration (Proposition 4.4.5.1). By virtue of Corollary 7.1.5.17, it will suffice to show that every lifting problem

$$\begin{array}{ccc}
 \partial\Delta^n & \xrightarrow{\sigma_0} & \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \\
 \downarrow & \nearrow & \downarrow V \\
 \Delta^n & \xrightarrow{\quad} & \mathrm{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})} \mathrm{Fun}(\mathcal{C}, \mathcal{E})
 \end{array} \tag{7.29}$$

has a solution, provided that $n \geq 0$ and $\sigma_0(0) = F$. Unwinding the definitions, we can rewrite (7.29) as a lifting problem

$$\begin{array}{ccc}
 \mathcal{C}^0 & \xrightarrow{G_0} & \mathrm{Fun}(\Delta^n, \mathcal{D}) \\
 \downarrow & \nearrow G & \downarrow V' \\
 \mathcal{C} & \xrightarrow{\quad} & \mathrm{Fun}(\partial\Delta^n, \mathcal{D}) \times_{\mathrm{Fun}(\partial\Delta^n, \mathcal{E})} \mathrm{Fun}(\Delta^n, \mathcal{E})
 \end{array} \tag{7.30}$$

Note that V' is also an isofibration of ∞ -categories (Proposition 4.4.5.1).

We will complete the proof by showing that the lifting problem (7.30) admits a solution $G : \mathcal{C} \rightarrow \mathrm{Fun}(\Delta^n, \mathcal{D})$ which is V' -left Kan extended from $\mathcal{C}^0$. By virtue of Proposition 7.3.5.5, it will suffice to show that for each object $C \in \mathcal{C}$, the induced lifting problem

$$\begin{array}{ccc}
 \mathcal{C}_{/C}^0 & \xrightarrow{\quad} & \mathrm{Fun}(\Delta^n, \mathcal{D}) \\
 \downarrow & \nearrow Q & \downarrow V' \\
 (\mathcal{C}_{/C}^0)^\triangleright & \xrightarrow{\quad} & \mathrm{Fun}(\partial\Delta^n, \mathcal{D}) \times_{\mathrm{Fun}(\partial\Delta^n, \mathcal{E})} \mathrm{Fun}(\Delta^n, \mathcal{E})
 \end{array} \tag{7.31}$$

admits a solution $Q : (\mathcal{C}_{/C}^0)^\triangleright \rightarrow \mathrm{Fun}(\Delta^n, \mathcal{D})$ which is a V' -colimit diagram. Our assumption that $\sigma_0(0) = F$ is U -left Kan extended from $\mathcal{C}^0$ guarantees that the composite map

$$(\mathcal{C}_{/C}^0)^\triangleright \rightarrow \mathrm{Fun}(\partial\Delta^n, \mathcal{D}) \rightarrow \mathrm{Fun}(\{0\}, \mathcal{D}) = \mathcal{D}$$

is a U -colimit diagram. Applying Proposition 7.1.8.7, we conclude that the lifting problem (7.31) admits a solution Q , and Proposition 7.1.8.10 guarantees that Q is automatically a V' -colimit diagram. $\square$

Corollary 7.3.6.9. *Let $F, G : \mathcal{C} \rightarrow \mathcal{D}$ be functors of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. If F is left Kan extended from $\mathcal{C}^0$ or G is right Kan extended from $\mathcal{C}^0$, then the restriction map*

$$\theta : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a trivial Kan fibration.

Proof. Let $F, G : \mathcal{C} \rightarrow \mathcal{D}$ be functors of ∞ -categories and let $\mathcal{C}^0$ be a full subcategory of $\mathcal{C}$. Assume either that F is left Kan extended from $\mathcal{C}^0$ or that G is right Kan extended from $\mathcal{C}^0$. Applying Proposition 7.3.6.7 in the special case $\mathcal{E} = \Delta^0$, we deduce that the restriction map

$$\theta : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a homotopy equivalence of Kan complexes. Since the restriction map $\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$ is an inner fibration of ∞ -categories (Corollary 4.1.4.2), the map θ is also a Kan fibration (Proposition 4.6.1.21), and therefore a trivial Kan fibration (Proposition 3.3.7.6). $\square$

Corollary 7.3.6.10. *Let $\mathcal{C}$ be an ∞ -category containing an initial object C , let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a cocartesian fibration of ∞ -categories, and let $F, G : \mathcal{C} \rightarrow \mathcal{D}$ be a pair of functors satisfying $U \circ F = U \circ G$. Suppose that F carries each morphism of $\mathcal{C}$ to a U -cocartesian morphism of $\mathcal{D}$. Then evaluation at C induces a homotopy equivalence*

$$\theta : \mathrm{Hom}_{\mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}_{/\mathcal{E}}(\{C\}, \mathcal{D})}(F(C), G(C)).$$

Proof. Let $\mathcal{C}^{\mathrm{init}}$ denote the full subcategory of $\mathcal{C}$ spanned by its initial objects. The morphism θ then factors as a composition

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})}(F, G) &\xrightarrow{\theta'} \mathrm{Hom}_{\mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}^{\mathrm{init}}, \mathcal{D})}(F|_{\mathcal{C}^{\mathrm{init}}}, G|_{\mathcal{C}^{\mathrm{init}}}) \\ &\xrightarrow{\theta''} \mathrm{Hom}_{\mathrm{Fun}_{/\mathcal{E}}(\{C\}, \mathcal{D})}(F(C), G(C)). \end{aligned}$$

Our assumption guarantees that F is U -left Kan extended from $\mathcal{C}^{\mathrm{init}}$ (Corollary 7.3.3.13), so that the morphism θ' is a homotopy equivalence (Proposition 7.3.6.7). Since $\mathcal{C}^{\mathrm{init}}$ is a contractible Kan complex (Corollary 4.6.7.15), the inclusion map $\{C\} \hookrightarrow \mathcal{C}^{\mathrm{init}}$ is a categorical equivalence of simplicial sets, which implies that θ'' is also a homotopy equivalence. $\square$

Corollary 7.3.6.11. *Let $\overline{F} : \mathcal{C} \rightarrow \mathcal{E}$ be a functor of ∞ -categories and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a cocartesian fibration. Suppose that $\mathcal{C}$ contains an initial object C having image $E = \overline{F}(C)$ and that the ∞ -category $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$ has an initial object. Then the ∞ -category $\mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ has an initial object. Moreover, an object $F \in \mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ is initial if and only if it satisfies the following conditions:*

(1) The image $F(C)$ is an initial object of the ∞ -category $\mathcal{D}_E$.

(2) The functor F carries each morphism of $\mathcal{C}$ to a U -cocartesian morphism of $\mathcal{D}$.

Proof. It follows from Corollary 7.3.6.10 that any object of $\mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ which satisfies conditions (1) and (2) is initial. It will therefore suffice to show that there exists an object $F \in \mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ satisfying (1) and (2) (any other initial object of $\mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$ will be isomorphic to F , and will therefore also satisfy (1) and (2)).

Let $\mathcal{C}^{\mathrm{init}}$ denote the full subcategory of $\mathcal{C}$ spanned by its initial objects, and let D be an initial object of the ∞ -category $\mathcal{D}_E$. Since $\mathcal{C}^{\mathrm{init}}$ is a contractible Kan complex, we can lift $\bar{F}|_{\mathcal{C}^{\mathrm{init}}}$ to a functor $F_0 : \mathcal{C}^{\mathrm{init}} \rightarrow \mathcal{D}$ satisfying $F_0(C) = D$. Corollary 7.3.5.11 then guarantees that F_0 admits a U -left Kan extension $F \in \mathrm{Fun}_{/\mathcal{E}}(\mathcal{C}, \mathcal{D})$, which satisfies condition (2) by virtue of Corollary 7.3.3.13. $\square$

Note that relative Kan extensions are characterized by the mapping property described in Proposition 7.3.6.7:

030N **Corollary 7.3.6.12.** *Suppose we are given a commutative diagram of ∞ -categories*

030P

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F_0} & \mathcal{D} \\ \downarrow & \nearrow & \downarrow U \\ \mathcal{C} & \xrightarrow{\bar{F}} & \mathcal{E} \end{array} \quad (7.32)$$

where $\mathcal{C}^0$ is a full subcategory of $\mathcal{C}$. Assume that the lifting problem (7.32) admits a solution given by a functor $\mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}^0$. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be an arbitrary solution to the lifting problem (7.32). Then the following conditions are equivalent:

(1) The functor F is U -left Kan extended from $\mathcal{C}^0$.

(2) For every functor $G : \mathcal{C} \rightarrow \mathcal{D}$, the diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) & \xrightarrow{\quad} & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0}) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{E})}(U \circ F, U \circ G) & \xrightarrow{\quad} & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})}(U \circ F|_{\mathcal{C}^0}, U \circ G|_{\mathcal{C}^0}). \end{array}$$

is a homotopy pullback square.

Proof. The implication (1) $\Rightarrow$ (2) follows from Proposition 7.3.6.7. To prove the converse, let $F' : \mathcal{C} \rightarrow \mathcal{D}$ be a solution to the lifting problem (7.32) which is U -left Kan extended from $\mathcal{C}^0$, and let $V : \text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}^0, \mathcal{E})} \text{Fun}(\mathcal{C}, \mathcal{E})$ be as in Remark 7.3.6.8. If condition (2) is satisfied, then F and F' are both V -initial objects of $\text{Fun}(\mathcal{C}, \mathcal{D})$ satisfying $V(F) = V(F')$. Applying Corollary 7.1.5.12, we see that F and F' are isomorphic as objects of the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$, so that F is also U -left Kan extended from $\mathcal{C}^0$ (Remark 7.3.3.17). $\square$

Corollary 7.3.6.13. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let $F_0 = F|_{\mathcal{C}^0}$ be the restriction of F to a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Suppose that the functor F_0 admits a left Kan extension to $\mathcal{C}$. The following conditions are equivalent:*

- (1) *The functor F is left Kan extended from $\mathcal{C}^0$.*
- (2) *For every functor $G : \mathcal{C} \rightarrow \mathcal{D}$, the restriction map*

$$\theta : \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a homotopy equivalence of Kan complexes.

- (3) *For every functor $G : \mathcal{C} \rightarrow \mathcal{D}$, the restriction map*

$$\theta : \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, G|_{\mathcal{C}^0})$$

is a trivial Kan fibration of simplicial sets.

Proof. The equivalence (1) $\Leftrightarrow$ (2) follows by applying Corollary 7.3.6.12 in the special case $\mathcal{E} = \Delta^0$. The equivalence (2) $\Leftrightarrow$ (3) is a special case of Proposition 3.3.7.6, since the morphism θ is automatically a Kan fibration (see Corollary 4.1.4.2 and Proposition 4.6.1.21). $\square$

Combining Proposition 7.3.6.7 with the existence criterion of Proposition 7.3.5.5, we obtain the following:

Theorem 7.3.6.14. *Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories. Let $\text{Fun}'(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which are U -left Kan extended from $\mathcal{C}^0$, and let $\mathcal{B}$ denote the full subcategory of $\text{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}^0, \mathcal{E})} \text{Fun}(\mathcal{C}, \mathcal{E})$ whose objects correspond to lifting problems*

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{\quad} & \mathcal{D} \\ \downarrow & \nearrow \text{dashed} & \downarrow U \\ \mathcal{C} & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

with the following property:

(*) For every object $C \in \mathcal{C}$, the induced lifting problem

$$\begin{array}{ccc} \mathcal{C}_{/C}^0 & \xrightarrow{\quad} & \mathcal{D} \\ \downarrow & \nearrow \text{dashed} & \downarrow U \\ (\mathcal{C}_{/C}^0)^\triangleright & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

admits a solution which is a U -colimit diagram $(\mathcal{C}_{/C}^0)^\triangleright \rightarrow \mathcal{D}$.

Then the restriction map

$$V : \text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}^0, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}^0, \mathcal{E})} \text{Fun}(\mathcal{C}, \mathcal{E})$$

restricts to a trivial Kan fibration $\text{Fun}'(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{B}$.

Stated more informally, Theorem 7.3.6.14 asserts that if we are given a lifting problem

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{\quad} & \mathcal{D} \\ \downarrow & \nearrow F \text{ dashed} & \downarrow U \\ \mathcal{C} & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

which has a *possibility* to be solved by a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}^0$, then the functor F exists and is unique up to a contractible space of choices.

Proof of Theorem 7.3.6.14. Note that the functor V is an isofibration of ∞ -categories (Proposition 4.4.5.1). It follows from Proposition 7.3.5.5 that $\mathcal{B}$ is the essential image of the functor $V|_{\text{Fun}'(\mathcal{C}, \mathcal{D})}$, and from Proposition 7.3.6.7 (together with Remark 7.3.6.8) that every object of $\text{Fun}'(\mathcal{C}, \mathcal{D})$ is V -initial when regarded as an object of $\text{Fun}(\mathcal{C}, \mathcal{D})$. Applying Corollary 7.1.5.18, we see that the functor $V|_{\text{Fun}(\mathcal{C}, \mathcal{D})} : \text{Fun}'(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{B}$ is a trivial Kan fibration. $\square$

030S **Corollary 7.3.6.15.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Let $\text{Fun}'(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which are left Kan extended from $\mathcal{C}^0$, and let $\text{Fun}'(\mathcal{C}^0, \mathcal{D})$ denote the full subcategory of $\text{Fun}(\mathcal{C}^0, \mathcal{D})$ spanned by those functors F_0 which satisfy the following condition:*

(*) For every object $C \in \mathcal{C}$, the diagram

$$\mathcal{C}_{/C}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C} \rightarrow \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D}$$

has a colimit in the ∞ -category $\mathcal{D}$.

Then the restriction map $\mathrm{Fun}'(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}'(\mathcal{C}^0, \mathcal{D})$ is a trivial Kan fibration of simplicial sets.

Proof. Apply Theorem 7.3.6.14 in the special case $\mathcal{E} = \Delta^0$. $\square$

We now return to the proof of Proposition 7.3.6.1.

Proof of Proposition 7.3.6.1. Let $F, G : \mathcal{C} \rightarrow \mathcal{D}$ be functors of ∞ -categories. Suppose we are given a simplicial set K equipped with diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$, together with a natural transformation $\beta : F_0 \rightarrow F \circ \delta$ which exhibits F as a left Kan extension of F_0 along δ . Let θ denote the composite map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(F \circ \delta, G \circ \delta) \xrightarrow{\circ[\beta]} \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(F_0, G \circ \delta).$$

We wish to show that θ is a homotopy equivalence.

It follows from Corollary 4.1.3.3 that there exists an inner anodyne morphism $K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞ -category. Since $\mathcal{C}$ and $\mathcal{D}$ are ∞ -categories, we can extend δ and F_0 to functors $\delta' : \mathcal{K} \rightarrow \mathcal{C}$ and $F'_0 : \mathcal{K} \rightarrow \mathcal{D}$, respectively (Proposition 1.5.6.7). Moreover, the restriction functor $\mathrm{Fun}(\mathcal{K}, \mathcal{D}) \rightarrow \mathrm{Fun}(K, \mathcal{D})$ is a trivial Kan fibration (Proposition 1.5.7.6). We can therefore extend β to a natural transformation $\beta' : F'_0 \rightarrow F \circ \delta'$, which induces a map of Kan complexes $\theta' : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K}, \mathcal{D})}(F'_0, G \circ \delta')$. By construction, the map θ is obtained (up to homotopy) by composing θ' with the restriction map $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{K}, \mathcal{D})}(F'_0, G \circ \delta') \rightarrow \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(F_0, G \circ \delta)$, which is a trivial Kan fibration. Consequently, to show that θ is a homotopy equivalence, it will suffice to show that θ' is a homotopy equivalence. We may therefore replace K by $\mathcal{K}$ and thereby reduce to proving Proposition 7.3.6.1 in the special case where $K = \mathcal{K}$ is an ∞ -category.

Let $\overline{\mathcal{C}}$ denote the relative join $\mathcal{K} \star_{\mathcal{C}} \mathcal{C}$. Note that the definition of θ (as a morphism in the homotopy category hKan) depends only on the homotopy class of β . We may therefore assume without loss of generality that there exists a functor $\overline{F} : \overline{\mathcal{C}} \rightarrow \mathcal{D}$ for which $\overline{F}|_{\mathcal{K}} = F_0$, $\overline{F}|_{\mathcal{C}} = F$, and the natural transformation β is given by the composition

$$\Delta^1 \times \mathcal{K} \simeq \mathcal{K} \star_{\mathcal{K}} \mathcal{K} \rightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} \xrightarrow{\overline{F}} \mathcal{D}.$$

Let $\overline{G} : \overline{\mathcal{C}} \rightarrow \mathcal{D}$ denote the functor given by the composition

$$\mathcal{K} \star_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \simeq \Delta^1 \times \mathcal{C} \rightarrow \mathcal{C} \xrightarrow{G} \mathcal{D}.$$

Our assumption on β guarantees that $\overline{F}$ is left Kan extended from the full subcategory $\mathcal{K} \subseteq \overline{\mathcal{C}}$ (Proposition 7.3.2.11). Applying Corollary 7.3.6.9, we deduce that precomposition with the inclusion $\mathcal{K} \hookrightarrow \overline{\mathcal{C}}$ determines a trivial Kan fibration

$$\varphi_- : \mathrm{Hom}_{\mathrm{Fun}(\overline{\mathcal{C}}, \mathcal{D})}(\overline{F}, \overline{G}) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K}, \mathcal{D})}(F_0, G \circ \delta).$$

We claim that $\overline{G}$ is right Kan extended from the full subcategory $\mathcal{C} \subseteq \overline{\mathcal{C}}$. To prove this, it will suffice to show that for every object $X \in \mathcal{K}$, the functor $\overline{G}$ is right Kan extended from $\mathcal{C}$ at X (see Proposition 7.3.3.7). Let $e_X : X \rightarrow \delta(X)$ denote the morphism in $\overline{\mathcal{C}}$ given by the edge

$$\Delta^1 \simeq \{X\} \star_{\{\delta(X)\}} \{\delta(X)\} \hookrightarrow \mathcal{K} \star_{\mathcal{C}} \mathcal{C} = \overline{\mathcal{C}}.$$

Note that e_X is cocartesian with respect to the projection map $\overline{\mathcal{C}} \rightarrow \Delta^1$ (Proposition 5.2.3.15), and therefore exhibits $\delta(X)$ as a $\mathcal{C}$ -reflection of X in the ∞ -category $\overline{\mathcal{C}}$ (Lemma 6.2.5.1). It will therefore suffice to show that $\overline{G}$ carries e_X to an isomorphism in the ∞ -category $\mathcal{D}$, which is clear (by construction, $\overline{G}(e_X)$ is the identity morphism id_D for $D = G(\delta(X))$). Applying Corollary 7.3.6.9 again, we deduce that precomposition with the inclusion map $\mathcal{C} \hookrightarrow \overline{\mathcal{C}}$ determines a trivial Kan fibration

$$\varphi_+ : \text{Hom}_{\text{Fun}(\overline{\mathcal{C}}, \mathcal{D})}(\overline{F}, \overline{G}) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{D})}(F, G).$$

Let $\varphi_{\pm} : \text{Hom}_{\text{Fun}(\overline{\mathcal{C}}, \mathcal{D})}(\overline{F}, \overline{G}) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F \circ \delta, G \circ \delta)$ be given by precomposition with the functor $\mathcal{K} \xrightarrow{\delta} \mathcal{C} \hookrightarrow \overline{\mathcal{C}}$. Consider the diagram of Kan complexes

030T

$$\begin{array}{ccccc} & & \text{Hom}_{\text{Fun}(\overline{\mathcal{C}}, \mathcal{D})}(\overline{F}, \overline{G}) & & \\ & \swarrow \varphi_+ & \downarrow \varphi_{\pm} & \searrow \varphi_- & \\ \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{D})}(F, G) & \longrightarrow & \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F \circ \delta, G \circ \delta) & \xrightarrow{\circ[\beta]} & \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F_0, G \circ \delta). \end{array} \quad (7.33)$$

Note that the diagonal maps are homotopy equivalences, and the triangle on the left is commutative. Consequently, to show that θ is a homotopy equivalence, it will suffice to show that the triangle on the right commutes up to homotopy.

Let $\text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F_0, F \circ \delta, G \circ \delta)$ be the Kan complex introduced in Notation 4.6.9.1. To verify the homotopy commutativity of the right triangle in the diagram (7.33), it will suffice to show that there exists map of Kan complexes $\rho : \text{Hom}_{\text{Fun}(\overline{\mathcal{C}}, \mathcal{D})}(\overline{F}, \overline{G}) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F_0, F \circ \delta, G \circ \delta)$ satisfying the following conditions:

- The composition

$$\text{Hom}_{\text{Fun}(\overline{\mathcal{C}}, \mathcal{D})}(\overline{F}, \overline{G}) \xrightarrow{\rho} \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F_0, F \circ \delta, G \circ \delta) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F_0, F \circ \delta)$$

is the constant map taking the value β .

- The composition

$$\text{Hom}_{\text{Fun}(\overline{\mathcal{C}}, \mathcal{D})}(\overline{F}, \overline{G}) \xrightarrow{\rho} \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F_0, F \circ \delta, G \circ \delta) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{K}, \mathcal{D})}(F_0, G \circ \delta)$$

is equal to φ_- .

- The composition

$$\mathrm{Hom}_{\mathrm{Fun}(\bar{\mathcal{C}}, \mathcal{D})}(\bar{F}, \bar{G}) \xrightarrow{\rho} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K}, \mathcal{D})}(F_0, F \circ \delta, G \circ \delta) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K}, \mathcal{D})}(F \circ \delta, G \circ \delta)$$

is equal to $\varphi_{\pm}$.

Let σ denote the 2-simplex of $\Delta^1 \times \Delta^1$ given on vertices by the formulae

$$\sigma(0) = (0, 0) \quad \sigma(1) = (0, 1) \quad \sigma(2) = (1, 1),$$

and let $T : \Delta^2 \times \mathcal{K} \rightarrow \Delta^1 \times \bar{\mathcal{C}}$ be the functor given by the composition

$$\begin{aligned} \Delta^2 \times \mathcal{K} &\xrightarrow{\sigma \times \mathrm{id}_{\mathcal{K}}} \Delta^1 \times \Delta^1 \times \mathcal{K} \\ &\simeq \Delta^1 \times (\mathcal{K} \star_{\mathcal{K}} \mathcal{K}) \\ &\rightarrow \Delta^1 \times (\mathcal{K} \star_{\mathcal{C}} \mathcal{C}) \\ &= \Delta^1 \times \bar{\mathcal{C}}. \end{aligned}$$

More concretely, the functor T is given on objects by the formulae

$$T(0, X) = (0, X) \quad T(1, X) = (0, \delta(X)) \quad T(2, X) = (1, \delta(X)).$$

We conclude by observing that precomposition with T induces a map of Kan complexes

$$\rho : \mathrm{Hom}_{\mathrm{Fun}(\bar{\mathcal{C}}, \mathcal{D})}(\bar{F}, \bar{G}) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{K}, \mathcal{D})}(F_0, F \circ \delta, G \circ \delta)$$

having the desired properties. □

7.3.7 Kan Extensions in Functor ∞ -Categories

Let $U : \mathcal{C} \rightarrow \mathcal{B}$ be an exponentiable inner fibration of ∞ -categories (Definition 4.5.9.10). 047V For every ∞ -category $\mathcal{D}$, Corollary 4.5.9.19 guarantees that the simplicial set $\mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ is an ∞ -category (see Construction 4.5.9.1). The goal of this section is to describe (relative) Kan extensions of functors which take values in the ∞ -category $\mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$. We can state our main result as follows:

Theorem 7.3.7.1. *Let $U : \mathcal{C} \rightarrow \mathcal{B}$ be an exponentiable inner fibration of ∞ -categories, let 047W $V : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, and let $V' : \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$ denote the functor given by postcomposition with V . Let $f : \mathcal{A} \rightarrow \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ be a functor of ∞ -categories, corresponding to a morphism $\mathcal{A} \rightarrow \mathcal{B}$ and a functor $F : \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$. Let $\mathcal{A}^0 \subseteq \mathcal{A}$ be a full subcategory. If F is V -left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$, then f is V' -left Kan extended from $\mathcal{A}^0$.*

We will give the proof of Theorem 7.3.7.1 at the end of this section.

047X **Remark 7.3.7.2.** In the situation of Theorem 7.3.7.1, suppose that the functor $F^0 = F|_{\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}}$ admits a V -left Kan extension $F' : \mathcal{A} \times_{\mathcal{B}} \mathcal{C}$ satisfying $V \circ F' = V \circ F$. Then the converse of Theorem 7.3.7.1 is also true: if f is V' -left Kan extended from $\mathcal{A}^0$, then F is V -left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$. To prove this, it will suffice to show that the functors F and F' are isomorphic (Remark 7.3.3.17). This is clear: we can identify F' with a functor $f' : \mathcal{A} \rightarrow \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ satisfying $V' \circ f' = V' \circ f$, and Theorem 7.3.7.1 guarantees that f' is V' -left Kan extended from $\mathcal{A}^0$. Since the functors f and f' coincide on $\mathcal{A}^0$, they are isomorphic by virtue of Theorem 7.3.6.14.

047Y **Corollary 7.3.7.3.** *Let $U : \mathcal{C} \rightarrow \mathcal{B}$ be an exponentiable inner fibration of ∞ -categories, let $\mathcal{D}$ be an ∞ -category, and let $\pi : \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \rightarrow \mathcal{B}$ be the projection map. Let $f : \mathcal{A} \rightarrow \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ be a functor of ∞ -categories and let $\mathcal{A}^0 \subseteq \mathcal{A}$ be a full subcategory. If the induced map $\mathcal{A} \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$, then f is π -left Kan extended from $\mathcal{A}^0$.*

Proof. Apply Theorem 7.3.7.1 in the special case $\mathcal{E} = \Delta^0$. □

047Z **Corollary 7.3.7.4.** *Let $\mathcal{C}$ be an ∞ -category, let $V : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, and let $V' : \text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{E})$ be the functor given by postcomposition with V . Suppose we are given another functor $f : \mathcal{A} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$ and a full subcategory $\mathcal{A}^0 \subseteq \mathcal{A}$. If the induced map $\mathcal{A} \times \mathcal{C} \rightarrow \mathcal{D}$ is V -left Kan extended from $\mathcal{A}^0 \times \mathcal{C}$, then f is V' -left Kan extended from $\mathcal{A}^0$.*

Proof. Apply Theorem 7.3.7.1 in the special case $\mathcal{B} = \Delta^0$. □

0480 **Corollary 7.3.7.5.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories and let $f : \mathcal{A} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$ be a functor of ∞ -categories, corresponding to a functor $F : \mathcal{A} \times \mathcal{C} \rightarrow \mathcal{D}$. Let $\mathcal{A}^0 \subseteq \mathcal{A}$ be a full subcategory. If F is left Kan extended from $\mathcal{A}^0 \times \mathcal{C}$, then f is left Kan extended from $\mathcal{A}^0$.*

Proof. Apply Corollary 7.3.7.4 in the special case $\mathcal{E} = \Delta^0$. □

0481 **Corollary 7.3.7.6.** *Let $U : \mathcal{C} \rightarrow \mathcal{B}$ be an exponentiable inner fibration of ∞ -categories, let $V : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories, and let $V' : \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$ be the isofibration given by postcomposition with V (see Proposition 4.5.9.18). Let e be a morphism of the ∞ -category $\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$, corresponding to a pair $(\bar{e}, f)$ where $\bar{e}$ is a morphism of $\mathcal{B}$ and $f : \Delta^1 \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories. If f is V -left Kan extended from $\{0\} \times_{\mathcal{B}} \mathcal{C}$, then the morphism e is V' -cocartesian.*

Proof. Apply Theorem 7.3.7.1 in the special case $\mathcal{A} = \Delta^1$ and $\mathcal{A}^0 = \{0\}$ (see Example 7.1.7.2). □

Example 7.3.7.7. In the situation of Corollary 7.3.7.6, suppose that $\mathcal{B} = \Delta^0$. Corollary 7.3.7.6 then asserts that a morphism $e : X \rightarrow Y$ in the functor ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$ is V' -cocartesian if, for every object $C \in \mathcal{C}$, the induced map $e_C : X(C) \rightarrow Y(C)$ is a V -cocartesian morphism of $\mathcal{D}$. This is a special case of Lemma 5.2.1.5. 0482

Example 7.3.7.8. In the situation of Corollary 7.3.7.6, suppose that U is a cartesian fibration. Let $U_{\bar{e}} : \Delta^1 \times_{\mathcal{B}} \mathcal{C} \rightarrow \Delta^1$ denote the cartesian fibration given by projection onto the first factor. By virtue of Proposition 7.3.3.11, the functor f is V -left Kan extended from $\{0\} \times_{\mathcal{B}} \mathcal{C}$ if and only if it carries $U_{\bar{e}}$ -cartesian morphisms of $\Delta^1 \times_{\mathcal{B}} \mathcal{C}$ to V -cocartesian morphisms of $\mathcal{D}$. In this case, Corollary 7.3.7.6 is a special case of (the dual of) Lemma 5.3.6.11. 0483

Corollary 7.3.7.9. Let $U : \mathcal{C} \rightarrow \mathcal{B}$ be an exponentiable inner fibration of ∞ -categories, let $\mathcal{D}$ be an ∞ -category, and let $\pi : \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \rightarrow \mathcal{B}$ be the projection map. Let e be a morphism of the ∞ -category $\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$, corresponding to a pair $(\bar{e}, f)$ where $\bar{e}$ is a morphism of $\mathcal{B}$ and $f : \Delta^1 \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories. If f is left Kan extended from $\{0\} \times_{\mathcal{B}} \mathcal{C}$, then the morphism e is π -cocartesian. 0484

Proof. Apply Corollary 7.3.7.6 in the special case $\mathcal{E} = \Delta^0$. $\square$

The proof of Theorem 7.3.7.1 will require some preliminaries.

Lemma 7.3.7.10. Let $V : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories, let K be a simplicial set equipped with a diagram $\bar{f} : K^{\triangleright} \rightarrow \mathcal{E}$, and let $\text{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D}) \subseteq \text{Fun}_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ be a full subcategory. Let $\text{Fun}'_{/\mathcal{E}}(K, \mathcal{D})$ denote the essential image of $\text{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ under the restriction map $\text{Fun}_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D}) \rightarrow \text{Fun}_{/\mathcal{E}}(K, \mathcal{D})$. Suppose that every simplicial set A satisfies the following condition: 0485

$(*_A)$ For every extension of $\bar{f}$ to a morphism $K^{\triangleright} \star A \rightarrow \mathcal{E}$, the restriction functor

$$\begin{array}{c} \text{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D}) \times_{\text{Fun}_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})} \text{Fun}_{/\mathcal{E}}(K^{\triangleright} \star A, \mathcal{D}) \\ \downarrow \theta_A \\ \text{Fun}'_{/\mathcal{E}}(K, \mathcal{D}) \times_{\text{Fun}_{/\mathcal{E}}(K, \mathcal{D})} \text{Fun}_{/\mathcal{E}}(K \star A, \mathcal{D}) \end{array}$$

is an equivalence of ∞ -categories.

Then every object of $\text{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ is a V -colimit diagram in the ∞ -category $\mathcal{D}$.

Proof. Without loss of generality, we may assume that the full subcategory $\text{Fun}'_{/\mathcal{E}}(K^{\triangleright}, \mathcal{D})$ is replete. For every extension of $\bar{f}$ to a morphism $K^{\triangleright} \star A \rightarrow \mathcal{E}$, let $\text{Fun}'_{/\mathcal{E}}(K^{\triangleright} \star A, \mathcal{D}) \subseteq$

$\mathrm{Fun}_{/\mathcal{E}}(K^\triangleright \star A, \mathcal{D})$ and $\mathrm{Fun}'_{/\mathcal{E}}(K \star A, \mathcal{D}) \subseteq \mathrm{Fun}_{/\mathcal{E}}(K \star A, \mathcal{D})$ denote the inverse images of $\mathrm{Fun}'_{/\mathcal{E}}(K^\triangleright, \mathcal{D})$ and $\mathrm{Fun}'_{/\mathcal{E}}(K, \mathcal{D})$, respectively. For every monomorphism of simplicial sets $A \hookrightarrow B$, Proposition 4.4.5.1 guarantees that the restriction map $\mathrm{Fun}_{/\mathcal{E}}(K \star B, \mathcal{D}) \rightarrow \mathrm{Fun}_{/\mathcal{E}}(K \star A, \mathcal{D})$ is an isofibration, and therefore induces an isofibration $\mathrm{Fun}'_{/\mathcal{E}}(K \star B, \mathcal{D}) \rightarrow \mathrm{Fun}'_{/\mathcal{E}}(K \star A, \mathcal{D})$. Combining Corollary 4.5.2.31 with assumptions $(*_A)$ and $(*_B)$, we conclude that the restriction map

$$\theta_{A,B} : \mathrm{Fun}'_{/\mathcal{E}}(K^\triangleright \star B, \mathcal{D}) \rightarrow \mathrm{Fun}'_{/\mathcal{E}}(K^\triangleright \star A, \mathcal{D}) \times_{\mathrm{Fun}'_{/\mathcal{E}}(K \star A, \mathcal{D})} \mathrm{Fun}'_{/\mathcal{E}}(K \star B, \mathcal{D})$$

is an equivalence of ∞ -categories. Proposition 4.4.5.1 implies that $\theta_{A,B}$ is also an isofibration, and is therefore a trivial Kan fibration (Proposition 4.5.5.20). In particular, $\theta_{A,B}$ is surjective on vertices. Unwinding the definitions, we conclude that every lifting problem

$$\begin{array}{ccc} (K^\triangleright \star A) \amalg_{(K \star A)} (K \star B) & \xrightarrow{g} & \mathcal{D} \\ \downarrow & \nearrow \text{dashed} & \downarrow V \\ K^\triangleright \star B & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

admits a solution, provided that the restriction $g|_{K^\triangleright}$ belongs to $\mathrm{Fun}'_{/\mathcal{E}}(K^\triangleright, \mathcal{D})$. The desired result now follows by invoking the criterion of Proposition 7.1.7.1. $\square$

0486 **Exercise 7.3.7.11.** Prove the converse of Lemma 7.3.7.10.

0487 **Remark 7.3.7.12.** In the situation of Lemma 7.3.7.10, suppose we are given an inner anodyne morphism of simplicial sets $A \hookrightarrow B$. Then every diagram $K^\triangleright \star A \rightarrow \mathcal{E}$ can be extended to a morphism $K^\triangleright \star B \rightarrow \mathcal{E}$, so that condition $(*_A)$ is satisfied if and only if condition $(*_B)$ is satisfied. Consequently, to show that every object of $\mathrm{Fun}'_{/\mathcal{E}}(K^\triangleright, \mathcal{D})$ is a V -colimit diagram, it suffices to verify condition $(*_A)$ in the special case where A is an ∞ -category (see Corollary 4.1.3.3).

We will deduce Theorem 7.3.7.1 from the following special case:

0488 **Proposition 7.3.7.13.** *Let $U : \mathcal{C} \rightarrow \mathcal{B}$ be an exponentiable inner fibration of ∞ -categories, let $V : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, and let $V' : \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$ denote the functor given by postcomposition with V . Let $\mathcal{K}$ be an ∞ -category and let $f : \mathcal{K}^\triangleright \rightarrow \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ be a functor, corresponding to a morphism $\mathcal{K}^\triangleright \rightarrow \mathcal{B}$ and a functor $F : \mathcal{K}^\triangleright \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$. If F is V -left Kan extended from $\mathcal{K} \times_{\mathcal{B}} \mathcal{C}$, then f is a V' -colimit diagram.*

Proof. Without loss of generality, we may assume that V is an isofibration, so that V' is also an isofibration (Proposition 4.5.9.18). Fix a morphism $\bar{f} : \mathcal{K}^\triangleright \rightarrow \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$, and let

$$\mathrm{Fun}'_{/\mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^\triangleright, \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})) \subseteq \mathrm{Fun}_{/\mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^\triangleright, \mathrm{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}))$$

denote the full subcategory spanned by those morphisms $\mathcal{K}^\triangleright \rightarrow \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$ which correspond to functors $\mathcal{K}^\triangleleft \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$ which are V -left Kan extended from $\mathcal{K}$, and let $\text{Fun}'_{/\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}, \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}))$ denote its essential image under the restriction map

$$\text{Fun}_{/\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^\triangleright, \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})) \rightarrow \text{Fun}_{/\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}, \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})).$$

We will complete the proof by showing that every object of $\text{Fun}'_{/\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^\triangleright, \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}))$ is a V' -colimit diagram in the ∞ -category $\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$. By virtue of Remark 7.3.7.12, it will suffice to verify condition $(*_\mathcal{A})$ of Lemma 7.3.7.10 for every ∞ -category $\mathcal{A}$.

Fix a morphism $\mathcal{K}^\triangleright \star \mathcal{A} \rightarrow \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$ extending $\bar{f}$, which we identify with a diagram $\mathcal{K}^\triangleright \star \mathcal{A} \rightarrow \mathcal{B}$ and a functor

$$\bar{G} : (\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{E}.$$

Let $\text{Fun}'_{/\mathcal{E}}((\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ denote the full subcategory of $\text{Fun}_{/\mathcal{E}}((\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ given by the inverse image of $\text{Fun}'_{/\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^\triangleright, \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}))$, and define $\text{Fun}'_{/\mathcal{E}}((\mathcal{K} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ similarly. We wish to show that the restriction map

$$\theta : \text{Fun}'_{/\mathcal{E}}((\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}'_{/\mathcal{E}}((\mathcal{K} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$$

is an equivalence of ∞ -categories. Unwinding the definitions (and using the existence criterion of Proposition 7.3.5.5), we see that a functor $G \in \text{Fun}_{/\mathcal{E}}((\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ belongs to the subcategory $\text{Fun}'_{/\mathcal{E}}((\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ if and only if it is V -left Kan extended from $(\mathcal{K} \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}$, and that a functor $G_0 \in \text{Fun}_{/\mathcal{E}}((\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C}, \mathcal{D})$ belongs to $\text{Fun}'_{/\text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})}(\mathcal{K}^\triangleright, \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}))$ if and only if it admits a left Kan extension $G : (\mathcal{K}^\triangleright \star \mathcal{A}) \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$ satisfying $V \circ G = \bar{G}$. Applying Theorem 7.3.6.14, we conclude that θ is a trivial Kan fibration. $\square$

Example 7.3.7.14. In the situation of Proposition 7.3.7.13, suppose that $\mathcal{B} = \Delta^0$, so that 0489 we can identify F with a functor from $\mathcal{K}^\triangleleft \times \mathcal{C}$ to $\mathcal{D}$. Let X denote the cone point of $\mathcal{K}^\triangleright$. For each object $C \in \mathcal{C}$, the inclusion map $\mathcal{K} \times \{\text{id}_C\} \hookrightarrow \mathcal{K} \times \mathcal{C}_{/C}$ is right cofinal (see Corollary 7.2.1.19). Applying Corollary 7.2.2.2, we deduce that F is V -left Kan extended from $\mathcal{K} \times \mathcal{C}$ if and only if the induced map

$$\mathcal{K}^\triangleleft \simeq \mathcal{K}^\triangleleft \times \{C\} \hookrightarrow \mathcal{K}^\triangleleft \times \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a V -colimit diagram for each $C \in \mathcal{C}$. Proposition 7.3.7.13 asserts that, if this condition is satisfied, then F determines a V' -colimit diagram $\mathcal{K}^\triangleleft \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$; this is a special case of Corollary 7.1.8.14.

Proof of Theorem 7.3.7.1. Let $U : \mathcal{C} \rightarrow \mathcal{B}$ be an inner fibration of ∞ -categories, let $V : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, and let $V' : \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{E})$ be the functor given by postcomposition with V . Suppose we are given a functor $f : \mathcal{A} \rightarrow \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$

and a full subcategory $\mathcal{A}^0 \subseteq \mathcal{A}$. Assume that the induced map $F : \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{D}$ is V -left Kan extended from $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$; we wish to show that f is V' -left Kan extended from $\mathcal{A}^0$. Fix an object $A \in \mathcal{A}$ and set $\mathcal{A}_{/A}^0 = \mathcal{A}^0 \times_{\mathcal{A}} \mathcal{A}_{/A}$; we wish to show that the composite map

$$(\mathcal{A}_{/A}^0)^{\triangleright} \hookrightarrow (\mathcal{A}_{/A})^{\triangleright} \rightarrow \mathcal{A} \xrightarrow{f} \text{Fun}(\mathcal{C} / \mathcal{B}, \mathcal{D})$$

is a V -colimit diagram. Let F_A denote the composition

$$(\mathcal{A}_{/A}^0)^{\triangleright} \times_{\mathcal{B}} \mathcal{C} \rightarrow \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

By virtue of Proposition 7.3.7.13, it will suffice to show that F_A is V -left Kan extended from $\mathcal{A}_{/A}^0 \times_{\mathcal{B}} \mathcal{C}$. Let X denote the cone point of $(\mathcal{A}_{/A}^0)^{\triangleright}$, let B denote its image in $\mathcal{B}$, and let $C \in \mathcal{C}$ be an object satisfying $U(C) = B$. Unwinding the definitions, we see that F_A is V -left Kan extended from $\mathcal{A}_{/A}^0 \times_{\mathcal{B}} \mathcal{C}$ at the object (X, C) if and only if the diagram

$$(\mathcal{A}_{/A}^0 \times_{\mathcal{B}_{/B}} \mathcal{C}_{/C})^{\triangleright} \rightarrow (\mathcal{A}_{/A}^0)^{\triangleright} \times_{(\mathcal{B}_{/B})^{\triangleright}} (\mathcal{C}_{/C})^{\triangleright} \rightarrow \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a V -colimit diagram. This follows from our assumption that F is V -left Kan extended from the full subcategory $\mathcal{A}^0 \times_{\mathcal{B}} \mathcal{C}$ at the object (A, C) . $\square$

7.3.8 Transitivity of Kan Extensions

030U Let $\overline{\mathcal{C}}$ be an ∞ -category equipped with full subcategories $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$. Our goal in this section is to show that a functor of ∞ -categories $\overline{F} : \overline{\mathcal{C}} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}^0$ if and only if it is left Kan extended from $\mathcal{C}$ and $\overline{F}|_{\mathcal{C}}$ is left Kan extended from $\mathcal{C}^0$ (Corollary 7.3.8.13). We begin by analyzing the case special case where the ∞ -category $\overline{\mathcal{C}}$ has the form $\mathcal{C}^{\triangleright}$.

030V **Proposition 7.3.8.1.** *Let $\mathcal{C}$ be an ∞ -category, let $\overline{F} : \mathcal{C}^{\triangleright} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be another functor of ∞ -categories. Assume that $F = \overline{F}|_{\mathcal{C}}$ is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then $\overline{F}$ is a U -colimit diagram if and only if the composite map*

$$(\mathcal{C}^0)^{\triangleright} \hookrightarrow \mathcal{C}^{\triangleright} \xrightarrow{\overline{F}} \mathcal{D}$$

is a U -colimit diagram.

Proof. For each object $D \in \mathcal{D}$, let $\underline{D} \in \text{Fun}(\mathcal{C}^{\triangleright}, \mathcal{D})$ denote the constant functor taking the value D . By virtue of Proposition 7.1.6.17, the functor $\overline{F}$ is a U -colimit diagram if and only

if, for each $D \in \mathcal{D}$, the upper half of the diagram

$$\begin{array}{ccc}
 \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^\triangleright, \mathcal{D})}(\overline{F}, \underline{D}) & \longrightarrow & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^\triangleright, \mathcal{E})}(U \circ \overline{F}, U \circ \underline{D}) \\
 \downarrow & & \downarrow \\
 \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})}(F, \underline{D}|_{\mathcal{C}}) & \longrightarrow & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{E})}(U \circ F, U \circ \underline{D}|_{\mathcal{C}}) \\
 \downarrow & & \downarrow \\
 \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, \underline{D}|_{\mathcal{C}^0}) & \longrightarrow & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})}(U \circ F|_{\mathcal{C}^0}, U \circ \underline{D}|_{\mathcal{C}^0})
 \end{array} \tag{7.34}$$

is a homotopy pullback square. Since F is U -left Kan extended from $\mathcal{C}^0$, Proposition 7.3.6.7 shows that the right half of the diagram is a homotopy pullback square. It follows that $\overline{F}$ is a U -colimit diagram if and only if the outer rectangle of (7.34) is a homotopy pullback square for each $D \in \mathcal{D}$ (Proposition 3.4.1.11).

Let v denote the cone point of $\mathcal{C}^\triangleright$. Let $\mathcal{C}^1$ denote the cone $(\mathcal{C}^0)^\triangleright$, which we regard as a full subcategory of $\mathcal{C}^\triangleright$. Note that the functors $\underline{D}$, $\underline{D}|_{\mathcal{C}^1}$, $U \circ \underline{D}$ and $U \circ \underline{D}|_{\mathcal{C}^1}$ are right Kan extended from the cone point, so Corollary 7.3.6.9 implies that the restriction maps

$$\begin{aligned}
 & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^\triangleright, \mathcal{D})}(\overline{F}, \underline{D}) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1, \mathcal{D})}(\overline{F}|_{\mathcal{C}^1}, \underline{D}|_{\mathcal{C}^1}) \rightarrow \mathrm{Hom}_{\mathcal{D}}(\overline{F}(v), D) \\
 & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^\triangleright, \mathcal{E})}(U \circ \overline{F}, U \circ \underline{D}) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1, \mathcal{E})}(U \circ \overline{F}|_{\mathcal{C}^1}, U \circ \underline{D}|_{\mathcal{C}^1}) \rightarrow \mathrm{Hom}_{\mathcal{E}}((U \circ \overline{F}(v)), U(D))
 \end{aligned}$$

are homotopy equivalences. It follows that the restriction map from the outer rectangle of (7.34) to the diagram

$$\begin{array}{ccc}
 \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1, \mathcal{D})}(\overline{F}|_{\mathcal{C}^1}, \underline{D}|_{\mathcal{C}^1}) & \longrightarrow & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{D})}(F|_{\mathcal{C}^0}, \underline{D}|_{\mathcal{C}^0}) \\
 \downarrow & & \downarrow \\
 \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^1, \mathcal{E})}(U \circ \overline{F}|_{\mathcal{C}^1}, U \circ \underline{D}|_{\mathcal{C}^1}) & \longrightarrow & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^0, \mathcal{E})}(U \circ F|_{\mathcal{C}^0}, U \circ \underline{D}|_{\mathcal{C}^0})
 \end{array} \tag{7.35}$$

is a levelwise homotopy equivalence. In particular, the outer rectangle of (7.34) is a homotopy pullback square if and only if (7.35) is a homotopy pullback square (Corollary 3.4.1.12). By virtue of Proposition 7.1.6.17, this is satisfied for every object $D \in \mathcal{D}$ if and only if F^1 is a U -colimit diagram. $\square$

Corollary 7.3.8.2. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, let $\mathcal{C}$ be a simplicial set, and let $\overline{F} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ be a diagram. Assume that, for each vertex $C \in \mathcal{C}$, the image $\overline{F}(C)$ is a*

U -initial object of $\mathcal{D}$. Then $\overline{F}$ is a U -colimit diagram if and only if it carries the cone point of $\mathcal{C}^\triangleright$ to a U -initial object of $\mathcal{D}$.

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne map $\iota : \mathcal{C} \hookrightarrow \mathcal{C}'$ where $\mathcal{C}'$ is an ∞ -category. Since $\mathcal{D}$ is an ∞ -category, we can extend $\overline{F}$ to a functor $\overline{F}' : \mathcal{C}'^\triangleright \rightarrow \mathcal{D}$. By virtue of Corollary 7.2.2.2, we can replace $\overline{F}$ by $\overline{F}'$ and thereby reduce to proving Corollary 7.3.8.2 in the special case where $\mathcal{C}$ is an ∞ -category. This follows from Proposition 7.3.8.1, applied in the special case where $\mathcal{C}^0 = \emptyset$ (see Example 7.3.3.6). $\square$

030Y Corollary 7.3.8.3. *Let $\mathcal{C}$ be an ∞ -category and let $\overline{F} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Suppose that $F = \overline{F}|_{\mathcal{C}}$ is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then $\overline{F}$ is a colimit diagram if and only if the composite map*

$$(\mathcal{C}^0)^\triangleright \hookrightarrow \mathcal{C}^\triangleright \xrightarrow{\overline{F}} \mathcal{D}$$

is a colimit diagram.

Proof. Apply Proposition 7.3.8.1 in the special case $\mathcal{E} = \Delta^0$. $\square$

The following is a variant of Corollary 7.1.8.4:

06AY Corollary 7.3.8.4 (Fubini's Theorem for Relative Colimits). *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, let K and L be simplicial sets, and let v and w denote the cone points of $K^\triangleright = K \star \{v\}$ and $L^\triangleright = L \star \{w\}$, respectively. Let $F : K^\triangleright \times L^\triangleright \rightarrow \mathcal{D}$ be a diagram having the property that, for each vertex $k \in K$, the restriction $F(k, \bullet) : L^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram. The following conditions are equivalent:*

- (1) *The restriction $F(\bullet, w) : K^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram.*
- (2) *The composition*

$$(K \times L)^\triangleright = (K \times L) \star \{(v, w)\} \subseteq (K \star \{v\}) \times (L \star \{w\}) \xrightarrow{F} \mathcal{D}$$

is a U -colimit diagram.

Proof. Choose inner anodyne morphisms $K \hookrightarrow \mathcal{K}$ and $L \hookrightarrow \mathcal{L}$, where $\mathcal{K}$ and $\mathcal{L}$ are ∞ -categories (Corollary 4.1.3.3). Then the induced map $K^\triangleright \star L^\triangleright \hookrightarrow \mathcal{K}^\triangleright \times \mathcal{L}^\triangleright$ is also inner anodyne (Example 4.3.6.7 and Lemma 1.5.7.5), so we can extend F to a functor $\overline{F} : \mathcal{K}^\triangleright \times \mathcal{L}^\triangleright \rightarrow \mathcal{D}$ (see Proposition 1.5.6.7). Using Lemma 7.2.2.2, can replace F by $\overline{F}$ and thereby reduce to proving Corollary 7.3.8.4 in the special case where K and L are ∞ -categories.

Set $\mathcal{C} = K \times L^\triangleright$, and let us identify the cone $\mathcal{C}^\triangleright$ with the full subcategory of $K^\triangleright \times L^\triangleright$ spanned by the objects of $\mathcal{C}$ together with the cone point (v, w) . Combining Example 4.3.7.11 and with Corollary 7.2.1.19, we see that the inclusion $K \times \{w\} \hookrightarrow \mathcal{C}$ is right cofinal. Using Lemma 7.2.2.2 again, we see that (1) is equivalent to the following:

(1') The restriction $F|_{\mathcal{C}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram.

Set $\mathcal{C}^0 = K \times L$. Our assumption that each $F(k, \bullet)$ is a U -colimit diagram guarantees that $F|_{\mathcal{C}}$ is U -left Kan extended from $F|_{\mathcal{C}^0}$ (see Proposition 7.3.4.3). The equivalence (1') $\Leftrightarrow$ (2) now follows from Proposition 7.3.8.1. $\square$

Variant 7.3.8.5 (Fubini's Theorem: Symmetric Form). In the situation of Corollary 7.3.8.4, 06AZ suppose that the diagram F satisfies the following pair of conditions:

- (a) For each vertex $k \in K$, the restriction $F(k, \bullet) : L^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram.
- (b) For each vertex $\ell \in L$, the restriction $F(\bullet, L) : K^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram.

Then the following conditions are equivalent:

- (1) The restriction $F(\bullet, w) : K^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram.
- (2) The composition

$$(K \times L)^\triangleright = (K \times L) \star \{(v, w)\} \subseteq (K \star \{v\}) \times (L \star \{w\}) \xrightarrow{F} \mathcal{D}$$

is a U -colimit diagram.

- (3) The restriction $F(v, \bullet) : L^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram.

The equivalence (1) $\Leftrightarrow$ (2) follows from assumption (a) (Corollary 7.3.8.4), and the equivalence (2) $\Leftrightarrow$ (3) follows from assumption (b).

Corollary 7.3.8.6. *Let K be a simplicial set and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories. 06B0 Then the collection of U -colimit diagrams $K^\triangleright \rightarrow \mathcal{D}$ is closed under levelwise U -colimits in the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{D})$ (see Definition 7.1.8.13).*

Proof. Let L be a simplicial set and let $f : L^\triangleright \rightarrow \text{Fun}(K^\triangleright, \mathcal{D})$ be a diagram, which we identify with a map $F : K^\triangleright \times L^\triangleright \rightarrow \mathcal{D}$. Then f is a levelwise U -colimit diagram (in the sense of Definition 7.1.8.13) if and only if F satisfies conditions (a) and (3) of Variant 7.3.8.5. If f carries vertex $\ell \in L$ to an F -colimit diagram in $\mathcal{D}$, then F also satisfies condition (b) of Variant 7.3.8.5. It follows that F also satisfies condition (1): that is, f carries the cone point of $L^\triangleright$ to an F -colimit diagram. $\square$

Corollary 7.3.8.7. *Let K be a simplicial set and let $\mathcal{D}$ be an ∞ -category. Then the 06B1 collection of colimit diagrams $K^\triangleright \rightarrow \mathcal{D}$ is closed under the formation of levelwise colimits (in the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{D})$).*

Proof. Apply Corollary 7.3.8.6 in the special case $\mathcal{E} = \Delta^0$. $\square$

030Z **Proposition 7.3.8.8.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose we are given a right fibration of ∞ -categories $V : \mathcal{B} \rightarrow \mathcal{C}$ and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. Then, for every object $B \in \mathcal{B}$, the functor $F \circ V$ is U -left Kan extended from $\mathcal{B}^0$ at B if and only if F is U -left Kan extended from $\mathcal{C}^0$ at $V(B)$.*

Proof. Set $C = V(B)$, and let F_C denote the composite map

$$(\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C})^{\triangleright} \rightarrow (\mathcal{C}_{/C})^{\triangleright} \rightarrow \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

We wish to show that F_C is a U -colimit diagram if the composite map

$$(\mathcal{B}^0 \times_{\mathcal{B}} \mathcal{B}_{/B})^{\triangleright} \rightarrow (\mathcal{B}_{/B})^{\triangleright} \rightarrow \mathcal{B} \xrightarrow{V} \mathcal{C} \xrightarrow{F} \mathcal{D}$$

is a U -colimit diagram. By virtue of Corollary 7.2.2.2, it will suffice to show that the natural map

$$\theta : \mathcal{B}^0 \times_{\mathcal{B}} \mathcal{B}_{/B} \rightarrow \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}$$

is right cofinal. By construction, θ is a pullback of the map $V_{/B} : \mathcal{B}_{/B} \rightarrow \mathcal{C}_{/V(B)}$. Our assumption that V is a right fibration guarantees that $V_{/B}$ is a trivial Kan fibration (Corollary 4.3.7.13). It follows that θ is also a trivial Kan fibration, and therefore right cofinal by virtue of Corollary 7.2.1.13. $\square$

0310 **Corollary 7.3.8.9.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose we are given a right fibration of ∞ -categories $V : \mathcal{B} \rightarrow \mathcal{C}$ and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. If F is U -left Kan extended from $\mathcal{C}^0$, then $F \circ V$ is U -left Kan extended from $\mathcal{B}^0$. The converse holds if every fiber of V is nonempty.*

0311 **Corollary 7.3.8.10.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose we are given a right fibration of ∞ -categories $V : \mathcal{B} \rightarrow \mathcal{C}$ and set $\mathcal{B}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{B}$. If F is left Kan extended from $\mathcal{C}^0$, then $F \circ V$ is left Kan extended from $\mathcal{B}^0$. The converse holds if every fiber of V is nonempty.*

Proof. Apply Corollary 7.3.8.9 in the special case $\mathcal{E} = \Delta^0$. $\square$

0312 **Proposition 7.3.8.11** (Transitivity for Kan Extensions). *Let $\overline{F} : \overline{\mathcal{C}} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories. Let $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$ be full subcategories. Then $\overline{F}$ is U -left Kan extended from $\mathcal{C}^0$ if and only if it satisfies the following pair of conditions:*

(1) *The functor $\overline{F}$ is U -left Kan extended from $\mathcal{C}$.*

(2) *The restriction $\overline{F}|_{\mathcal{C}}$ is U -left Kan extended from $\mathcal{C}^0$.*

0313 **Remark 7.3.8.12.** In the special case $\overline{\mathcal{C}} = \mathcal{C}^{\triangleright}$, Proposition 7.3.8.11 is essentially a restatement of Proposition 7.3.8.1 (see Example 7.3.3.10).

Proof of Proposition 7.3.8.11. It follows immediately from the definitions that if $\overline{F}$ is U -left Kan extended from $\mathcal{C}^0$, then the functor $F = \overline{F}|_{\mathcal{C}}$ has the same property. We may therefore assume that condition (2) is satisfied. Fix an object $X \in \overline{\mathcal{C}}$. We will complete the proof by showing that $\overline{F}$ is U -left Kan extended from $\mathcal{C}^0$ at X if and only if it is U -left Kan extended from $\mathcal{C}$ at X . Let $\overline{F}_X$ denote the composite map

$$(\mathcal{C} \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X})^{\triangleright} (\overline{\mathcal{C}}_{/X})^{\triangleright} \rightarrow \overline{\mathcal{C}} \xrightarrow{\overline{F}} \mathcal{D}.$$

We wish to show that $\overline{F}_X$ is a U -colimit diagram if and only if its restriction to $(\mathcal{C}^0 \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X})^{\triangleright}$ is a U -colimit diagram. Let F_X denote the restriction of $\overline{F}_X$ to $\mathcal{C} \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X}$. By virtue of Proposition 7.3.8.1, it will suffice to show that F_X is U -left Kan extended from $\mathcal{C}^0 \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X}$. This follows by applying Corollary 7.3.8.9 to the right fibration $\mathcal{C} \times_{\overline{\mathcal{C}}} \overline{\mathcal{C}}_{/X} \rightarrow \mathcal{C}$. $\square$

Corollary 7.3.8.13. *Let $\overline{F} : \overline{\mathcal{C}} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C} \subseteq \overline{\mathcal{C}}$ be full subcategories. Then $\overline{F}$ is left Kan extended from $\mathcal{C}^0$ if and only if it satisfies the following pair of conditions:* 0314

- (1) *The functor $\overline{F}$ is left Kan extended from $\mathcal{C}$.*
- (2) *The restriction $\overline{F}|_{\mathcal{C}}$ is left Kan extended from $\mathcal{C}^0$.*

Proof. Apply Proposition 7.3.8.11 in the special case $\mathcal{E} = \Delta^0$. $\square$

Corollary 7.3.8.14. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and let $C, C' \in \mathcal{C}$ be objects which are isomorphic. If F is U -left Kan extended from $\mathcal{C}^0$ at C , then it is U -left Kan extended from $\mathcal{C}^0$ at C' .* 0315

Proof. Let $\mathcal{C}^1 \subseteq \mathcal{C}$ be the full subcategory spanned by the objects of $\mathcal{C}^0$ together with the object C , and let $\mathcal{C}^2 \subseteq \mathcal{C}$ be the full subcategory spanned by the objects of $\mathcal{C}$ together with the objects C and C' . If F is U -left Kan extended from $\mathcal{C}^0$ at C , then the functor $F|_{\mathcal{C}^1}$ is U -left Kan extended from $\mathcal{C}^0$. Since every object of $\mathcal{C}^2$ is isomorphic to an object of $\mathcal{C}^1$, the functor $F|_{\mathcal{C}^2}$ is automatically U -left Kan extended from $\mathcal{C}^1$ (Proposition 7.3.3.7). Applying Proposition 7.3.8.11, we see that $F|_{\mathcal{C}^2}$ is also U -left Kan extended from $\mathcal{C}^0$. In particular, F is U -left Kan extended from $\mathcal{C}^0$ at the object $C' \in \mathcal{C}^2$. $\square$

We now prove a variant of Proposition 7.3.8.11, which gives a criterion for the *existence* of relative Kan extensions.

Proposition 7.3.8.15. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, and suppose that F is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Set $F_0 = F|_{\mathcal{C}^0}$. Then the restriction map* 0316

$$\theta : \mathcal{D}_{F/} \rightarrow \mathcal{D}_{F_0/} \times_{\mathcal{E}_{(U \circ F_0)/}} \mathcal{E}_{(U \circ F)/}$$

is an equivalence of ∞ -categories.

Proof. Note that the restriction maps

$$\mathcal{D}_{F/} \rightarrow \mathcal{D}_{F_0/} \quad \mathcal{D}_{F_0/} \rightarrow \mathcal{D} \quad \mathcal{E}_{(U \circ F)/} \rightarrow \mathcal{E}_{(U \circ F_0)/}$$

are left fibrations of simplicial sets (Corollary 4.3.6.12). It follows that we can regard θ as a functor of ∞ -categories which are left-fibered over $\mathcal{D}$. Consequently, to show that θ is an equivalence of ∞ -categories, it will suffice to show that for every object $D \in \mathcal{D}$, the commutative diagram

$$\begin{array}{ccc} \mathcal{D}_{F/} \times_{\mathcal{D}} \{D\} & \xrightarrow{\quad\quad\quad} & \mathcal{D}_{F_0/} \times_{\mathcal{D}} \{D\} \\ \downarrow & & \downarrow \\ \mathcal{E}_{(U \circ F)/} \times_{\mathcal{E}} \{U(D)\} & \xrightarrow{\quad\quad\quad} & \{U(D)\} \times_{\mathcal{E}_{(U \circ F_0)/}} \times_{\mathcal{E}} \{U(D)\} \end{array} \quad (7.36)$$

induces a homotopy equivalence of Kan complexes

$$\mathcal{D}_{F/} \times_{\mathcal{D}} \{D\} \rightarrow (\mathcal{D}_{F_0/} \times_{\mathcal{E}_{(U \circ F_0)/}} \mathcal{E}_{(U \circ F)/}) \times_{\mathcal{D}} \{D\}.$$

Note that the horizontal maps in the diagram (7.36) are left fibrations between Kan complexes (Corollary 4.3.6.12), and therefore Kan fibrations (Corollary 4.4.3.8). We are therefore reduced to showing that the diagram (7.36) is a homotopy pullback square (Example 3.4.1.3).

Let $\underline{D} \in \text{Fun}(\mathcal{C}, \mathcal{D})$ denote the constant functor taking the value D . Using Theorem 4.6.4.19, we obtain a (termwise) homotopy equivalence from (7.36) to the diagram of morphism spaces

$$\begin{array}{ccc} \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{D})}(F, \underline{D}) & \xrightarrow{\quad\quad\quad} & \text{Hom}_{\text{Fun}(\mathcal{C}^0, \mathcal{E})}(F_0, \underline{D}|_{\mathcal{C}^0}) \\ \downarrow & & \downarrow \\ \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{E})}(U \circ F, U \circ \underline{D}) & \xrightarrow{\quad\quad\quad} & \text{Hom}_{\text{Fun}(\mathcal{C}^0, \mathcal{E})}(U \circ F_0, U \circ \underline{D}|_{\mathcal{C}^0}). \end{array} \quad (7.37)$$

Using Corollary 3.4.1.12, we are reduced to showing that the diagram (7.37) is a homotopy pullback square, which is a special case of Proposition 7.3.6.7. $\square$

Corollary 7.3.8.16. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, where U is an inner fibration and F is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Set $F_0 = F|_{\mathcal{C}^0}$. Then the restriction map*

$$\theta : \mathcal{D}_{F/} \rightarrow \mathcal{D}_{F_0/} \times_{\mathcal{E}_{(U \circ F_0)/}} \mathcal{E}_{(U \circ F)/}$$

is a trivial Kan fibration.

Proof. It follows from Proposition 4.3.6.8 that θ is a left fibration, and therefore an isofibration (Example 4.4.1.11). By virtue of Proposition 4.5.5.20, it will suffice to show that θ is an equivalence of ∞ -categories, which follows from Proposition 7.3.8.15. $\square$

Corollary 7.3.8.17. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which is Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$, and set $F_0 = F|_{\mathcal{C}^0}$. Then the restriction functor $\theta : \mathcal{C}_{F/} \rightarrow \mathcal{C}_{F_0/}$ is a trivial Kan fibration.* 031A

Proof. Apply Corollary 7.3.8.16 in the special case $\mathcal{E} = \Delta^0$. $\square$

Corollary 7.3.8.18. *Let $\mathcal{C}$ be an ∞ -category, let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an inner fibration of ∞ -categories, and suppose we are given a lifting problem* 031B

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow & \nearrow \overline{F} & \downarrow U \\ \mathcal{C}^\triangleright & \xrightarrow{\quad} & \mathcal{E} \end{array} \quad (7.38) \quad 031C$$

Assume that F is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. The following conditions are equivalent:

- (1) *The lifting problem (7.38) admits a solution $\overline{F} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram.*
- (2) *The induced lifting problem*

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F|_{\mathcal{C}^0}} & \mathcal{D} \\ \downarrow & \nearrow \overline{F}_0 & \downarrow U \\ (\mathcal{C}^0)^\triangleright & \xrightarrow{\quad} & \mathcal{E} \end{array} \quad (7.39) \quad 031D$$

admits a solution $\overline{F}_0 : (\mathcal{C}^0)^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram.

Proof. The implication (1) $\Rightarrow$ (2) follows immediately from Proposition 7.3.8.1. For the converse, suppose that $\overline{F}_0 : (\mathcal{C}^0)^\triangleright \rightarrow \mathcal{D}$ is a U -colimit diagram which solves the lifting problem (7.39). Applying Corollary 7.3.8.16, we see that $\overline{F}_0$ can be extended to a functor $\overline{F} : \mathcal{C}^\triangleright \rightarrow \mathcal{D}$ which solves the lifting problem (7.38). It then follows from Proposition 7.3.8.1 that $\overline{F}$ is a U -colimit diagram. $\square$

Corollary 7.3.8.19. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then F has a colimit in $\mathcal{D}$ if and only if the restriction $F|_{\mathcal{C}^0}$ has a colimit in $\mathcal{D}$.* 031E

Proof. Apply Corollary 7.3.8.18 in the special case $\mathcal{E} = \Delta^0$. $\square$

03E5 **Remark 7.3.8.20.** In the situation of Corollary 7.3.8.19, an object of $\mathcal{D}$ is a colimit of the diagram F if and only if it is a colimit of the diagram $F|_{\mathcal{C}^0}$. This follows by combining Corollaries 7.3.8.19 and 7.3.8.3.

031F **Proposition 7.3.8.21.** *Let $\bar{\mathcal{C}}$ be an ∞ -category, let $\mathcal{C} \subseteq \bar{\mathcal{C}}$ be a full subcategory, and let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an isofibration of ∞ -categories. Suppose we are given a lifting problem*

031G

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow & \nearrow \bar{F} & \downarrow U \\ \bar{\mathcal{C}} & \longrightarrow & \mathcal{E}, \end{array} \quad (7.40)$$

where F is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. The following conditions are equivalent:

- (1) The lifting problem (7.40) admits a solution $\bar{F} : \bar{\mathcal{C}} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}$.
- (2) The induced lifting problem

031H

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F|_{\mathcal{C}^0}} & \mathcal{D} \\ \downarrow & \nearrow \bar{F} & \downarrow U \\ \bar{\mathcal{C}} & \longrightarrow & \mathcal{E}, \end{array} \quad (7.41)$$

admits a solution $\bar{F} : \bar{\mathcal{C}} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}^0$.

Proof. The implication (1) $\Rightarrow$ (2) follows immediately from Proposition 7.3.8.11. For the converse, assume that (2) is satisfied. To prove (1), it will suffice to show that for each object $C \in \bar{\mathcal{C}}$, the induced lifting problem

031J

$$\begin{array}{ccc} \mathcal{C}_{/C} & \xrightarrow{F_C} & \mathcal{D} \\ \downarrow & \nearrow \bar{F}_C & \downarrow U \\ (\mathcal{C}_{/C})^\triangleright & \longrightarrow & \mathcal{E} \end{array} \quad (7.42)$$

admits a solution $\overline{F}_C : (\mathcal{C}/C)^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram (Proposition 7.3.5.5). Arguing as in the proof of Proposition 7.3.8.11, we see that F_C is U -left Kan extended from the full subcategory $\mathcal{C}_{/C}^0 \subseteq \mathcal{C}/C$. Let F_C^0 denote the restriction of F_C to the subcategory $\mathcal{C}_{/C}^0 \subseteq \mathcal{C}/C$. By virtue of Corollary 7.3.8.18, it will suffice to show that the induced lifting problem

$$\begin{array}{ccc}
 \mathcal{C}_{/C}^0 & \xrightarrow{F_C^0} & \mathcal{D} \\
 \downarrow & \nearrow \overline{F}_C^0 & \downarrow U \\
 (\mathcal{C}_{/C}^0)^\triangleright & \longrightarrow & \mathcal{E}
 \end{array}
 \tag{7.43}$$

has a solution $\overline{F}_C^0 : (\mathcal{C}_{/C}^0)^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram, which follows immediately from assumption (2). $\square$

Corollary 7.3.8.22. *Let $\overline{\mathcal{C}}$ be an ∞ -category, let $\mathcal{C} \subseteq \overline{\mathcal{C}}$ be a full subcategory, and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which is left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then F admits a left Kan extension $\overline{\mathcal{C}} \rightarrow \mathcal{D}$ if and only if the restriction $F|_{\mathcal{C}^0}$ admits a left Kan extension $\overline{\mathcal{C}} \rightarrow \mathcal{D}$.* 031L

Proof. Apply Proposition 7.3.8.21 in the special case $\mathcal{E} = \Delta^0$. $\square$

We close this section by establishing counterparts of Corollaries 7.3.8.13 and 7.3.8.19 for Kan extensions along more general functors.

Proposition 7.3.8.23. *Let $\mathcal{C}_0, \mathcal{C}_1, \mathcal{C}_2$, and $\mathcal{D}$ be ∞ -categories. Suppose we are given functors $F_i : \mathcal{C}_i \rightarrow \mathcal{D}$ for $0 \leq i \leq 2$, functors $G : \mathcal{C}_0 \rightarrow \mathcal{C}_1$ and $H : \mathcal{C}_1 \rightarrow \mathcal{C}_2$, and natural transformations* 031M

$$\alpha : F_0 \rightarrow F_1 \circ G \quad \beta : F_1 \rightarrow F_2 \circ H,$$

where α exhibits F_1 as a left Kan extension of F_0 along G . The following conditions are equivalent:

- (1) The natural transformation β exhibits F_2 as a left Kan extension of F_1 along H .
- (2) Let $\gamma : F_0 \rightarrow F_2 \circ H \circ G$ be a composition of α with $\beta|_{\mathcal{C}^0}$ (formed in the ∞ -category $\text{Fun}(\mathcal{C}_0, \mathcal{D})$). Then γ exhibits F_2 as a left Kan extension of F_0 along $H \circ G$.

Proof. Let $\mathcal{C}$ denote the iterated relative join $(\mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1) \star_{\mathcal{C}_2} \mathcal{C}_2$, so that we have a cocartesian fibration of ∞ -categories $\pi : \mathcal{C} \rightarrow \Delta^2$ having fibers $\pi^{-1}\{i\} = \mathcal{C}_i$ for $0 \leq i \leq 2$ (see Lemma 5.2.3.17). For $0 \leq i < j \leq 2$, let $\mathcal{C}_{ij}$ denote the fiber product $N_\bullet(\{i < j\}) \times_{\Delta^2} \mathcal{C}$, which we

will identify with $\mathcal{C}_i \star_{\mathcal{C}_j} \mathcal{C}_j$. By virtue of Remark 7.3.1.10, we are free to replace α and β by homotopic natural transformations. We can therefore assume that there exist functors

$$F_{01} : \mathcal{C}_{01} \rightarrow \mathcal{D} \quad F_{12} : \mathcal{C}_{12} \rightarrow \mathcal{D}$$

satisfying $F_{01}|_{\mathcal{C}_0} = F_0$, $F_{01}|_{\mathcal{C}_1} = F_1 = F_{12}|_{\mathcal{C}_1}$, and $F_{12}|_{\mathcal{C}_2} = F_2$, where α and β are given by the composite maps

$$\Delta^1 \times \mathcal{C}_0 \simeq \mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \rightarrow \mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1 \xrightarrow{F_{01}} \mathcal{D}$$

$$\Delta^1 \times \mathcal{C}_1 \simeq \mathcal{C}_1 \star_{\mathcal{C}_1} \mathcal{C}_1 \rightarrow \mathcal{C}_1 \star_{\mathcal{C}_2} \mathcal{C}_2 \xrightarrow{F_{12}} \mathcal{D}$$

(see Warning 7.3.2.12). Note that F_{01} and F_{12} can be amalgamated to a morphism of simplicial sets $F' : \Lambda_1^2 \times_{\Delta^1} \mathcal{C} \rightarrow \mathcal{D}$. Since π is a cocartesian fibration, the inclusion map $\Lambda_1^2 \times_{\Delta^1} \mathcal{C} \hookrightarrow \mathcal{C}$ is a categorical equivalence (Proposition 5.3.6.1). Applying Lemma 4.5.5.2, we can extend F' to a functor $F : \mathcal{C} \rightarrow \mathcal{D}$.

Let F_{02} denote the restriction of F to $\mathcal{C}_{02}$, and let $\gamma : F_0 \rightarrow F_2 \circ H \circ G$ denote the natural transformation given by the composite map

$$\Delta^1 \times \mathcal{C}_0 \simeq \mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0 \rightarrow \mathcal{C}_0 \star_{\mathcal{C}_2} \mathcal{C}_2 \xrightarrow{F_{02}} \mathcal{D}.$$

Note that the composite map

$$\Delta^2 \times \mathcal{C}_0 \simeq (\mathcal{C}_0 \star_{\mathcal{C}_0} \mathcal{C}_0) \star_{\mathcal{C}_0} \mathcal{C}_0 \rightarrow (\mathcal{C}_0 \star_{\mathcal{C}_1} \mathcal{C}_1) \star_{\mathcal{C}_2} \mathcal{C}_2 \xrightarrow{F} \mathcal{D}$$

can be regarded as a 2-simplex of the ∞ -category $\text{Fun}(\mathcal{C}_0, \mathcal{D})$, which witnesses γ as a composition of α with $\beta|_{\mathcal{C}_0}$. Applying Proposition 7.3.2.11, we see that (1) and (2) can be reformulated as follows:

(1') The functor $F_{12} : \mathcal{C}_{12} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}_1$.

(2') The functor $F_{02} : \mathcal{C}_{02} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}_0$.

By assumption, the natural transformation α exhibits F_1 as a left Kan extension of F_0 along G . Applying Proposition 7.3.2.11, we see that the functor F_{01} is left Kan extended from $\mathcal{C}_0$. In particular, F is left Kan extended from $\mathcal{C}^0$ at every object of the full subcategory $\mathcal{C}_1 \subseteq \mathcal{C}$. It follows that (2') is equivalent to the following:

(2'') The functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}_0$.

Using Corollary 7.3.8.13, we see that (2'') is equivalent to the following:

(1'') The functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}_{01}$.

To complete the proof, it will suffice to show that conditions (1') and (1'') are equivalent. We will prove something slightly more precise: for every object $X \in \mathcal{C}_2$, the conditions are equivalent:

(1'_X) The functor $F_{12} : \mathcal{C}_{12} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}_1$ at X .

(1''_X) The functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is left Kan extended from $\mathcal{C}_{01}$ at X .

Let us regard the object X as fixed, and let F_X denote the composite map

$$(\mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \hookrightarrow (\mathcal{C}_{/X})^{\triangleright} \rightarrow \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

We wish to show that F_X is a colimit diagram in $\mathcal{D}$ if and only if its restriction to $(\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright}$ is a colimit diagram in $\mathcal{D}$. By virtue of Corollary 7.2.2.3, it will suffice to show that the inclusion map $\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X} \hookrightarrow \mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X}$ is right cofinal. This follows by applying Proposition 7.2.3.12 to the upper square of the pullback diagram

$$\begin{array}{ccc} \mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X} & \longrightarrow & \{1\} \\ \downarrow & & \downarrow \\ \mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X} & \longrightarrow & \Delta^1 \\ \downarrow & & \downarrow \\ \mathcal{C}_{/X} & \xrightarrow{\pi'} & \Delta^2, \end{array}$$

where π' denotes the composite map $\mathcal{C}_{/X} \rightarrow \mathcal{C} \rightarrow \Delta^2$ (which is a cocartesian fibration by virtue of Proposition 5.1.4.20). $\square$

Proposition 7.3.8.24. *Let $\mathcal{C}_0$, $\mathcal{C}_1$, $\mathcal{C}_2$, and $\mathcal{D}$ be ∞ -categories. Suppose we are given 031N functors $F_0 : \mathcal{C}_0 \rightarrow \mathcal{D}$, $F_1 : \mathcal{C}_1 \rightarrow \mathcal{D}$, $G : \mathcal{C}_0 \rightarrow \mathcal{C}_1$, and $H : \mathcal{C}_1 \rightarrow \mathcal{C}_2$, where F_1 is a left Kan extension of F_0 along G . The following conditions are equivalent:*

- (1) *The functor F_1 admits a left Kan extension along H .*
- (2) *The functor F_0 admits a left Kan extension along $H \circ G$.*

Proof. The implication (1) $\Rightarrow$ (2) is immediate from Proposition 7.3.8.23. To prove the converse, assume that (2) is satisfied. Define $\mathcal{C}$ as in the proof of Proposition 7.3.8.23. Using the criterion of Corollary 7.3.5.8, we see that F_0 admits a left Kan extension $F : \mathcal{C} \rightarrow \mathcal{D}$. It follows from Proposition 7.3.2.11 that $F|_{\mathcal{C}_1}$ is a left Kan extension of F_0 along G , and is therefore isomorphic to F_1 (Remark 7.3.6.6). We may therefore assume without loss of generality that $F_1 = F|_{\mathcal{C}_1}$ (Remark 7.3.1.11). We will complete the proof by showing that $F_{12} = F|_{\mathcal{C}_{12}}$ is left Kan extended from $\mathcal{C}_1$, and therefore exhibits $F|_{\mathcal{C}_2}$ as a left Kan extension of F_1 along H (Proposition 7.3.2.11).

Fix an object $X \in \mathcal{C}_2$, and let F_X denote the composite map

$$(\mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \hookrightarrow (\mathcal{C}_{/X})^{\triangleright} \rightarrow \mathcal{C} \xrightarrow{F} \mathcal{D}.$$

We wish to show that the composite map

$$(\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \hookrightarrow (\mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X})^{\triangleright} \xrightarrow{F_X} \mathcal{D}$$

is a colimit diagram in $\mathcal{D}$. As in the proof of Proposition 7.3.8.23, the inclusion map $\mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C}_{/X} \hookrightarrow \mathcal{C}_{01} \times_{\mathcal{C}} \mathcal{C}_{/X}$ is right cofinal. It will therefore suffice to show that F_X is a colimit diagram in $\mathcal{D}$ (Corollary 7.2.2.3). This is clear: by construction, the functor F is left Kan extended from the full subcategory $\mathcal{C}_0 \subseteq \mathcal{C}$, and is therefore also left Kan extended from the larger subcategory $\mathcal{C}_{01} \subseteq \mathcal{C}$ (Proposition 7.3.8.11). $\square$

039X **Corollary 7.3.8.25.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, let $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$ be diagrams, and let $\alpha : F_0 \rightarrow F \circ \delta$ be a natural transformation which exhibits F as a left Kan extension of F_0 along δ (see Variant 7.3.1.5). Then:*

- (1) *The diagram F admits a colimit in $\mathcal{D}$ if and only if F_0 admits a colimit in $\mathcal{D}$.*
- (2) *Let X be an object of $\mathcal{D}$, let $\underline{X} : \mathcal{C} \rightarrow \mathcal{D}$ denote the constant functor taking the value X . Then a natural transformation $\beta : F \rightarrow \underline{X}$ exhibits X as a colimit of the diagram F if and only if the composite natural transformation*

$$F_0 \xrightarrow{\alpha} F \circ \delta \xrightarrow{\beta|_K} \underline{X}|_K$$

exhibits X as a colimit of the diagram F_0 .

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $i : K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞ -category. Since $\mathcal{C}$ is an ∞ -category, we extend δ and F_0 to functors $\bar{\delta} : \mathcal{K} \rightarrow \mathcal{C}$ and $\bar{F}_0 : \mathcal{K} \rightarrow \mathcal{D}$, respectively. Similarly, we can extend α to a natural transformation $\bar{\alpha} : \bar{F}_0 \rightarrow F \circ \bar{\delta}$. It follows from Proposition 7.3.1.15 that $\bar{\alpha}$ exhibits F as a left Kan extension of $\bar{F}_0$ along $\bar{\delta}$. We may therefore replace K by $\mathcal{K}$ and thereby reduce to proving Corollary 7.3.8.25 in the special case where K is an ∞ -category. In this case, assertion (1) is a special case of Proposition 7.3.8.24, and assertion (2) is a special case of Proposition 7.3.8.23 (see Example 7.3.1.7). $\square$

031P **Exercise 7.3.8.26.** Show that the conclusions of Propositions 7.3.8.23 and 7.3.8.24 hold if we drop the assumption that the simplicial set $\mathcal{C}_0$ is an ∞ -category.

7.3.9 Relative Colimits for Cocartesian Fibrations

Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories. Our goal in this section is to show that, if U is a cocartesian fibration, then the study of U -colimit diagrams can be reformulated in terms of colimits in the fibers of U . Our main result can be stated as follows:

Proposition 7.3.9.1. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a cocartesian fibration of ∞ -categories and let K be a simplicial set. The following conditions are equivalent:*

- (1) *For every object $E \in \mathcal{E}$, the ∞ -category $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$ admits K -indexed colimits. Moreover, for every morphism $u : E \rightarrow E'$ in $\mathcal{E}$, the covariant transport functor $u_! : \mathcal{D}_E \rightarrow \mathcal{D}_{E'}$ preserves K -indexed colimits.*
- (2) *Every lifting problem*

$$\begin{array}{ccc} K & \xrightarrow{f} & \mathcal{D} \\ \downarrow & \nearrow \bar{f} & \downarrow U \\ K^{\triangleright} & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

031Z

(7.44)

admits a solution $\bar{f} : K^{\triangleright} \rightarrow \mathcal{C}$ which is a U -colimit diagram.

Corollary 7.3.9.2. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a cocartesian fibration of ∞ -categories, let $\mathcal{C}$ be an ∞ -category, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that the following conditions are satisfied:*

- *For every object $C \in \mathcal{C}$ and every object $E \in \mathcal{E}$, the ∞ -category $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$ admits $\mathcal{C}^0_C$ -indexed colimits.*
- *For every object $C \in \mathcal{C}$ and every morphism $e : E \rightarrow E'$ in $\mathcal{E}$, the covariant transport functor $e_! : \mathcal{D}_E \rightarrow \mathcal{D}_{E'}$ preserves $\mathcal{C}^0_C$ -indexed colimits.*

Then every lifting problem

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F} & \mathcal{D} \\ \downarrow & \nearrow \bar{F} & \downarrow U \\ \mathcal{C} & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

admits a solution $\bar{F} : \mathcal{C} \rightarrow \mathcal{D}$ which is U -left Kan extended from $\mathcal{C}^0$.

Proof. Combine Propositions 7.3.5.5 and 7.3.9.1. □

Our proof of Proposition 7.3.9.1 will require some preliminaries. Suppose we are given a lifting problem

06B3

$$\begin{array}{ccc}
 K & \xrightarrow{f} & \mathcal{D} \\
 \downarrow & \nearrow \bar{f} & \downarrow U \\
 K^\triangleright & \xrightarrow{g} & \mathcal{E},
 \end{array} \tag{7.45}$$

where U is a cocartesian fibration of ∞ -categories, and that we wish to show the existence of a solution where $\bar{f}$ is a U -colimit diagram. If g is the constant diagram associated to an object $E \in \mathcal{E}$, then we can identify f with a diagram in the ∞ -category $\mathcal{D}_E = \{E\} \times_{\mathcal{E}} \mathcal{D}$. In this case, Corollary 7.1.7.16 asserts that a solution exists if and only if f admits a colimit in the ∞ -category $\mathcal{D}_E$ which is *transport-stable*: that is, which is preserved by the covariant transport functor $u_! : \mathcal{D}_E \rightarrow \mathcal{D}_{E'}$ associated to every morphism $u : E \rightarrow E'$ of the ∞ -category $\mathcal{E}$. This proves the implication (2) $\Rightarrow$ (1) of Proposition 7.3.9.1. The converse follows from a more general existence result (Proposition 7.3.9.6) which we prove at the end of this section. Our starting point is the following:

031R **Proposition 7.3.9.3.** *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an inner fibration of ∞ -categories, let K be a simplicial set, and let $\alpha : F_0 \rightarrow F_1$ be a natural transformation between diagrams $F_0, F_1 : K^\triangleright \rightarrow \mathcal{D}$. Suppose that, for every vertex $x \in K^\triangleright$, the morphism $\alpha_x : F_0(x) \rightarrow F_1(x)$ is U -cocartesian. Then:*

- (1) *If F_0 is a U -colimit diagram, then F_1 is also a U -colimit diagram.*
- (2) *If F_1 is a U -colimit diagram and the natural transformation α carries the cone point $v \in K^\triangleright$ to an isomorphism $\alpha_v : F_0(v) \rightarrow F_1(v)$, then F_0 is a U -colimit diagram.*

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $i : K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞ -category. It follows that the induced map $i^\triangleright : K^\triangleright \hookrightarrow \mathcal{K}^\triangleright$ is also inner anodyne (Example 4.3.6.7), so that the restriction map $\text{Fun}(\mathcal{K}^\triangleright, \mathcal{D}) \rightarrow \text{Fun}(K^\triangleright, \mathcal{D})$ is a trivial Kan fibration of simplicial sets (Proposition 1.5.7.6). We can therefore lift α to a natural transformation $\bar{\alpha} : \bar{F}_0 \rightarrow \bar{F}_1$ between natural transformations $\bar{F}_0, \bar{F}_1 : \mathcal{K}^\triangleright \rightarrow \mathcal{D}$. Since $i^\triangleright$ is bijective on vertices, the natural transformation $\bar{\alpha}$ carries each object of $\mathcal{K}^\triangleright$ to a U -cocartesian morphism of $\mathcal{D}$. The morphism $i^\triangleright$ is right cofinal (Corollary 7.2.1.13), so Corollary 7.2.2.2 guarantees that F_0 is a U -colimit diagram if and only if $\bar{F}_0$ is a U -colimit diagram. Similarly, F_1 is a U -colimit diagram if and only if $\bar{F}_1$ is a U -colimit diagram. We may therefore replace α by $\bar{\alpha}$ in the statement of Proposition 7.3.9.3, and thereby reduce to the case where $K = \mathcal{K}$ is an ∞ -category.

Let us identify α with a functor of ∞ -categories $F : \Delta^1 \times \mathcal{K}^\triangleright \rightarrow \mathcal{D}$. For each object $x \in \mathcal{K}^\triangleright$, we can regard $\Delta^1 \times \{x\}$ with a morphism $e_x : (0, x) \rightarrow (1, x)$ in the ∞ -category

$\Delta^1 \times \mathcal{K}^\triangleright$. By construction, the functor F carries each e_x to the U -cocartesian morphism α_x of $\mathcal{D}$. By virtue of Proposition 4.6.7.23, e_x is final when viewed as an object of the ∞ -category

$$(\{0\} \times \mathcal{K}^\triangleright) \times_{(\Delta^1 \times \mathcal{K}^\triangleright)} (\Delta^1 \times \mathcal{K}^\triangleright)_{/(1,x)} \simeq (\mathcal{K}^\triangleright)_{/x},$$

so that F is U -left Kan extended from $\{0\} \times \mathcal{K}^\triangleright$ at $(1, x)$ (Corollary 7.2.2.5). Allowing the object x to vary, we see that the functor F is U -left Kan extended from $\{0\} \times \mathcal{K}^\triangleright$.

We now prove (1). Suppose that F_0 is a U -colimit diagram. Then F_0 is U -left Kan extended from $\mathcal{K}$ (Example 7.3.3.9). Applying Proposition 7.3.8.11, we see that the functor F is U -left Kan extended from $\{0\} \times \mathcal{K}$, and therefore from the larger subcategory $\Delta^1 \times \mathcal{K} \subseteq \Delta^1 \times \mathcal{K}^\triangleright$. It follows that the composite map

$$(\Delta^1 \times \mathcal{K}) \star \{(1, v)\} \hookrightarrow \Delta^1 \times (\mathcal{K} \star \{v\}) \xrightarrow{F} \mathcal{D}$$

is a U -colimit diagram. Since the inclusion map $\{1\} \times \mathcal{K} \hookrightarrow \Delta^1 \times \mathcal{K}$ is right cofinal (Proposition 7.2.1.3), Corollary 7.2.2.2 guarantees that $F_1 = F|_{\{1\} \times \mathcal{K}^\triangleright}$ is also a U -colimit diagram.

We now prove (2). Let $\pi : \mathcal{K}^\triangleright \rightarrow \Delta^1$ be the functor carrying $\mathcal{K}$ to the vertex $0 \in \Delta^1$ and the cone point $v \in \mathcal{K}^\triangleright$ to the vertex $1 \in \Delta^1$, and let $G : \mathcal{K}^\triangleright \rightarrow \mathcal{D}$ be the functor given by the composition

$$\mathcal{K}^\triangleright \xrightarrow{(\pi, \text{id})} \Delta^1 \times \mathcal{K}^\triangleright \xrightarrow{F} \mathcal{D}.$$

Note that there is a natural transformation $\beta : F_0 \rightarrow G$ which is the identity when restricted to $\mathcal{K}$ and which carries the cone point v to the morphism $\alpha_v : F_0(v) \rightarrow F_1(v) = G(v)$. If α_v is an isomorphism, then the natural transformation β is also an isomorphism (Theorem 4.4.4.4). Consequently, to show that F_0 is a U -colimit diagram, it will suffice to show that G is a U -colimit diagram (Proposition 7.1.6.9). Arguing as above, we see that the functor $F|_{\Delta^1 \times \mathcal{K}}$ is U -left Kan extended from the full subcategory $\{0\} \times \mathcal{K} \subseteq \Delta^1 \times \mathcal{K}$. Applying Proposition 7.3.8.1, we see that G is a U -colimit diagram if and only if the composite map

$$(\Delta^1 \times \mathcal{K}) \star \{(1, v)\} \hookrightarrow \Delta^1 \times (\mathcal{K} \star \{v\}) \xrightarrow{F} \mathcal{D}$$

is a U -colimit diagram. By virtue of Corollary 7.2.2.2, this is equivalent to the requirement that F_1 is a U -colimit diagram. $\square$

Corollary 7.3.9.4. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a cocartesian fibration of ∞ -categories, let K be a weakly contractible simplicial set, and let $\bar{f} : K^\triangleright \rightarrow \mathcal{D}$ be a diagram. The following conditions are equivalent:*

- (1) *The diagram $\bar{f}$ carries each edge of $K^\triangleright$ to a U -cocartesian morphism of $\mathcal{D}$.*
- (2) *The restriction $f = \bar{f}|_K$ carries each edge of K to a U -cocartesian morphism of $\mathcal{E}$, and $\bar{f}$ is a U -colimit diagram.*

Proof. Without loss of generality, we may assume that f carries each edge of K to a U -cocartesian morphism of $\mathcal{D}$. Let $\pi : \Delta^1 \times K^\triangleright \rightarrow K^\triangleright$ be the morphism which is the identity on $\{0\} \times K^\triangleright$ and which carries $\{1\} \times K^\triangleright$ to the cone point $v \in K^\triangleright$. Set $D = f(v) \in \mathcal{D}$ and $E = U(D) \in \mathcal{E}$. Proposition 5.2.1.3 guarantees that the lifting problem

$$\begin{array}{ccc} \{0\} \times K^\triangleright & \xrightarrow{\bar{f}} & \mathcal{D} \\ \downarrow & \nearrow \alpha & \downarrow U \\ \Delta^1 \times K^\triangleright & \xrightarrow{U \circ \bar{f} \circ \pi} & \mathcal{E} \end{array}$$

admits a solution $\alpha : \Delta^1 \times K^\triangleright \rightarrow \mathcal{D}$ which carries $\Delta^1 \times \{x\}$ to a U -cocartesian morphism of $\mathcal{D}$, for each vertex $x \in K^\triangleright$. Set $\bar{g} = \alpha|_{\{1\} \times K^\triangleright}$, which we regard as a morphism from $K^\triangleright$ to the ∞ -category $\mathcal{D}_E$, and let us identify α with a natural transformation from $\bar{f}$ to $\bar{g}$. Note that $\alpha_v : \bar{f}(v) \rightarrow \bar{g}(v)$ is a U -cocartesian morphism of $\mathcal{C}$ satisfying $U(\alpha_v) = \text{id}_E$, and is therefore an isomorphism (Proposition 5.1.1.9). Applying Proposition 7.3.9.3, we can reformulate (2) as follows:

(2') The morphism $\bar{g} : K^\triangleright \rightarrow \mathcal{D}_E$ is a U -colimit diagram in $\mathcal{D}$.

Set $g = \bar{g}|_K$. For every edge $u : x \rightarrow y$ of K , we have a commutative diagram

$$\begin{array}{ccc} f(x) & \xrightarrow{f(u)} & f(y) \\ \downarrow \alpha_x & & \downarrow \alpha_y \\ g(x) & \xrightarrow{g(u)} & g(y) \end{array}$$

in the ∞ -category $\mathcal{D}$ where the morphisms $f(u)$, α_x , and α_y are U -cocartesian. Applying Corollary 5.1.2.4, we deduce that $g(u)$ is U -cocartesian when viewed as a morphism of $\mathcal{D}$, and is therefore an isomorphism in the ∞ -category $\mathcal{D}_E$ (Proposition 5.1.1.9). Similarly, for every vertex $x \in K$, the unique edge $c_x : x \rightarrow v$ of $K^\triangleright$ determines a commutative diagram

$$\begin{array}{ccc} f(x) & \xrightarrow{\bar{f}(c_x)} & \bar{f}(v) \\ \downarrow \alpha_x & & \downarrow \alpha_v \\ g(x) & \xrightarrow{\bar{g}(c_x)} & \bar{g}(v), \end{array}$$

where α_x is U -cocartesian and α_v is an isomorphism. Combining Corollary 5.1.2.4, Corollary 5.1.2.5, and Proposition 5.1.1.9, we see that $\bar{f}(c_x)$ is U -cocartesian if and only if $\bar{g}(c_x)$ is an isomorphism in the ∞ -category $\mathcal{D}_E$. We can therefore reformulate condition (1) as follows:

(1') The diagram $\bar{g}$ carries each edge of $K^\triangleright$ to an isomorphism in the ∞ -category $\mathcal{D}_E$.

By virtue of Corollary 7.2.3.5, (1') is equivalent to the requirement that $\bar{g}$ is a colimit diagram in the ∞ -category $\mathcal{D}_E$. In particular, the implication (2') $\Rightarrow$ (1') follows from Corollary 7.1.7.8. To prove the converse, it will suffice to show that condition (1') is satisfied, then for every morphism $u : E \rightarrow E'$ in $\mathcal{E}$, the covariant transport functor $u_! : \mathcal{D}_E \rightarrow \mathcal{D}_{E'}$ carries $\bar{g}$ to a colimit diagram in the ∞ -category $\mathcal{D}_{E'}$ (Corollary 7.1.7.16). This follows immediately from Corollary 7.2.3.5 (applied to the composite diagram $K^\triangleleft \xrightarrow{\bar{g}} \mathcal{D}_E \xrightarrow{u_!} \mathcal{D}_{E'}$). $\square$

Example 7.3.9.5. Let $\mathcal{D}$ be an ∞ -category and let $f : K \rightarrow \mathcal{D}$ be a diagram indexed 05ZV by a weakly contractible simplicial set K . Suppose that f carries each edge of K to an isomorphism in $\mathcal{D}$. Then an extension $\bar{f} : K^\triangleright \rightarrow \mathcal{D}$ is a colimit diagram if and only if it carries each edge of $K^\triangleright$ to an isomorphism in $\mathcal{D}$ (this follows by applying Corollary 7.3.9.4 in the special case $\mathcal{E} = \Delta^0$). Note that such an extension always exists: the weak contractibility of K guarantees that f is nullhomotopic when viewed as a morphism from K to the core $\mathcal{D}^\simeq$.

Proposition 7.3.9.6. Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a cocartesian fibration of ∞ -categories, and suppose 031W we are given a lifting problem

$$\begin{array}{ccc} K & \xrightarrow{f_0} & \mathcal{D} \\ \downarrow & \nearrow \bar{f}_0 & \downarrow U \\ K^\triangleright & \xrightarrow{g} & \mathcal{E} \end{array} \quad (7.46) \quad 031X$$

Let $v \in K^\triangleright$ be the cone point and set $E = g(v)$. Then there exists a diagram $f_1 : K \rightarrow \mathcal{D}_E \subseteq \mathcal{D}$ and a natural transformation $\alpha : f_0 \rightarrow f_1$ which carries each vertex $x \in K$ to a U -cocartesian morphism $\alpha_x : f_0(x) \rightarrow f_1(x)$ of $\mathcal{D}$, where $U \circ \alpha$ is given by the composition $\Delta^1 \times K \xrightarrow{c} K^\triangleright \xrightarrow{g} \mathcal{E}$. Moreover, the lifting problem (7.46) admits a solution $\bar{f}_0 : K^\triangleright \rightarrow \mathcal{C}$ which is a U -colimit diagram if and only if the following pair of conditions is satisfied:

- (1) The diagram f_1 admits a colimit $\bar{f}_1 : K^\triangleright \rightarrow \mathcal{D}_E$ in the ∞ -category $\mathcal{D}_E$.
- (2) Let $u : E \rightarrow E'$ be a morphism in the ∞ -category $\mathcal{D}$ and let $u_! : \mathcal{D}_E \rightarrow \mathcal{D}_{E'}$ be the covariant transport functor of Notation 5.2.2.9. Then $(u_! \circ \bar{f}_1) : K^\triangleright \rightarrow \mathcal{D}_{E'}$ is a colimit diagram in the ∞ -category $\mathcal{C}_{E'}$.

Proof. The existence (and essential uniqueness) of the diagram f_1 and the natural transformation $\alpha : f_0 \rightarrow f_1$ follow from Proposition 5.2.1.3. Let us first show that conditions (1) and (2) are necessary. Suppose that the lifting problem (7.46) admits a solution $\bar{f}_0 : K^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram. Using Proposition 5.2.1.3, we can extend f_1 to a diagram $\bar{f}_1 : K^\triangleright \rightarrow \mathcal{D}_E$ and α to a natural transformation $\bar{\alpha} : \bar{f}_0 \rightarrow \bar{f}_1$ which carries each vertex $x \in K^\triangleright$ to a U -cocartesian morphism $\bar{\alpha}_x : \bar{f}_0(x) \rightarrow \bar{f}_1(x)$. Proposition 7.3.9.3 guarantees that $\bar{f}_1$ is a U -colimit diagram in the ∞ -category $\mathcal{D}$, and therefore satisfies conditions (1) and (2) by virtue of Corollary 7.1.7.16.

Now suppose that conditions (1) and (2) are satisfied. Let $\bar{f}_1 : K^\triangleright \rightarrow \mathcal{D}_E$ be a colimit diagram extending f_1 . It follows from (2) that $\bar{f}_1$ is a U -colimit diagram in the ∞ -category $\mathcal{D}$. Let $\pi : (\Delta^1 \times K)^\triangleright \rightarrow K^\triangleright$ denote the morphism which is the identity when restricted to $\{0\} \times K$, and which carries $(\{1\} \times K)^\triangleright$ to the cone point of $K^\triangleright$. Since the inclusion map $\{1\} \times K \hookrightarrow \Delta^1 \times K$ is right cofinal (Proposition 7.2.1.3), Proposition 7.2.2.9 guarantees that the lifting problem

$$\begin{array}{ccc} \Delta^1 \times K & \xrightarrow{\alpha} & \mathcal{D} \\ \downarrow & \nearrow \bar{\alpha} & \downarrow U \\ (\Delta^1 \times K)^\triangleright & \xrightarrow{g \circ \pi} & \mathcal{E} \end{array}$$

admits a solution $\bar{\alpha} : (\Delta^1 \times K)^\triangleright \rightarrow \mathcal{D}$ which is a U -colimit diagram. Note that in this case $\bar{f}'_1 = \bar{\alpha}|_{(\{1\} \times K)^\triangleright}$ is also a U -colimit diagram (Corollary 7.2.2.2). Setting $\bar{f}_0 = \bar{\alpha}|_{(\{0\} \times K)^\triangleright}$, we note that $\bar{\alpha}$ determines a natural transformation of functors $\bar{f}_0 \rightarrow \bar{f}'_1$ which carries each vertex of x to a U -cocartesian morphism of $\mathcal{D}$ and carries the cone point to an identity morphism of $\mathcal{D}$. Applying the criterion of Proposition 7.3.9.3, we conclude that $\bar{f}_0$ is a U -colimit diagram which solves the lifting problem (7.46). $\square$

7.4 Limits and Colimits of Spaces

02SX Let $\mathcal{S}$ denote the ∞ -category of spaces (Construction 5.5.1.1). In the first part of this section, we show that every small diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ admits both a limit $\varprojlim(\mathcal{F})$ colimit $\varinjlim(\mathcal{F})$, both of which can be described explicitly in terms of the ∞ -category of elements $\int_{\mathcal{C}} \mathcal{F}$ introduced in Definition 5.6.2.1:

- (1) Let $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ denote the forgetful functor. Since U is a left fibration (Example 5.6.2.9), the collection of sections of U can be organized into a Kan complex $Y = \mathrm{Hom}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$. In §7.4.1, we show that Y is a limit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}$ (Corollary 7.4.1.7).

- (2) Let X be a fibrant replacement for the ∞ -category $\int_{\mathcal{C}} \mathcal{F}$: that is, a Kan complex equipped with a weak homotopy equivalence $\int_{\mathcal{C}} \mathcal{F} \rightarrow X$. In §7.4.3, we show that X is a colimit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}$ (Corollary 7.4.3.3).

Recall that the ∞ -category of spaces $\mathcal{S}$ can be regarded as a full subcategory of the ∞ -category $\mathcal{QC}$ of small ∞ -categories (Remark 5.5.4.8). In the second half of this section, we extend the preceding results to the situation where $\mathcal{F}$ is a diagram in the ∞ -category $\mathcal{QC}$. In this case, the forgetful functor $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ is a cocartesian fibration, which is generally not a left fibration. However, we have the following variants of (1) and (2):

- (1⁺) Let $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$ denote the full subcategory of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$ spanned by those sections of U which carry each morphism of $\mathcal{C}$ to a U -cocartesian morphism of $\int_{\mathcal{C}} \mathcal{F}$. In §7.4.4, we show that the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$ is a limit of the diagram $\mathcal{F}$ (Corollary 7.4.4.2).
- (2⁺) Let W be the collection of all U -cocartesian morphisms of $\int_{\mathcal{C}} \mathcal{F}$, and let $(\int_{\mathcal{C}} \mathcal{F})[W^{-1}]$ denote a localization of $\int_{\mathcal{C}} \mathcal{F}$ with respect to W (Definition 6.3.1.9). In §7.4.5, we show that $(\int_{\mathcal{C}} \mathcal{F})[W^{-1}]$ is a colimit of the diagram $\mathcal{F}$ (Corollary 7.4.5.2).

For many applications, it is not enough to describe the limit $\varprojlim(\mathcal{F})$ and colimit $\varinjlim(\mathcal{F})$ as *abstract* ∞ -categories: we also need to understand their relationship to the diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$. In other words, we would like to have criteria which can be used to detect when an extension $\overline{\mathcal{F}} : \mathcal{C}^{\triangleleft} \rightarrow \mathcal{QC}$ is a limit diagram, and when an extension $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathcal{QC}$ is a colimit diagram. To formulate these criteria, it will be convenient to slightly shift our perspective. Fix a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ having covariant transport representation $\mathcal{F}$ (that is, a cocartesian fibration which is equivalent to the forgetful functor $\int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$).

- Suppose U is obtained as the pullback of a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^{\triangleleft}$, and let $\overline{\mathcal{E}}_{\mathbf{0}}$ denote the fiber of $\overline{U}$ over the cone point $\mathbf{0} \in \mathcal{C}^{\triangleleft}$. In §7.4.4, we introduce a map

$$\mathrm{Df} : \overline{\mathcal{E}}_{\mathbf{0}} \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}),$$

which we will refer to as the *covariant diffraction functor* (Construction 7.4.4.9). Roughly speaking, it is characterized by the requirement that for every object $X \in \overline{\mathcal{E}}_{\mathbf{0}}$ and every object $C \in \mathcal{C}$, there is a $\overline{U}$ -cocartesian morphism $X \rightarrow \mathrm{Df}(X)(C)$ (depending functorially on X and C).

- Suppose U is obtained as the pullback of a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^{\triangleright}$, and let $\overline{\mathcal{E}}_{\mathbf{1}}$ denote the fiber of $\overline{U}$ over the cone point $\mathbf{1} \in \mathcal{C}^{\triangleright}$. In §7.4.5, we introduce a map

$$\mathrm{Rf} : \mathcal{E} \rightarrow \overline{\mathcal{E}}_{\mathbf{1}},$$

which we will refer to as the *covariant refraction functor* (Definition 7.4.5.8). Roughly speaking, it is characterized by the requirement that for every object $X \in \mathcal{E}$, there is a $\overline{U}$ -cocartesian morphism $X \rightarrow \mathrm{Rf}(X)$ (depending functorially on X).

We will deduce (1^+) and (2^+) from the following more precise assertions:

Diffraction Criterion: Suppose we are given a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \overline{\mathcal{E}} \\ \downarrow U & & \downarrow \overline{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleleft, \end{array}$$

where U and $\overline{U}$ are cocartesian fibrations. Then the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{E}^\triangleleft} : \mathcal{C}^\triangleleft \rightarrow \mathcal{QC}$ is a limit diagram (in the ∞ -category $\mathcal{QC}$) if and only if the covariant diffraction functor $\mathrm{Df} : \overline{\mathcal{E}}_0 \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a fully faithful embedding, whose essential image is the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U (Theorem 7.4.4.6 and Remark 7.4.4.11).

Refraction Criterion: Suppose we are given a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \overline{\mathcal{E}} \\ \downarrow U & & \downarrow \overline{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright, \end{array}$$

where U and $\overline{U}$ are cocartesian fibrations. Then the covariant transport representation $\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{E}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}$ is a colimit diagram (in the ∞ -category $\mathcal{QC}$) if and only if the covariant refraction functor $\mathrm{Rf} : \mathcal{E} \rightarrow \overline{\mathcal{E}}_1$ exhibits $\overline{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect to the collection of U -cocartesian morphisms (Theorem 7.4.5.13).

02SY Remark 7.4.0.1. In the outline above, we have implicitly suggested that $\mathcal{C}$ is an ∞ -category. This is not important: all of the results of this section can be applied to diagrams $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ indexed by an arbitrary (small) simplicial set $\mathcal{C}$.

02SZ Remark 7.4.0.2. For any cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^\triangleleft$, the associated covariant diffraction functor $\mathrm{Df} : \overline{\mathcal{E}}_0 \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ automatically factors through the full subcategory $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ (see Construction 7.4.4.9). Similarly, for any cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$, the covariant refraction functor $\mathrm{Rf} : \mathcal{E} \rightarrow \overline{\mathcal{E}}_1$ automatically carries U -cocartesian edges of $\mathcal{E}$ to isomorphisms in the ∞ -category $\overline{\mathcal{E}}_1$ (Remark 7.4.5.12).

7.4.1 Limits of Spaces

Let $\mathcal{S}$ denote the ∞ -category of spaces (Construction 5.5.1.1). Our first goal in this section is to show that the ∞ -category $\mathcal{S}$ admits small limits (Corollary 7.4.1.2). We begin by establishing a recognition principle for limits in $\mathcal{S}$.

Proposition 7.4.1.1. *Let $\mathcal{C}$ be a simplicial set, let Y be a Kan complex, and let $\beta : \underline{Y}_{\mathcal{C}} \rightarrow \mathcal{F}$ be a morphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{S})$. The following conditions are equivalent:*

- (1) *The natural transformation β exhibits Y as a limit of the diagram $\mathcal{F}$ in the ∞ -category $\mathcal{S}$ (see Definition 7.1.0.1).*
- (2) *Composition with β induces a homotopy equivalence*

$$\theta : \mathrm{Hom}_{\mathcal{S}}(\Delta^0, Y) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F}).$$

Proof. Assume that (2) is satisfied; we will prove (1) (the reverse implication is immediate from the definitions). Let X be a small Kan complex; we wish to show composition with β induces a homotopy equivalence $\theta_X : \mathrm{Hom}_{\mathcal{S}}(X, Y) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{X}_{\mathcal{C}}, \mathcal{F})$. Choose a simplicial set K equipped with a weak homotopy equivalence $u : K \rightarrow \mathrm{Hom}_{\mathcal{S}}(\Delta^0, X)$ (for example, we can take $K = X$ and u to be the homotopy equivalence of Remark 5.5.1.5). It follows from Example 7.1.2.10 that u exhibits X as a copower of Δ^0 by K in the ∞ -category $\mathcal{S}$, so that the composite map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \times K \xrightarrow{\mathrm{id} \times u} \mathrm{Hom}_{\mathcal{S}}(X, Y) \times \mathrm{Hom}_{\mathcal{S}}(\Delta^0, X) \xrightarrow{\circ} \mathrm{Hom}_{\mathcal{C}}(\Delta^0, Y)$$

determines a homotopy equivalence $T : \mathrm{Hom}_{\mathcal{S}}(X, Y) \rightarrow \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{S}}(\Delta^0, Y))$. Similarly, the composite map

$$K \xrightarrow{u} \mathrm{Hom}_{\mathcal{S}}(\Delta^0, X) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \underline{X}_{\mathcal{C}})$$

exhibits $\underline{X}_{\mathcal{C}}$ as a copower of $\underline{\Delta}_{\mathcal{C}}^0$ by K in the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{S})$ (see Proposition 7.1.8.3), so that u also determines a homotopy equivalence $T' : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{X}_{\mathcal{C}}, \mathcal{F}) \rightarrow \mathrm{Fun}(K, \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F}))$. Note that we have a homotopy commutative diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{S}}(X, Y) & \xrightarrow{\theta_X} & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{X}_{\mathcal{C}}, \mathcal{F}) \\ \downarrow \sim T & & \downarrow \sim T' \\ \mathrm{Fun}(K, \mathrm{Hom}_{\mathcal{S}}(\Delta^0, Y)) & \longrightarrow & \mathrm{Fun}(K, \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})) \end{array}$$

where the bottom horizontal map is obtained by applying the functor $\text{Fun}(K, \bullet)$ to θ and is therefore a homotopy equivalence by virtue of assumption (2). It follows that θ_X is also a homotopy equivalence. $\square$

Recall that every Kan complex Y is homotopy equivalent to the morphism space $\text{Hom}_{\mathcal{S}}(\Delta^0, Y)$ (Remark 5.5.1.5). Consequently, Proposition 7.4.1.1 guarantees that if a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ admits a limit, then the limit $\varprojlim(\mathcal{F})$ is homotopy equivalent to the morphism space $M = \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})$. We now show that, modulo set-theoretic technicalities, this condition is always satisfied:

05QP Corollary 7.4.1.2. *Let $\mathcal{C}$ be a simplicial set, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a diagram, and suppose that the morphism space $M = \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})$ is essentially small. Then M is a limit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}$.*

Proof. Let Y be a Kan complex and let $u : Y \rightarrow \text{Hom}_{\mathcal{S}}(\Delta^0, Y)$ be the homotopy equivalence of Remark 5.5.1.5. As in the proof of Proposition 7.4.1.1, we observe that u exhibits the constant functor $\underline{Y}_{\mathcal{C}}$ as a copower of $\underline{\Delta}_{\mathcal{C}}^0$ by Y , and therefore induces a homotopy equivalence

$$T : \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{Y}_{\mathcal{C}}, \mathcal{F}) \rightarrow \text{Fun}(Y, \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})) = \text{Fun}(Y, M).$$

Setting $Y = M$, it follows that there exists a natural transformation $\beta : \underline{M}_{\mathcal{C}} \rightarrow \mathcal{F}$ such that $T(\beta)$ is homotopic to the identity morphism id_M . In particular, $T(\beta)$ is a homotopy equivalence, so that β exhibits M as a limit of $\mathcal{F}$ (Proposition 7.4.1.1). $\square$

05QQ Corollary 7.4.1.3. *The ∞ -category $\mathcal{S}$ admits small limits.*

05QR Variant 7.4.1.4. Let κ be an uncountable cardinal, let $\mathcal{S}_{<\kappa}$ denote the ∞ -category of essentially κ -small spaces, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be a diagram indexed by a simplicial set $\mathcal{C}$. It follows from the proof of Corollary 7.4.1.2 that $\mathcal{F}$ admits a limit in the ∞ -category $\mathcal{S}_{<\kappa}$ if and only if the morphism space $M = \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S}_{<\kappa})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})$ is essentially κ -small. Moreover, if this condition is satisfied, then M is a limit of $\mathcal{F}$. In particular, the limit of $\mathcal{F}$ is independent of κ (that is, it is preserved by the inclusion functors $\mathcal{S}_{<\kappa} \hookrightarrow \mathcal{S}_{<\lambda}$ for $\lambda \geq \kappa$).

05E2 Remark 7.4.1.5 (Limits of Truncated Spaces). Let n be an integer and let $\mathcal{S}_{\leq n}$ denote the full subcategory of $\mathcal{S}$ spanned by the n -truncated spaces (Definition 3.5.9.1). Then $\mathcal{S}_{\leq n}$ is a reflective subcategory of $\mathcal{S}$ (Example 6.2.2.12). Combining Corollary 7.4.1.3 with Variant 7.1.4.26, we conclude that the ∞ -category $\mathcal{S}_{\leq n}$ admits small limits, which are preserved by the inclusion functor $\mathcal{S}_{\leq n} \hookrightarrow \mathcal{S}$. In other words, if $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ is a diagram having the property that each of the Kan complexes $\mathcal{F}(C)$ is n -truncated, then the limit $\varprojlim(\mathcal{F}) \simeq \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})$ is also n -truncated.

Our next goal is to show that, if $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ is given as the covariant transport representation of a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, then the limit $\varprojlim(\mathcal{F})$ has a more explicit description: it can be identified with the space of sections of U .

Proposition 7.4.1.6. *Let $\mathcal{C}$ be a small simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be the covariant 05QS transport representation of a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ (Definition 5.6.5.1). Then the simplicial set $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a Kan complex, which is a limit of the diagram $\mathcal{F}$.*

Corollary 7.4.1.7. *Let $\mathcal{C}$ be a small simplicial set. Then any diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ admits a 02VD limit in the ∞ -category $\mathcal{S}$, given by the ∞ -category $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$.*

Proof. Apply Proposition 7.4.1.6 to the left fibration $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ of Example 5.6.2.9. $\square$

To prove Proposition 7.4.3.1, it will be convenient to reformulate the notion of covariant transport representation.

Definition 7.4.1.8. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a 05QT diagram, and let $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ be a natural transformation. For each vertex $C \in \mathcal{C}$, the restriction of α to the fiber $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ determines a natural transformation from the constant functor taking the value Δ^0 to the constant functor taking the value $\mathcal{F}(C)$, which we can identify with a morphism of Kan complexes

$$\alpha_C : \mathcal{E}_C \rightarrow \text{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{F}(C)).$$

We say that α exhibits $\mathcal{F}$ as a covariant transport representation for U if, for every vertex $C \in \mathcal{C}$, the morphism α_C is a homotopy equivalence.

The terminology of Definition 7.4.1.8 is justified by the following:

Proposition 7.4.1.9. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ 05QU be a diagram. The following conditions are equivalent:*

- (1) *The diagram $\mathcal{F}$ is a covariant transport representation for U , in the sense of Definition 5.6.5.1.*
- (2) *There exists a natural transformation $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ which exhibits $\mathcal{F}$ as a covariant transport representation for U , in the sense of Definition 7.4.1.8.*
- (3) *There exists an equivalence of U with the left fibration $\{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{C} \rightarrow \mathcal{C}$.*

Proof. Unwinding the definitions, we see that commutative diagrams

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{T} & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{C} \\ & \searrow U & \swarrow \\ & \mathcal{C} & \end{array}$$

can be identified with morphisms $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ in the ∞ -category $\text{Fun}(\mathcal{E}, \mathcal{S})$. Under this identification, T is an equivalence of left fibrations over $\mathcal{C}$ if and only if α exhibits $\mathcal{F}$ as a covariant transport representation for U (Corollary 5.1.7.16). This proves the equivalence (2) $\Leftrightarrow$ (3). The equivalence (1) $\Leftrightarrow$ (3) follows from the observation that the coslice diagonal

$$\mathcal{S}_* = \mathcal{S}_{\Delta^0/} \hookrightarrow \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S}$$

is an equivalence of left fibrations over $\mathcal{S}$ (Corollary 4.6.4.20). $\square$

05QV Example 7.4.1.10. Let $\mathcal{C}$ be a simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a diagram. Then the coslice diagonal

$$\int_{\mathcal{C}} \mathcal{F} = \mathcal{C} \times_{\mathcal{S}} \mathcal{S}_{\Delta^0/} \hookrightarrow \mathcal{C} \times_{\mathcal{S}} (\{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S}) = \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{C}$$

can be identified with a natural transformation

$$\alpha : \underline{\Delta}^0_{\int_{\mathcal{C}} \mathcal{F}} \rightarrow \mathcal{F}|_{\int_{\mathcal{C}} \mathcal{F}}$$

which exhibits $\mathcal{F}$ as a covariant transport representation for the left fibration $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$.

05QW Example 7.4.1.11. Let $\mathcal{C} = N_{\bullet}(\mathcal{C}_0)$ be the nerve of a category $\mathcal{C}_0$, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be the (homotopy coherent) nerve of a functor $\mathcal{F}_0 : \mathcal{C}_0 \rightarrow \text{Kan}$, and let $\mathcal{E} = N_{\bullet}^{\mathcal{F}_0}(\mathcal{C}_0)$ denote the weighted nerve of Definition 5.3.3.1, so that the projection map $U : \mathcal{E} \rightarrow \mathcal{C}$ is a left fibration of ∞ -categories (Corollary 5.3.3.19). Restricting the natural transformation α of Example 7.4.1.10 along the comparison map

$$\mathcal{E} = N_{\bullet}^{\mathcal{F}_0}(\mathcal{C}_0) \rightarrow \int_{\mathcal{C}} \mathcal{F}$$

of Construction 5.6.4.1, we obtain a natural transformation $\alpha' : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ which exhibits $\mathcal{F}$ as a covariant transport representation for U (see Proposition 5.6.4.8). Beware that, although the functors $\underline{\Delta}^0_{\mathcal{E}}$ and $\mathcal{F}|_{\mathcal{E}}$ can be obtained from strictly commutative diagrams $\text{h}\mathcal{E} \rightarrow \text{Kan}$, the natural transformation α generally cannot be obtained from a natural transformation of Kan-valued functors (even up to homotopy).

05QX Example 7.4.1.12. Let $\mathcal{C} = N_{\bullet}(\mathcal{C}_0)$ be the nerve of a category $\mathcal{C}_0$, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of ∞ -categories, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ denote the (homotopy coherent) nerve of the strict transport representation $\mathcal{F}_0 = \text{sTr}_{\mathcal{E}/\mathcal{C}_0}$ (see Construction 5.3.1.5). Set $\mathcal{E}' = N_{\bullet}^{\mathcal{F}_0}(\mathcal{C}_0)$, so that Example 7.4.1.11 supplies a natural transformation $\alpha' : \underline{\Delta}^0_{\mathcal{E}'} \rightarrow \mathcal{F}|_{\mathcal{E}'}$ which exhibits $\mathcal{F}$ as a covariant transport representation of U' . The scaffolds of Constructions 5.3.4.7 and 5.3.4.11 provide categorical equivalences of simplicial sets

$$\mathcal{E} \xleftarrow{\lambda_u} \underset{\rightarrow}{\text{holim}}(\mathcal{F}_0) \xrightarrow{\lambda_t} \mathcal{E}'.$$

It follows that there exists a natural transformation $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ which is characterized up to homotopy by the requirement that $[\alpha]$ and $[\alpha']$ have the same image in the homotopy category $\text{hFun}(\text{holim}(\mathcal{F}_0), \mathcal{S})$. Moreover, α exhibits $\mathcal{F}$ as a covariant transport representation for U . Beware that, although the homotopy class $[\alpha]$ is canonically determined, the construction of α requires some auxiliary choices (which cannot be made functorially at the level of simplicial sets).

Construction 7.4.1.13. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a morphism of simplicial sets, let $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ be the simplicial set parametrizing sections of U , and let

$$\text{ev} : \text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C} \rightarrow \mathcal{E} \quad (F, C) \mapsto F(C)$$

be the evaluation functor. Suppose we are given a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ and a natural transformation $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$. The image of α under the functor

$$\text{Fun}(\mathcal{E}, \mathcal{S}) \xrightarrow{\circ \text{ev}} \text{Fun}(\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}, \mathcal{S})$$

can be identified with a comparison morphism

$$T : \text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}^0_{\mathcal{C}}, \mathcal{F}).$$

We will deduce Proposition 7.4.1.6 from the following:

Proposition 7.4.1.14. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a diagram, and let $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ be a natural transformation. If α exhibits $\mathcal{F}$ as a covariant transport representation of U , then the comparison morphism

$$T : \text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}^0_{\mathcal{C}}, \mathcal{F})$$

of Construction 7.4.1.13 is a homotopy equivalence of Kan complexes.

Proof. For every morphism of simplicial sets $S \rightarrow \mathcal{C}$, we can apply Construction 7.4.1.13 to the left fibration $S \times_{\mathcal{C}} \mathcal{E} \rightarrow S$ to obtain a comparison map

$$T_S : \text{Fun}_{/\mathcal{C}}(S, \mathcal{E}) = \text{Fun}_{/S}(S, S \times_{\mathcal{C}} \mathcal{E}) \rightarrow \text{Hom}_{\text{Fun}(S, \mathcal{S})}(\underline{\Delta}^0_S, \mathcal{F}|_S).$$

Let us say that S is *good* if the morphism T_S is a homotopy equivalence. We now proceed in several steps.

- (a) Let $S = \{C\}$ be a vertex of the simplicial set $\mathcal{C}$. In this case, T_S agrees with the comparison map $\alpha_C : \mathcal{E}_C \rightarrow \text{Hom}_{\mathcal{C}}(\Delta^0, \mathcal{F}(C))$ appearing in Definition 7.4.1.8, which is a homotopy equivalence by virtue of our assumption on α .

- (b) The construction of T_S depends functorially on S : that is, if we are given a morphism $f : S' \rightarrow S$ in $(\text{Set}_\Delta)_/\mathcal{C}$, then the diagram of Kan complexes

$$\begin{array}{ccc}
 \text{Fun}_/\mathcal{C}(S, \mathcal{E}) & \xrightarrow{\quad} & \text{Fun}_/\mathcal{C}(S', \mathcal{E}) \\
 \downarrow T_S & & \downarrow T_{S'} \\
 \text{Hom}_{\text{Fun}(S, \mathcal{C})}(\underline{\Delta}^0_S, \mathcal{F}|_S) & \xrightarrow{\quad} & \text{Hom}_{\text{Fun}(S', \mathcal{C})}(\underline{\Delta}^0_{S'}, \mathcal{F}|_{S'})
 \end{array} \tag{7.47}$$

is commutative. For the upper horizontal map, this follows from Corollaries 4.2.5.2 and Corollary 4.4.3.8.

- (c) Let $S = \Delta^n$ be a standard simplex and let $S' = \{0\}$ be its initial vertex, so that the inclusion $S' \hookrightarrow S$ is left anodyne (Corollary 4.2.4.11). Then horizontal maps appearing in (7.47) are homotopy equivalences. For the upper horizontal map this follows from Proposition 4.2.5.4, and for the lower horizontal map it follows from Proposition 7.3.6.7. Combining this observation with (a), we conclude that S is good.
- (d) The construction $S \mapsto T_S$ carries coproducts in the category $(\text{Set}_\Delta)_/\mathcal{C}$ to products in the category $\text{Fun}([1], \text{Kan})$. Consequently, the collection of good simplicial sets is closed under coproducts.

- (e) Suppose we are given a pushout square

$$\begin{array}{ccc}
 S & \xrightarrow{\quad} & S_0 \\
 \downarrow & & \downarrow \\
 S_1 & \xrightarrow{\quad} & S_{01}
 \end{array} \tag{7.48}$$

in the category $(\text{Set}_\Delta)_/\mathcal{C}$. Then the induced diagram

$$\begin{array}{ccc}
 T_S & \xleftarrow{\quad} & T_{S_0} \\
 \uparrow & & \uparrow \\
 T_{S_1} & \xleftarrow{\quad} & T_{S_{01}}
 \end{array} \tag{7.49}$$

is a pullback square in the category $\text{Fun}([1], \text{Kan})$. Moreover, if the horizontal maps in the diagram (7.48) are monomorphisms, then (7.49) is a (levelwise) homotopy pullback square: this follows from (b) and Example 3.4.1.3. Consequently, if S , S_0 , and S_1 are good, then S is also good (see Corollary 3.4.1.12).

- (f) Let S be a simplicial set of dimension $\leq k$, for some integer $k \geq -1$. To prove this, we proceed by induction on k . If $k = -1$, then $S = \emptyset$ and the statement is clear. To handle the general case, let $S' = \text{sk}_{n-1}(S)$ denote the $(n-1)$ -skeleton of S , so that Proposition 1.1.4.12 supplies a pushout square

$$\begin{array}{ccc} \coprod \partial \Delta^k & \longrightarrow & \coprod \Delta^k \\ \downarrow & & \downarrow \\ S' & \longrightarrow & S, \end{array}$$

where the horizontal maps are monomorphisms. It follows from our inductive hypothesis that S' and $\coprod \partial \Delta^k$ are good. By virtue of (e), we are reduced to showing that the coproduct $\coprod \Delta^k$ is good, which follows from (c) and (d).

We now complete the proof by showing that every object $S \in (\text{Set}_\Delta)_/\mathcal{C}$ is good. Note that T_S can be realized as the limit of a tower

$$\begin{array}{ccccc} \cdots & \longrightarrow & \text{Fun}_{/\mathcal{C}}(\text{sk}_1(S), \mathcal{E}) & \longrightarrow & \text{Fun}_{/\mathcal{C}}(\text{sk}_0(S), \mathcal{E}) \\ & & \downarrow T_{\text{sk}_1(S)} & & \downarrow T_{\text{sk}_0(S)} \\ \cdots & \longrightarrow & \text{Hom}_{\text{Fun}(\text{sk}_1(S), \mathcal{C})}(\underline{\Delta}_{\text{sk}_1(S)}^0, \mathcal{F}|_{\text{sk}_1(S)}) & \longrightarrow & \text{Hom}_{\text{Fun}(\text{sk}_0(S), \mathcal{C})}(\underline{\Delta}_{\text{sk}_0(S)}^0, \mathcal{F}|_{\text{sk}_0(S)}), \end{array}$$

where the horizontal maps are Kan fibrations. Consequently, to show that T_S is a homotopy equivalence, it will suffice to show that $T_{\text{sk}_k(S)}$ is a homotopy equivalence for every integer $k \geq 0$ (see Example 4.5.6.18), which follows from (f). $\square$

Proof of Proposition 7.4.1.6. Let $\mathcal{C}$ be a small simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be the covariant transport representation of a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$. Combining Propositions 7.4.1.9 and Proposition 7.4.1.14, we deduce that the Kan complex $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is homotopy equivalent to the morphism space $\text{Hom}_{\text{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})$ and is therefore a limit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}$ (Corollary 7.4.1.2). $\square$

Variant 7.4.1.15 (Size Estimates for Limits). Let λ be an uncountable cardinal and let $\kappa = \text{ecf}(\lambda)$ be its exponential cofinality. Suppose we are given a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\lambda}$, where $\mathcal{C}$ is a κ -small simplicial set. Then $\mathcal{F}$ can be identified with the covariant transport representation of a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ which is essentially λ -small. Applying Variant 4.7.9.11, we deduce that the Kan complex $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is also essentially λ -small, and can therefore be identified with a limit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}_{<\lambda}$. In particular, the ∞ -category $\mathcal{S}_{<\lambda}$ admits κ -small limits. 03UB

For many applications, we will need a more precise version of Proposition 7.4.1.6, which characterizes limit *diagrams* in the ∞ -category $\mathcal{S}$.

05R3 **Proposition 7.4.1.16.** *Suppose we are given a pullback diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleleft, \end{array}$$

where U and $\bar{U}$ are essentially small left fibrations, and let $\bar{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathcal{S}$ be a covariant transport representation for $\bar{U}$. The following conditions are equivalent:

- (1) The morphism $\bar{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathcal{S}$ is a limit diagram.
- (2) The restriction map

$$Q : \mathrm{Fun}_{/\mathcal{C}^\triangleleft}(\mathcal{C}^\triangleleft, \bar{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$$

is a homotopy equivalence of Kan complexes.

05R4 **Remark 7.4.1.17.** In the formulation of Proposition 7.4.1.16, the essential smallness assumption on $\bar{U}$ is not important. If $\bar{U}$ is essentially κ -small (for some uncountable cardinal κ which is not necessary small), then it admits a covariant transport representation $\bar{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathcal{S}_{<\kappa}$, which is a limit diagram if and only if Q is a homotopy equivalence.

Proof of Proposition 7.4.1.16. Using Proposition 7.4.1.9, we can choose a natural transformation $\bar{\alpha} : \underline{\Delta}_{\bar{\mathcal{E}}}^0 \rightarrow \bar{\mathcal{F}}|_{\bar{\mathcal{E}}}$ which exhibits $\bar{\mathcal{F}}$ as a covariant transport representation for $\bar{U}$. Set $\mathcal{F} = \bar{\mathcal{F}}|_{\mathcal{C}}$, so that we have a commutative diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Fun}_{/\mathcal{C}^\triangleleft}(\mathcal{C}^\triangleleft, \bar{\mathcal{E}}) & \xrightarrow{Q} & \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^\triangleleft, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}^\triangleleft}^0, \bar{\mathcal{F}}) & \longrightarrow & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F}) \end{array}$$

where the vertical maps are given by Construction 7.4.1.13, and are therefore homotopy equivalences (Proposition 7.4.1.14). It follows that (2) is equivalent the following:

- (2') The restriction map $Q' : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^\triangleleft, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}^\triangleleft}^0, \bar{\mathcal{F}}) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F})$ is a homotopy equivalence.

Choose a Kan complex Y and a natural transformation $\bar{\beta} : \underline{Y}_{\mathcal{C}^\triangleleft} \rightarrow \overline{\mathcal{F}}$ which exhibits Y as a limit of the diagram $\overline{\mathcal{F}}$ (so that β induces a homotopy equivalence $Y \rightarrow \overline{\mathcal{F}}(v)$, where v denotes the cone point of $\mathcal{C}^\triangleleft \simeq \{v\} \star \mathcal{C}$). Then $\bar{\beta}$ restricts to a natural transformation $\beta : \underline{Y}_{\mathcal{C}} \rightarrow \mathcal{F}$. We then have a commutative diagram of Kan complexes

$$\begin{array}{ccc} & \mathrm{Hom}_{\mathcal{S}}(\Delta^0, Y) & \\ \bar{\theta} \swarrow & & \searrow \theta \\ \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^\triangleleft, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}^\triangleleft}^0, \overline{\mathcal{F}}) & \xrightarrow{Q'} & \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\underline{\Delta}_{\mathcal{C}}^0, \mathcal{F}), \end{array}$$

where θ and $\bar{\theta}$ are induced by composition with β and $\bar{\beta}$, respectively. It follows from Proposition 7.4.1.1 that $\bar{\theta}$ is a homotopy equivalence. Moreover, $\overline{\mathcal{F}}$ is a limit diagram if and only if β exhibits Y as a limit of $\mathcal{F}$: that is, if and only if θ is also a homotopy equivalence. Using the commutativity of the diagram, we see that this is equivalent to condition (2'). $\square$

For later use, we record some consequences of Proposition 7.4.1.16.

Proposition 7.4.1.18. *Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which is locally κ -small. Then a morphism of simplicial sets $f : K^\triangleleft \rightarrow \mathcal{C}$ is a limit diagram if and only if, for every object $X \in \mathcal{C}$, the composition* 039L

$$K^\triangleleft \xrightarrow{F} \mathcal{C} \xrightarrow{h^X} \mathcal{S}_{<\kappa}$$

is a limit diagram; here h^X denotes the functor corepresented by X (Notation 5.6.6.14).

Proof. Applying Proposition 7.1.6.17, we see that F is a limit diagram if and only if, for every object $X \in \mathcal{C}$, the restriction map

$$\theta_X : \mathrm{Hom}_{\mathrm{Fun}(K^\triangleleft, \mathcal{C})}(\underline{X}, F) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{C})}(\underline{X}|_K, F|_K)$$

is a homotopy equivalence of Kan complexes. Let $\mathcal{E}$ denote the oriented fiber product $\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C}$ and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be given by projection onto the second factor. Note that U is a left fibration (Proposition 4.6.4.13) and that θ_X can be identified with the restriction map

$$\mathrm{Fun}_{/\mathcal{C}}(K^\triangleleft, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(K, \mathcal{E}).$$

The identity morphism id_X can be viewed as an initial object of $\mathcal{E}$ satisfying $U(\mathrm{id}_X) = X$ (Proposition 4.6.7.23), so the corepresentable functor $h^X : \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ is a covariant transport representation for U (Proposition 5.6.6.21). Applying Proposition 7.4.1.16, we see that θ_X is a homotopy equivalence if and only if $h^X \circ F$ is a limit diagram in the ∞ -category $\mathcal{S}$. $\square$

039M **Corollary 7.4.1.19.** *Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which is locally κ -small. For every object $X \in \mathcal{C}$, the functors*

$$h^X : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa} \quad h_X : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$$

preserve K -indexed limits, for every simplicial set K .

04KM **Remark 7.4.1.20.** Let $\mathcal{C}$ be an ∞ -category and let W be a collection of morphisms of $\mathcal{C}$. It follows from Corollary 7.4.1.19 that the collection of W -local objects (Definition 6.2.3.1) is closed under the formation of all limits which exist in $\mathcal{C}$. Similarly, the collection of W -colocal objects is closed under the formation of all colimits which exist in $\mathcal{C}$.

04KN **Remark 7.4.1.21.** Let $\mathcal{C}$ be an ∞ -category, and let f be a morphism of $\mathcal{C}$ which is the levelwise colimit of a diagram

$$K \rightarrow \mathrm{Fun}(\Delta^1, \mathcal{C}) \quad v \mapsto f_v.$$

If an object $C \in \mathcal{C}$ is f_v -local for each vertex $v \in K$, then it is also f -local. This follows from Propositions 7.4.1.18 and 7.1.3.14.

7.4.2 Digression: Functoriality of Covariant Transport

05R5 Let $\mathcal{C}$ be an ∞ -category. For every diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$, let $\int_{\mathcal{C}} \mathcal{F}$ denote the ∞ -category of elements of $\mathcal{F}$ (Definition 5.6.2.1), so that the projection map $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ is a left fibration (Example 5.6.2.9). By virtue of Corollary 5.6.0.6, the construction $\mathcal{F} \mapsto \int_{\mathcal{C}} \mathcal{F}$ induces a bijection

$$\begin{array}{c} \{\text{Diagrams } \mathcal{C} \rightarrow \mathcal{S}\} / \text{Isomorphism} \\ \downarrow \theta \\ \{\text{Essentially small left fibrations } \mathcal{E} \rightarrow \mathcal{C}\} / \text{Equivalence} \end{array} .$$

Our goal in this section is to prove a stronger result, which upgrades θ to an equivalence of homotopy categories (Theorem 7.4.2.4).

05R6 **Notation 7.4.2.1.** Let $\mathcal{C}$ be a simplicial set. We let $\mathrm{LFib}(\mathcal{C})$ denote the full subcategory of $(\mathrm{Set}_{\Delta})_{/\mathcal{C}}$ spanned by the (essentially small) left fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$. We will regard $\mathrm{LFib}(\mathcal{C})$ as a simplicially enriched category, with morphism spaces given by

$$\mathrm{Hom}_{\mathrm{LFib}(\mathcal{C})}(\mathcal{E}, \mathcal{E}')_{\bullet} = \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}').$$

It follows from Corollary 4.4.2.5 that the simplicial category $\mathrm{LFib}(\mathcal{C})$ is locally Kan.

Definition 7.4.2.2. Suppose we are given a commutative diagram of simplicial sets

05R7

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\Gamma} & \mathcal{E}' \\ & \searrow U & \swarrow U' \\ & \mathcal{C}, & \end{array}$$

where U and U' are left fibrations having covariant transport representations $\mathcal{F} = \mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ and $\mathcal{F}' = \mathrm{Tr}_{\mathcal{E}'/\mathcal{C}}$, respectively. We say that a natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ is *compatible with Γ* if the diagram

$$\begin{array}{ccc} & \underline{\Delta}_{\mathcal{E}}^0 & \\ \alpha \swarrow & & \searrow \alpha'|_{\mathcal{E}} \\ \mathcal{F}|_{\mathcal{E}} & \xrightarrow{\gamma|_{\mathcal{E}}} & \mathcal{F}'|_{\mathcal{E}} \end{array}$$

commutes up to homotopy (in the ∞ -category $\mathrm{Fun}(\mathcal{E}, \mathcal{S})$). Here $\alpha : \underline{\Delta}_{\mathcal{E}}^0 \rightarrow \mathcal{F}|_{\mathcal{E}}$ and $\alpha' : \underline{\Delta}_{\mathcal{E}'}^0 \rightarrow \mathcal{F}'|_{\mathcal{E}'}$ denote natural transformations which exhibit $\mathcal{F}$ and $\mathcal{F}'$ as covariant transport representations of U and U' , in the sense of Definition 7.4.1.8.

Warning 7.4.2.3. The compatibility condition of Definition 7.4.2.2 depends not only on the morphisms γ and Γ , but also on the choice of natural transformations

05R8

$$\alpha : \underline{\Delta}_{\mathcal{E}}^0 \rightarrow \mathcal{F}|_{\mathcal{E}} \quad \alpha' : \underline{\Delta}_{\mathcal{E}'}^0 \rightarrow \mathcal{F}'|_{\mathcal{E}'}$$

exhibiting $\mathcal{F}$ and $\mathcal{F}'$ as covariant transport representations for U and U' , respectively. We will sometimes omit mention of these choices, particularly in situations where there are natural candidates for α and α' . For example:

- Suppose that $\mathcal{E} = \int_{\mathcal{C}} \mathcal{F}$ and $\mathcal{E}' = \int_{\mathcal{C}} \mathcal{F}'$ are the ∞ -categories of elements of $\mathcal{F}$ and $\mathcal{F}'$, respectively. Then we can take α and α' to be the natural transformations of Example 7.4.1.10.
- Suppose that $\mathcal{F}$ and $\mathcal{F}'$ are obtained from strictly commutative diagrams of Kan complexes $\mathcal{F}_0, \mathcal{F}'_0 : \mathcal{C}_0 \rightarrow \mathrm{Kan}$, and that $\mathcal{E} = \mathrm{N}_{\bullet}^{\mathcal{F}}(\mathcal{C}_0)$ and $\mathcal{E}' = \mathrm{N}_{\bullet}^{\mathcal{F}'}(\mathcal{C}_0)$ are the weighted nerves introduced in Definition 5.3.3.1. Then we can take α and α' to be the natural transformations given in Example 7.4.1.11.
- Suppose $\mathcal{C} = \mathrm{N}_{\bullet}(\mathcal{C}_0)$ and that the diagrams $\mathcal{F}, \mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$ are the homotopy coherent nerve of the strict transport representations $s\mathrm{Tr}_{\mathcal{E}/\mathcal{C}_0}, s\mathrm{Tr}_{\mathcal{E}'/\mathcal{C}_0} : \mathcal{C}_0 \rightarrow \mathrm{Kan}$. In this case, we can take α and α' to be the natural transformations described in Example 7.4.1.12 (which are well-defined up to homotopy).

05R9 **Theorem 7.4.2.4.** *Let $\mathcal{C}$ be a simplicial set. Then the construction*

$$(\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}) \mapsto (U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C})$$

determines an equivalence of homotopy categories

$$\mathrm{hFun}(\mathcal{C}, \mathcal{S}) \rightarrow \mathrm{hLFib}(\mathcal{C}),$$

which carries (the homotopy class of) a natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ to (the homotopy class) of a map $\Gamma \in \mathrm{Fun}_{/\mathcal{C}}(\int_{\mathcal{C}} \mathcal{F}, \int_{\mathcal{C}} \mathcal{F}')$ which is compatible with γ .

05RA **Remark 7.4.2.5.** We will see later that the equivalence $\mathrm{hFun}(\mathcal{C}, \mathcal{S}) \rightarrow \mathrm{hLFib}(\mathcal{C})$ of Theorem 7.4.2.4 can be upgraded to an equivalence of ∞ -categories from $\mathrm{Fun}(\mathcal{C}, \mathcal{S})$ to the homotopy coherent nerve of $\mathrm{LFib}(\mathcal{C})$. See Theorem [?].

Our proof of Theorem 7.4.2.4 begins with the following observation:

05RB **Proposition 7.4.2.6.** *Let $\mathcal{C}$ be an ∞ -category and let $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ be a natural transformation between functors $\mathcal{F}, \mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$ which are given as covariant transport representations for left fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U' : \mathcal{E}' \rightarrow \mathcal{C}$, respectively. Then there exists a morphism $\Gamma \in \mathrm{Hom}_{\mathrm{LFib}(\mathcal{C})}(\mathcal{E}, \mathcal{E}')$ which is compatible with γ . Moreover, the homotopy class $[\Gamma]$ is uniquely determined.*

Proof. Fix natural transformations $\alpha : \underline{\Delta}_{\mathcal{E}}^0 \rightarrow \mathcal{F}|_{\mathcal{E}}$ and $\alpha' : \underline{\Delta}_{\mathcal{E}'}^0 \rightarrow \mathcal{F}'|_{\mathcal{E}'}$ which exhibit $\mathcal{F}$ and $\mathcal{F}'$ as covariant transport representations for U and U' , respectively. Then α' induces a map of Kan complexes

$$05RC \quad \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}') \xrightarrow{\rho} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}, \mathcal{S})}(\underline{\Delta}_{\mathcal{E}}^0, \mathcal{F}'|_{\mathcal{E}}), \quad (7.50)$$

which carries a morphism $\Gamma \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ to the pullback of α' along Γ . To prove Proposition 7.4.2.6, it suffices to show that ρ is bijective on connected components. In fact, the morphism ρ is a homotopy equivalence: this follows by applying Proposition 7.4.1.14 to the left fibration $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}' \rightarrow \mathcal{E}$. $\square$

05RD **Example 7.4.2.7.** Let $\mathcal{C}$ be a simplicial set and let $\mathrm{Path}[\mathcal{C}]_{\bullet}$ denote the simplicial path category of $\mathcal{C}$ (Notation 2.4.4.2). In this case, we can identify diagrams $\mathcal{F}, \mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$ with simplicially enriched functors $\mathcal{F}, \mathcal{F}' : \mathrm{Path}[\mathcal{C}]_{\bullet} \rightarrow \mathrm{Kan}$. Suppose that $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ arises from a natural transformation of simplicial functors $\gamma_0 : \mathcal{F}_0 \rightarrow \mathcal{F}'_0$. Applying Construction [?] to γ_0 , we obtain a map $\Gamma : \int_{\mathcal{C}} \mathcal{F} \rightarrow \int_{\mathcal{C}} \mathcal{F}'$ which is compatible with γ .

05RE **Example 7.4.2.8.** Let $\mathcal{C} = \mathbf{N}_{\bullet}(\mathcal{C}_0)$ be the nerve of a category $\mathcal{C}_0$. Suppose that $\mathcal{F}, \mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$ are obtained as the nerves of strictly commutative diagrams $\mathcal{F}_0, \mathcal{F}'_0 : \mathcal{C}_0 \rightarrow \mathrm{Kan}$, and let $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ be obtained from a natural transformation $\gamma_0 : \mathcal{F}_0 \rightarrow \mathcal{F}'_0$. Applying the weighted nerve construction to γ_0 , we obtain a functor $\Gamma : \mathbf{N}_{\bullet}^{\mathcal{F}_0}(\mathcal{C}_0) \rightarrow \mathbf{N}_{\bullet}^{\mathcal{F}'_0}(\mathcal{C}_0)$ which is compatible with γ .

Example 7.4.2.9. Let $\mathcal{C}$ be a simplicial set, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be the covariant transport representation of a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, and let $\gamma : \mathcal{F} \rightarrow \mathcal{F}$ be the identity transformation. Then the identity map $\Gamma : \mathcal{E} \rightarrow \mathcal{E}$ is compatible with γ . 05RF

Remark 7.4.2.10 (Composition). Let $\mathcal{C}$ be a simplicial set. Let $\mathcal{F}, \mathcal{F}', \mathcal{F}'' : \mathcal{C} \rightarrow \mathcal{S}$ be covariant transport representations for left fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$, $U' : \mathcal{E}' \rightarrow \mathcal{C}$, and $U'' : \mathcal{E}'' \rightarrow \mathcal{C}$. Suppose we are given a commutative diagram 05RG

$$\begin{array}{ccc} & \mathcal{F}' & \\ \gamma \nearrow & & \nwarrow \gamma' \\ \mathcal{F} & \xrightarrow{\gamma''} & \mathcal{F}'' \end{array}$$

in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{S})$. If $\Gamma : \mathcal{E} \rightarrow \mathcal{E}'$ is compatible with γ and $\Gamma' : \mathcal{E}' \rightarrow \mathcal{E}''$ is compatible with γ' , then the composite map $(\Gamma' \circ \Gamma) : \mathcal{E} \rightarrow \mathcal{E}''$ is compatible with γ'' .

The main content of Theorem 7.4.2.4 is contained in the following:

Proposition 7.4.2.11. Suppose we are given a commutative diagram of simplicial sets 05RH

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\Gamma} & \mathcal{E}' \\ & \searrow U & \swarrow U' \\ & \mathcal{C}, & \end{array}$$

where U and U' are left fibrations having covariant transport representations $\mathcal{F} = \text{Tr}_{\mathcal{E}/\mathcal{C}}$ and $\mathcal{F}' = \text{Tr}_{\mathcal{E}'/\mathcal{C}}$, respectively. Then there exists a natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ such that Γ is compatible with γ . Moreover, γ is unique up to homotopy.

Example 7.4.2.12. In the situation of Proposition 7.4.2.11, suppose that $\mathcal{C} = \mathbf{N}_{\bullet}(\mathcal{C}_0)$ be the nerve of a category $\mathcal{C}_0$, and that $\mathcal{F}$ and $\mathcal{F}'$ are given as the (homotopy coherent) nerves of the strict transport representations $\text{sTr}_{\mathcal{E}/\mathcal{C}_0}, \text{sTr}_{\mathcal{E}'/\mathcal{C}_0} : \mathcal{C}_0 \rightarrow \text{Kan}$. In this case, we can take $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ to be the (homotopy coherent) nerve of the natural transformation $\gamma_0 : \text{sTr}_{\mathcal{E}/\mathcal{C}_0} \rightarrow \text{sTr}_{\mathcal{E}'/\mathcal{C}_0}$ given by composition with Γ . See Examples 7.4.2.8 and 7.4.1.12. 05RJ

Proof of Theorem 7.4.2.4. Let $\mathcal{C}$ be a simplicial set. It follows from Proposition 7.4.2.6 (together with Example 7.4.2.9 and Remark 7.4.2.10) that there is a unique functor

$$\Theta : \text{hFun}(\mathcal{C}, \mathcal{S}) \rightarrow \text{hLFib}(\mathcal{C})$$

which is given on objects by the construction $\mathcal{F} \mapsto \int_{\mathcal{C}} \mathcal{F}$ and on morphisms by the construction $[\gamma] \mapsto [\Gamma]$, where $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ denotes a natural transformation and $\Gamma \in \text{Fun}_{/\mathcal{C}}(\int_{\mathcal{C}} \mathcal{F}, \int_{\mathcal{C}} \mathcal{F}')$ is chosen to be compatible with γ . It follows from Corollary 5.6.0.6 that the functor Θ is bijective on isomorphism classes: in particular, it is essentially surjective. To complete the proof, it suffices to show that Θ is fully faithful, which is a reformulation of Proposition 7.4.2.11. $\square$

Our proof of Proposition 7.4.2.11 will make use of the following reformulation of Definition 7.4.1.8:

03LT Proposition 7.4.2.13 (Covariant Transport as a Kan Extension). *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small left fibration of ∞ -categories, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ be a natural transformation. Then α exhibits $\mathcal{F}$ as covariant transport representation for U (in the sense of Definition 7.4.1.8) if and only if it exhibits $\mathcal{F}$ as a left Kan extension of $\underline{\Delta}^0_{\mathcal{E}}$ along U (in the sense of Variant 7.3.1.5).*

Proof. Using Proposition 7.3.4.1, we can reduce to the special case where the ∞ -category $\mathcal{C} = \{C\}$ consists of a single vertex. In this case, the desired result is a reformulation of Example 7.1.2.10. $\square$

05RK Variant 7.4.2.14. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of ∞ -categories and let κ be an uncountable cardinal. Suppose we are given a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ and a natural transformation $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$. If U is essentially κ -small, then the following conditions are equivalent:

- (1) The natural transformation α exhibits $\mathcal{F}$ as a covariant transport representation for U .
- (2) The natural transformation α exhibits $\mathcal{F}$ as a left Kan extension of the constant functor $\underline{\Delta}^0|_{\mathcal{E}}$ along U .

Beware that, if U is not assumed to be essentially κ -small, then it is possible for condition (2) to be satisfied while condition (1) is not (see Exercise 7.1.2.12).

03LV Corollary 7.4.2.15. *Let κ be an uncountable cardinal and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of ∞ -categories which is essentially κ -small. Then a functor $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ is a covariant transport representation for U (in the sense of Definition 5.6.5.1) if and only if it is a left Kan extension of the constant functor $\underline{\Delta}^0_{\mathcal{E}}$ along U .*

05RL Remark 7.4.2.16 (Existence of Covariant Transport Representations). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small cocartesian fibration of simplicial sets. In §5.6, we showed that U admits a covariant transport representation $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$, which is uniquely determined up

to isomorphism (Theorem 5.6.0.2). In the special case where $U : \mathcal{E} \rightarrow \mathcal{C}$ is a left fibration of ∞ -categories, we can give an alternative proof of this fact using the characterization of Proposition 7.4.2.13. By virtue of Corollary 7.4.2.15, it will suffice to show that the constant functor $\underline{\Delta}^0_{\mathcal{E}}$ admits a left Kan extension along U . Using the criterion of Proposition 7.3.4.4, we are reduced to showing that for every object $C \in \mathcal{C}$, the constant functor $\mathcal{E}_C \rightarrow \{\Delta^0\} \hookrightarrow \mathcal{S}$ admits a colimit, which follows from Example 7.1.2.10.

Corollary 7.4.2.17. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be a 05RM diagram, and let $\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}}$ be a natural transformation which exhibits $\mathcal{F}$ as a covariant transport representation for U . Then, for every diagram $\mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$, precomposition with α induces a homotopy equivalence of Kan complexes*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S}_{<\kappa})}(\mathcal{F}, \mathcal{G}) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}, \mathcal{S}_{<\kappa})}(\underline{\Delta}^0_{\mathcal{E}}, \mathcal{G}|_{\mathcal{E}}).$$

Proof. Combine Proposition 7.4.2.13 with the universal property of left Kan extensions (Proposition 7.3.6.1). $\square$

Proof of Proposition 7.4.2.11. Suppose we are given a commutative diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\Gamma} & \mathcal{E}' \\ & \searrow U & \swarrow U' \\ & \mathcal{C}, & \end{array}$$

where U and U' are left fibrations. Let $\mathcal{F}, \mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$ be diagrams and let

$$\alpha : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}|_{\mathcal{E}} \quad \alpha' : \underline{\Delta}^0_{\mathcal{E}'} \rightarrow \mathcal{F}'|_{\mathcal{E}'}$$

be natural transformations exhibiting $\mathcal{F}$ and $\mathcal{F}'$ as covariant transport representations for U and U' , respectively. The restriction of α' along Γ determines a morphism $\beta : \underline{\Delta}^0_{\mathcal{E}} \rightarrow \mathcal{F}'|_{\mathcal{E}}$. We wish to show that β can be realized as the composition of α with $\gamma|_{\mathcal{E}}$, for some natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{F}'$ which is uniquely determined up to homotopy. To prove this, it suffices to show that the map of Kan complexes

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{F}') \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{E}, \mathcal{S})}(\underline{\Delta}^0_{\mathcal{E}}, \mathcal{F}'|_{\mathcal{E}}) \quad \gamma \mapsto \gamma|_{\mathcal{E}} \circ \alpha$$

is bijective on connected components. In fact, this map is a homotopy equivalence: this is a special case of Corollary 7.4.2.17. $\square$

7.4.3 Colimits of Spaces

05RN Let $\mathcal{S}$ be the ∞ -category of spaces (Construction 5.5.1.1). Our goal in this section is to show that every small diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ admits a colimit $X = \varinjlim(\mathcal{F})$. More precisely, we will prove the following:

02VE **Proposition 7.4.3.1.** *Let $\mathcal{C}$ be a small simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be the covariant transport representation of a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ (Definition 5.6.5.1). Then an object $X \in \mathcal{S}$ is a colimit of $\mathcal{F}$ if and only if there exists a weak homotopy equivalence $\mathcal{E} \rightarrow X$.*

05RP **Remark 7.4.3.2.** The proof of Proposition 7.4.3.1 given in this section will proceed by reduction to the special case where $\mathcal{F}$ is the constant functor $\Delta^0_{\mathcal{C}}$, using the theory of Kan extensions developed in §7.3. In §7.4.5, we will formulate a more general result which describes the colimit of the covariant transport representation $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ for a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ which is not assumed to be a left fibration (see Proposition 7.4.5.1 and Remark 7.4.5.4). For this, we give a different proof which is independent of the results of this section (and does not use the theory of Kan extensions).

02VF **Corollary 7.4.3.3.** *Let $\mathcal{C}$ be a small simplicial set. Then any diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ admits a colimit in the ∞ -category $\mathcal{S}$. Moreover, a Kan complex X is a colimit of the diagram $\mathcal{F}$ if and only if there exists a weak homotopy equivalence $\int_{\mathcal{C}} \mathcal{F} \rightarrow X$.*

Proof. Apply Proposition 7.4.3.1 to the left fibration $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ of Example 5.6.2.9. $\square$

039K **Corollary 7.4.3.4.** *Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a (strictly commutative) diagram of Kan complexes indexed by $\mathcal{C}$. Then a Kan complex X is a colimit of the functor $N^{\mathrm{hc}}_{\bullet}(\mathcal{F}) : N_{\bullet}(\mathcal{C}) \rightarrow \mathcal{S}$ if and only if it is weakly homotopy equivalent to the weighted nerve $N^{\mathcal{F}}_{\bullet}(\mathcal{C})$ of Definition 5.3.3.1.*

Proof. Combine Proposition 7.4.3.1 with Example 5.6.5.6. $\square$

05RQ **Example 7.4.3.5.** Let $\mathcal{C}$ be a simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be the constant diagram $\Delta^0_{\mathcal{C}}$ taking the value $\Delta^0 \in \mathcal{S}$. Then $\mathcal{F}$ is a covariant transport representation for the left fibration $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$. In this case, Proposition 7.4.3.1 asserts that a Kan complex X is a colimit of $\mathcal{F}$ if and only if there exists a weak homotopy equivalence $\mathcal{C} \rightarrow X$, which is a special case of Example 7.1.2.10.

Following the convention of Remark 4.7.0.5, we can regard Proposition 7.4.3.1 as a special case of the following more general result:

05RR **Proposition 7.4.3.6.** *Let κ be an uncountable cardinal and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be the covariant transport representation of a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, where $\mathcal{E}$ is essentially κ -small. Then a Kan complex X is a colimit of $\mathcal{F}$ (in the ∞ -category $\mathcal{S}_{<\kappa}$) if and only if there exists a weak homotopy equivalence $\mathcal{E} \rightarrow X$.*

Proof. Using Proposition 5.6.7.2, we can reduce to the situation where $\mathcal{C}$ is an ∞ -category. In this case, Corollary 7.4.2.15 guarantees that $\mathcal{F}$ is a left Kan extension of the constant functor $\underline{\Delta}^0_{\mathcal{E}}$ along U . Applying Corollary 7.3.8.25, we see that an object $X \in \mathcal{S}_{<\kappa}$ is a colimit of $\mathcal{F}$ if and only if it is a colimit of the constant diagram $\underline{\Delta}^0_{\mathcal{E}}$. By virtue of Variant 7.1.2.11, this is equivalent to the existence of a weak homotopy equivalence $\mathcal{E} \rightarrow X$. $\square$

Example 7.4.3.7 (Colimits of Corepresentable Functors). Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞ -category which is essentially κ -small, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be a functor which is corepresentable by an object $X \in \mathcal{C}$. Then the colimit $\varinjlim(\mathcal{F})$ is contractible. To prove this, we observe that $\mathcal{F}$ is a covariant transport representation for the left fibration $\mathcal{C}_{X/} \rightarrow \mathcal{C}$ (Proposition 5.6.6.21). By virtue of Proposition 7.4.3.6, it will suffice to show that the coslice ∞ -category $\mathcal{C}_{X/}$ is weakly contractible, which follows from Corollary 4.6.7.26. 05RS

Corollary 7.4.3.8 (Size Estimates for Colimits). Let λ be an uncountable regular cardinal and let $\kappa = \text{cf}(\lambda)$ be the cofinality of κ . Then the ∞ -category $\mathcal{S}_{<\lambda}$ admits κ -small colimits, which are preserved by the inclusion functors $\mathcal{S}_{<\lambda} \hookrightarrow \mathcal{S}_{<\mu}$ for any $\mu \geq \lambda$. 05RT

Proof. Let $\mathcal{C}$ be a κ -small simplicial set; we wish to show that every diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\lambda}$ admits a colimit (which is preserved by the inclusion functors $\mathcal{S}_{<\lambda} \hookrightarrow \mathcal{S}_{<\mu}$ for $\mu \geq \lambda$). Choose a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ having $\mathcal{F}$ as its covariant transport representation (for example, we can take $\mathcal{E}$ to be the ∞ -category of elements $\int_{\mathcal{C}} \mathcal{F}$ (see Definition 5.6.2.1). Since U is essentially λ -small and $\mathcal{C}$ is κ -small, the ∞ -category $\mathcal{E}$ is essentially λ -small (Proposition 4.7.9.10). We can therefore choose a weak homotopy equivalence $\mathcal{E} \rightarrow X$, where X is a λ -small Kan complex. Applying Proposition 7.4.3.6, we conclude that X is a colimit of $\mathcal{F}$. $\square$

Warning 7.4.3.9 (Fake Colimits). Let λ be an uncountable cardinal and suppose we are given a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\lambda}$ indexed by a simplicial set $\mathcal{C}$. It follows from Variant 7.4.1.4 that if $\mathcal{F}$ admits a limit in the ∞ -category $\mathcal{S}_{<\lambda}$, then that limit is independent of λ : that is, it is automatically preserved by the inclusion functors $\mathcal{S}_{<\lambda} \hookrightarrow \mathcal{S}_{<\mu}$ for every cardinal $\lambda \geq \kappa$. Corollary 7.4.3.8 implies that the same result holds for colimits, provided that the simplicial set $\mathcal{C}$ is κ -small for $\kappa = \text{cf}(\lambda)$. Beware that this cardinality assumption cannot be omitted: if the simplicial set $\mathcal{C}$ is too large, then it is possible for a X to be a colimit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}_{<\lambda}$ which does not remain a colimit in $\mathcal{S}_{<\mu}$ for $\mu \gg \lambda$ (see Exercise 7.1.2.12). In this case, we will generally reserve the notation $\varinjlim(\mathcal{F})$ for the “true” colimit of $\mathcal{F}$ (computed in the ∞ -category $\mathcal{S}_{<\mu}$ for μ sufficiently large), characterized by the requirement that it is weakly homotopy equivalent to $\int_{\mathcal{C}} \mathcal{F}$. 05RU

Corollary 7.4.3.10. Let κ be an uncountable regular cardinal. Then the ∞ -category $\mathcal{S}_{<\kappa}$ admits κ -small colimits, which are preserved by the inclusion functors $\mathcal{S}_{<\kappa} \hookrightarrow \mathcal{S}_{<\lambda}$ for $\lambda \geq \kappa$. 05RV

04K3 **Proposition 7.4.3.11.** *Let $\mathcal{C}$ be an ∞ -category and let $F : \mathcal{C}' \rightarrow \mathcal{C}$ be a morphism of simplicial sets. The following conditions are equivalent:*

- (1) *The morphism F is right cofinal (Definition 7.2.1.1).*
- (2) *For every functor of ∞ -categories $G : \mathcal{C} \rightarrow \mathcal{D}$ which admits a colimit $X = \varinjlim(G)$, the object $X \in \mathcal{D}$ is also a colimit of the diagram $(G \circ F) : \mathcal{C}' \rightarrow \mathcal{D}$.*
- (3) *For every uncountable regular cardinal κ and every diagram $G : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ which admits a colimit $X = \varinjlim(G)$, the object $X \in \mathcal{S}_{<\kappa}$ is also a colimit of the diagram $(G \circ F) : \mathcal{C}' \rightarrow \mathcal{S}_{<\kappa}$.*
- (4) *For every uncountable regular cardinal κ and every corepresentable functor $G : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$, the colimit $\varinjlim(G \circ F)$ is contractible.*

Proof. The implication (1) $\Rightarrow$ (2) follows from Corollary 7.2.2.11, the implication (2) $\Rightarrow$ (3) is immediate, and the implication (3) $\Rightarrow$ (4) follows from Example 7.4.3.7. We will complete the proof by showing that (4) implies (1). Choose an uncountable regular cardinal κ such that K is κ -small and $\mathcal{C}$ is essentially κ -small. Fix an object $X \in \mathcal{C}$ and let $h^X : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be a functor corepresented by X (Theorem 5.6.6.13). Using Proposition 5.6.6.21, we see that $h^X \circ F$ is a covariant transport representation for the left fibration $K \times_{\mathcal{C}} \mathcal{C}_{X/} \rightarrow K$. If condition (4) is satisfied, then Proposition 7.4.3.6 guarantees that the simplicial set $K \times_{\mathcal{C}} \mathcal{C}_{X/}$ is weakly contractible. Allowing X to vary and applying the criterion of Theorem 7.2.3.1, we conclude that F is right cofinal. $\square$

03E7 **Corollary 7.4.3.12.** *Let $F : \mathcal{C}' \rightarrow \mathcal{C}$ be a morphism of simplicial sets, let κ be an uncountable regular cardinal for which $\mathcal{C}'$ and $\mathcal{C}$ are essentially κ -small, and let λ be a cardinal of exponential cofinality $\geq \kappa$. The following conditions are equivalent:*

- (1) *The morphism F is left cofinal.*
- (2) *For every ∞ -category $\mathcal{D}$ and every limit diagram $\overline{G} : \mathcal{C}^{\triangleleft} \rightarrow \mathcal{D}$, the composite map $(\overline{G} \circ F^{\triangleleft}) : \mathcal{C}'^{\triangleleft} \rightarrow \mathcal{D}$ is also a limit diagram.*
- (3) *For every limit diagram $\overline{G} : \mathcal{C}^{\triangleleft} \rightarrow \mathcal{S}_{<\lambda}$, the composite map $(\overline{G} \circ F^{\triangleleft}) : \mathcal{C}'^{\triangleleft} \rightarrow \mathcal{S}_{<\lambda}$ is also a limit diagram.*

Proof. The implication (1) $\Rightarrow$ (2) follows from Corollary 7.2.2.3 and the implication (2) $\Rightarrow$ (3) is immediate. We will complete the proof by showing that (3) implies (1). Assume that condition (3) is satisfied; we wish to show that the map $F^{\text{op}} : \mathcal{C}'^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is right cofinal. Without loss of generality, we may assume that $\mathcal{C}$ is a κ -small ∞ -category. For every object $X \in \mathcal{C}$, let $h_X : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}_{<\kappa}$ be the functor represented by X , set $G = h_X^{\text{op}}$, and let $\overline{G} : \mathcal{C}^{\triangleleft} \rightarrow (\mathcal{S}_{<\kappa})$ be an extension of G to a limit diagram (so that $\overline{G}$ carries the cone point of

$\mathcal{C}^\triangleleft$ to a contractible Kan complex, by virtue of Example 7.4.3.7). By virtue of Proposition 7.4.3.11, it will suffice to show that the composite map

$$\mathcal{C}'^\triangleleft \xrightarrow{F^\triangleleft} \mathcal{C}^\triangleleft \xrightarrow{\bar{G}} (\mathcal{S}_{<\kappa})^{\text{op}}$$

is also a limit diagram. Our assumption that $\lambda \geq \text{ecf}(\kappa)$ guarantees that the ∞ -category $\mathcal{S}_{<\kappa}$ is locally λ -small (Remark 5.5.4.14). Applying the criterion of Proposition 7.4.1.18, we are reduced to showing that for every representable functor $H : \mathcal{S}_{<\kappa}^{\text{op}} \rightarrow \mathcal{S}_{<\lambda}$, the composite map

$$\mathcal{C}'^\triangleleft \xrightarrow{F^\triangleleft} \mathcal{C}^\triangleleft \xrightarrow{\bar{G}} \mathcal{S}_{<\kappa}^{\text{op}} \xrightarrow{H} \mathcal{S}_{<\lambda}$$

is a limit diagram, which is a special case of assumption (3). $\square$

For some applications, we will need a more precise version of Proposition 7.4.3.6.

Proposition 7.4.3.13. *Let κ be an uncountable cardinal, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be a diagram, 05RW and let $\beta : \mathcal{F} \rightarrow \underline{X}_{\mathcal{C}}$ be a natural transformation. Suppose we are given a left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ and a commutative diagram*

$$\begin{array}{ccc} & \mathcal{F}|_{\mathcal{E}} & \\ \alpha \nearrow & & \searrow \beta|_{\mathcal{E}} \\ \underline{\Delta}_{\mathcal{E}}^0 & \xrightarrow{\gamma} & \underline{X}_{\mathcal{E}} \end{array}$$

in the ∞ -category $\text{Fun}(\mathcal{E}, \mathcal{S}_{<\kappa})$. Assume that $\mathcal{E}$ is essentially κ -small and that α exhibits $\mathcal{F}$ as a covariant transport representation for U (Definition 7.4.1.8). The following conditions are equivalent:

- (1) *The natural transformation β exhibits X as a colimit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}_{<\kappa}$.*
- (2) *The natural transformation γ determines a weak homotopy equivalence of simplicial sets $\mathcal{E} \rightarrow \text{Hom}_{\mathcal{S}_{<\kappa}}(\Delta^0, X)$.*

Proof. Using Variant 7.4.2.14, we see that α exhibits $\mathcal{F}$ as a left Kan extension of the constant diagram $\underline{\Delta}_{\mathcal{E}}^0$ along U . By virtue of Corollary 7.3.8.25, this is equivalent to the assertion that γ exhibits X as a colimit of the diagram $\underline{\Delta}_{\mathcal{E}}^0$. The equivalence of (1) and (2) now follows from Variant 7.1.2.11. $\square$

02VJ **Corollary 7.4.3.14.** *Suppose we are given a pullback diagram of small simplicial sets*

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright, \end{array}$$

where U and $\bar{U}$ are left fibrations. Choose an uncountable regular cardinal κ such that U and $\mathcal{C}$ are essentially κ -small, and let $\bar{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathcal{S}_{<\kappa}$ be a covariant transport representation for $\bar{U}$. The following conditions are equivalent:

- (1) *The inclusion map $\mathcal{E} \hookrightarrow \bar{\mathcal{E}}$ is a weak homotopy equivalence of simplicial sets.*
- (2) *The inclusion map $\mathcal{E} \hookrightarrow \bar{\mathcal{E}}$ is left cofinal.*
- (3) *The covariant transport representation $\bar{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathcal{S}_{<\kappa}$ is a colimit diagram.*

Proof. Let v denote the cone point of $\mathcal{C}^\triangleright = \mathcal{C} \star \{v\}$ and let $\bar{\mathcal{E}}_v = \{v\} \times_{\mathcal{C}^\triangleright} \bar{\mathcal{E}}$ denote the corresponding fiber of $\bar{\mathcal{E}}$. Since the inclusion map $\{v\} \hookrightarrow \mathcal{C}^\triangleright$ is right anodyne (Example 4.3.7.11), the inclusion $\iota : \bar{\mathcal{E}}_v \hookrightarrow \bar{\mathcal{E}}$ is also right anodyne (Corollary 7.2.3.13). In particular, ι is a weak homotopy equivalence of simplicial sets.

Let $q : \Delta^1 \times \mathcal{C}^\triangleright \rightarrow \mathcal{C}^\triangleright$ be the morphism of simplicial sets characterized by the requirement that $q|_{\{0\} \times \mathcal{C}^\triangleright}$ is the identity morphism and $q|_{\{1\} \times \mathcal{C}^\triangleright}$ is the constant morphism taking the value v . Set $X = \bar{\mathcal{F}}(v)$, so that the composition

$$\Delta^1 \times \mathcal{C}^\triangleright \xrightarrow{q} \mathcal{C}^\triangleright \xrightarrow{\bar{\mathcal{F}}} \mathcal{S}_{<\kappa}$$

can be identified with a natural transformation $\beta : \bar{\mathcal{F}} \rightarrow \underline{X}|_{\mathcal{C}^\triangleright}$.

Choose a natural transformation $\alpha : \underline{\Delta}^0_{\bar{\mathcal{E}}} \rightarrow \bar{\mathcal{F}}|_{\bar{\mathcal{E}}}$ which exhibits $\bar{\mathcal{F}}$ as a covariant transport representation for $\bar{U}$, and let $\gamma : \underline{\Delta}^0|_{\bar{\mathcal{E}}} \rightarrow \underline{X}_{\bar{\mathcal{E}}}$ be a composition of $\beta|_{\bar{\mathcal{E}}}$ with α . Then γ can be identified with a morphism of simplicial sets $T : \bar{\mathcal{E}} \rightarrow \text{Hom}_{\mathcal{S}_{<\kappa}}(\Delta^0, X)$. Our assumption on α guarantees that the composite map

$$\bar{\mathcal{E}}_v \xrightarrow{\iota} \bar{\mathcal{E}} \xrightarrow{T} X$$

is a weak homotopy equivalence of simplicial sets. We can therefore reformulate condition (1) as follows:

- (1') *The restriction $T|_{\mathcal{E}} : \mathcal{E} \rightarrow \text{Hom}_{\mathcal{S}_{<\kappa}}(\Delta^0, X)$ is a weak homotopy equivalence.*

Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$. Using Proposition 7.4.3.13, we see that (1') is equivalent to the requirement that the natural transformation $\beta|_{\mathcal{C}} : \mathcal{F} \rightarrow \underline{X}_{\mathcal{C}}$ exhibits X as a colimit of $\mathcal{F}$. The equivalence (1') $\Leftrightarrow$ (3) now follows from Remark 7.1.3.6.

The implication (2) $\Rightarrow$ (1) follows from Proposition 7.2.1.5. We will complete the proof by showing that (1) implies (2). monomorphism $\mathcal{C} \hookrightarrow \mathcal{C}'$, where $\mathcal{C}'$ is an ∞ -category. Then the induced map $\mathcal{C}^{\triangleright} \rightarrow \mathcal{C}'^{\triangleright}$ is also inner anodyne (Corollary 4.3.6.6); in particular, it is a categorical equivalence. Using Proposition 5.6.7.2 (and Remark 5.6.7.4), we can assume that $\overline{U}$ is the pullback of a left fibration $\overline{U}' : \overline{\mathcal{E}}' \rightarrow \mathcal{C}'^{\triangleright}$. Setting $\mathcal{E}' = \mathcal{C}' \times_{\mathcal{C}^{\triangleright}} \overline{\mathcal{E}}'$, we have a commutative diagram of inclusion maps

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \overline{\mathcal{E}} \\ \downarrow & & \downarrow \\ \mathcal{E}' & \longrightarrow & \overline{\mathcal{E}}', \end{array}$$

where the vertical maps are categorical equivalences (Corollary 5.6.7.6). Consequently, to prove that the inclusion map $\mathcal{E} \hookrightarrow \overline{\mathcal{E}}$ is left cofinal, it will suffice to show that the inclusion $\mathcal{E}' \hookrightarrow \overline{\mathcal{E}}'$ is left cofinal (Corollary 7.2.1.22). We may therefore replace $\overline{U}$ by the left fibration $\overline{U}' : \overline{\mathcal{E}}' \rightarrow \mathcal{C}'^{\triangleright}$, and thereby reduce to proving the implication (1) $\Rightarrow$ (2) under the assumption that $\mathcal{C}$ is an ∞ -category.

Let $\mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \overline{\mathcal{E}}_v$ denote the oriented fiber product of Definition 4.6.4.1, so that the diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \overline{\mathcal{E}}_v & \xrightarrow{\pi'} & \overline{\mathcal{E}}_v \\ \downarrow \pi & & \downarrow \iota \\ \mathcal{E} & \longrightarrow & \overline{\mathcal{E}} \end{array}$$

commutes up to homotopy. Assume that condition (1) is satisfied: that is, the lower horizontal map is a weak homotopy equivalence. Since π is a trivial Kan fibration and ι is a weak homotopy equivalence, it follows that π' is also a weak homotopy equivalence. For each vertex $X \in \overline{\mathcal{E}}_v$, we have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \{X\} & \longrightarrow & \{X\} \\ \downarrow & & \downarrow \\ \mathcal{E} \tilde{\times}_{\overline{\mathcal{E}}} \overline{\mathcal{E}}_v & \xrightarrow{\pi'} & \overline{\mathcal{E}}_v. \end{array} \tag{7.51}$$

048A

Since π' is an isofibration of ∞ -categories (Corollary 5.3.7.3), the diagram (7.51) is a categorical pullback square (Corollary 4.5.2.28). Because $\bar{\mathcal{E}}_v$ is a Kan complex, the diagram (7.51) is also a homotopy pullback square (Variant 4.5.2.12). Since π' is a weak homotopy equivalence, it follows that the upper horizontal map is also a weak homotopy equivalence: that is, the oriented fiber product $\mathcal{E} \tilde{\times}_{\bar{\mathcal{E}}} \{X\}$ is weakly contractible (Corollary 3.4.1.5). Condition (2) now follows by allowing the object X to vary and applying the criterion of Theorem 7.2.3.1 (together with Remark 7.2.3.2). $\square$

05JA Corollary 7.4.3.15. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of ∞ -categories, let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory, and set $\mathcal{E}^0 = \mathcal{E} \times_{\mathcal{C}} \mathcal{C}^0$. Let κ be an uncountable regular cardinal for which U and $\mathcal{C}$ are essentially κ -small. The following conditions are equivalent:*

- (1) *The covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ is left Kan extended from $\mathcal{C}^0$.*
- (2) *The inclusion functor $\mathcal{E}^0 \hookrightarrow \mathcal{E}$ is left cofinal.*

Proof. Fix an object $C \in \mathcal{C}$ and set $\mathcal{C}_{/C}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/C}$. Note that the inclusion map $\mathcal{C}_{/C}^0 \rightarrow \mathcal{C}_{/C}$ factors as a composition

$$\mathcal{C}_{/C}^0 \hookrightarrow (\mathcal{C}_{/C}^0)^{\triangleright} \xrightarrow{\lambda} \mathcal{C}_{/C},$$

where λ carries the cone point $(\mathcal{C}_{/C}^0)^{\triangleright}$ to the final object $\mathrm{id}_C \in \mathcal{C}_{/C}$. In particular, λ is right cofinal (Corollary 7.2.1.9). It follows that the induced map $\lambda_{\mathcal{E}} : \mathcal{E} \times_{\mathcal{C}} (\mathcal{C}_{/C}^0)^{\triangleright} \rightarrow \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$ is also right cofinal (Proposition 7.2.3.12); in particular, $\lambda_{\mathcal{E}}$ is a weak homotopy equivalence (Proposition 7.2.1.5). Combining this observation with Corollary 7.4.3.14, we see that the following conditions are equivalent:

- (1_C) *The covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ is left Kan extended from $\mathcal{C}^0$ at the object $C \in \mathcal{C}$.*
- (1'_C) *The inclusion map $\iota_C : \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}^0 \hookrightarrow \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$ is a weak homotopy equivalence.*

Choose an object $X \in \mathcal{E}$ satisfying $U(X) = C$ and set $\mathcal{E}_{/X}^0 = \mathcal{E}^0 \times_{\mathcal{E}} \mathcal{E}_{/X}$, so that we have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E}_{/X}^0 & \xrightarrow{\quad} & \mathcal{E}_{/X} \\ \downarrow & & \downarrow \\ \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}^0 & \xrightarrow{\quad \iota_C \quad} & \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C} \end{array} \tag{7.52}$$

Since U is a left fibration, the vertical maps in this diagram are Kan fibrations; it follows that (7.52) is also a homotopy pullback square (Example 3.4.1.3). In particular, if condition (1'_C)

is satisfied, then the inclusion map $\mathcal{E}_{/X}^0 \hookrightarrow \mathcal{E}_{/X}$ is a weak homotopy equivalence (Corollary 3.4.1.5), so that the ∞ -category $\mathcal{E}_{/X}^0$ is weakly contractible. Conversely, if $\mathcal{E}_{/X}^0$ is weakly contractible for *every* object $X \in \mathcal{C}$ satisfying $U(X) = C$, then ι_C is a weak homotopy equivalence: this follows from the observation that every connected component of $\mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$ has nonempty intersection with the fiber $\mathcal{E}_C = \mathcal{E} \times_{\mathcal{C}} \{C\}$. It follows that $(1'_C)$ can be reformulated as follows:

(2_C) For every object $X \in \mathcal{E}$ satisfying $U(X) = C$, the ∞ -category $\mathcal{E}_{/X}^0$ is weakly contractible.

The equivalence of (1) and (2) now follows from the equivalence $(1_C) \Leftrightarrow (2_C)$ by allowing the object $C \in \mathcal{C}$ to vary (and applying Theorem 7.2.3.1). $\square$

7.4.4 Limits of ∞ -Categories

Let $\mathcal{QC}$ denote the ∞ -category of (small) ∞ -categories (Construction 5.5.4.1). Our goal in this section is to show that the ∞ -category $\mathcal{QC}$ admits small limits (Corollary 7.4.4.3). Recall that, if $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration of simplicial sets, then $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ denotes the full subcategory of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ spanned by those sections of U which carry each edge of $\mathcal{C}$ to a U -cocartesian edge of $\mathcal{E}$ (Notation 5.3.1.10). We can state a preliminary version of our main result as follows:

Proposition 7.4.4.1. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of small simplicial sets and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a covariant transport representation for U . Then the diagram $\mathcal{F}$ has a limit in the ∞ -category $\mathcal{QC}$, given by the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U .* 05RX

Corollary 7.4.4.2. *Let $\mathcal{C}$ be a small simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram in the ∞ -category $\mathcal{QC}$. Then the ∞ -category of cocartesian sections $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$ is a limit of the diagram $\mathcal{F}$.* 02TK

Proof. Apply Proposition 7.4.4.1 to the cocartesian fibration $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$. $\square$

Corollary 7.4.4.3. *The ∞ -category $\mathcal{QC}$ admits small limits.* 02TL

Remark 7.4.4.4. Let $\mathcal{C}$ be a small simplicial set, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram, and let $\varprojlim(\mathcal{F})$ denote its limit (formed in the ∞ -category $\mathcal{QC}$). Assume that, for each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{F}(C)$ is a Kan complex. Then $\varprojlim(\mathcal{F})$ is also a Kan complex, which can be regarded as a limit of $\mathcal{F}$ in the subcategory $\mathcal{S} \subset \mathcal{QC}$. In particular, the inclusion functor $\mathcal{S} \hookrightarrow \mathcal{QC}$ preserves small limits. This is a special case of Variant 7.1.4.26, since $\mathcal{S}$ is a reflective subcategory of $\mathcal{QC}$ (Example 6.2.2.11). However, it can also be deduced directly from Corollary 7.4.4.2: the assumption that each $\mathcal{F}(C)$ is a Kan complex 05RY

guarantees that the projection map $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ is a left fibration (Example 5.6.2.9), so that $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F}) = \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$ is a Kan complex by virtue of Corollary 4.4.2.5.

05RZ Remark 7.4.4.5. Let $n \geq -2$ be an integer and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram having the property that, for each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{F}(C)$ is locally n -truncated. Then the limit $\varprojlim(\mathcal{F})$ is also locally n -truncated. This is a special case of Variant 7.1.4.26, since the locally n -truncated ∞ -categories span a reflective subcategory of $\mathcal{QC}$ (Variant 6.2.2.13). Alternatively, it can be deduced from the description of $\varprojlim(\mathcal{F})$ supplied by Proposition 7.4.4.1. If $\mathcal{F}$ is the covariant transport representation of a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, then U is essentially $(n+1)$ -categorical (Variant 5.1.5.17). It follows from Corollary 4.8.6.22 that the ∞ -category of sections $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is locally n -truncated, so that the full subcategory $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ is also locally n -truncated.

We will deduce Proposition 7.4.4.1 from a more precise result, which characterizes limit diagrams in the ∞ -category $\mathcal{QC}$.

02T8 Theorem 7.4.4.6 (Diffraction Criterion). *Let κ be an uncountable cardinal and suppose we are given a pullback diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\quad} & \overline{\mathcal{E}} \\ \downarrow U & & \downarrow \overline{U} \\ \mathcal{C} & \xrightarrow{\quad} & \mathcal{C}^{\triangleleft}, \end{array}$$

where U and $\overline{U}$ are essentially κ -small cocartesian fibrations. The following conditions are equivalent:

(1) *The restriction map*

$$\mathrm{Fun}_{/\mathcal{C}^{\triangleleft}}^{\mathrm{CCart}}(\mathcal{C}^{\triangleleft}, \overline{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞ -categories.

(2) *The covariant transport representation*

$$\mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^{\triangleleft}} : \mathcal{C}^{\triangleleft} \rightarrow \mathcal{QC}_{<\kappa}$$

of Notation 5.6.5.16 is a limit diagram in the ∞ -category $\mathcal{QC}_{<\kappa}$.

05S0 Remark 7.4.4.7. In the situation of Theorem 7.4.4.6, condition (1) does not depend on the cardinal κ . It follows that if a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}_{<\kappa}$ admits a limit in the ∞ -category $\mathcal{QC}_{<\kappa}$, then that limit is preserved by the inclusion functors $\mathcal{QC}_{<\kappa} \hookrightarrow \mathcal{QC}_{<\lambda}$ for $\lambda \geq \kappa$.

Remark 7.4.4.8. In the situation of Theorem 7.4.4.6, the restriction map $\mathrm{Fun}_{/\mathcal{C}^\triangleleft}^{\mathrm{CCart}}(\mathcal{C}^\triangleleft, \overline{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ is automatically an isofibration of ∞ -categories (Remark 5.3.1.18). Using Proposition 4.5.5.20, we see that condition (1) of Theorem 7.4.4.6 is equivalent to the following *a priori* stronger condition:

(1') The restriction map

$$\mathrm{Fun}_{/\mathcal{C}^\triangleleft}^{\mathrm{CCart}}(\mathcal{C}^\triangleleft, \overline{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$$

is a trivial Kan fibration of simplicial sets.

Proof of Theorem 7.4.4.6. Choose an uncountable cardinal λ of exponential cofinality $\geq \kappa$, so that the ∞ -category $\mathcal{QC}_{<\kappa}$ is locally λ -small (Remark 5.5.4.14). For every object $\mathcal{K} \in \mathcal{QC}_{<\kappa}$, let $h^\mathcal{K} : \mathcal{QC}_{<\kappa} \rightarrow \mathcal{S}_{<\lambda}$ be the functor corepresented by $\mathcal{K}$. By virtue of Proposition 5.6.6.17, we may assume that $h^\mathcal{K}$ is obtained from the homotopy coherent nerve of the simplicial functor

$$\mathrm{QCat} \rightarrow \mathrm{Kan} \quad \mathcal{D} \mapsto \mathrm{Fun}(\mathcal{K}, \mathcal{D})^\simeq.$$

By virtue of Proposition 7.4.1.18, it will suffice to show that the following conditions are equivalent:

(1 $_\mathcal{K}$) The restriction map

$$\mathrm{Fun}(\mathcal{K}, \mathrm{Fun}_{/\mathcal{C}^\triangleleft}^{\mathrm{CCart}}(\mathcal{C}^\triangleleft, \overline{\mathcal{E}}))^\simeq \rightarrow \mathrm{Fun}(\mathcal{K}, \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}))^\simeq$$

is a homotopy equivalence of Kan complexes.

(2 $_\mathcal{K}$) The composition $h^\mathcal{K} \circ \mathrm{Tr}_{\overline{\mathcal{E}}/\mathcal{C}^\triangleleft}$ is a limit diagram in the ∞ -category $\mathcal{S}_{<\lambda}$.

Using Example 5.6.5.9, we can replace U by the projection map

$$\mathcal{C}^\triangleleft \times_{\mathrm{Fun}(\mathcal{K}, \mathcal{C}^\triangleleft)} \mathrm{Fun}(\mathcal{K}, \overline{\mathcal{E}}) \rightarrow \mathcal{C}^\triangleleft$$

and thereby reduce to proving the equivalence (1 $_\mathcal{K}$) $\Leftrightarrow$ (2 $_\mathcal{K}$) in the special case where $\mathcal{K} = \Delta^0$. In this case, the desired result follows by applying Proposition 7.4.1.16 to the underlying left fibration of U (see Example 5.6.5.8). $\square$

It will be convenient to reformulate condition (1) of Theorem 7.4.4.6.

Construction 7.4.4.9 (Covariant Diffraction). Suppose we are given a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\quad} & \overline{\mathcal{E}} \\ \downarrow U & & \downarrow \overline{U} \\ \mathcal{C} & \xrightarrow{\quad} & \mathcal{C}^\triangleleft, \end{array}$$

where U and $\bar{U}$ are cocartesian fibrations. Let $\bar{\mathcal{E}}_{\mathbf{0}}$ denote the fiber of $\bar{U}$ over the cone point $\mathbf{0} \in \mathcal{C}^{\triangleleft}$. We then have restriction maps

$$\bar{\mathcal{E}}_{\mathbf{0}} \xleftarrow{\text{ev}} \text{Fun}_{/\mathcal{C}^{\triangleleft}}^{\text{CCart}}(\mathcal{C}^{\triangleleft}, \bar{\mathcal{E}}) \xrightarrow{\theta} \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E}),$$

where ev is a trivial Kan fibration (Corollary 5.3.1.23). Composing θ with a section of ev , we obtain a functor of ∞ -categories $\text{Df} : \bar{\mathcal{E}}_{\mathbf{0}} \rightarrow \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ which is well-defined up to isomorphism. We will refer to Df as the *covariant diffraction functor* associated to the cocartesian fibration $\bar{U}$.

02TE Remark 7.4.4.10. In the situation of Construction 7.4.4.9, let $C \in \mathcal{C}$ be a vertex and let $\text{ev}_C : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E}) \rightarrow \mathcal{E}_C$ be the evaluation functor, given on objects by $\text{ev}_C(F) = F(C)$. Then the composition

$$\bar{\mathcal{E}}_{\mathbf{0}} \xrightarrow{\text{Df}} \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E}) \xrightarrow{\text{ev}_C} \mathcal{E}_C$$

is given by covariant transport along the unique edge $\mathbf{0} \rightarrow C$ of $\mathcal{C}^{\triangleleft}$.

02TF Remark 7.4.4.11. Suppose we are given a pullback diagram of small simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^{\triangleleft}. \end{array}$$

Then the covariant diffraction functor $\text{Df} : \bar{\mathcal{E}}_{\mathbf{0}} \rightarrow \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ of Construction 7.4.4.9 is an equivalence of ∞ -categories if the restriction functor

$$\text{Fun}_{/\mathcal{C}^{\triangleleft}}^{\text{CCart}}(\mathcal{C}^{\triangleleft}, \bar{\mathcal{E}}) \rightarrow \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞ -categories.

We now show that there exists a good supply of cocartesian fibrations which satisfy the hypotheses of Theorem 7.4.4.6.

02TG Proposition 7.4.4.12. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then there exists a pullback diagram*

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^{\triangleleft}, \end{array}$$

where $\overline{U}$ is a cocartesian fibration and the restriction map

$$\mathrm{Fun}_{/\mathcal{C}^\triangleleft}^{\mathrm{CCart}}(\mathcal{C}^\triangleleft, \overline{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞ -categories.

Proof. Let $\mathrm{ev} : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C} \rightarrow \mathcal{E}$ denote the evaluation morphism (given on vertices by the formula $\mathrm{ev}(F, C) = F(C)$), and let

$$\mathcal{E}' = (\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}) \star_{\mathcal{E}} \mathcal{E}$$

denote the relative join of Construction 5.2.3.1. Note that we have a canonical map

$$U' : \mathcal{E}' = (\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}) \star_{\mathcal{E}} \mathcal{E} \rightarrow \mathcal{C} \star_{\mathcal{C}} \mathcal{C} \simeq \Delta^1 \times \mathcal{C}.$$

Let $\pi : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C} \rightarrow \mathcal{C}$ be given by projection onto the second factor. Note that π is a cocartesian fibration, and that an edge of the product $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}$ is π -cocartesian if and only if its image in $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ is an isomorphism. It follows that the ev carries π -cocartesian edges of $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}$ to U -cocartesian edges of $\mathcal{E}$. Applying Lemma 5.2.3.17, we deduce that U' is a cocartesian fibration. By construction, we can identify $\mathcal{E}$ with the inverse image of $\{1\} \times \mathcal{C}$ under U' .

Let $\mathcal{E}''$ denote the pushout

$$(\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}^\triangleleft) \amalg_{(\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}^\triangleleft)} \mathcal{E}'.$$

Amalgamating U' with the projection map $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}^\triangleleft \rightarrow \mathcal{C}^\triangleleft$, we obtain a morphism of simplicial sets $U'' : \mathcal{E}'' \rightarrow K$, where K denotes the pushout $(\{0\} \times \mathcal{C})^\triangleleft \amalg_{(\{0\} \times \mathcal{C})} (\Delta^1 \times \mathcal{C})$. It follows from Proposition 5.1.4.8 that U'' is also a cocartesian fibration.

Let us abuse notation by identifying K with its image in the simplicial set $(\Delta^1 \times \mathcal{C})^\triangleleft$. Since the inclusion map $\{0\} \times \mathcal{C} \hookrightarrow \Delta^1 \times \mathcal{C}$ is left anodyne (Proposition 4.2.5.3), the inclusion $K \hookrightarrow (\Delta^1 \times \mathcal{C})^\triangleleft$ is inner anodyne (Example 4.3.6.5). Applying Proposition 5.6.7.2, we can write U'' as the pullback of a cocartesian fibration $U''' : \mathcal{E}''' \rightarrow (\Delta^1 \times \mathcal{C})^\triangleleft$. We then have a commutative diagram of simplicial sets

$$\begin{array}{ccccccc} \mathcal{E} & \longrightarrow & \mathcal{E}' & \longrightarrow & \mathcal{E}'' & \longrightarrow & \mathcal{E}''' \\ \downarrow U & & \downarrow U' & & \downarrow U'' & & \downarrow U''' \\ \{1\} \times \mathcal{C} & \longrightarrow & \Delta^1 \times \mathcal{C} & \longrightarrow & K & \longrightarrow & (\Delta^1 \times \mathcal{C})^\triangleleft, \end{array}$$

where each square is a pullback and each vertical map is a cocartesian fibration. Let $\bar{\mathcal{E}}$ denote the pullback $(\{1\} \times \mathcal{C})^\triangleleft \times_{(\Delta^1 \times \mathcal{C})^\triangleleft} \mathcal{E}'''$, so that U''' restricts to a cocartesian fibration $\bar{U} : \bar{\mathcal{E}} \rightarrow (\{1\} \times \mathcal{C})^\triangleleft$. We will complete the proof by showing that the commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\quad} & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \{1\} \times \mathcal{C} & \xrightarrow{\quad} & (\{1\} \times \mathcal{C})^\triangleleft \end{array}$$

satisfies the requirements of Proposition 7.4.4.12.

For every simplicial subset $A \subseteq (\Delta^1 \times \mathcal{C})^\triangleleft$, let $\mathcal{D}(A)$ denote the ∞ -category

$$\mathrm{Fun}_{/A}^{\mathrm{CCart}}(A, A \times_{(\Delta^1 \times \mathcal{C})^\triangleleft} \mathcal{E}''').$$

Let $\mathbf{0}$ denote the cone point of $(\Delta^1 \times \mathcal{C})^\triangleleft$. Note that we have a commutative diagram of restriction functors

$$\begin{array}{ccc} \mathcal{D}((\Delta^1 \times \mathcal{C})^\triangleleft) & \xrightarrow{\alpha'} & \mathcal{D}((\{1\} \times \mathcal{C})^\triangleleft) \\ \downarrow \beta & & \downarrow \alpha \\ \mathcal{D}(K) & \xrightarrow{\beta'} & \mathcal{D}(\{1\} \times \mathcal{C}) \\ \downarrow \gamma & & \\ \mathcal{D}(\{\mathbf{0}\}) & & \end{array}$$

We wish to show that α is an equivalence of ∞ -categories. Since the inclusion $K \hookrightarrow (\Delta^1 \times \mathcal{C})^\triangleleft$ is inner anodyne (as noted above) and the inclusion $(\{1\} \times \mathcal{C})^\triangleleft \hookrightarrow (\Delta^1 \times \mathcal{C})^\triangleleft$ is left anodyne (Lemma 4.3.7.8), the morphisms α' and β are trivial Kan fibrations (Proposition 5.3.1.21). It will therefore suffice to show that β' is an equivalence of ∞ -categories.

Amalgamating the map

$$\begin{aligned} \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \Delta^1 \times \mathcal{C} &\simeq (\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}) \star_{(\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C})} (\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}) \\ &\rightarrow (\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}) \star_{\mathcal{E}} \mathcal{E} \\ &= \mathcal{E}' \end{aligned}$$

with the identity on $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times \mathcal{C}^\triangleleft$, we obtain a morphism of simplicial sets $F : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times K \rightarrow \mathcal{E}''$. If e is an edge of the product $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \times K$ whose image in

$\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ is an isomorphism, then $F(e)$ is a U'' -cocartesian edge of $\mathcal{E}''$. We can therefore identify F with a morphism of simplicial sets $f : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \rightarrow \mathcal{D}(K)$. Unwinding the definitions, we see that $\beta' \circ f$ is an isomorphism of simplicial sets. Consequently, to show that β' is an equivalence of ∞ -categories, it will suffice to show that f is an equivalence of ∞ -categories. Similarly, the composite map $\gamma \circ f$ is an isomorphism, so we are reduced to proving that γ is an equivalence of ∞ -categories. Since β is a trivial Kan fibration, this is equivalent to the assertion that $\gamma \circ \beta$ is an equivalence of ∞ -categories, which is a special case of Corollary 5.3.1.23. $\square$

Remark 7.4.4.13. Let λ be an uncountable regular cardinal and let $\kappa = \mathrm{ecf}(\lambda)$ denote its exponential cofinality. In the situation of Proposition 7.4.4.12, suppose that the cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is essentially λ -small and that the simplicial set $\mathcal{C}$ is κ -small. Then fiber of $\bar{U}$ over the cone point of $\mathcal{C}^\triangleleft$ is equivalent to the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$, which is also essentially λ -small (Variant 4.7.9.11). It follows that the cocartesian fibration $\bar{U}$ is essentially λ -small. 02TH

Proof of Proposition 7.4.4.1. Let $\mathcal{C}$ be a small simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be the covariant transport representation for a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$. Using Proposition 7.4.4.12, we can choose a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\quad} & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \xrightarrow{\quad} & \mathcal{C}^\triangleleft, \end{array}$$

where $\bar{U}$ is a cocartesian fibration and the restriction map

$$\mathrm{Fun}_{/\mathcal{C}^\triangleleft}^{\mathrm{CCart}}(\mathcal{C}^\triangleleft, \bar{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞ -categories. It follows from Remark 7.4.4.13 that the cocartesian fibration $\bar{U}$ is essentially small, so that $\mathcal{F}$ admits an extension $\bar{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathcal{QC}$ which is a covariant transport representation for $\bar{U}$ (Corollary 5.6.5.13). Applying Theorem 7.4.4.6, we see that $\bar{\mathcal{F}}$ is a limit diagram in $\mathcal{QC}$. In particular, it carries the cone point of $\mathcal{C}^\triangleleft$ to an ∞ -category $\mathcal{D}$ which is a limit of the diagram $\mathcal{F}$. By virtue of Remark 7.4.4.11, the ∞ -category $\mathcal{D}$ is equivalent to the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U . $\square$

Variant 7.4.4.14. Let λ be an uncountable cardinal of exponential cofinality $\kappa = \mathrm{ecf}(\lambda)$ and suppose we are given a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}_{<\lambda}$, where $\mathcal{C}$ is a κ -small simplicial set. It follows from the proof of Proposition 7.4.4.1 (together with Remark 7.4.4.13) that the 05S1

diagram $\mathcal{F}$ admits a limit $\varprojlim(\mathcal{F})$, which can be identified with $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ for any cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ with covariant transport representation $\mathcal{F}$ (for example, we can take $\mathcal{E} = \int_{\mathcal{C}} \mathcal{F}$). In particular, the ∞ -category $\mathcal{QC}_{<\lambda}$ admits κ -small limits, which are preserved by the inclusion functors $\mathcal{QC}_{<\lambda} \hookrightarrow \mathcal{QC}_{<\mu}$ for every $\mu \geq \lambda$.

We close this section by recording some consequences of Proposition 7.4.4.1 (and its proof).

06B4 Proposition 7.4.4.15. *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram of ∞ -categories having a limit $\varprojlim(\mathcal{F})$, let K be a simplicial set, and suppose we are given a diagram $\bar{q} : K^{\triangleright} \rightarrow \varprojlim(\mathcal{F})$. For each vertex $C \in \mathcal{C}$, let $\bar{q}_C$ denote the composition of $\bar{q}$ with the natural map $\varprojlim(\mathcal{F}) \rightarrow \mathcal{F}(C)$. If each $\bar{q}_C$ is a colimit diagram in the ∞ -category $\mathcal{F}(C)$, then $\bar{q}$ is a colimit diagram in the ∞ -category $\varprojlim(\mathcal{F})$.*

Proof. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration having covariant transport representation $\mathcal{F}$ (for example, we can take $\mathcal{E} = \int_{\mathcal{C}} \mathcal{F}$). Using Proposition 7.4.4.1, we can identify $\varprojlim(\mathcal{F})$ with the ∞ -category $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U . For each object $C \in \mathcal{C}$, our assumption on $\bar{q}_C$ guarantees that the evaluation map $\text{ev}_C : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E}) \rightarrow \mathcal{E}_C$ carries $\bar{q}$ to a colimit diagram in the ∞ -category $\mathcal{E}_C$ (see Remark 7.4.4.10), which remains a colimit diagram after applying the covariant transport functor $f_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ associated to any edge $f : C \rightarrow C'$ of $\mathcal{C}$. Applying Corollary 7.1.10.3, we deduce that $\bar{q}$ is a colimit diagram in the ∞ -category of sections $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$, and therefore also in the full subcategory $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$. $\square$

06B5 Proposition 7.4.4.16. *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram having a limit $\varprojlim(\mathcal{F})$ and let $q : K \rightarrow \varprojlim(\mathcal{F})$ be a diagram. Assume that:*

- (a) *For each vertex $C \in \mathcal{C}$, the diagram $q_C : K \rightarrow \varprojlim(\mathcal{F}) \rightarrow \mathcal{F}(C)$ admits a colimit in the ∞ -category $\mathcal{F}(C)$.*
- (b) *For every edge $e : C \rightarrow D$ of $\mathcal{C}$, the functor $\mathcal{F}(e) : \mathcal{F}(C) \rightarrow \mathcal{F}(D)$ preserves the colimit of the diagram q_C .*

Then the diagram q admits a colimit in the ∞ -category $\varprojlim(\mathcal{F})$. Moreover, a diagram $\bar{q} : K^{\triangleright} \rightarrow \varprojlim(\mathcal{F}(C))$ extending q is a colimit diagram if and only if it satisfies the following condition:

- (*) *For every vertex $C \in \mathcal{C}$, the composition $K^{\triangleright} \rightarrow \varprojlim(\mathcal{F}) \rightarrow \mathcal{F}(C)$ is a colimit diagram in the ∞ -category $\mathcal{F}(C)$.*

Proof. As in the proof of Proposition 7.4.4.15, we may assume that $\mathcal{F}$ is the covariant transport representation of a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, and that $\varprojlim(\mathcal{F})$ is the ∞ -category $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U . Combining assumptions (a) and (b) with

Corollary 7.1.10.3, we deduce that q can be extended to a diagram $\bar{q} : K^\triangleright \rightarrow \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ satisfying condition (*). Any such extension is automatically a colimit diagram (Proposition 7.4.4.15). Conversely, any colimit diagram $\bar{q}' : K^\triangleright \rightarrow \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{C}, \mathcal{E})$ extending q is isomorphic to $\bar{q}$, and therefore also satisfies condition (*). $\square$

Corollary 7.4.4.17. *Let K be a simplicial set and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram of ∞ -categories satisfying the following conditions:*

- (a) *For each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{F}(C)$ admits K -indexed colimits.*
- (b) *For each edge $e : C \rightarrow C'$ of $\mathcal{C}$, the functor $\mathcal{F}(e) : \mathcal{F}(C) \rightarrow \mathcal{F}(C')$ preserves K -indexed limits.*

Then the ∞ -category $\varinjlim(\mathcal{F})$ admits K -indexed colimits. Moreover, a map $\bar{q} : K^\triangleright \rightarrow \varinjlim(\mathcal{F})$ is a colimit diagram if and only if its image in $\mathcal{F}(C)$ is a colimit diagram, for each $C \in \mathcal{C}$.

7.4.5 Colimits of ∞ -Categories

Let $\mathcal{QC}$ denote the ∞ -category of (small) ∞ -categories (Construction 5.5.4.1). Our goal in this section is to show that $\mathcal{QC}$ admits small colimits: that is, every diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ indexed by a small simplicial set $\mathcal{C}$ admits a colimit in $\mathcal{QC}$. In the situation where $\mathcal{F}(C)$ is a Kan complex for each $C \in \mathcal{C}$, this follows from the results of §7.4.3: if we choose a weak homotopy equivalence $T : \int_{\mathcal{C}} \mathcal{F} \rightarrow X$, where X is a Kan complex, then X is a colimit of $\mathcal{F}$ in the ∞ -category $\mathcal{S}$ (Proposition 7.4.3.1), and therefore also in the ∞ -category $\mathcal{QC}$ (Remark 7.4.5.4). Recall that T is a weak homotopy equivalence if and only if it exhibits X as a localization $(\int_{\mathcal{C}} \mathcal{F})[W^{-1}]$, where W is the collection of all edges of the simplicial set $\int_{\mathcal{C}} \mathcal{F}$ (Proposition 6.3.1.21). This is a special case of the following more general assertion:

Proposition 7.4.5.1. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration between small simplicial sets, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a covariant transport representation of U . Then the diagram $\mathcal{F}$ admits a colimit in $\mathcal{QC}$. Moreover, an object $\mathcal{D} \in \mathcal{QC}$ is a colimit of the diagram $\mathcal{F}$ if and only if it is equivalent to the localization $\mathcal{E}[W^{-1}]$, where W is the collection of all U -cocartesian morphisms of $\mathcal{E}$.*

Corollary 7.4.5.2. *Let $\mathcal{C}$ be a small simplicial set, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram, let $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ denote the projection map, and let W be the collection of all U -cocartesian morphisms of $\int_{\mathcal{C}} \mathcal{F}$. Then the localization $(\int_{\mathcal{C}} \mathcal{F})[W^{-1}]$ is a colimit of the diagram $\mathcal{F}$ in the ∞ -category $\mathcal{QC}$.*

Proof. Apply Proposition 7.4.5.1 in the case $\mathcal{E} = \int_{\mathcal{C}} \mathcal{F}$. $\square$

Corollary 7.4.5.3. *The ∞ -category $\mathcal{QC}$ admits small colimits.*

02V1

05S3 Remark 7.4.5.4. Let $\mathcal{C}$ be a small simplicial set, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ be a diagram, and let $\varinjlim(\mathcal{F})$ denote its colimit (formed in the ∞ -category $\mathcal{QC}$). Assume that, for each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{F}(C)$ is a Kan complex. Then $\varinjlim(\mathcal{F})$ is also a Kan complex, which can be regarded as a limit of $\mathcal{F}$ in the subcategory $\mathcal{S} \subset \mathcal{QC}$. In particular, the inclusion functor $\mathcal{S} \hookrightarrow \mathcal{QC}$ preserves small colimits. This is a special case of Variant 7.1.4.26, since $\mathcal{S}$ is a coreflective subcategory of $\mathcal{QC}$ (Example 6.2.2.11). However, it can also be deduced directly from Corollary 7.4.5.2: the assumption that each $\mathcal{F}(C)$ is a Kan complex guarantees that the projection map $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ is a left fibration (Example 5.6.2.9). In particular, every edge of the simplicial set $\int_{\mathcal{C}} \mathcal{F}$ is U -cocartesian (Example 5.1.1.3), so that the localization $(\int_{\mathcal{C}} \mathcal{F})[W^{-1}]$ is automatically a Kan complex (Proposition 6.3.1.21).

039J Corollary 7.4.5.5. Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QC}\mathbf{at}$ be a (strictly commutative) diagram of ∞ -categories indexed by $\mathcal{C}$. Let $U : \mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow \mathbf{N}_{\bullet}(\mathcal{C})$ be the cocartesian fibration of Definition 5.3.3.1, and let W be the collection of U -cocartesian morphisms of $\mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C})$. Then the localization $\mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C})[W^{-1}]$ is a colimit of the diagram $\mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathcal{F}) : \mathbf{N}_{\bullet}(\mathcal{C}) \rightarrow \mathcal{QC}$.

Proof. Combine Proposition 7.4.5.1 with Example 5.6.5.6. $\square$

05ZW Example 7.4.5.6. Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors between small ∞ -categories, and let $\mathcal{E}$ denote the oriented fiber product $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$. It follows from Corollary 5.3.7.3 that projection onto the second factor determines a cocartesian fibration of ∞ -categories $U : \mathcal{E} \rightarrow \mathcal{C}_1$, which admits a covariant transport representation

$$\mathrm{Tr}_{\mathcal{E}/\mathcal{C}_1} : \mathcal{C}_1 \rightarrow \mathcal{QC} \quad (C \in \mathcal{C}_1) \mapsto (\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \{C\}).$$

Now suppose that the functor F_1 is a right fibration. In this case, Corollary 6.2.4.8 guarantees that the homotopy fiber product $\mathcal{E}' = \mathcal{C}_0 \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C}_1$ is a coreflective subcategory of $\mathcal{E}$. Moreover, a morphism in $\mathcal{E}$ is a $\mathcal{E}'$ -colocal equivalence if and only if it is U -cocartesian. It follows that the inclusion functor $\mathcal{E}' \hookrightarrow \mathcal{E}$ admits a right adjoint $G : \mathcal{E} \rightarrow \mathcal{E}'$ (Proposition 6.2.2.18), and that G exhibits $\mathcal{E}'$ as a localization of $\mathcal{E}$ with respect to the collection of U -cocartesian morphisms (Example 6.3.3.10). Applying Proposition 7.4.5.1, we deduce that $\mathcal{E}'$ is a colimit of the transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}_1}$ in the ∞ -category $\mathcal{QC}$. Stated more informally, we have an equivalence of ∞ -categories

$$\varinjlim_{C \in \mathcal{C}_1} (\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \{C\}) \xrightarrow{\sim} (\mathcal{C}_0 \times_{\mathcal{C}} \mathcal{C}_1).$$

05ZX Example 7.4.5.7. Let $\mathcal{C}$ be a small ∞ -category. Applying Example 7.4.5.6 in the special case $\mathcal{C}_0 = \mathcal{C} = \mathcal{C}_1$, we deduce that $\mathcal{C}$ can be realized as the colimit of a diagram

$$\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC} \quad C \mapsto \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\},$$

given by covariant transport for the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$.

We will deduce Proposition 7.4.5.1 from a more precise result, which characterizes cocartesian fibrations $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ for which the covariant transport representation $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}$ is a colimit diagram. Let $\mathbf{1} \in \mathcal{C}^\triangleright$ denote the cone point. For every vertex $C \in \mathcal{C}$, there is a unique edge $e_C : C \rightarrow \mathbf{1}$ in $\mathcal{C}^\triangleright$. Covariant transport along e_C determines a functor

$$e_{C!} : \overline{\mathcal{E}}_C = \{C\} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}} \rightarrow \{\mathbf{1}\} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}} = \overline{\mathcal{E}}_1.$$

In what follows, it will be convenient to amalgamate the functors $\{e_{C!}\}_{C \in \mathcal{C}}$ into a single morphism $\text{Rf} : \mathcal{C} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}} \rightarrow \overline{\mathcal{E}}_1$, which we will refer to as the *covariant refraction diagram*.

Definition 7.4.5.8. Let $\mathcal{C}$ be a simplicial set and let $\mathbf{1}$ denote the cone point of the simplicial set $\mathcal{C}^\triangleright \simeq \mathcal{C} \star \{\mathbf{1}\}$. Suppose that we are given a cocartesian fibration $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$, and set

$$\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}} \quad \overline{\mathcal{E}}_1 = \{\mathbf{1}\} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}}.$$

We will say that a morphism $\text{Rf} : \mathcal{E} \rightarrow \overline{\mathcal{E}}_1$ is a *covariant refraction diagram* if there exists a morphism of simplicial sets $H : \Delta^1 \times \mathcal{E} \rightarrow \overline{\mathcal{E}}$ satisfying the following conditions:

- The restriction $H|_{\{0\} \times \mathcal{E}}$ is the identity morphism from $\mathcal{E}$ to itself.
- The restriction $H|_{\{1\} \times \mathcal{E}}$ is equal to Rf .
- For every vertex $X \in \mathcal{E}$, the restriction $H|_{\Delta^1 \times \{X\}}$ is a $\overline{U}$ -cocartesian edge of $\overline{\mathcal{E}}$.

Remark 7.4.5.9. In the situation of Definition 7.4.5.8, suppose that $\text{Rf} : \mathcal{E} \rightarrow \overline{\mathcal{E}}_1$ is a covariant refraction diagram. Then, for every vertex $C \in \mathcal{C}$, the restriction $\text{Rf}|_{\mathcal{E}_C} : \mathcal{E}_C \rightarrow \overline{\mathcal{E}}_1$ is given by covariant transport along the unique edge $e_C : C \rightarrow \mathbf{1}$ of $\mathcal{C}^\triangleright$, in the sense of Definition 5.2.2.4.

Proposition 7.4.5.10. Let $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ be a cocartesian fibration of simplicial sets, set $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}}$, and let $\mathbf{1}$ denote the cone point of $\mathcal{C}^\triangleright$. Then:

- (1) There exists a covariant refraction diagram $\text{Rf} : \mathcal{E} \rightarrow \overline{\mathcal{E}}_1$ (Definition 7.4.5.8).
- (2) Let $F : \mathcal{E} \rightarrow \overline{\mathcal{E}}_1$ be any morphism of simplicial sets. Then F is a covariant refraction diagram if and only if it is isomorphic to Rf as an object of the ∞ -category $\text{Fun}(\mathcal{E}, \overline{\mathcal{E}}_1)$.

Proof. This is a special case of Lemma 5.2.2.13. $\square$

Example 7.4.5.11. Let $\mathcal{C}$ be an ∞ -category and let $\mathbf{1}$ denote the cone point of $\mathcal{C}^\triangleright$. Using Example 5.2.3.18, we see that the tautological map $V : \mathcal{C}^\triangleright \rightarrow (\Delta^0)^\triangleright \simeq \Delta^1$ is a cocartesian fibration. If $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ is another cocartesian fibration, then the ∞ -categories $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}}$ and $\overline{\mathcal{E}}_1 = \{\mathbf{1}\} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}}$ can be identified with the fibers of the composite map

$$(V \circ \overline{U}) : \overline{\mathcal{E}} \rightarrow \Delta^1,$$

which is also a cocartesian fibration (Proposition 5.1.4.14). In this case, the covariant refraction diagram $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ of Proposition 7.4.5.10 is given by covariant transport for the cocartesian fibration $V \circ \bar{U}$ (along the nondegenerate edge of Δ^1).

02UT **Remark 7.4.5.12.** Suppose we are given a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright, \end{array}$$

where U and $\bar{U}$ are cocartesian fibrations. Let $\mathbf{1}$ denote the cone point of $\mathcal{C}^\triangleright$ and let $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ be a covariant refraction diagram. For every U -cocartesian edge $e : X \rightarrow Y$ of $\mathcal{E}$, the image $\text{Rf}(e)$ is an isomorphism in the ∞ -category $\bar{\mathcal{E}}_1$. To prove this, we observe that there is a morphism $\Delta^1 \times \Delta^1 \rightarrow \bar{\mathcal{E}}$ as indicated in the diagram

$$\begin{array}{ccc} X & \longrightarrow & \text{Rf}(X) \\ \downarrow e & & \downarrow \text{Rf}(e) \\ Y & \longrightarrow & \text{Rf}(Y), \end{array}$$

where the horizontal maps are $\bar{U}$ -cocartesian. Applying Proposition 5.1.4.13, we deduce that $\text{Rf}(e)$ is an $\bar{U}$ -cocartesian edge of $\bar{\mathcal{E}}$, and therefore an isomorphism in the ∞ -category $\bar{\mathcal{E}}_1$ (Proposition 5.1.4.12).

We have the following recognition principle for colimits in the ∞ -category $\mathcal{QC}$:

02UU **Theorem 7.4.5.13** (Refraction Criterion). *Let λ be an uncountable cardinal and suppose we are given a pullback diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright \end{array}$$

where U and $\bar{U}$ are essentially λ -small cocartesian fibrations. Let W be the collection of all U -cocartesian edges of $\mathcal{E}$, and assume that the following condition is satisfied. Then the covariant transport representation $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}_{<\lambda}$ is a colimit diagram if the following condition is satisfied:

(*) The covariant refraction diagram $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ exhibits $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect W .

The converse holds if $\mathcal{C}$ is κ -small, where $\kappa = \text{cf}(\lambda)$ is the cofinality of λ .

We will give the proof of Theorem 7.4.5.13 in §7.4.6.

Remark 7.4.5.14. In the statement of Theorem 7.4.5.13, the covariant refraction diagram $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ and the covariant transport representation $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}_{<\lambda}$ are only well-defined up to isomorphism (as objects of the ∞ -categories $\text{Fun}(\mathcal{E}, \bar{\mathcal{E}}_1)$ and $\text{Fun}(\mathcal{C}^\triangleright, \mathcal{QC}_{<\lambda})$, respectively). However, the hypothesis and conclusion of the theorem depend only on their isomorphism classes (see Exercise 6.3.1.11 and Corollary 7.1.3.15). 02UV

Remark 7.4.5.15. In the statement of Theorem 7.4.5.13, condition (*) does not depend on the cardinal λ . Consequently, if condition (*) is satisfied, then $\bar{\mathcal{F}}$ is a also colimit diagram in the ∞ -category $\mathcal{QC}_{<\mu}$ for every cardinal $\mu \geq \lambda$. 05S4

Exercise 7.4.5.16. Let $\bar{U} : \bar{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ and $\bar{U}' : \bar{\mathcal{E}}' \rightarrow \mathcal{C}^\triangleright$ be cocartesian fibrations of simplicial sets which are equivalent as inner fibrations over $\mathcal{C}^\triangleright$ (in the sense of Definition 5.1.7.1). Show that $\bar{U}$ satisfies condition (*) of Theorem 7.4.5.13 if and only if $\bar{U}'$ satisfies condition (*) of Theorem 7.4.5.13. 02UW

Corollary 7.4.5.17. Let $\mathcal{C}$ be a small ∞ -category, let $\bar{U} : \bar{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ be an essentially small cocartesian fibration, and set $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^\triangleright} \bar{\mathcal{E}}$. Let $F : \bar{\mathcal{E}} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which carries $\bar{U}$ -cocartesian morphisms of $\bar{\mathcal{E}}$ to isomorphisms in $\mathcal{D}$. If the covariant transport representation $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}$ is a colimit diagram, then F is left Kan extended from $\mathcal{E}$. 039P

Proof. Let $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ be a covariant refraction diagram, so that there exists a natural transformation $h : \text{id}_{\mathcal{E}} \rightarrow \text{Rf}$ (in the ∞ -category $\text{Fun}(\mathcal{E}, \bar{\mathcal{E}})$) which carries each object $X \in \mathcal{E}$ to an $\bar{U}$ -cocartesian morphism $h_X : X \rightarrow \text{Rf}(X)$. Our assumption that $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright}$ is a colimit diagram guarantees that the functor Rf exhibits $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ (Theorem 7.4.5.13). Moreover, for each object $X \in \mathcal{C}$, the functor F carries h_X to an isomorphism in the ∞ -category $\mathcal{D}$. Set $F_0 = F|_{\mathcal{E}}$ and $F_1 = F|_{\bar{\mathcal{E}}_1}$. Applying Proposition 7.3.1.18, we deduce that the natural transformation $F(h) : F_0 \rightarrow F_1 \circ \text{Rf}$ exhibits the functor F_1 as a left Kan extension of F_0 along Rf . By virtue of Example 7.4.5.11, the natural transformation h exhibits Rf as a covariant transport functor for the cocartesian fibration

$$\bar{\mathcal{E}} \xrightarrow{\bar{U}} \mathcal{C}^\triangleright \rightarrow (\Delta^0)^\triangleright \simeq \Delta^1.$$

Applying Corollary 7.3.2.14, we conclude that the functor F is left Kan extended from $\mathcal{E}$. □

To prove Proposition 7.4.5.1, we need to show that there is a good supply of cocartesian fibrations which satisfy the hypotheses of Theorem 7.4.5.13.

02UX **Proposition 7.4.5.18.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets and let $\mathbf{1}$ denote the cone point of $\mathcal{C}^\triangleright$. Then there exists a pullback diagram*

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright, \end{array}$$

where $\bar{U}$ is a cocartesian fibration and a covariant refraction diagram $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_{\mathbf{1}}$ which exhibits $\bar{\mathcal{E}}_{\mathbf{1}}$ as a localization of $\mathcal{E}$ with respect to the collection of all U -cocartesian edges of $\mathcal{E}$.

Proof. Let W be the collection of all U -cocartesian edges of $\mathcal{E}$. Applying Proposition 6.3.2.1, we deduce that there exists an ∞ -category $\mathcal{E}[W^{-1}]$ and a diagram $\text{Rf} : \mathcal{E} \rightarrow \mathcal{E}[W^{-1}]$ which exhibits $\mathcal{E}[W^{-1}]$ as a localization of $\mathcal{E}$ with respect to W . In particular, the diagram Rf carries each U -cocartesian edge of $\mathcal{E}$ to an isomorphism in $\mathcal{E}[W^{-1}]$. Let $\bar{\mathcal{E}}$ denote the relative join $\mathcal{E} \star_{\mathcal{E}[W^{-1}]} \mathcal{E}[W^{-1}]$ (Construction 5.2.3.1). Applying Lemma 5.2.3.17 to the commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\text{Rf}} & \mathcal{E}[W^{-1}] \\ \downarrow U & & \downarrow \\ \mathcal{C} & \longrightarrow & \Delta^0, \end{array}$$

we deduce that vertical maps induce a cocartesian fibration

$$\bar{U} : \bar{\mathcal{E}} = \mathcal{E} \star_{\mathcal{E}[W^{-1}]} \mathcal{E}[W^{-1}] \rightarrow \mathcal{C} \star_{\Delta^0} \Delta^0 \simeq \mathcal{C}^\triangleright.$$

By construction, we have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright, \end{array}$$

and the fiber of $\bar{U}$ over the cone point $\mathbf{1} \in \mathcal{C}^\triangleright$ can be identified with the ∞ -category $\mathcal{E}[W^{-1}]$. Moreover, Rf induces a morphism of simplicial sets

$$H : \Delta^1 \times \mathcal{E} \simeq \mathcal{E} \star_{\mathcal{E}} \mathcal{E} \rightarrow \mathcal{E} \star_{\mathcal{E}[W^{-1}]} \mathcal{E}[W^{-1}] = \bar{\mathcal{E}}$$

for which $H|_{\{0\} \times \mathcal{E}}$ is the inclusion map $\mathcal{E} \hookrightarrow \bar{\mathcal{E}}$, and $H|_{\{1\} \times \mathcal{E}}$ is the diagram $\text{Rf} : \mathcal{E} \rightarrow \mathcal{E}[W^{-1}]$. For every vertex $X \in \mathcal{E}$, the criterion of Lemma 5.2.3.17 guarantees that $H|_{\Delta^1 \times \{X\}}$ is a $\bar{U}$ -cocartesian edge of $\bar{\mathcal{E}}$, so that H exhibits $\text{Rf} : \mathcal{E} \rightarrow \mathcal{E}[W^{-1}]$ as a covariant refraction diagram. $\square$

Remark 7.4.5.19. Let λ be an uncountable cardinal and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian 02UY
fibration of simplicial sets which is essentially λ -small. Let $\kappa = \text{cf}(\lambda)$ be the cofinality of λ . If $\mathcal{C}$ is κ -small, then the simplicial set $\mathcal{E}$ is essentially λ -small (Proposition 4.7.9.10), so any localization of $\mathcal{E}$ is also essentially λ -small (Proposition 6.3.2.13). It follows that any cocartesian fibration $\bar{U} : \bar{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ satisfying the requirements of Proposition 7.4.5.18 is also essentially λ -small.

Proposition 7.4.5.1 is a special case of the following:

Proposition 7.4.5.20. Let λ be an uncountable cardinal, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}_{<\lambda}$ be the 05S5
covariant transport representation of a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$. Assume that $\mathcal{C}$ is κ -small, where $\kappa = \text{cf}(\lambda)$ is the cofinality of λ . Let W be the collection of all U -cocartesian edges $\mathcal{E}$. Then the ∞ -category $\mathcal{E}[W^{-1}]$ is a colimit of $\mathcal{F}$ in the ∞ -category $\mathcal{QC}_{<\lambda}$. Moreover, the colimit of $\mathcal{F}$ is preserved by the inclusion functors $\mathcal{QC}_{<\lambda} \hookrightarrow \mathcal{QC}_{<\mu}$ for $\mu \geq \lambda$.

Proof. By virtue of Proposition 7.4.5.18, there exists a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\quad} & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \xrightarrow{\quad} & \mathcal{C}^\triangleright \end{array}$$

where $\bar{U}$ is a cocartesian fibration, and a covariant refraction diagram $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ which exhibits $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect to W . It follows from Remark 7.4.5.19 that $\bar{U}$ is essentially λ -small. Using Corollary 5.6.5.13, we can extend $\mathcal{F}$ to a diagram $\bar{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}_{<\lambda}$ which is a covariant transport representation for λ . It follows from Theorem 7.4.5.13 that $\bar{\mathcal{F}}$ is a colimit diagram in $\mathcal{QC}_{<\lambda}$ (and that it remains a colimit diagram in $\mathcal{QC}_{<\mu}$ for $\mu \geq \lambda$). $\square$

Warning 7.4.5.21 (Fake Colimits). In the formulation of Proposition 7.4.5.20, the assumption 05S6
that $\mathcal{C}$ is κ -small cannot be omitted. If $\mathcal{C}$ is “too large” in comparison with λ , then it is possible to have a colimit diagram $\bar{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}_{<\lambda}$ which does not satisfy condition $(*)$ of Theorem 7.4.5.13 (see Warning 7.4.3.9). In this case, $\bar{\mathcal{F}}$ does not remain a colimit diagram in $\mathcal{QC}_{<\mu}$ for $\mu \gg \lambda$.

Corollary 7.4.5.22. Let λ be an uncountable cardinal and let $\kappa = \text{cf}(\lambda)$ be the cofinality of 03U9
 λ . Then the ∞ -category $\mathcal{QC}_{<\lambda}$ admits κ -small colimits, which are preserved by the inclusion functors $\mathcal{QC}_{<\lambda} \hookrightarrow \mathcal{QC}_{<\mu}$ for $\mu \geq \lambda$.

03U8 **Corollary 7.4.5.23.** *Let κ be an uncountable regular cardinal. Then the ∞ -category $\mathcal{QC}_{<\kappa}$ admits κ -small colimits, which are preserved by the inclusion functors $\mathcal{QC}_{<\kappa} \hookrightarrow \mathcal{QC}_{<\lambda}$ for $\lambda \geq \kappa$.*

7.4.6 Proof of the Refraction Criterion

02V2 Our goal in this section is to prove Theorem 7.4.5.13. Our starting point is the following extension property for outer horns of the ∞ -category $\mathcal{QC}$:

02V3 **Lemma 7.4.6.1.** *Let κ be an uncountable cardinal, let $n \geq 2$, let $X : \Lambda_0^n \rightarrow \mathcal{QC}_{<\kappa}$ be a diagram, and let W be a collection of morphisms of the ∞ -category $X(0)$ which satisfies the following pair of conditions:*

- (1) *Let $1 \leq i \leq n$, and let $X(0 < i) : X(0) \rightarrow X(i)$ be the functor obtained by evaluating X on the edge $N_\bullet(\{0 < i\}) \subseteq \Lambda_0^n$. Then $X(0 < i)$ carries each element of W to an isomorphism in the ∞ -category $X(i)$.*
- (2) *The functor $X(0 < 1) : X(0) \rightarrow X(1)$ exhibits $X(1)$ as a localization of $X(0)$ with respect to W .*

Then X can be extended to an n -simplex $\Delta^n \rightarrow \mathcal{QC}_{<\kappa}$.

Proof. Set $\mathcal{C} = X(0)$, $\mathcal{D} = X(1)$, and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be the functor $X(0 < 1)$. Using the isomorphism $\Lambda_0^n \simeq (\partial\Delta^{n-1})^\triangleleft$, we can identify X with a diagram $\sigma_0 : \partial\Delta^{n-1} \rightarrow (\mathcal{QC}_{<\kappa})_{\mathcal{C}/}$. To complete the proof, it will suffice to show that σ_0 can be extended to an $(n-1)$ -simplex of $(\mathcal{QC}_{<\kappa})_{\mathcal{C}/}$. Let us identify the objects of the ∞ -category $(\mathcal{QC}_{<\kappa})_{\mathcal{C}/}$ with pairs $(\mathcal{E}, G)$, where $\mathcal{E}$ is a κ -small ∞ -category and $G : \mathcal{C} \rightarrow \mathcal{E}$ is a functor. Let $\mathcal{QC}_{\mathcal{C}/}^W$ denote the full subcategory of $(\mathcal{QC}_{<\kappa})_{\mathcal{C}/}$ spanned by those pairs $(\mathcal{E}, G)$, where the functor G carries each element of W to an isomorphism in $\mathcal{E}$. It follows from assumption (1) that the diagram σ_0 factors through the subcategory $\mathcal{QC}_{\mathcal{C}/}^W \subseteq \mathcal{QC}_{\mathcal{C}/}^{<\kappa}$. To prove the existence of σ , it will suffice (by virtue of Corollary 4.6.7.14) to show that $\sigma_0(0) = (\mathcal{D}, F)$ is an initial object of the ∞ -category $\mathcal{QC}_{\mathcal{C}/}^W$. Fix another object $(\mathcal{E}, G) \in \mathcal{QC}_{\mathcal{C}/}^W$; we wish to show that the morphism space $\mathrm{Hom}_{\mathcal{QC}_{\mathcal{C}/}^W}((\mathcal{D}, F), (\mathcal{E}, G)) = \mathrm{Hom}_{\mathcal{QC}_{\mathcal{C}/}^{<\kappa}}((\mathcal{D}, F), (\mathcal{E}, G))$ is a contractible Kan complex. Using Corollary 4.6.9.18 and Remark 5.5.4.6, we can identify $\mathrm{Hom}_{\mathcal{QC}_{\mathcal{C}/}^{<\kappa}}((\mathcal{D}, F), (\mathcal{E}, G))$ with the homotopy fiber of the map of Kan complexes

$$\mathrm{Fun}(\mathcal{D}, \mathcal{E}) \simeq \xrightarrow{\circ F} \mathrm{Fun}(\mathcal{C}, \mathcal{E}) \simeq$$

over the vertex $G \in \mathrm{Fun}(\mathcal{C}, \mathcal{E})$. Assumption (2) guarantees that this map is a homotopy equivalence onto the summand of $\mathrm{Fun}(\mathcal{C}, \mathcal{E})$ spanned by those functors $\mathcal{C} \rightarrow \mathcal{E}$ which carry each element of W to an isomorphism in $\mathcal{E}$. It will therefore suffice to show that this summand contains the functor G , which follows from the definition of $\mathcal{QC}_{\mathcal{C}/}^W$. $\square$

We now prove a weak form of Theorem 7.4.5.13 (which is already sufficient for most of our applications):

Proposition 7.4.6.2. *Let κ be an uncountable regular cardinal. Suppose we are given a pullback diagram of essentially κ -small ∞ -categories*

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright, \end{array}$$

where U and $\bar{U}$ are cocartesian fibrations. Let W be the collection of all U -cocartesian morphism of $\mathcal{E}$, let 0 denote the cone point of $\mathcal{C}^\triangleright \simeq \mathcal{C} \star \{0\}$, and assume that the covariant refraction diagram $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_0$ of Proposition 7.4.5.10 exhibits $\bar{\mathcal{E}}_0$ as a localization of $\mathcal{E}$ with respect to W . Then the covariant transport representation $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}_{<\kappa}$ is a colimit diagram.

Proof. Fix an integer $n > 0$, and suppose we are given a diagram $\mathcal{F}_0 : \mathcal{C} \star \partial\Delta^n \rightarrow \mathcal{QC}_{<\kappa}$ for which the restriction $\mathcal{F}_0|_{\mathcal{C} \star \{0\}}$ coincides with $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright}$. We wish to show that $\mathcal{F}_0$ can be extended to a functor $\mathcal{F} : \mathcal{C} \star \Delta^n \rightarrow \mathcal{QC}_{<\kappa}$. Applying Lemma 5.6.7.1, we can choose a pullback diagram

$$\begin{array}{ccc} \bar{\mathcal{E}} & \longrightarrow & \bar{\mathcal{E}}^- \\ \downarrow \bar{U} & & \downarrow \bar{U}^- \\ \mathcal{C} \star \{0\} & \longrightarrow & \mathcal{C} \star \partial\Delta^n, \end{array}$$

where $\bar{U}^-$ is a cocartesian fibration having covariant transport representation $\mathcal{F}_0$. For $0 \leq i \leq n$, let us write $\bar{\mathcal{E}}_i^-$ for the ∞ -category given by the fiber of $\bar{U}^-$ on the vertex $i \in \partial\Delta^n$.

Fix an auxiliary symbol c , so that the projection map $\mathcal{C} \rightarrow \{c\}$ induces a cocartesian fibration of ∞ -categories $V^+ : \mathcal{C} \star \Delta^n \rightarrow \{c\} \star \Delta^n$ (this follows by repeated application of Lemma 5.2.3.17). Note that V^+ restricts to a morphism of simplicial sets $V^- : \mathcal{C} \star \partial\Delta^n \rightarrow \{c\} \star \partial\Delta^n$ which is a pullback of V^+ , and therefore also a cocartesian fibration (Remark 5.1.4.6). Applying Proposition 5.1.4.14, we deduce that the composite map $(V^- \circ \bar{U}^-) : \bar{\mathcal{E}}^- \rightarrow \{c\} \star \partial\Delta^n \simeq \Lambda_0^{n+1}$ is also a cocartesian fibration.

Let $\mathcal{G}_0 : \{c\} \star \partial\Delta^n \rightarrow \mathcal{QC}_{<\kappa}$ be a covariant transport representation for the cocartesian fibration $V^- \circ \bar{U}^-$. Let us identify $\mathcal{G}_0(c)$ with the ∞ -category $\mathcal{E}$. For $0 \leq i \leq n$, we can identify $\mathcal{G}_0(i)$ with the ∞ -category $\bar{\mathcal{E}}_i^-$ for $0 \leq i \leq n$, and the restriction of $\mathcal{G}_0$ to the edge

$\{c\} \star \{i\}$ with a functor $G_i : \mathcal{E} \rightarrow \bar{\mathcal{E}}_i^-$. Applying Example 7.4.5.11 (and Remark 5.6.5.10), we see that G_i is a covariant refraction diagram for the cocartesian fibration

$$(\mathcal{C} \star \{i\}) \times_{\mathcal{C} \star \partial \Delta^n} \bar{\mathcal{E}}^- \rightarrow \mathcal{C} \star \{i\}.$$

In particular, each of the functors G_i carries elements of W to isomorphisms in the ∞ -category $\bar{\mathcal{E}}_i^-$ (Remark 7.4.5.12). Moreover, the functor G_0 is isomorphic to Rf (Proposition 7.4.5.10), and therefore exhibits $\bar{\mathcal{E}}_0^- = \bar{\mathcal{E}}_0$ as a localization of $\mathcal{E}$ with respect to W (Exercise 6.3.1.11). Applying Lemma 7.4.6.1, we can extend $\mathcal{G}_0$ to a diagram $\mathcal{G} : \{c\} \star \Delta^n \rightarrow \mathcal{QC}^{<\kappa}$. Using Lemma 5.6.7.1, we can choose a pullback diagram

$$\begin{array}{ccc} \bar{\mathcal{E}}^- & \xrightarrow{\quad} & \bar{\mathcal{E}}^+ \\ \downarrow V^- \circ \bar{U}^- & & \downarrow T \\ \mathcal{C} \star \partial \Delta^n & \xrightarrow{\quad} & \mathcal{C} \star \Delta^n, \end{array}$$

where T is a cocartesian fibration having covariant transport representation $\mathcal{G}$. Note that we can write T uniquely as a composition

$$\bar{\mathcal{E}}^+ \xrightarrow{\bar{U}^+} \mathcal{C} \star \Delta^n \xrightarrow{V^+} \{c\} \star \Delta^n,$$

where $\bar{U}^+$ is a morphism of simplicial sets which fits into a pullback diagram

$$\begin{array}{ccc} \bar{\mathcal{E}}^- & \xrightarrow{\quad} & \bar{\mathcal{E}}^+ \\ \downarrow \bar{U}^- & & \downarrow \bar{U}^+ \\ \mathcal{C} \star \partial \Delta^n & \xrightarrow{\quad} & \mathcal{C} \star \Delta^n. \end{array}$$

We will show that the morphism $\bar{U}^+$ is a cocartesian fibration. Assuming this, we can complete the proof by applying Corollary 5.6.5.13 to extend $\mathcal{F}_0$ to a diagram $\mathcal{F} : \mathcal{C} \star \Delta^n \rightarrow \mathcal{QC}^{<\kappa}$ (which is a covariant transport representation for the cocartesian fibration $\bar{U}^+$).

We first prove that $\bar{U}^+$ is an inner fibration of simplicial sets. Suppose we are given integers $0 < i < m$; we wish to show that every lifting problem

02V5

$$\begin{array}{ccc} \Lambda_i^m & \xrightarrow{\sigma_0} & \bar{\mathcal{E}}^+ \\ \downarrow & \nearrow \sigma & \downarrow \bar{U}^+ \\ \Delta^m & \xrightarrow{\bar{\sigma}} & \mathcal{C} \star \Delta^n \end{array}$$

(7.53)

admits a solution. If $\bar{\sigma}$ factors through $\mathcal{C}$, then a solution exists by virtue of the fact that U is an inner fibration. Let us therefore assume that $\bar{\sigma}$ does not factor through $\mathcal{C}$. Since T is an inner fibration, we can extend σ_0 to an n -simplex σ of $\bar{\mathcal{E}}^+$ satisfying $T \circ \sigma = V^+ \circ \bar{\sigma}$. We claim that the n -simplex σ solves the lifting problem (7.53). Set $\bar{\sigma}' = \bar{U}^+ \circ \sigma$; we wish to show that $\bar{\sigma}'$ coincides with $\bar{\sigma}$ (as m -simplices of the simplicial set $\mathcal{C} \star \Delta^n$). Note that we have $V^+ \circ \bar{\sigma} = V^+ \circ \bar{\sigma}'$. It follows that $\bar{\sigma}$ and $\bar{\sigma}'$ both carry the final vertex $m \in \Delta^m$ to the same vertex of $\Delta^n \subseteq \mathcal{C} \star \Delta^n$. Consequently, it will suffice to show that $\bar{\sigma}$ and $\bar{\sigma}'$ agree when restricted to the face $\Delta^{m-1} \subseteq \Delta^m$. This follows from the commutativity of the diagram (7.53), since Δ^{m-1} is contained in the horn $\Lambda_i^m \subseteq \Delta^m$.

Fix an object X of the ∞ -category $\bar{\mathcal{E}}^+$ having image $\bar{X} = \bar{U}^+(X)$ and a morphism $\bar{e} : \bar{X} \rightarrow \bar{Y}$ in the ∞ -category $\mathcal{C} \star \Delta^m$. We will complete the proof by showing that $\bar{e}$ can be lifted to an $\bar{U}^+$ -cocartesian morphism $e : X \rightarrow Y$ of $\mathcal{E}$. If $\bar{X}$ and $\bar{Y}$ belong to $\mathcal{C}$, then we take $e : X \rightarrow Y$ to be a U -cocartesian morphism of $\mathcal{E}$ satisfying $U(e) = \bar{e}$ (which exists by virtue of our assumption that U is a cocartesian fibration). Otherwise, we take $e : X \rightarrow Y$ to be a T -cocartesian morphism of $\bar{\mathcal{E}}^+$ satisfying $T(e) = V^+(\bar{e})$ (which exists by virtue of the fact that T is a cocartesian fibration). In either case, we will prove that the morphism e is $\bar{U}^+$ -cocartesian by verifying the criterion of Proposition 5.1.2.1. Choose another object $Z \in \bar{\mathcal{E}}^+$ having image $\bar{Z} = \bar{U}^+(Z)$; we wish to show that the diagram of Kan complexes

$$\begin{array}{ccc}
 \{c\} \times_{\mathrm{Hom}_{\bar{\mathcal{E}}^+}(X,Y)} \mathrm{Hom}_{\bar{\mathcal{E}}^+}(X,Y,Z) & \longrightarrow & \mathrm{Hom}_{\bar{\mathcal{E}}^+}(X,Z) \\
 \downarrow & & \downarrow \\
 \{\bar{e}\} \times_{\mathrm{Hom}_{\mathcal{C} \star \Delta^n}(\bar{X},\bar{Y})} \mathrm{Hom}_{\mathcal{C} \star \Delta^n}(\bar{X},\bar{Y},\bar{Z}) & \longrightarrow & \mathrm{Hom}_{\mathcal{C} \star \Delta^n}(\bar{X},\bar{Z})
 \end{array} \tag{7.54}$$

is a homotopy pullback square. We consider several cases:

- Suppose first that the object $\bar{Z}$ belongs to $\mathcal{C}$. If $\bar{X}$ and $\bar{Y}$ belong to $\mathcal{C}$, then we deduce that (7.54) is a homotopy pullback square by applying Proposition 5.1.2.1 to the cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ (since, by construction, the morphism e is U -cocartesian). Otherwise, each of the Kan complexes appearing in the diagram (7.54) is empty, so there is nothing to prove.
- Suppose that the objects $\bar{Y}$ and $\bar{Z}$ belong to Δ^n . In this case, we deduce that (7.54) is a homotopy pullback square by applying Proposition 5.1.2.1 to the cocartesian fibration $T : \bar{\mathcal{E}}^+ \rightarrow \{c\} \star \Delta^n$ (since, by construction, the morphism e is T -cocartesian).
- Suppose that the objects $\bar{X}$ and $\bar{Y}$ belong to $\mathcal{C}$, but the object $\bar{Z}$ belongs to Δ^n . In this case, the Kan complexes on the bottom row of (7.54) are contractible (see Example 4.6.1.6; in fact, they are both isomorphic to Δ^0). In particular, the bottom horizontal

map is a homotopy equivalence. To show that (7.54) is a homotopy pullback square, we must show that the upper horizontal map is also a homotopy equivalence (Corollary 3.4.1.5). In other words, we must show that composition with the homotopy class $[e]$ induces an isomorphism $\theta : \mathrm{Hom}_{\bar{\mathcal{E}}^+}(Y, Z) \rightarrow \mathrm{Hom}_{\bar{\mathcal{E}}^+}(X, Z)$ in the homotopy category $\mathbf{hKan}$ (see Notation 4.6.9.15). Let

$$G : \mathcal{E} = \{c\} \times_{\{c\} \star \Delta^n} \bar{\mathcal{E}}^+ \rightarrow \{\bar{Z}\} \times_{\{c\} \star \Delta^n} \bar{\mathcal{E}}^+ = \bar{\mathcal{E}}_{\bar{Z}}^+$$

be given by covariant transport for the cocartesian fibration T . Using Corollary 5.1.2.3, we can identify θ with the morphism $\mathrm{Hom}_{\bar{\mathcal{E}}_{\bar{Z}}^+}(G(Y), Z) \rightarrow \mathrm{Hom}_{\bar{\mathcal{E}}_{\bar{Z}}^+}(G(X), Z)$ given by precomposition with the morphism $G(e) : G(X) \rightarrow G(Y)$. Since the morphism e is U -cocartesian, its image $G(e)$ is an isomorphism in the ∞ -category $\bar{\mathcal{E}}_{\bar{Z}}^+$, so that θ is a homotopy equivalence as desired. $\square$

To extend Proposition 7.4.6.2 to the case where $\mathcal{C}$ is not assumed to be an ∞ -category, we will need the following variant of Corollary 5.6.7.6:

02V7 **Lemma 7.4.6.3.** *Suppose we are given a pullback diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E}_0 & \xrightarrow{\tilde{F}} & \mathcal{E} \\ \downarrow U_0 & & \downarrow U \\ \mathcal{C}_0 & \xrightarrow{F} & \mathcal{C}, \end{array}$$

where U_0 and U are cocartesian fibrations. Let W_0 denote the collection of all U -cocartesian edges of $\mathcal{E}_0$, and let W denote the collection of all U -cocartesian morphisms of $\mathcal{E}$. If F is inner anodyne, then $\tilde{F}$ induces an equivalence of ∞ -categories $\mathcal{E}_0[W_0^{-1}] \rightarrow \mathcal{E}[W^{-1}]$.

02V8 **Remark 7.4.6.4.** Using Theorem 7.4.5.13, one can show that conclusion of Lemma 7.4.6.3 holds more generally under the assumption that $F : \mathcal{C}_0 \rightarrow \mathcal{C}$ is a left cofinal morphism of simplicial sets. For simplicity, let us assume that each of the simplicial sets appearing in the statement of Lemma 7.4.6.3 is small. Using Proposition 7.4.5.18, we can assume that U is the pullback of a cocartesian fibration $\bar{U} : \bar{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ for which the covariant refraction diagram $\mathrm{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ exhibits the ∞ -category $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect to W . Using Theorem 7.4.5.13, we deduce that the covariant transport representation $\mathrm{Tr} = \mathrm{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}$ is a colimit diagram. Since F is right cofinal, it follows that the restriction $\mathrm{Tr}|_{\mathcal{C}_0^\triangleright}$ is also a colimit diagram (Corollary 7.2.2.3). Applying Theorem 7.4.5.13 again, we conclude that $\mathrm{Rf}|_{\mathcal{E}_0}$ exhibits $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}_0$ with respect to W_0 , so that $\tilde{F}$ induces an equivalence $\mathcal{E}_0[W_0^{-1}] \xrightarrow{\sim} \mathcal{E}[W^{-1}]$.

Proof of Lemma 7.4.6.3. Fix an ∞ -category $\mathcal{D}$; we wish to show that precomposition with $\tilde{F}$ induces an equivalence of ∞ -categories $\mathrm{Fun}(\mathcal{E}[W^{-1}], \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{E}_0[W_0^{-1}], \mathcal{D})$ (see Notation 6.3.1.1). Corollary 5.6.7.6 guarantees that $\tilde{F}$ is a categorical equivalence of simplicial sets, so that precomposition with $\tilde{F}$ induces an equivalence of ∞ -categories $\mathrm{Fun}(\mathcal{E}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{E}_0, \mathcal{D})$. It will therefore suffice to prove the following:

- (*) Let $G : \mathcal{E} \rightarrow \mathcal{D}$ be a morphism of simplicial sets with the property that $G \circ \tilde{F}$ carries every U_0 -cocartesian edge of $\mathcal{E}_0$ to an isomorphism in $\mathcal{D}$. Then G carries each U -cocartesian edge of $\mathcal{E}$ to an isomorphism in $\mathcal{D}$.

Let us henceforth regard the ∞ -category $\mathcal{D}$ and the functor $G : \mathcal{E} \rightarrow \mathcal{D}$ as fixed. For every morphism of simplicial sets $K \rightarrow \mathcal{C}$, let $\mathcal{E}_K$ denote the fiber product $K \times_{\mathcal{C}} \mathcal{E}$, let $U_K : \mathcal{E}_K \rightarrow K$ be the projection map, and let G_K denote the restriction of G to $\mathcal{E}_K$. Let us say that a monomorphism of simplicial sets $K' \hookrightarrow K$ is *good* if, for every morphism $K \rightarrow \mathcal{C}$ with the property that $G_{K'}$ carries $U_{K'}$ -cocartesian morphisms of $\mathcal{E}_{K'}$ to isomorphisms in $\mathcal{D}$, the morphism G_K carries U_K -cocartesian morphisms of $\mathcal{E}_K$ to isomorphisms in $\mathcal{D}$. To prove (*), it will suffice to show that $F : \mathcal{C}_0 \rightarrow \mathcal{C}$ is weakly saturated. It is not difficult to see that the collection of good morphisms is weakly saturated, in the sense of Definition 1.5.4.13. It will therefore suffice to show that the horn inclusion $\Lambda_i^n \hookrightarrow \Delta^n$ is good for $0 < i < n$. In other words, it will suffice to prove (*) in the special case where $\mathcal{C} = \Delta^n$ is a standard simplex and $F : \Lambda_i^n \hookrightarrow \Delta^n$ is the inclusion of an inner horn.

If $n \geq 3$, then every edge of $\mathcal{C} = \Delta^n$ is contained in the horn Λ_i^n ; it follows that the morphism $\tilde{F} : \mathcal{E}_0 \rightarrow \mathcal{E}$ induces a bijection $W_0 \xrightarrow{\sim} W$, so there is nothing to prove. We may therefore assume without loss of generality that $n = 2$. Let $w : X \rightarrow Z$ be a U -cocartesian of $\mathcal{E}$ which does not belong to the simplicial subset $\mathcal{E}_0 = \Lambda_1^2 \times_{\Delta^2} \mathcal{E}$, so that $U(X) = 0$ and $U(Z) = 2$. Since U is a cocartesian fibration, we can choose a U -cocartesian morphism $u : X \rightarrow Y$ with $U(Y) = 1$. Our assumption that u is U -cocartesian guarantees that there exists a 2-simplex of $\mathcal{E}'$ whose boundary is indicated in the diagram

$$\begin{array}{ccc} & Y & \\ u \nearrow & & \searrow v \\ X & \xrightarrow{w} & Z. \end{array}$$

Invoking Corollary 5.1.2.4, we see that v is also U -cocartesian, so that u and v can be regarded as elements of W_0 . It now suffices to observe that if $G : \mathcal{E} \rightarrow \mathcal{D}$ is any functor which carries both u and v to isomorphisms in $\mathcal{D}$, then G also carries w to an isomorphism in $\mathcal{D}$. □

Proof of Theorem 7.4.5.13. Let λ be an uncountable cardinal and suppose we are given a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \bar{\mathcal{E}} \\ \downarrow U & & \downarrow \bar{U} \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright, \end{array}$$

where U and $\bar{U}$ are essentially λ -small cocartesian fibrations. Let W denote the collection of all U -cocartesian edges of $\mathcal{E}$, let $\mathbf{1}$ denote the cone point of $\mathcal{C}^\triangleright$, let $\text{Rf} : \mathcal{E} \rightarrow \bar{\mathcal{E}}_1$ be a covariant refraction diagram (Definition 7.4.5.8). Assume first that Rf exhibits the ∞ -category $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect to W . We wish to show that the covariant transport representation $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright} : \mathcal{C}^\triangleright \rightarrow \mathcal{QC}_{<\lambda}$ is a colimit diagram in the ∞ -category $\mathcal{QC}_{<\lambda}$.

Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $\mathcal{C} \hookrightarrow \mathcal{C}'$, where $\mathcal{C}'$ is an ∞ -category. Note that the induced map $\mathcal{C}^\triangleright \hookrightarrow \mathcal{C}'^\triangleright$ is also inner anodyne (Proposition 4.3.6.4). Applying Corollary 5.6.7.3, we can realize $\bar{U}$ as the pullback of a cocartesian fibration of ∞ -categories $\bar{U}' : \bar{\mathcal{E}}' \rightarrow \mathcal{C}'^\triangleright$. Form a pullback diagram

02V9

$$\begin{array}{ccc} \mathcal{E}' & \longrightarrow & \bar{\mathcal{E}}' \\ \downarrow U' & & \downarrow \bar{U}' \\ \mathcal{C}' & \longrightarrow & \mathcal{C}'^\triangleright, \end{array} \tag{7.55}$$

and let W' denote the collection of all U' -cocartesian morphisms of $\mathcal{E}'$. Using Proposition 7.4.5.10, we can choose a covariant refraction diagram $\text{Rf}' : \mathcal{E}' \rightarrow \bar{\mathcal{E}}'_1 = \bar{\mathcal{E}}_1$ for the cocartesian fibration $\bar{U}'$. Note that the restriction $\text{Rf}|_{\mathcal{E}}$ is a covariant refraction collapse diagram for the cocartesian fibration $\bar{U}$, and is therefore isomorphic to Rf as an object of the ∞ -category $\text{Fun}(\mathcal{E}, \bar{\mathcal{E}}_1)$. It follows that $\text{Rf}'|_{\mathcal{E}}$ also exhibits the ∞ -category $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect to W (Exercise 6.3.1.11). Applying Lemma 7.4.6.3, we see that Rf exhibits $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}'$ with respect to W .

Enlarging λ if necessary, we may assume that λ is regular and that the ∞ -categories $\mathcal{C}'$ and $\bar{\mathcal{E}}'$ are essentially λ -small. Using Corollary 5.6.5.13, we can extend $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright}$ to a functor $\text{Tr}_{\bar{\mathcal{E}}'/\mathcal{C}'^\triangleright} : \mathcal{C}'^\triangleright \rightarrow \mathcal{QC}_{<\lambda}$ which is a covariant transport representation for $\bar{U}'$. Applying Proposition 7.4.6.2 to the diagram of ∞ -categories (7.55), we deduce that $\text{Tr}_{\bar{\mathcal{E}}'/\mathcal{C}'^\triangleright}$ is a colimit diagram in the ∞ -category $\mathcal{QC}_{<\lambda}$. Since the inclusion map $\mathcal{C} \hookrightarrow \mathcal{C}'$ is right cofinal (Proposition 7.2.1.3), it follows that $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright}$ is also a colimit diagram in $\mathcal{QC}_{<\lambda}$, as desired.

We now prove the converse. Let $\kappa = \text{cf}(\lambda)$ be the cofinality of λ . Assume that the simplicial set $\mathcal{C}$ is κ -small and that the covariant transport representation $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright}$ is a colimit

diagram in the ∞ -category $\mathcal{QC}_{<\lambda}$; we wish to show that the covariant refraction diagram Rf exhibits $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect to W . By virtue of Proposition 7.4.5.18 (and Remark 7.4.5.19), we can choose another pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \mathcal{E}^+ \\ \downarrow U & & \downarrow U^+ \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\flat, \end{array}$$

where U^+ is an essentially λ -small cocartesian fibration for which the covariant refraction diagram $\text{Rf}^+ : \mathcal{E} \rightarrow \mathcal{E}_1^+$ exhibits $\mathcal{E}_1^+$ as a localization of $\mathcal{E}$ with respect to W . Applying Corollary 5.6.5.13, we see that U^+ admits a covariant transport representation $\text{Tr}_{\mathcal{E}^+/\mathcal{C}^\flat} : \mathcal{C}^\flat \rightarrow \mathcal{QC}^{<\lambda}$ satisfying $(\text{Tr}_{\mathcal{E}^+/\mathcal{C}^\flat})|_{\mathcal{C}} = (\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\flat})|_{\mathcal{C}}$. The first part of the proof shows that $\text{Tr}_{\mathcal{E}^+/\mathcal{C}^\flat}$ is also a colimit diagram, and is therefore isomorphic to $\text{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\flat}$ as an object of the ∞ -category $\text{Fun}(\mathcal{C}^\flat, \mathcal{QC})$. Using Theorem 5.6.0.2, we see $\bar{U} : \bar{\mathcal{E}} \rightarrow \mathcal{C}^\flat$ and $U^+ : \mathcal{E}^+ \rightarrow \mathcal{C}^\flat$ are equivalent as cocartesian fibrations over $\mathcal{C}^\flat$. Applying Exercise 7.4.5.16, we conclude that Rf also exhibits $\bar{\mathcal{E}}_1$ as a localization of $\mathcal{E}$ with respect to W , as desired. $\square$

7.5 Homotopy Limits and Colimits

Let $\mathcal{C}$ be a small category, and let $\mathcal{F} : \mathcal{C} \rightarrow \text{Kan}$ be a diagram of Kan complexes indexed by $\mathcal{C}$. Recall that the diagram $\mathcal{F}$ has a limit $\varprojlim(\mathcal{F})$ in the category of simplicial sets, given concretely by the formula

$$\varprojlim(\mathcal{F})(C)_n = \varprojlim_{C' \in \mathcal{C}} \mathcal{F}(C')_n$$

(Remark 1.1.0.8). However, from the perspective of homotopy theory, the construction $\mathcal{F} \mapsto \varprojlim(\mathcal{F})$ is poorly behaved:

- Although each of the simplicial sets $\{\mathcal{F}(C)\}_{C \in \mathcal{C}}$ is assumed to be a Kan complex, the inverse limit $\varprojlim(\mathcal{F})$ need not be a Kan complex.
- If $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ is a natural transformation between diagrams $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \text{Kan}$ which is a levelwise homotopy equivalence (Remark 4.5.6.2), then the induced map $\varprojlim(\mathcal{F}) \rightarrow \varprojlim(\mathcal{G})$ need not be a (weak) homotopy equivalence (see Warning 3.4.0.1).

These deficiencies can be remedied by working in the framework of ∞ -categories. By passing to the homotopy coherent nerve, every functor of ordinary categories $\mathcal{F} : \mathcal{C} \rightarrow \text{Kan}$ determines a functor of ∞ -categories $N_\bullet^{\text{hc}}(\mathcal{F}) : N_\bullet(\mathcal{C}) \rightarrow N_\bullet^{\text{hc}}(\text{Kan}) = \mathcal{S}$. By virtue of Corollaries 7.4.1.3 and 7.4.3.3, the ∞ -category of spaces $\mathcal{S}$ admits small limits and colimits.

In particular, there exists a Kan complex X which is a limit of the diagram $N_{\bullet}^{\text{hc}}(\mathcal{F})$. This construction has the advantage of being homotopy invariant: if $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ is a levelwise homotopy equivalence, then X is also a limit of the diagram $N_{\bullet}^{\text{hc}}(\mathcal{G})$ (see Remark 7.1.1.8). However, it has the disadvantage of being somewhat inexplicit: the Kan complex X is *a priori* well-defined only up to homotopy equivalence, rather than up to isomorphism.

By combining the results of §7.4 and §5.3, we can obtain a more direct description of the Kan complex X . Let $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ denote the $\mathcal{F}$ -weighted nerve of $\mathcal{C}$ (Definition 5.3.3.1). It follows from Example 5.6.5.6 that $N_{\bullet}^{\text{hc}}(\mathcal{F})$ is a covariant transport representation for the left fibration $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$. By virtue of Proposition 7.4.1.6, the Kan complex $\text{Fun}_{/N_{\bullet}(\mathcal{C})}(N_{\bullet}(\mathcal{C}), N_{\bullet}^{\mathcal{F}}(\mathcal{C}))$ is a limit of the diagram $N_{\bullet}^{\text{hc}}(\mathcal{F})$. We will denote this Kan complex by $\varprojlim(\mathcal{F})$ and refer to it as the *homotopy limit* of the diagram $\mathcal{F}$ (Construction 7.5.1.1). In §7.5.1, we give review some elementary properties of this construction (which goes back to the work of Bousfield and Kan; see [7]).

In §7.5.2, we extend the definition of the homotopy limit $\varprojlim(\mathcal{F})$ to the case where $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ is a diagram of ∞ -categories (rather than a diagram of Kan complexes). In this case, the projection map $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ is a cocartesian fibration (rather than a left fibration), and we define $\varprojlim(\mathcal{F})$ to be the ∞ -category of *cocartesian* sections of U (that is, sections which carry each morphism of $\mathcal{C}$ to a U -cocartesian morphism of $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$; see Construction 7.5.2.1). It follows from the results of §7.4 that $\varprojlim(\mathcal{F})$ is a limit of the diagram of ∞ -categories $N_{\bullet}^{\text{hc}}(\mathcal{F}) : N_{\bullet}(\mathcal{C}) \rightarrow \mathbf{QC}$ (Proposition 7.5.2.6).

In §7.5.3, we consider another perspective on the homotopy limit construction $\mathcal{F} \mapsto \varprojlim(\mathcal{F})$: it can be viewed as a *right derived functor* of the usual inverse limit $\mathcal{F} \mapsto \varprojlim(\mathcal{F})$. More precisely, for every diagram of ∞ -categories $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$, there is a canonical isomorphism $\varprojlim(\mathcal{F}) \simeq \varprojlim(\mathcal{F}^+)$, where $\mathcal{F}^+ : \mathcal{C} \rightarrow \mathbf{QCat}$ is an *isofibrant replacement* for the diagram $\mathcal{F}$ (see Construction 7.5.3.3 and Proposition 7.5.3.7). In particular, there is a tautological map $\varprojlim(\mathcal{F}) \hookrightarrow \varprojlim(\mathcal{F})$ (see Remark 7.5.2.12), which is an equivalence of ∞ -categories when the diagram $\mathcal{F}$ is already isofibrant (Proposition 7.5.3.12). This condition is satisfied, for example, when the diagram $\mathcal{F}$ corresponds to a tower of ∞ -categories

$$\cdots \rightarrow \mathcal{E}(3) \rightarrow \mathcal{E}(2) \rightarrow \mathcal{E}(1) \rightarrow \mathcal{E}(0)$$

in which the transition functors are isofibrations (see Example 7.5.3.13).

Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a diagram of Kan complexes and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleleft} \rightarrow \mathbf{Kan}$ be an extension of $\mathcal{F}$, carrying the initial object of $\mathcal{C}^{\triangleleft}$ to a Kan complex X . We say that $\overline{\mathcal{F}}$ is a *homotopy limit diagram* if the composite map

$$X \rightarrow \varprojlim(\mathcal{F}) \hookrightarrow \varprojlim(\overline{\mathcal{F}})$$

is a homotopy equivalence (Definition 7.5.4.1). In §7.5.4, we show that this condition is equivalent to the requirement that $N_{\bullet}^{\text{hc}}(\overline{\mathcal{F}})$ is a limit diagram in the ∞ -category $\mathcal{S}$

(Proposition 7.5.4.5). Moreover, we extend the definition of homotopy limit diagram to the case where $\mathcal{F}$ is an arbitrary diagram of simplicial sets (Definition 7.5.4.8), and show that it generalizes the notion of homotopy pullback diagram introduced in §3.4.1 (Proposition 7.5.4.13). In §7.5.5, we introduce the parallel (and closely related) notion of *categorical limit diagram* (Definition 7.5.5.11), and show that it generalizes the notion of categorical pullback square introduced in §4.5.2 (Corollary 7.5.5.10).

There is a close relationship between the homotopy limit construction $\mathcal{F} \mapsto \varprojlim(\mathcal{F})$ of this section and the homotopy colimit construction $\mathcal{F} \mapsto \varinjlim(\mathcal{F})$ introduced in §5.3.2. If $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \text{Set}_\Delta$ is a diagram of simplicial sets and X is a Kan complex, then there is a canonical isomorphism of simplicial sets

$$\varprojlim(X^{\mathcal{F}})^{\text{op}} \simeq \text{Fun}(\varinjlim(\mathcal{F}^{\text{op}}), X^{\text{op}}),$$

where $X^{\mathcal{F}} : \mathcal{C} \rightarrow \text{Kan}$ denotes the functor given by $C \mapsto \text{Fun}(\mathcal{F}(C), X)$ (Example 7.5.1.7; see Example 7.5.2.11 for a generalization to the case where X is an ∞ -category). Just as the homotopy limit construction can be viewed as a *right* derived functor of the limit functor $\varprojlim : \text{Fun}(\mathcal{C}, \text{Set}_\Delta) \rightarrow \text{Set}_\Delta$, the homotopy colimit construction can be viewed as a *left* derived functor of the colimit functor $\varinjlim : \text{Fun}(\mathcal{C}, \text{Set}_\Delta) \rightarrow \text{Set}_\Delta$. More precisely, we show in §7.5.6 that the homotopy colimit of a diagram $\mathcal{F}$ is isomorphic to the colimit $\varinjlim(\mathcal{G})$, where $\mathcal{G}$ is a projectively cofibrant diagram of simplicial sets equipped with a levelwise weak homotopy equivalence $\alpha : \mathcal{G} \rightarrow \mathcal{F}$ (Construction 7.5.6.8).

In §7.5.7, we show that the homotopy colimit construction has a close relationship with the formation of colimits in the ∞ -category $\mathcal{S}$. If $\mathcal{F} : \mathcal{C} \rightarrow \text{Kan}$ is a diagram of Kan complexes, then a Kan complex is a colimit of the diagram $N_\bullet^{\text{hc}}(\mathcal{F})$ if and only if it is weakly homotopy equivalent to $\varinjlim(\mathcal{F})$ (Proposition 7.5.7.1). In fact, we can be more precise: if $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Kan}$ is a diagram extending $\mathcal{F}$ which carries the final object of $\mathcal{C}^\triangleright$ to a Kan complex X , then $N_\bullet^{\text{hc}}(\mathcal{F})$ is a colimit diagram if and only if the composite map $\varinjlim(\mathcal{F}) \twoheadrightarrow \varinjlim(\overline{\mathcal{F}}) \rightarrow X$ is a weak homotopy equivalence (Corollary 7.5.7.7). If this condition is satisfied, we will say that $\overline{\mathcal{F}}$ is a *homotopy colimit diagram* (Definition 7.5.7.3). In §7.5.8, we introduce the parallel notion of *categorical colimit diagram* (Definition 7.5.8.2), which has a similar relationship with colimits in the ∞ -category $\mathcal{QC}$ (Corollary 7.5.8.9).

7.5.1 Homotopy Limits of Kan Complexes

In this section, we introduce the *homotopy limit* of a diagram of Kan complexes, following Bousfield and Kan (see [7]).

Construction 7.5.1.1 (Homotopy Limits of Kan Complexes). Let $\mathcal{C}$ be a category, let $\mathcal{F} : \mathcal{C} \rightarrow \text{Kan}$ be a diagram of Kan complexes indexed by $\mathcal{C}$, and $N_\bullet^{\mathcal{F}}(\mathcal{C})$ denote the weighted

nerve of $\mathcal{F}$ (Definition 5.3.3.1). We define

$$\operatorname{holim}_{\leftarrow}(\mathcal{F}) = \operatorname{Fun}_{/N_{\bullet}(\mathcal{C})}(N_{\bullet}(\mathcal{C}), N_{\bullet}^{\mathcal{F}}(\mathcal{C}))$$

to be the simplicial set which parametrizes sections of the projection map $N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$. We will refer to $\operatorname{holim}_{\leftarrow}(\mathcal{F})$ as the *homotopy limit* of the diagram $\mathcal{F}$.

03A1 Proposition 7.5.1.2. *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a diagram of Kan complexes. Then the homotopy limit $\operatorname{holim}_{\leftarrow}(\mathcal{F})$ is a Kan complex.*

Proof. This is a special case of Corollary 4.4.2.5, since the projection map $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ is a left fibration (Corollary 5.3.3.19). $\square$

03A2 Remark 7.5.1.3 (Homotopy Invariance). Let $\mathcal{C}$ be a category and let $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ be a natural transformation between functors $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathbf{Kan}$. Then α induces a morphism of weighted nerves $T : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}^{\mathcal{G}}(\mathcal{C})$, and therefore a morphism of Kan complexes $\operatorname{holim}_{\leftarrow}(\alpha) : \operatorname{holim}_{\leftarrow}(\mathcal{F}) \rightarrow \operatorname{holim}_{\leftarrow}(\mathcal{G})$. If α is a levelwise homotopy equivalence, then T is an equivalence of left fibrations over $N_{\bullet}(\mathcal{C})$ (Corollary 5.3.3.20), so $\operatorname{holim}_{\leftarrow}(\alpha)$ is a homotopy equivalence.

03A3 Warning 7.5.1.4. In [7], Bousfield and Kan define the homotopy limit of an arbitrary diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$ to be the simplicial set $\operatorname{Fun}_{/N_{\bullet}(\mathcal{C})}(N_{\bullet}(\mathcal{C}), N_{\bullet}^{\mathcal{F}}(\mathcal{C}))$ appearing in Construction 7.5.1.1. We will avoid this convention for two reasons:

- Many important features of the Bousfield-Kan construction (such as the homotopy invariance property of Remark 7.5.1.3) are true for diagrams of Kan complexes, but not for general diagrams of simplicial sets.
- In the case where $\mathcal{F}$ is a diagram of ∞ -categories, it will be convenient to adopt a slightly different definition of homotopy limit (Construction 7.5.2.1), which generally does not agree with the Bousfield-Kan construction.

Note that every (strictly commutative) diagram of Kan complexes $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ determines a diagram

$$N_{\bullet}^{\mathrm{hc}} : N_{\bullet}(\mathcal{C}) \rightarrow N_{\bullet}^{\mathrm{hc}}(\mathbf{Kan}) = \mathcal{S}$$

in the ∞ -category of spaces $\mathcal{S}$.

03A4 Proposition 7.5.1.5. *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a diagram of Kan complexes. Then the Kan complex $\operatorname{holim}_{\leftarrow}(\mathcal{F})$ is a limit of the diagram*

$$N_{\bullet}^{\mathrm{hc}}(\mathcal{F}) : N_{\bullet}(\mathcal{C}) \rightarrow N_{\bullet}^{\mathrm{hc}}(\mathbf{Kan}) = \mathcal{S}$$

in the ∞ -category $\mathcal{S}$.

Proof. This is a special case of Proposition 7.4.1.6, since the functor $N_{\bullet}^{\text{hc}}(\mathcal{F})$ is a covariant transport representation for the projection map $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ (Example 5.6.5.6). $\square$

We now give a more concrete description of the homotopy limit.

Remark 7.5.1.6. Let $\mathcal{C}$ be a category. For each object $C \in \mathcal{C}$, let $\mathcal{E}(C)$ denote the simplicial set $N_{\bullet}(\mathcal{C}_{/C})$. The construction $C \mapsto \mathcal{E}(C)$ determines a functor $\mathcal{E} : \mathcal{C} \rightarrow \text{Set}_{\Delta}$, which we view as an object of the functor category $\text{Fun}(\mathcal{C}, \text{Set}_{\Delta})$. For every diagram of Kan complexes $\mathcal{F} : \mathcal{C} \rightarrow \text{Kan}$, Proposition 5.3.3.24 supplies a canonical isomorphism

$$\text{holim}_{\leftarrow}(\mathcal{F}) = \text{Hom}_{\text{Fun}(\mathcal{C}, \text{Set}_{\Delta})}(\mathcal{E}, \mathcal{F})_{\bullet},$$

where the right hand side is defined using the simplicial enrichment of $\text{Fun}(\mathcal{C}, \text{Set}_{\Delta})$ described in Example 2.4.2.2.

Stated more concretely, we can identify $\text{holim}_{\leftarrow}(\mathcal{F})$ with a simplicial subset of the product $\prod_{C \in \mathcal{C}} \text{Fun}(N_{\bullet}(\mathcal{C}_{/C}), \mathcal{F}(C))$, whose n -simplices are collections of maps $\{\sigma_C : \Delta^n \times N_{\bullet}(\mathcal{C}_{/C}) \rightarrow \mathcal{F}(C)\}$ which satisfy the following condition:

(*) For every morphism $f : C \rightarrow D$ in the category $\mathcal{C}$, the diagram of simplicial sets

$$\begin{array}{ccc} \Delta^n \times N_{\bullet}(\mathcal{C}_{/C}) & \xrightarrow{\circ f} & \Delta^n \times N_{\bullet}(\mathcal{C}_{/D}) \\ \downarrow \sigma_C & & \downarrow \sigma_D \\ \mathcal{F}(C) & \xrightarrow{\mathcal{F}(f)} & \mathcal{F}(D) \end{array}$$

is commutative.

In particular, we have an equalizer diagram of simplicial sets

$$\text{holim}_{\leftarrow}(\mathcal{F}) \rightarrow \prod_C \text{Fun}(N_{\bullet}(\mathcal{C}_{/C}), \mathcal{F}(C)) \rightrightarrows \prod_{f:C \rightarrow D} \text{Fun}(N_{\bullet}(\mathcal{C}_{/C}), \mathcal{F}(D)).$$

Example 7.5.1.7 (Duality with Homotopy Colimits). Let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \text{Set}_{\Delta}$ be a diagram of simplicial sets, let X be a Kan complex, and let $X^{\mathcal{F}} : \mathcal{C} \rightarrow \text{Kan}$ be the diagram of Kan complexes given by the formula $X^{\mathcal{F}}(C) = \text{Fun}(\mathcal{F}(C), X)$. Let us write $\mathcal{F}^{\text{op}} : \mathcal{C}^{\text{op}} \rightarrow \text{Set}_{\Delta}$ for the functor given by the formula $\mathcal{F}^{\text{op}}(C) = \mathcal{F}(C)^{\text{op}}$, and let $\mathcal{E} : \mathcal{C} \rightarrow \text{Set}_{\Delta}$ denote the functor given by $\mathcal{E}(C) = N_{\bullet}(\mathcal{C}_{/C})$. Combining Remark 7.5.1.6 with Proposition 5.3.2.21, we obtain canonical isomorphisms

$$\begin{aligned} \text{holim}_{\leftarrow}(X^{\mathcal{F}})^{\text{op}} &\simeq \text{Hom}_{\text{Fun}(\mathcal{C}, \text{Set}_{\Delta})}(\mathcal{E}, X^{\mathcal{F}})^{\text{op}}_{\bullet} \\ &\simeq \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \text{Set}_{\Delta})}(\mathcal{F}, X^{\mathcal{E}})^{\text{op}}_{\bullet} \\ &\simeq \text{Fun}(\text{holim}_{\rightarrow}(\mathcal{F}^{\text{op}}), X^{\text{op}}). \end{aligned}$$

7.5.2 Homotopy Limits of ∞ -Categories

03A7 We now extend the definition of homotopy limit to diagrams taking values in the category $\mathbf{QCat}$.

03A8 **Construction 7.5.2.1** (Homotopy Limits of ∞ -Categories). Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a (strictly commutative) diagram of ∞ -categories, let $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ denote the weighted nerve of $\mathcal{F}$ (Definition 5.3.3.1), and let $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ the cocartesian fibration of Corollary 5.3.3.16. We let $\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F})$ denote the full subcategory

$$\mathrm{Fun}_{/N_{\bullet}(\mathcal{C})}^{\mathrm{CCart}}(N_{\bullet}(\mathcal{C}), N_{\bullet}^{\mathcal{F}}(\mathcal{C})) \subseteq \mathrm{Fun}_{/N_{\bullet}(\mathcal{C})}(N_{\bullet}(\mathcal{C}), N_{\bullet}^{\mathcal{F}}(\mathcal{C}))$$

whose objects are functors $G : N_{\bullet}(\mathcal{C}) \rightarrow N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ which satisfy $U \circ G = \mathrm{id}_{N_{\bullet}(\mathcal{C})}$ and which carry each morphism of $\mathcal{C}$ to a U -cocartesian morphism of $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ (see Notation 5.3.1.10). We will refer to $\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F})$ as the *homotopy limit* of the diagram $\mathcal{F}$.

03A9 **Example 7.5.2.2** (Homotopy Limits of Kan Complexes). Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a (strictly commutative) diagram of Kan complexes. Then the projection map $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ is a left fibration of simplicial sets (Corollary 5.3.3.19). It follows that every morphism of the ∞ -category $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ is U -cocartesian, so the homotopy limit $\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F})$ of Construction 7.5.2.1 coincides with the homotopy limit $\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F})$ of Construction 7.5.1.1.

03AA **Remark 7.5.2.3.** Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a (strictly commutative) diagram of ∞ -categories, let K be a simplicial set, and let $\mathcal{F}^K : \mathcal{C} \rightarrow \mathbf{QCat}$ denote the functor given on objects by the formula $\mathcal{F}^K(C) = \mathrm{Fun}(K, \mathcal{F}(C))$. Then there is a canonical isomorphism of simplicial sets $\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F}^K) \simeq \mathrm{Fun}(K, \mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F}))$ (see Remarks 5.3.3.5 and 5.3.1.19).

03Y3 **Variant 7.5.2.4** (Homotopy Limits of Ordinary Categories). Let $\mathbf{Cat}$ denote the (ordinary) category of categories, let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor, and let $\int_{\mathcal{C}} \mathcal{F}$ denote the category of elements of $\mathcal{F}$. We let $\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F})$ denote the category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \int_{\mathcal{C}} \mathcal{F})$ whose objects are sections of the projection functor $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$ which carry each morphism of $\mathcal{C}$ to a U -cocartesian morphism of $\int_{\mathcal{C}} \mathcal{F}$. Let $N_{\bullet}(\mathcal{F})$ denote the $\mathbf{QCat}$ -valued functor given by $C \mapsto N_{\bullet}(\mathcal{F}(C))$. Combining Proposition 1.5.3.3 with Example 5.6.1.8, we obtain a canonical isomorphism of simplicial sets

$$\mathop{\mathrm{holim}}\limits_{\leftarrow}(N_{\bullet}(\mathcal{F})) \simeq N_{\bullet}(\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F})).$$

In particular, the formation of homotopy limits preserves the full subcategory of $\mathbf{QCat}$ spanned by the (nerves of) ordinary categories.

03Y4 **Remark 7.5.2.5.** Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of ordinary categories. Then the category $\mathop{\mathrm{holim}}\limits_{\leftarrow}(\mathcal{F})$ can be described more concretely as follows:

(1) An $M \in \varprojlim(\mathcal{F})$ is a rule which assigns to each object $C \in \mathcal{C}$ an object $M(C) \in \mathcal{F}$, and to each morphism $u : C \rightarrow D$ in $\mathcal{C}$ an isomorphism $M(u) : \mathcal{F}(u)(M(C)) \xrightarrow{\sim} M(D)$, subject to the following constraints:

- For each object $C \in \mathcal{C}$, $M(\text{id}_C)$ is the identity morphism from $M(C)$ to itself.
- For every pair of composable morphisms $u : C \rightarrow D$ and $v : D \rightarrow E$ of $\mathcal{C}$, we have $M(v \circ u) = M(v) \circ \mathcal{F}(v)(M(u))$.

(2) If M and N are objects of $\varprojlim(\mathcal{F})$, then a morphism $\alpha : M \rightarrow N$ in $\varprojlim(\mathcal{F})$ is a rule which assigns to each object $C \in \mathcal{C}$ a morphism $\alpha_C : M(C) \rightarrow N(C)$ in the category $\mathcal{F}(C)$, subject to the following constraint:

- For every morphism $u : C \rightarrow D$ of $\mathcal{C}$, the diagram

$$\begin{array}{ccc} \mathcal{F}(u)(M(C)) & \xrightarrow[\sim]{M(u)} & M(D) \\ \downarrow \mathcal{F}(u)(\alpha_C) & & \downarrow \alpha_D \\ \mathcal{F}(u)(N(C)) & \xrightarrow[\sim]{N(u)} & N(D) \end{array}$$

commutes (in the category $\mathcal{F}(D)$).

Proposition 7.5.2.6. *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a (strictly commutative) diagram of ∞ -categories. Then the homotopy limit $\varprojlim(\mathcal{F})$ is an ∞ -category. Moreover, $\varprojlim(\mathcal{F})$ can be identified with a limit of the diagram*

$$\mathbf{N}_\bullet^{\text{hc}}(\mathcal{F}) : \mathbf{N}_\bullet(\mathcal{C}) \rightarrow \mathbf{N}_\bullet^{\text{hc}}(\mathbf{QCat}) = \mathcal{QC}$$

in the ∞ -category $\mathcal{QC}$.

Proof. By virtue of Example 5.6.5.6, the functor $\mathbf{N}_\bullet^{\text{hc}}(\mathcal{F})$ is a covariant transport representation for the cocartesian fibration $U : \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C}) \rightarrow \mathbf{N}_\bullet(\mathcal{C})$. Proposition 7.5.2.6 is therefore a special case of Proposition 7.4.4.1. $\square$

Remark 7.5.2.7 (Homotopy Invariance). Let $\mathcal{C}$ be a category and let $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ be a natural transformation between functors $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathbf{QCat}$. Then α determines a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C}) & \xrightarrow{T} & \mathbf{N}_\bullet^{\mathcal{G}}(\mathcal{C}) \\ & \searrow U & \swarrow V \\ & \mathbf{N}_\bullet(\mathcal{C}) & \end{array}$$

The functor T carries U -cocartesian morphisms of $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ to V -cocartesian morphisms of $N_{\bullet}^{\mathcal{G}}(\mathcal{C})$ (see Corollary 5.3.3.16), and therefore induces a functor of ∞ -categories $\text{holim}(\alpha) : \text{holim}(\mathcal{F}) \rightarrow \text{holim}(\mathcal{G})$. If α is a levelwise categorical equivalence, then T is an equivalence of cocartesian fibrations over $N_{\bullet}(\mathcal{C})$ (Corollary 5.3.3.20), so $\text{holim}(\alpha)$ is an equivalence of ∞ -categories.

03AD Example 7.5.2.8 (Homotopy Limits of Cores). Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories, and let $\mathcal{F}^{\simeq} : \mathcal{C} \rightarrow \mathbf{Kan}$ be the functor given on objects by the formula $\mathcal{F}^{\simeq}(C) = \mathcal{F}(C)^{\simeq}$. Then the inclusion map $\mathcal{F}^{\simeq} \hookrightarrow \mathcal{F}$ induces a monomorphism of simplicial sets $\text{holim}(\mathcal{F}^{\simeq}) \rightarrow \text{holim}(\mathcal{F})$, whose image is the core of the ∞ -category $\text{holim}(\mathcal{F})$ (see Example 5.3.3.21 and Remark 5.3.1.20). In other words, there is a canonical isomorphism of Kan complexes $\text{holim}(\mathcal{F}^{\simeq}) \simeq \text{holim}(\mathcal{F})^{\simeq}$.

03AE Remark 7.5.2.9. Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories and let $\mathcal{F}_0 = \mathcal{F}|_{\mathcal{C}_0}$ be the restriction of $\mathcal{F}$ to a subcategory $\mathcal{C}_0 \subseteq \mathcal{C}$. Suppose that the inclusion $N_{\bullet}(\mathcal{C}_0) \hookrightarrow N_{\bullet}(\mathcal{C})$ is left anodyne (this condition is satisfied, for example, if the inclusion map $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ has a right adjoint: see Corollary 7.2.3.7). Then the restriction map $\text{holim}(\mathcal{F}) \rightarrow \text{holim}(\mathcal{F}_0)$ is a trivial Kan fibration of ∞ -categories (see Proposition 5.3.1.21).

03AF Remark 7.5.2.10. Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories. Arguing as in Remark 7.5.1.6, we can identify the homotopy limit $\text{holim}(\mathcal{F})$ with a simplicial subset of the product $\prod_{C \in \mathcal{C}} \text{Fun}(N_{\bullet}(\mathcal{C}_{/C}), \mathcal{F}(C))$, whose n -simplices are collections of maps $\{\sigma_C : \Delta^n \times N_{\bullet}(\mathcal{C}_{/C}) \rightarrow \mathcal{F}(C)\}$ which satisfy the following pair of conditions:

(*) For every morphism $f : C \rightarrow D$ in the category $\mathcal{C}$, the diagram of simplicial sets

$$\begin{array}{ccc} \Delta^n \times N_{\bullet}(\mathcal{C}_{/C}) & \xrightarrow{\circ f} & \Delta^n \times N_{\bullet}(\mathcal{C}_{/D}) \\ \downarrow \sigma_C & & \downarrow \sigma_D \\ \mathcal{F}(C) & \xrightarrow{\mathcal{F}(f)} & \mathcal{F}(D) \end{array}$$

is commutative.

(*)' For every object $C \in \mathcal{C}$ and every integer $0 \leq i \leq n$, the composite map

$$\{i\} \times N_{\bullet}(\mathcal{C}_{/C}) \hookrightarrow \Delta^n \times N_{\bullet}(\mathcal{C}_{/C}) \xrightarrow{\sigma_C} \mathcal{F}(C)$$

carries every morphism in the category $\mathcal{C}_{/C}$ to an isomorphism in the ∞ -category $\mathcal{F}(C)$.

Example 7.5.2.11 (Duality with Homotopy Colimits). Let $\mathcal{C}$ be a category, let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathbf{Set}_\Delta$ be a diagram of simplicial sets, and let W denote the collection of horizontal edges of the homotopy colimit $\text{holim}(\mathcal{F}^{\text{op}})$ (see Definition 5.3.4.1). Let $\mathcal{D}$ be an ∞ -category and let $\mathcal{D}^{\mathcal{F}} : \mathcal{C} \rightarrow \mathbf{QCat}$ denote the functor given by the formula $\mathcal{D}^{\mathcal{F}}(C) = \text{Fun}(\mathcal{F}(C), \mathcal{D})$. Arguing as in Example 7.5.1.7, we obtain a canonical isomorphism

$$\theta : \text{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}(\mathbf{N}_\bullet(\mathcal{C}), \mathbf{N}_\bullet^{\mathcal{D}^{\mathcal{F}}}(\mathcal{C}))^{\text{op}} \simeq \text{Fun}(\text{holim}(\mathcal{F}^{\text{op}}), \mathcal{D}^{\text{op}}).$$

Unwinding the definitions, we see that θ restricts to an isomorphism of ∞ -categories $\text{holim}(\mathcal{D}^{\mathcal{F}})^{\text{op}} \simeq \text{Fun}(\text{holim}(\mathcal{F}^{\text{op}})[W^{-1}], \mathcal{D}^{\text{op}})$.

Remark 7.5.2.12 (Comparison with the Limit). Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories and let $X = \varprojlim(\mathcal{F})$ denote the limit of $\mathcal{F}$, formed in the category of simplicial sets. Let $\underline{X} : \mathcal{C} \rightarrow \mathbf{Set}_\Delta$ denote the constant functor taking the value X . We then have a tautological map $\underline{X} \rightarrow \mathcal{F}$. The induced morphism of simplicial sets

$$X \times \mathbf{N}_\bullet(\mathcal{C}) \simeq \mathbf{N}_\bullet^{\underline{X}}(\mathcal{C}) \rightarrow \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C})$$

determines a comparison map $\iota : X = \varprojlim(\mathcal{F}) \rightarrow \text{holim}(\mathcal{F})$. Note that ι is a monomorphism of simplicial sets (since each of the projection maps $X = \varprojlim(\mathcal{F}) \rightarrow \mathcal{F}(C)$ factor through ι).

Proposition 7.5.2.13. *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories, and suppose that the category $\mathcal{C}$ has an initial object. Then the comparison map $\iota : \varprojlim(\mathcal{F}) \hookrightarrow \text{holim}(\mathcal{F})$ of Remark 7.5.2.12 is an equivalence of ∞ -categories.*

Proof. Let $C \in \mathcal{C}$ be an initial object, so that the inclusion map $\{C\} \rightarrow \mathbf{N}_\bullet(\mathcal{C})$ is left anodyne (Corollary 4.6.7.25). Applying Remark 7.5.2.9, we see that evaluation at C induces an equivalence of ∞ -categories $\text{ev}_C : \text{holim}(\mathcal{F}) \rightarrow \mathcal{F}(C)$. Our assumption that C is initial also guarantees that the composition $(\text{ev}_C \circ \iota) : \varprojlim(\mathcal{F}) \rightarrow \mathcal{F}(C)$ is an isomorphism of simplicial sets, so that $\varprojlim(\mathcal{F})$ is an ∞ -category and ι is an equivalence of ∞ -categories. $\square$

Example 7.5.2.14. Let I be a set, which we regard as a category having only identity morphisms. Let $\mathcal{F} : I \rightarrow \mathbf{QCat}$ be a diagram, which we view as a collection of ∞ -categories $\{\mathcal{C}_i\}_{i \in I}$ indexed by I . Then the comparison morphism

$$\prod_{i \in I} \mathcal{C}_i = \varprojlim(\mathcal{F}) \rightarrow \text{holim}(\mathcal{F})$$

of Remark 7.5.2.12 is an isomorphism.

Exercise 7.5.2.15 (Homotopy Limits of Sets). Let $\mathcal{C}$ be a category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}$ be a diagram in the category of sets. Let us abuse notation by identifying $\mathbf{Set}$ with the full subcategory of Kan spanned by the constant simplicial sets. Show that the comparison map $\varprojlim(\mathcal{F}) \hookrightarrow \text{holim}(\mathcal{F})$ of Remark 7.5.2.12 is an isomorphism.

Beware that the comparison morphism of Remark 7.5.2.12 is not an isomorphism in general.

03AM Example 7.5.2.16. Let $[1]$ denote the linearly ordered set $\{0 < 1\}$ and let $\mathcal{F} : [1] \rightarrow \mathbf{QCat}$ be a diagram, which we identify with a functor of ∞ -categories $T : \mathcal{C} \rightarrow \mathcal{D}$. Then the homotopy limit $\mathop{\mathrm{holim}}\nolimits(\mathcal{F})$ of Construction 7.5.1.1 can be identified with the homotopy fiber product

$$\mathcal{C} \times_{\mathcal{D}}^{\mathrm{h}} \mathcal{D} = \mathcal{C} \times_{\mathrm{Fun}(\{0\}, \mathcal{D})} \mathrm{Isom}(\mathcal{D})$$

of Construction 4.5.2.1. Under this identification, the comparison morphism $\mathop{\mathrm{lim}}\nolimits(\mathcal{F}) \rightarrow \mathop{\mathrm{holim}}\nolimits(\mathcal{F})$ of Remark 7.5.2.12 corresponds to the monomorphism

$$\mathcal{C} \simeq \mathcal{C} \times_{\mathcal{D}} \mathcal{D} \hookrightarrow \mathcal{C} \times_{\mathcal{D}}^{\mathrm{h}} \mathcal{D}$$

of Proposition 3.4.0.7. This morphism is usually not an isomorphism of simplicial sets, though it is always an equivalence of ∞ -categories (Proposition 7.5.2.13).

03AN Example 7.5.2.17. Let $\mathcal{K}$ be the partially ordered set depicted in the diagram

$$\bullet \rightarrow \bullet \leftarrow \bullet$$

and suppose we are given a functor $\mathcal{F} : \mathcal{K} \rightarrow \mathbf{QCat}$, which we depict as a diagram of ∞ -categories

$$\mathcal{C}_0 \xrightarrow{T_0} \mathcal{C} \xleftarrow{T_1} \mathcal{C}_1.$$

Then the homotopy limit $\mathop{\mathrm{holim}}\nolimits(\mathcal{F})$ can be identified with the iterated homotopy pullback $\mathcal{C}_0 \times_{\mathcal{C}}^{\mathrm{h}} (\mathcal{C}_1 \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C})$. Applying Corollary 4.5.2.21, we see that the equivalence $\mathcal{C}_1 \hookrightarrow \mathcal{C}_1 \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C}$ of Example 7.5.2.16 induces an equivalence of ∞ -categories

$$\mathcal{C}_0 \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C}_1 \hookrightarrow \mathcal{C}_0 \times_{\mathcal{C}}^{\mathrm{h}} (\mathcal{C}_1 \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C}) \simeq \mathop{\mathrm{holim}}\nolimits(\mathcal{F}).$$

In particular, the comparison map $\mathop{\mathrm{lim}}\nolimits(\mathcal{F}) \rightarrow \mathop{\mathrm{holim}}\nolimits(\mathcal{F})$ is a categorical equivalence of simplicial sets if and only if the inclusion $\mathcal{C}_0 \times_{\mathcal{C}} \mathcal{C}_1 \hookrightarrow \mathcal{C}_0 \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C}_1$ is a categorical equivalence of simplicial sets. This condition is satisfied if either T_0 or T_1 is a isofibration of ∞ -categories (Corollary 4.5.2.29), but not in general.

7.5.3 The Homotopy Limit as a Derived Functor

03AP Let $\mathcal{C}$ be a small category. In general, the inverse limit functor $\mathop{\mathrm{lim}}\nolimits : \mathrm{Fun}(\mathcal{C}, \mathbf{QCat}) \rightarrow \mathbf{Set}_{\Delta}$ does not respect categorical equivalence: that is, if $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ is a levelwise categorical equivalence of diagrams $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathbf{QCat}$, then the induced map $\mathop{\mathrm{lim}}\nolimits(\alpha) : \mathop{\mathrm{lim}}\nolimits(\mathcal{F}) \rightarrow \mathop{\mathrm{lim}}\nolimits(\mathcal{G})$ need not be a categorical equivalence of simplicial sets. In §7.5.2 and §4.5.6, we discussed two different ways of addressing this point:

- We can replace the limit $\varprojlim(\mathcal{F})$ by the homotopy limit $\operatorname{holim}(\mathcal{F})$ of Construction 7.5.2.1. If $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ is a levelwise categorical equivalence of diagrams $\mathcal{F}, \mathcal{G}$, then Remark 7.5.2.7 guarantees that the induced map $\operatorname{holim}(\alpha) : \operatorname{holim}(\mathcal{F}) \rightarrow \operatorname{holim}(\mathcal{G})$ is an equivalence of ∞ -categories.
- We can restrict our attention to *isofibrant* diagrams of ∞ -categories (Definition 4.5.6.3). If $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ is a levelwise categorical equivalence between isofibrant diagrams, then Corollary 4.5.6.16 guarantees that the induced map $\varprojlim(\alpha) : \varprojlim(\mathcal{F}) \rightarrow \varprojlim(\mathcal{G})$ is an equivalence of ∞ -categories.

In this section, we will show that these perspectives are closely related: if $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ is a diagram of ∞ -categories, then the homotopy limit $\operatorname{holim}(\mathcal{F})$ can be identified with the limit of an *isofibrant replacement* for $\mathcal{F}$. More precisely, we show that there exists a canonical isomorphism $\operatorname{holim}(\mathcal{F}) \simeq \varprojlim(\mathcal{F}^+)$, where $\mathcal{F}^+ : \mathcal{C} \rightarrow \mathbf{QCat}$ is an isofibrant diagram of simplicial sets equipped with a levelwise categorical equivalence $\alpha : \mathcal{F} \hookrightarrow \mathcal{F}^+$ (Construction 7.5.3.3 and Proposition 7.5.3.7). Moreover, we show that for *any* isofibrant diagram $\mathcal{G} : \mathcal{C} \rightarrow \mathbf{QCat}$, the inclusion map $\varprojlim(\mathcal{G}) \hookrightarrow \operatorname{holim}(\mathcal{G})$ is an equivalence of ∞ -categories (Proposition 7.5.3.12). Consequently, if $\beta : \mathcal{F} \rightarrow \mathcal{G}$ is any levelwise categorical equivalence from $\mathcal{F}$ to an isofibrant diagram $\mathcal{G}$, then the maps

$$\operatorname{holim}(\mathcal{F}) \xrightarrow{\operatorname{holim}(\beta)} \operatorname{holim}(\mathcal{G}) \leftarrow \varprojlim(\mathcal{G})$$

are equivalences of ∞ -categories; in particular, the ∞ -categories $\operatorname{holim}(\mathcal{F})$ and $\varprojlim(\mathcal{G})$ are equivalent (see Remark 7.5.3.15).

We begin with some elementary observations.

Proposition 7.5.3.1. *Let $\mathcal{C}$ be a small category and let $U : \mathcal{E} \rightarrow \mathbf{N}_\bullet(\mathcal{C})$ be an isofibration of ∞ -categories. Then the weak transport representation*

$$\operatorname{wTr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \mathbf{Set}_\Delta \quad C \mapsto \operatorname{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}(\mathbf{N}_\bullet(\mathcal{C}_C), \mathcal{E})$$

of Construction 5.3.1.1 is an isofibrant diagram of simplicial sets.

Proof. Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_\Delta$ be a functor and let $\mathcal{F}_0 \subseteq \mathcal{F}$ be a subfunctor for which the inclusion $\mathcal{F}_0 \hookrightarrow \mathcal{F}$ is a levelwise categorical equivalence. We wish to show that every natural transformation $\alpha_0 : \mathcal{F}_0 \rightarrow \operatorname{wTr}_{\mathcal{E}/\mathcal{C}}$ admits an extension $\alpha : \mathcal{F} \rightarrow \operatorname{wTr}_{\mathcal{E}/\mathcal{C}}$. Using Corollary 5.3.2.23, we can reformulate this as a lifting problem

$$\begin{array}{ccc} \operatorname{holim}(\mathcal{F}_0) & \xrightarrow{\quad} & \mathcal{E} \\ \downarrow & \nearrow \text{dashed} & \downarrow U \\ \operatorname{holim}(\mathcal{F}) & \xrightarrow{\quad} & \mathbf{N}_\bullet(\mathcal{C}) \end{array}$$

in the category of simplicial sets. Since U is an isofibration, we are reduced to showing that the inclusion map $\text{holim}(\mathcal{F}_0) \hookrightarrow \text{holim}(\mathcal{F})$ is a categorical equivalence (Proposition 4.5.5.1), which is a special case of Variant 5.3.2.19. $\square$

03AR **Corollary 7.5.3.2.** *Let $\mathcal{C}$ be a small category and let $U : \mathcal{E} \rightarrow \mathbf{N}_\bullet(\mathcal{C})$ be a cocartesian fibration of ∞ -categories. Then the strict transport representation*

$$\text{sTr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \text{Set}_\Delta \quad C \mapsto \text{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}^{\text{CCart}}(\mathbf{N}_\bullet(\mathcal{C}_C), \mathcal{E})$$

of Construction 5.3.1.5 is an isofibrant diagram of simplicial sets.

Proof. Let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a functor and let $\mathcal{F}_0 \subseteq \mathcal{F}$ be a subfunctor for which the inclusion $\mathcal{F}_0 \hookrightarrow \mathcal{F}$ is a levelwise categorical equivalence. Suppose we are given a natural transformation $\alpha_0 : \mathcal{F}_0 \rightarrow \text{sTr}_{\mathcal{E}/\mathcal{C}}$. It follows from Proposition 7.5.3.1 that α_0 can be extended to a natural transformation $\alpha : \mathcal{F} \rightarrow \text{wTr}_{\mathcal{E}/\mathcal{C}}$. To complete the proof, it will suffice to show that α factors through the subfunctor $\text{sTr}_{\mathcal{E}/\mathcal{C}}$. Equivalently, we must show that for each object $C \in \mathcal{C}$, the lifting problem

$$\begin{array}{ccc} \mathcal{F}_0(C) & \longrightarrow & \text{sTr}_{\mathcal{E}/\mathcal{C}}(C) \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ \mathcal{F}(C) & \longrightarrow & \text{wTr}_{\mathcal{E}/\mathcal{C}}(C) \end{array}$$

admits a (unique) solution. This is clear, since the left vertical map is a categorical equivalence and $\text{sTr}_{\mathcal{E}/\mathcal{C}}(C)$ is a replete subcategory of $\text{wTr}_{\mathcal{E}/\mathcal{C}}(C)$ (see Remark 5.3.1.15). $\square$

03AS **Construction 7.5.3.3** (Explicit Isofibrant Replacement). Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a (strictly commutative) diagram of ∞ -categories. Let $\mathbf{N}_\bullet^\mathcal{F}(\mathcal{C})$ denote the $\mathcal{F}$ -weighted nerve of $\mathcal{C}$ (Definition 5.3.3.1), and let $\mathcal{F}^+ = \text{sTr}_{\mathbf{N}_\bullet^\mathcal{F}(\mathcal{C})/\mathcal{C}}$ denote the strict transport representation of the projection map $\mathbf{N}_\bullet^\mathcal{F}(\mathcal{C}) \rightarrow \mathbf{N}_\bullet(\mathcal{C})$. It follows from Remark 5.3.4.10 that there is a unique natural transformation $\alpha : \mathcal{F} \rightarrow \mathcal{F}^+$ for which the diagram of simplicial sets

$$\begin{array}{ccc} & \text{holim}(\mathcal{F}^+) & \\ \text{holim}(\alpha) \nearrow & & \searrow \lambda_u \\ \text{holim}(\mathcal{F}) & \xrightarrow{\lambda_t} & \mathbf{N}_\bullet^\mathcal{F}(\mathcal{C}), \end{array}$$

is commutative, where λ_u denotes the universal scaffold of Construction 5.3.4.7 and λ_t denotes the taut scaffold of Construction 5.3.4.11. We will refer to $\mathcal{F}^+$ as the *isofibrant replacement* of $\mathcal{F}$.

Proposition 7.5.3.4. *Let $\mathcal{C}$ be a small category, let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of 03AT
 ∞ -categories, and let $\alpha : \mathcal{F} \rightarrow \mathcal{F}^+$ be the natural transformation of Construction 7.5.3.3. Then $\mathcal{F}^+ : \mathcal{C} \rightarrow \mathbf{QCat}$ is an isofibrant diagram, and α is a levelwise categorical equivalence. Moreover, α is also a monomorphism.*

Proof. It follows from Corollary 7.5.3.2 that the diagram $\mathcal{F}^+$ is isofibrant. To see that α is a monomorphism, we observe that for each object $C \in \mathcal{C}$, the functor

$$\alpha_C : \mathcal{F}(C) \rightarrow \mathcal{F}^+(C) = \mathrm{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}^{\mathrm{CCart}}(\mathbf{N}_\bullet(\mathcal{C}_{C/}), \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C}))$$

has a left inverse, given by the evaluation map

$$\mathrm{ev}_C : \mathrm{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}^{\mathrm{CCart}}(\mathbf{N}_\bullet(\mathcal{C}_{C/}), \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C})) \rightarrow \{C\} \times_{\mathbf{N}_\bullet(\mathcal{C})} \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C}) \simeq \mathcal{F}(C).$$

Since ev_C is a trivial Kan fibration (Proposition 5.3.1.7), it follows that α_C is an equivalence of ∞ -categories. □

Corollary 7.5.3.5 (Existence of Isofibrant Replacements). *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_\Delta$ be a diagram 03AU
of simplicial sets. Then there exists a monomorphism of diagrams $\alpha : \mathcal{F} \hookrightarrow \mathcal{G}$, where α is a levelwise categorical equivalence and $\mathcal{G} : \mathcal{C} \rightarrow \mathbf{QCat}$ is an isofibrant diagram of ∞ -categories.*

Proof. Using Proposition 4.1.3.2, we can reduce to the case where $\mathcal{F}$ is a diagram of ∞ -categories. In this case, we can take α to be the natural transformation $\mathcal{F} \hookrightarrow \mathcal{F}^+$ of Construction 7.5.3.3 (Proposition 7.5.3.4). □

Variant 7.5.3.6. Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_\Delta$ be a diagram of simplicial sets. Then there exists a 03AV
monomorphism of diagrams $\alpha : \mathcal{F} \hookrightarrow \mathcal{G}$, where α is a levelwise weak homotopy equivalence and $\mathcal{G} : \mathcal{C} \rightarrow \mathbf{Kan}$ is an isofibrant diagram of Kan complexes.

Proof. Using Proposition 3.1.7.1, we can reduce to the case where $\mathcal{F}$ is a diagram of Kan complexes. In this case, we can again take α to be the natural transformation $\mathcal{F} \hookrightarrow \mathcal{F}^+$ of Construction 7.5.3.3 (since α is a levelwise categorical equivalence, it follows that $\mathcal{F}^+$ is also a diagram of Kan complexes: see Remark 4.5.1.21). □

Proposition 7.5.3.7. *Let $\mathcal{C}$ be a small category, let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram, and 03AW
let $\mathcal{F}^+ : \mathcal{C} \rightarrow \mathbf{QCat}$ be the isofibrant replacement of Construction 7.5.3.3. Then there is a*

canonical isomorphism of simplicial sets $\theta : \operatorname{holim}(\mathcal{F}) \xrightarrow{\sim} \varprojlim(\mathcal{F}^+)$, which is characterized by the following requirement: for each object $C \in \mathcal{C}$, the composition

$$\begin{aligned} \operatorname{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}^{\operatorname{CCart}}(\mathbf{N}_\bullet(\mathcal{C}), \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C})) &= \operatorname{holim}_{\leftarrow}(\mathcal{F}) \\ &\xrightarrow{\theta} \varprojlim(\mathcal{F}^+) \\ &\rightarrow \mathcal{F}^+(C) \\ &= \operatorname{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}^{\operatorname{CCart}}(\mathbf{N}_\bullet(\mathcal{C}_{C/}), \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C})) \end{aligned}$$

is given by precomposition with the projection map $\mathcal{C}_{C/} \rightarrow \mathcal{C}$.

Proposition 7.5.3.7 is a consequence of the following concrete assertion:

03AX Lemma 7.5.3.8. *Let $\mathcal{C}$ be a category. Then the collection of projection maps $\{\mathbf{N}_\bullet(\mathcal{C}_{C/}) \rightarrow \mathbf{N}_\bullet(\mathcal{C})\}_{C \in \mathcal{C}}$ exhibit $\mathbf{N}_\bullet(\mathcal{C})$ as the colimit of the diagram*

$$\mathcal{C}^{\operatorname{op}} \rightarrow \operatorname{Set}_\Delta \quad C \mapsto \mathbf{N}_\bullet(\mathcal{C}_{C/}).$$

Proof. Fix an integer $n \geq 0$; we wish to show that the canonical map

$$\rho : \varinjlim_{C \in \mathcal{C}^{\operatorname{op}}} \mathbf{N}_n(\mathcal{C}_{C/}) \rightarrow \mathbf{N}_n(\mathcal{C})$$

is an isomorphism in the category of sets. Let σ be an n -simplex of $\mathbf{N}_n(\mathcal{C})$, given by a diagram

$$X_0 \rightarrow X_1 \rightarrow \cdots \rightarrow X_n$$

in the category $\mathcal{C}$. Then the fiber $\rho^{-1}\{\sigma\}$ can be identified with the colimit

$$\varinjlim_{C \in \mathcal{C}^{\operatorname{op}}} \operatorname{Hom}_{\mathcal{C}}(C, X_0),$$

formed in the category of sets. This colimit consists of a single element, represented by the identity morphism $\operatorname{id}_{X_0} \in \operatorname{Hom}_{\mathcal{C}}(X_0, X_0)$. $\square$

03AY Remark 7.5.3.9. Let $\mathcal{C}$ be a category, let $U : \mathcal{E} \rightarrow \mathbf{N}_\bullet(\mathcal{C})$ is a morphism of simplicial sets, and let $\operatorname{wTr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \operatorname{Set}_\Delta$ denote the weak transport representation of Construction 5.3.1.1, given on objects by the formula $\operatorname{wTr}_{\mathcal{E}/\mathcal{C}}(C) = \operatorname{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}(\mathbf{N}_\bullet(\mathcal{C}_{C/}), \mathcal{E})$. Then Lemma 7.5.3.8 supplies a canonical isomorphism of simplicial sets

$$\operatorname{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}(\mathbf{N}_\bullet(\mathcal{C}), \mathcal{E}) \xrightarrow{\sim} \varprojlim(\operatorname{wTr}_{\mathcal{E}/\mathcal{C}}).$$

03AZ Variant 7.5.3.10. Let $\mathcal{C}$ be a category, let $U : \mathcal{E} \rightarrow \mathbf{N}_\bullet(\mathcal{C})$ be a cocartesian fibration of ∞ -categories, and let $\operatorname{sTr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \operatorname{Set}_\Delta$ denote the strict transport representation of Construction 5.3.1.5, given on objects by the formula $\operatorname{sTr}_{\mathcal{E}/\mathcal{C}}(C) = \operatorname{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}^{\operatorname{CCart}}(\mathbf{N}_\bullet(\mathcal{C}_{C/}), \mathcal{E})$. Then the isomorphism of Remark 7.5.3.9 restricts to an isomorphism of simplicial sets

$$\operatorname{Fun}_{/\mathbf{N}_\bullet(\mathcal{C})}^{\operatorname{CCart}}(\mathbf{N}_\bullet(\mathcal{C}), \mathcal{E}) \xrightarrow{\sim} \varprojlim(\operatorname{sTr}_{\mathcal{E}/\mathcal{C}}).$$

Proof of Proposition 7.5.3.7. Apply Variant 7.5.3.10 in the special case where $\mathcal{E} = \mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C})$ is the $\mathcal{F}$ -weighted nerve of the category $\mathcal{C}$. $\square$

Remark 7.5.3.11. In the situation of Proposition 7.5.3.7, the isomorphism $\theta : \operatorname{holim}(\mathcal{F}) \xrightarrow{\sim} \varprojlim(\mathcal{F}^+)$ fits into a commutative diagram

$$\begin{array}{ccc} & \operatorname{holim}(\mathcal{F}) & \\ \iota \nearrow & & \searrow \theta \\ \varprojlim(\mathcal{F}) & \xrightarrow{\varprojlim(\alpha)} & \varprojlim(\mathcal{F}^+), \end{array}$$

where ι is the comparison map of Remark 7.5.2.12 and $\alpha : \mathcal{F} \hookrightarrow \mathcal{F}^+$ is the natural transformation appearing in Construction 7.5.3.3.

Proposition 7.5.3.12. Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be an isofibrant diagram of ∞ -categories. Then the inclusion map $\iota : \varprojlim(\mathcal{F}) \hookrightarrow \operatorname{holim}(\mathcal{F})$ is an equivalence of ∞ -categories.

Proof. Let $\alpha : \mathcal{F} \hookrightarrow \mathcal{F}^+$ be the isofibrant replacement of Construction 7.5.3.3. By virtue of Proposition 7.5.3.7 (and Remark 7.5.3.11), it will suffice to show that the limit $\varprojlim(\alpha) : \varprojlim(\mathcal{F}) \hookrightarrow \varprojlim(\mathcal{F}^+)$ is an equivalence of ∞ -categories. This is a special case of Corollary 4.5.6.17, since α is a levelwise categorical equivalence between isofibrant diagrams (Proposition 7.5.3.4). $\square$

Example 7.5.3.13 (Towers of Isofibrations). Suppose we are given a tower of ∞ -categories

$$\cdots \rightarrow \mathcal{C}(3) \rightarrow \mathcal{C}(2) \rightarrow \mathcal{C}(1) \rightarrow \mathcal{C}(0),$$

which we identify with a functor $\mathcal{F} : \mathbf{Z}_{\geq 0}^{\text{op}} \rightarrow \mathbf{QCat}$. If each of the transition functors $\mathcal{C}(n+1) \rightarrow \mathcal{C}(n)$ is an isofibration, then the comparison map $\varprojlim_n \mathcal{C}(n) = \varprojlim(\mathcal{F}) \hookrightarrow \operatorname{holim}(\mathcal{F})$ is an equivalence of ∞ -categories. This follows by combining Example 4.5.6.8 with Proposition 7.5.3.12.

Warning 7.5.3.14. Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a strictly commutative diagram of ∞ -categories and let $\alpha : \mathcal{F} \hookrightarrow \mathcal{F}^+$ denote the isofibrant replacement of Construction 7.5.3.3, and let $\theta : \operatorname{holim}(\mathcal{F}) \xrightarrow{\sim} \varprojlim(\mathcal{F}^+)$ be the isomorphism of Proposition 7.5.3.7. We then have a

diagram of simplicial sets

$$\begin{array}{ccc}
 \varprojlim(\mathcal{F}) & \xrightarrow{\varprojlim(\alpha)} & \varprojlim(\mathcal{F}^+) \\
 \downarrow & \nearrow \theta & \downarrow \\
 \operatorname{holim}(\mathcal{F}) & \xrightarrow{\operatorname{holim}(\alpha)} & \operatorname{holim}(\mathcal{F}^+),
 \end{array}$$

~

where the outer square and the upper left triangle are commutative (Remark 7.5.3.11). Beware that the lower right triangle is usually *not* commutative. That is, $\varprojlim(\mathcal{F})$ and $\varprojlim(\mathcal{F}^+)$ are isomorphic when viewed as *abstract* simplicial sets, but do not coincide when identified with simplicial subsets of $\operatorname{holim}(\mathcal{F}^+)$.

03B4 **Remark 7.5.3.15** (The Homotopy Limit as a Right Derived Functor). The results of this section can be interpreted in the language of model categories. For every small category $\mathcal{C}$, the category $\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta)$ can be equipped with a model structure in which the cofibrations are monomorphisms and the weak equivalences are levelwise categorical equivalences (see Example [?]). The inverse limit functor

$$\varprojlim : \operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta) \rightarrow \operatorname{Set}_\Delta$$

then admit a *right derived functor* $\operatorname{Rlim} : \operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta) \rightarrow \operatorname{Set}_\Delta$, which carries a diagram $\mathcal{F} : \mathcal{C} \rightarrow \operatorname{Set}_\Delta$ to the limit of a fibrant replacement of $\mathcal{F}$. It follows from Propositions 7.5.3.4 and 7.5.3.7 that, when restricted to the subcategory $\operatorname{Fun}(\mathcal{C}, \operatorname{QCat}) \subset \operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta)$, the functor Rlim is (categorically) equivalent to the homotopy limit functor $\operatorname{holim} : \operatorname{Fun}(\mathcal{C}, \operatorname{QCat}) \rightarrow \operatorname{QCat}$ of Construction 7.5.2.1. We will return to this point in §[?].

7.5.4 Homotopy Limit Diagrams

03B5 Let $\mathcal{F} : \mathcal{C} \rightarrow \operatorname{Kan}$ be a diagram in the category of Kan complexes, and let

$$N_\bullet^{\operatorname{hc}}(\mathcal{F}) : N_\bullet(\mathcal{C}) \rightarrow N_\bullet^{\operatorname{hc}}(\operatorname{Kan}) = \mathcal{S}$$

be the induced functor of ∞ -categories. Then the homotopy limit $\varprojlim(\mathcal{F})$ is a Kan complex, which can be regarded as a limit of the diagram $N_\bullet^{\operatorname{hc}}(\mathcal{F})$ in the ∞ -category of spaces $\mathcal{S}$ (Proposition 7.5.1.5). For many applications, this assertion is insufficiently precise: we would like to have not only a Kan complex X which is known *abstractly* to be a limit of the diagram $N_\bullet^{\operatorname{hc}}(\mathcal{F})$, but also a diagram $N_\bullet(\mathcal{C}^\triangleleft) \rightarrow \mathcal{S}$ which *exhibits* X as a limit of $N_\bullet^{\operatorname{hc}}(\mathcal{F})$.

Definition 7.5.4.1. Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ be a functor having 03B6 restriction $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$. We will say that $\overline{\mathcal{F}}$ is a *homotopy limit diagram* if the composite map

$$\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \varprojlim(\mathcal{F}) \hookrightarrow \operatorname{holim}(\mathcal{F})$$

is a homotopy equivalence of Kan complexes; here $\mathbf{0}$ denotes the initial object of the cone $\mathcal{C}^\triangleleft \simeq \{\mathbf{0}\} \star \mathcal{C}$, and the morphism on the right is the comparison map of Remark 7.5.2.12).

Example 7.5.4.2 (Limits of Isofibrant Diagrams). Let $\mathcal{C}$ be a small category and let 03B7 $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Set}_\Delta$ be a limit diagram in the category of simplicial sets. Suppose that the diagram $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$ is isofibrant (Definition 4.5.6.3) and that, for each object $C \in \mathcal{C}$, the simplicial set $\mathcal{F}(C)$ is a Kan complex. Then $\overline{\mathcal{F}}$ is a homotopy limit diagram of Kan complexes: this follows by combining Corollary 4.5.6.21 with Proposition 7.5.3.12.

Warning 7.5.4.3. For every diagram of Kan complexes $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$, the homotopy limit 03B8 $\varprojlim(\mathcal{F})$ of Construction 7.5.1.1 is well-defined. However, one cannot always extend $\mathcal{F}$ to a homotopy limit diagram $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ (see Warning 3.4.1.8). This is possible only if the tautological map $\varprojlim(\mathcal{F}) \hookrightarrow \operatorname{holim}(\mathcal{F})$ has a left homotopy inverse. However, we can always choose a levelwise homotopy equivalence $\alpha : \mathcal{F} \hookrightarrow \mathcal{G}$, where $\mathcal{G}$ is an isofibrant diagram of Kan complexes (Variant 7.5.3.6). We can then extend $\mathcal{G}$ can be extended to a limit diagram $\overline{\mathcal{G}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$, which is also a homotopy limit diagram (Example 7.5.4.2). Moreover, if take $\mathcal{G} = \mathcal{F}^+$ to be the isofibrant replacement of Construction 7.5.3.3, then $\overline{\mathcal{G}}$ carries the initial object of $\mathcal{C}^\triangleleft$ to the homotopy limit $\varprojlim(\mathcal{F})$ (Proposition 7.5.3.7).

Proposition 7.5.4.4 (Homotopy Invariance). Let $\mathcal{C}$ be a category and let $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ be a 03B9 natural transformation between diagrams $\overline{\mathcal{F}}, \overline{\mathcal{G}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$ is a homotopy equivalence of Kan complexes. Then any two of the following conditions imply the third:

- (1) The functor $\overline{\mathcal{F}}$ is a homotopy limit diagram.
- (2) The functor $\overline{\mathcal{G}}$ is a homotopy limit diagram.
- (3) The natural transformation α induces a homotopy equivalence $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \overline{\mathcal{G}}(\mathbf{0})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^\triangleleft$.

Proof. Setting $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$ and $\mathcal{G} = \overline{\mathcal{G}}|_{\mathcal{C}}$, we observe that α determines a commutative diagram of Kan complexes

$$\begin{array}{ccc} \overline{\mathcal{F}}(\mathbf{0}) & \xrightarrow{\quad} & \overline{\mathcal{G}}(\mathbf{0}) \\ \downarrow & & \downarrow \\ \varprojlim(\mathcal{F}) & \xrightarrow{\quad} & \varprojlim(\mathcal{G}), \end{array}$$

where the bottom horizontal map is a homotopy equivalence (Remark 7.5.1.3). The desired result now follows from the two-out-of-three property (Remark 3.1.6.7). $\square$

03BA Proposition 7.5.4.5. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathcal{F}}$ is a homotopy limit diagram (in the sense of Definition 7.5.4.1) if and only if the induced functor of ∞ -categories*

$$N_{\bullet}^{\mathrm{hc}}(\overline{\mathcal{F}}) : N_{\bullet}(\mathcal{C}^\triangleleft) \rightarrow N_{\bullet}^{\mathrm{hc}}(\mathbf{Kan}) = \mathcal{S}$$

is a limit diagram (in the sense of Definition 7.1.3.4).

Proof. Let $N_{\bullet}^{\overline{\mathcal{F}}}(\mathcal{C}^\triangleleft)$ be the weighted nerve of the functor $\overline{\mathcal{F}}$ (Definition 5.3.3.1) and let $U : N_{\bullet}^{\overline{\mathcal{F}}}(\mathcal{C}^\triangleleft) \rightarrow N_{\bullet}(\mathcal{C}^\triangleleft)$ be the projection map. Then U is a left fibration, and $N_{\bullet}^{\mathrm{hc}}(\overline{\mathcal{F}})$ is a covariant transport representation for U (Example 5.6.5.6). Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$. Applying Proposition 7.4.1.16, we deduce that $N_{\bullet}^{\mathrm{hc}}(\overline{\mathcal{F}})$ is a limit diagram in the ∞ -category $\mathcal{S}$ if and only if the restriction map

$$\rho : \mathrm{Fun}_{/N_{\bullet}(\mathcal{C}^\triangleleft)}(N_{\bullet}(\mathcal{C}^\triangleleft), N_{\bullet}^{\overline{\mathcal{F}}}(\mathcal{C}^\triangleleft)) \rightarrow \simeq \mathrm{Fun}_{/N_{\bullet}(\mathcal{C})}(N_{\bullet}(\mathcal{C}), N_{\bullet}^{\mathcal{F}}(\mathcal{C}))$$

is a homotopy equivalence of Kan complexes. We then have a commutative diagram ρ fits into a commutative diagram

$$\begin{array}{ccc} \varprojlim(\overline{\mathcal{F}}) & \xrightarrow{\rho'} & \varprojlim(\mathcal{F}) \\ \downarrow \bar{\iota} & & \downarrow \iota \\ \mathrm{holim}(\overline{\mathcal{F}}) & \xrightarrow{\rho} & \mathrm{holim}(\mathcal{F}), \end{array}$$

where ι and $\bar{\iota}$ are the comparison maps of Remark 7.5.2.12. Since the category $\mathcal{C}^\triangleleft$ has an initial object, the morphism $\bar{\iota}$ is a homotopy equivalence (Proposition 7.5.2.13). It follows that ρ is a homotopy equivalence if and only if the composition $\rho \circ \bar{\iota} = \iota \circ \rho'$ is a homotopy equivalence. We conclude by observing that the composition $\iota \circ \rho'$ can be identified with the map $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \varprojlim(\mathcal{F})$ appearing in Definition 7.5.4.1. $\square$

03BB Corollary 7.5.4.6. *Let $\mathcal{C}$ be a small category, let $\mathcal{D}$ be a locally Kan simplicial category, and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathcal{D}$ be a functor. The following conditions are equivalent:*

(1) *The functor*

$$N_{\bullet}^{\mathrm{hc}}(\overline{\mathcal{F}}) : N_{\bullet}(\mathcal{C})^\triangleleft \simeq N_{\bullet}(\mathcal{C}^\triangleleft) \rightarrow N_{\bullet}^{\mathrm{hc}}(\mathcal{D})$$

is a limit diagram in the ∞ -category $N_{\bullet}^{\mathrm{hc}}(\mathcal{D})$.

(2) For every object $D \in \mathcal{D}$, the functor

$$\mathcal{C}^\triangleleft \rightarrow \mathbf{Kan} \quad C \mapsto \mathrm{Hom}_{\mathcal{D}}(D, \mathcal{F}(C))_\bullet$$

is a homotopy limit diagram of Kan complexes.

Proof. By virtue of Proposition 7.4.1.18, condition (1) is satisfied if and only if, for every object $D \in \mathcal{D}$, the composition $(h^D \circ N_\bullet^{\mathrm{hc}}(\mathcal{F})) : N_\bullet(\mathcal{C})^\triangleleft \rightarrow \mathcal{S}$ is a limit diagram in the ∞ -category $\mathcal{S}$, where $h^D : N_\bullet^{\mathrm{hc}}(\mathcal{D}) \rightarrow \mathcal{S}$ denotes a functor corepresented by D . Using Proposition 5.6.6.17, we can take h^D to be the homotopy coherent nerve of the simplicial functor $\mathrm{Hom}_{\mathcal{D}}(D, \bullet) : \mathcal{D} \rightarrow \mathbf{Kan}$. In this case, $h^D \circ N_\bullet^{\mathrm{hc}}(X)$ is the homotopy coherent nerve of the functor $C \mapsto \mathrm{Hom}_{\mathcal{D}}(D, \mathcal{F}(C))_\bullet$. The equivalence (1) $\Leftrightarrow$ (2) now follows from the criterion of Proposition 7.5.4.5. $\square$

Corollary 7.5.4.7. *Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be an isofibrant diagram of Kan complexes. Then $\mathcal{F}$ has a limit in the category $\mathbf{Kan}$, which is preserved by the inclusion functor $N_\bullet(\mathbf{Kan}) \hookrightarrow N_\bullet^{\mathrm{hc}}(\mathbf{Kan}) = \mathcal{S}$.* 03BC

Proof. Combine Example 7.5.4.2 with Proposition 7.5.4.5. $\square$

For some applications, it is useful to extend Definition 7.5.4.1 to diagrams of simplicial sets which do not take values in the full subcategory $\mathbf{Kan} \subset \mathbf{Set}_\Delta$ of Kan complexes.

Definition 7.5.4.8 (Homotopy Limit Diagrams of Simplicial Sets). Let $\mathcal{C}$ be a small category. We say that a functor $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Set}_\Delta$ is a *homotopy limit diagram* if there exists a levelwise weak homotopy equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$, where $\overline{\mathcal{G}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ is a homotopy limit diagram of Kan complexes (in the sense of Definition 7.5.4.1). 03BD

Remark 7.5.4.9. Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ be a functor. The following conditions are equivalent: 03BE

- (1) The functor $\overline{\mathcal{F}}$ is a homotopy limit diagram in the sense of Definition 7.5.4.1 (that is, it induces a homotopy equivalence $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \varprojlim(\overline{\mathcal{F}}|_{\mathcal{C}})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^\triangleleft$).
- (2) The functor $\overline{\mathcal{F}}$ is a homotopy limit diagram in the sense of Definition 7.5.4.8: that is, there exists a homotopy limit diagram of Kan complexes $\overline{\mathcal{G}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ and a levelwise weak homotopy equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$.

The implication (1) $\Rightarrow$ (2) is immediate, and the reverse implication follows from Proposition 7.5.4.4.

Proposition 7.5.4.10. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Set}_\Delta$ be a functor. The following conditions are equivalent:* 03BF

- (1) The functor $\overline{\mathcal{F}}$ is a homotopy limit diagram. That is, there exists a homotopy limit diagram $\overline{\mathcal{F}}' : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ and a levelwise weak homotopy equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{F}}'$.
- (2) Let $\overline{\mathcal{F}}' : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ be any functor. If there exists a levelwise weak homotopy equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{F}}'$, then $\overline{\mathcal{F}}'$ is a homotopy limit diagram.

Proof. Using Proposition 3.1.7.1, we can choose a functor $\overline{\mathcal{G}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ and a natural transformation $\beta : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ which carries each object $C \in \mathcal{C}^\triangleleft$ to an anodyne morphism of simplicial sets $\beta_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$. We will show that (1) and (2) are equivalent to the following:

- (3) The functor $\overline{\mathcal{G}}$ is a homotopy limit diagram.

The implications (2) $\Rightarrow$ (3) $\Rightarrow$ (1) are immediate. To prove the reverse implications, suppose we are given another functor $\overline{\mathcal{F}}' : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ and a levelwise weak homotopy equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{F}}'$. We will show that $\overline{\mathcal{F}}'$ is a homotopy limit diagram if and only if $\overline{\mathcal{G}}$ is a homotopy limit diagram.

Applying Proposition 3.1.7.1 again, we can choose a functor $\overline{\mathcal{G}}' : \mathcal{C}^\triangleleft \rightarrow \mathbf{Kan}$ and a commutative diagram

$$\begin{array}{ccc} \overline{\mathcal{F}} & \xrightarrow{\alpha} & \overline{\mathcal{F}}' \\ \downarrow \beta & & \downarrow \beta' \\ \overline{\mathcal{G}} & \xrightarrow{\alpha'} & \overline{\mathcal{G}}' \end{array}$$

with the property that, for every object $C \in \mathcal{C}^\triangleleft$, the induced map

$$\overline{\mathcal{F}}'(C) \coprod_{\overline{\mathcal{F}}(C)} \overline{\mathcal{G}}(C) \rightarrow \overline{\mathcal{G}}'(C)$$

is anodyne (and, in particular, a weak homotopy equivalence). Applying Proposition 3.4.2.11, we see that the diagram of simplicial sets

$$\begin{array}{ccc} \overline{\mathcal{F}}(C) & \xrightarrow{\alpha_C} & \overline{\mathcal{F}}'(C) \\ \downarrow \beta_C & & \downarrow \beta'_C \\ \overline{\mathcal{G}}(C) & \xrightarrow{\alpha'_C} & \overline{\mathcal{G}}'(C) \end{array}$$

is a homotopy pushout square. Since α_C and β_C are weak homotopy equivalences, it follows that α'_C and β'_C are also weak homotopy equivalences (Proposition 3.4.2.10). Applying Proposition 7.5.4.4, we see that $\overline{\mathcal{F}}'$ and $\overline{\mathcal{G}}$ are homotopy limit diagrams if and only if $\overline{\mathcal{G}}'$ is a homotopy limit diagram. $\square$

Corollary 7.5.4.11 (Homotopy Invariance). *Let $\mathcal{C}$ be a category, let $\overline{\mathcal{F}}, \overline{\mathcal{G}} : \mathcal{C}^\Delta \rightarrow \mathbf{Set}_\Delta$ be 03BG functors, and let $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ be a natural transformation. Suppose that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$ is a weak homotopy equivalence. Then any two of the following conditions imply the third:*

- (1) *The functor $\overline{\mathcal{F}}$ is a homotopy limit diagram.*
- (2) *The functor $\overline{\mathcal{G}}$ is a homotopy limit diagram.*
- (3) *The natural transformation α induces a weak homotopy equivalence $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \overline{\mathcal{G}}(\mathbf{0})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^\Delta$.*

Proof. Using Proposition 3.1.7.1, we can choose functors $\overline{\mathcal{F}}', \overline{\mathcal{G}}' : \mathcal{C}^\Delta \rightarrow \mathbf{Kan}$ and a commutative diagram

$$\begin{array}{ccc} \overline{\mathcal{F}} & \xrightarrow{\alpha} & \overline{\mathcal{G}} \\ \downarrow & & \downarrow \\ \overline{\mathcal{F}}' & \xrightarrow{\alpha'} & \overline{\mathcal{G}}', \end{array}$$

where the vertical maps are levelwise weak homotopy equivalences. Using Proposition 7.5.4.10, we can replace α by the natural transformation $\alpha' : \overline{\mathcal{F}}' \rightarrow \overline{\mathcal{G}}'$, in which case the desired result follows from Proposition 7.5.4.4. $\square$

Corollary 7.5.4.12. *Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{Set}_\Delta$ be a functor. Let 03BH $\overline{\mathcal{F}}^{\mathrm{op}} : \mathcal{C}^\Delta \rightarrow \mathbf{Set}_\Delta$ be the functor given on objects by $\overline{\mathcal{F}}^{\mathrm{op}}(C) = \overline{\mathcal{F}}(C)^{\mathrm{op}}$. Then $\overline{\mathcal{F}}$ is a homotopy limit diagram if and only if $\overline{\mathcal{F}}^{\mathrm{op}}$ is a homotopy limit diagram.*

Proof. For each object $C \in \mathcal{C}^\Delta$, let $|\overline{\mathcal{F}}(C)|$ denote the geometric realization of the simplicial set $\overline{\mathcal{F}}(C)$ (Definition 1.2.3.1). Then the construction $C \mapsto \mathrm{Sing}_\bullet(|\overline{\mathcal{F}}(C)|)$ determines a functor $\overline{\mathcal{G}} : \mathcal{C}^\Delta \rightarrow \mathbf{Kan}$, and the unit maps $\overline{\mathcal{F}}(C) \rightarrow \mathrm{Sing}_\bullet(|\overline{\mathcal{F}}(C)|)$ determine a levelwise weak homotopy equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ (Theorem 3.6.4.1). By virtue of Corollary 7.5.4.11, it will suffice to show that the functor $\overline{\mathcal{G}}$ is a homotopy limit diagram if and only if $\overline{\mathcal{G}}^{\mathrm{op}}$ is a homotopy limit diagram. This is clear, since the functors $\overline{\mathcal{G}}$ and $\overline{\mathcal{G}}^{\mathrm{op}}$ are isomorphic (see Example 1.4.2.5). $\square$

The notion of homotopy pullback square (see §3.4.1) can be regarded as a special case of the notion of homotopy limit diagram:

03BJ **Proposition 7.5.4.13.** *Suppose we are given a commutative diagram of simplicial sets*

$$\begin{array}{ccc}
 X_{01} & \longrightarrow & X_0 \\
 \downarrow & & \downarrow \\
 X_1 & \longrightarrow & X,
 \end{array} \tag{7.56}$$

which we identify with a functor $\mathcal{F} : [1] \times [1] \rightarrow \mathbf{Set}_\Delta$. Then (7.56) is a homotopy pullback square (in the sense of Definition 3.4.1.1) if and only if $\mathcal{F}$ is a homotopy limit diagram (in the sense of Definition 7.5.4.8).

Proof. Using Proposition 3.1.7.1, we can choose a levelwise weak homotopy equivalence $\alpha : \mathcal{F} \rightarrow \mathcal{F}'$, where $\mathcal{F}'$ is a diagram of Kan complexes. Using Corollaries 3.4.1.12 and 7.5.4.11, we can replace $\mathcal{F}$ by $\mathcal{F}'$ and thereby reduce to the case where (7.56) is a diagram of Kan complexes. By virtue of Corollary 3.4.1.6, the diagram (7.56) is a homotopy pullback square if and only if it induces a homotopy equivalence $f : X_{01} \rightarrow X_0 \times_X^h X_1$, where $X_0 \times_X^h X_1$ is the homotopy fiber product of Construction 3.4.0.3. On the other hand, $\mathcal{F}$ is a homotopy limit diagram if and only if the composition $\iota \circ f$ is a homotopy equivalence, where

$$\iota : X_0 \times_X^h X_1 \hookrightarrow X_0 \times_X^h (X_1 \times_X^h X) \simeq \varprojlim(F)$$

is the comparison map described in Example 7.5.2.17. The desired result now follows from the observation that ι is a homotopy equivalence (see Example 7.5.2.17). $\square$

7.5.5 Categorical Limit Diagrams

03BL The theory of homotopy limit diagrams introduced in §7.5.4 should be regarded as belonging to the “classical” homotopy theory of simplicial sets: for example, it is invariant under weak homotopy equivalence (Corollary 7.5.4.11). When using simplicial sets to model higher category theory (rather than homotopy theory), it is useful to work with slightly different class of diagrams.

03BM **Definition 7.5.5.1** (Categorical Limit Diagrams of ∞ -Categories). Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleleft \rightarrow \mathbf{QCat}$ be a functor having restriction $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$. We will say that $\overline{\mathcal{F}}$ is a *categorical limit diagram* if the composite map

$$\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \varprojlim(\mathcal{F}) \hookrightarrow \mathrm{holim}(\mathcal{F})$$

is an equivalence of ∞ -categories; here $\mathbf{0}$ denotes the initial object of the cone $\mathcal{C}^\triangleleft \simeq \{\mathbf{0}\} \star \mathcal{C}$, and the morphism on the right is the comparison map of Remark 7.5.2.12.

Example 7.5.5.2. Let $\mathcal{C}$ be a category. A diagram of Kan complexes $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{Kan}$ is a 03BN categorical limit diagram (in the sense of Definition 7.5.5.1) if and only if it is a homotopy limit diagram (in the sense of Definition 7.5.4.1).

Example 7.5.5.3 (Limits of Isofibrant Diagrams). Let $\mathcal{C}$ be a small category and let 03BP $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{Set}_\Delta$ be a limit diagram in the category of simplicial sets. Suppose that the diagram $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$ is isofibrant (Definition 4.5.6.3). Then $\overline{\mathcal{F}}$ is a categorical limit diagram of ∞ -categories: this follows by combining Corollary 4.5.6.13 with Proposition 7.5.3.12.

Warning 7.5.5.4. Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories. 03BQ In general, the condition that $\overline{\mathcal{F}}$ is a categorical limit diagram (in the sense of Definition 7.5.5.1) is independent of the condition that it is a homotopy limit diagram (in the sense of Definition 7.5.4.8): see Exercises 4.5.2.13 and 4.5.2.14.

Remark 7.5.5.5. Let $\mathcal{C}$ be a category, let $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ be a categorical limit diagram of 03BR ∞ -categories, and define $\overline{\mathcal{F}}^\sim : \mathcal{C}^\Delta \rightarrow \mathbf{Kan}$ by the formula $\overline{\mathcal{F}}^\sim(C) = \overline{\mathcal{F}}(C)^\simeq$. Then $\overline{\mathcal{F}}^\sim$ is a homotopy limit diagram. This follows by combining Example 7.5.2.8 with Remark 4.5.1.20.

Remark 7.5.5.6 (Homotopy Invariance). Let $\mathcal{C}$ be a small category and let $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ 03BS be a natural transformation between diagrams $\overline{\mathcal{F}}, \overline{\mathcal{G}} : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$ is an equivalence of ∞ -categories. Then α determines a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \overline{\mathcal{F}}(\mathbf{0}) & \longrightarrow & \operatorname{holim}(\overline{\mathcal{F}}|_{\mathcal{C}}) \\ \downarrow & & \downarrow \\ \overline{\mathcal{G}}(\mathbf{0}) & \longrightarrow & \operatorname{holim}(\overline{\mathcal{G}}|_{\mathcal{C}}), \end{array}$$

where the right vertical map is an equivalence (Remark 7.5.2.7). It follows that any two of the following conditions imply the third:

- (1) The functor $\overline{\mathcal{F}}$ is a categorical limit diagram.
- (2) The functor $\overline{\mathcal{G}}$ is a categorical limit diagram.
- (3) The natural transformation α induces an equivalence of ∞ -categories $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \overline{\mathcal{G}}(\mathbf{0})$, where $\mathbf{0}$ denotes the cone point of $\mathcal{C}^\Delta$.

Proposition 7.5.5.7. Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ be a functor. The 03BT following conditions are equivalent:

(1) The functor $\overline{\mathcal{F}}$ is a categorical limit diagram, in the sense of Definition 7.5.5.1.

(2) For every simplicial set K , the functor

$$\overline{\mathcal{F}}^K : \mathcal{C}^\Delta \rightarrow \mathbf{QCat} \quad C \mapsto \mathrm{Fun}(K, \overline{\mathcal{F}}(C))$$

is a categorical limit diagram.

(3) For every simplicial set K , the functor

$$(\overline{\mathcal{F}}^K)^\simeq : \mathcal{C}^\Delta \rightarrow \mathbf{Kan} \quad C \mapsto \mathrm{Fun}(K, \overline{\mathcal{F}}(C))^\simeq$$

is a homotopy limit diagram.

(4) The functor $(\overline{\mathcal{F}}^{\Delta^1})^\simeq : \mathcal{C}^\Delta \rightarrow \mathbf{Kan}$ is a homotopy limit diagram.

Proof. The implication (1) $\Rightarrow$ (2) follows from Remarks 7.5.2.3 and 4.5.1.16, the implication (2) $\Rightarrow$ (3) from Remark 7.5.5.5, and the implication (3) $\Rightarrow$ (4) is immediate. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$, and let $\mathbf{0}$ denote the initial object of $\mathcal{C}^\Delta$. Using Remark 7.5.2.3 and Example 7.5.2.8, we see that condition (4) is equivalent to the requirement that the map $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \varprojlim(\mathcal{F})$ induces a homotopy equivalence of Kan complexes

$$\mathrm{Fun}(\Delta^1, \overline{\mathcal{F}}(\mathbf{0}))^\simeq \rightarrow \mathrm{Fun}(\Delta^1, \varprojlim(\mathcal{F}))^\simeq \simeq \varprojlim((\overline{\mathcal{F}}^{\Delta^1})^\simeq).$$

The implication (4) $\Rightarrow$ (1) now follows from Theorem 4.5.7.1. $\square$

03BU Corollary 7.5.5.8. *Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ be a functor. Then $\overline{\mathcal{F}}$ is a categorical limit diagram if and only if the induced functor of ∞ -categories*

$$\mathbf{N}_\bullet^{\mathrm{hc}}(\overline{\mathcal{F}}) : \mathbf{N}_\bullet(\mathcal{C}^\Delta) \rightarrow \mathbf{N}_\bullet^{\mathrm{hc}}(\mathbf{QCat}) = \mathcal{QC}$$

is a limit diagram in the ∞ -category $\mathcal{QC}$ (in the sense of Definition 7.1.3.4).

Proof. By virtue of Corollary 7.5.4.6, the diagram $\mathbf{N}_\bullet^{\mathrm{hc}}(\overline{\mathcal{F}})$ is a limit diagram in the ∞ -category $\mathcal{QC}$ if and only if, for every ∞ -category $\mathcal{E}$, the diagram of Kan complexes

$$\mathcal{C}^\Delta \rightarrow \mathbf{Kan} \quad C \mapsto \mathrm{Hom}_{\mathbf{QCat}}(\mathcal{E}, \overline{\mathcal{F}}(C))_\bullet = \mathrm{Fun}(\mathcal{E}, \overline{\mathcal{F}}(C))^\simeq$$

is a homotopy limit diagram. Using Proposition 7.5.5.7, we see that this is equivalent to the requirement that $\overline{\mathcal{F}}$ is a categorical limit diagram. $\square$

03BV Corollary 7.5.5.9. *Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be an isofibrant diagram of ∞ -categories. Then $\mathcal{F}$ has a limit in the category $\mathbf{QCat}$, which is preserved by the inclusion functor $\mathbf{N}_\bullet(\mathbf{QCat}) \hookrightarrow \mathbf{N}_\bullet^{\mathrm{hc}}(\mathbf{QCat}) = \mathcal{QC}$.*

Proof. Combine Example 7.5.5.3 with Corollary 7.5.5.8. $\square$

Corollary 7.5.5.10. *Suppose we are given a commutative diagram of ∞ -categories* 03BW

$$\begin{array}{ccc} \mathcal{C}_{01} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow \\ \mathcal{C}_1 & \longrightarrow & \mathcal{C}, \end{array} \quad (7.57) \quad \text{03BX}$$

which we identify with a functor $\overline{\mathcal{F}} : [1] \times [1] \rightarrow \mathcal{QC}$. The following conditions are equivalent:

- (1) The diagram (7.57) is a categorical pullback square, in the sense of Definition 4.5.2.8.
- (2) The functor $\overline{\mathcal{F}}$ is a categorical limit diagram, in the sense of Definition 7.5.5.1.

Proof. Using Proposition 4.5.2.15, we can restate (2) as follows:

- (2') For every simplicial set K , the diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Fun}(K, \mathcal{C}_{01})^{\simeq} & \longrightarrow & \mathrm{Fun}(K, \mathcal{C}_0)^{\simeq} \\ \downarrow & & \downarrow \\ \mathrm{Fun}(K, \mathcal{C}_1)^{\simeq} & \longrightarrow & \mathrm{Fun}(K, \mathcal{C})^{\simeq} \end{array}$$

is a homotopy pullback square.

The equivalence (1) $\Leftrightarrow$ (2') follows by combining Propositions 7.5.4.13, and 7.5.5.7. $\square$

We now extend the scope of Definition 7.5.5.1 to arbitrary diagrams of simplicial sets.

Definition 7.5.5.11 (Categorical Limit Diagrams of Simplicial Sets). Let $\mathcal{C}$ be a category. 03BY
We say that a functor $\overline{\mathcal{F}} : \mathcal{C}^{\Delta} \rightarrow \mathrm{Set}_{\Delta}$ is a *categorical limit diagram* if there exists a levelwise categorical equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$, where $\overline{\mathcal{G}} : \mathcal{C}^{\Delta} \rightarrow \mathcal{QCat}$ is a categorical limit diagram (in the sense of Definition 7.5.5.1).

Remark 7.5.5.12. Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\Delta} \rightarrow \mathcal{QCat}$ be a functor. The following 03BZ
conditions are equivalent:

- (1) The functor $\overline{\mathcal{F}}$ is a categorical limit diagram in the sense of Definition 7.5.5.1: that is, it induces an equivalence of ∞ -categories $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \varprojlim(\overline{\mathcal{F}}|_{\mathcal{C}})$.

- (2) The functor $\overline{\mathcal{F}}$ is a categorical limit diagram in the sense of Definition 7.5.5.11: that is, there exists a levelwise categorical equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$, where $\overline{\mathcal{G}} : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ induces an equivalence of ∞ -categories $\overline{\mathcal{G}}(\mathbf{0}) \rightarrow \varprojlim(\overline{\mathcal{G}}|_{\mathcal{C}})$.

The implication (1) $\Rightarrow$ (2) is immediate, and the reverse implication follows from Remark 7.5.5.6.

03C0 Proposition 7.5.5.13. *Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \mathbf{Set}_\Delta$ be a functor. The following conditions are equivalent:*

- (1) *The functor $\overline{\mathcal{F}}$ is a categorical limit diagram. That is, there exists a categorical limit diagram $\overline{\mathcal{F}}' : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ and a levelwise categorical equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{F}}'$.*
- (2) *Let $\overline{\mathcal{F}}' : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ be any functor. If there exists a levelwise categorical equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{F}}'$, then $\overline{\mathcal{F}}'$ is a categorical limit diagram.*

Proof. We proceed as in the proof of Proposition 7.5.4.10. Using Proposition 4.1.3.2, we can choose a functor $\overline{\mathcal{G}} : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ and a natural transformation $\beta : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ for which the morphism of simplicial sets $\beta_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$ is inner anodyne for each object $C \in \mathcal{C}^\Delta$. We will show that (1) and (2) are equivalent to the following:

- (3) The functor $\overline{\mathcal{G}}$ is a categorical limit diagram.

The implications (2) $\Rightarrow$ (3) $\Rightarrow$ (1) are immediate. To prove the reverse implications, suppose we are given another functor $\overline{\mathcal{F}}' : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ and a levelwise categorical equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{F}}'$. We will show that $\overline{\mathcal{F}}'$ is a categorical limit diagram if and only if $\overline{\mathcal{G}}$ is a categorical limit diagram.

Applying Proposition 4.1.3.2 again, we can choose a functor $\overline{\mathcal{G}}' : \mathcal{C}^\Delta \rightarrow \mathbf{QCat}$ and a commutative diagram

$$\begin{array}{ccc} \overline{\mathcal{F}} & \xrightarrow{\alpha} & \overline{\mathcal{F}}' \\ \downarrow \beta & & \downarrow \beta' \\ \overline{\mathcal{G}} & \xrightarrow{\alpha'} & \overline{\mathcal{G}}' \end{array}$$

with the property that, for every object $C \in \mathcal{C}^\Delta$, the induced morphism of simplicial sets $\overline{\mathcal{F}}'(C) \amalg_{\overline{\mathcal{F}}(C)} \overline{\mathcal{G}}(C) \rightarrow \overline{\mathcal{G}}'(C)$ is inner anodyne (and, in particular, a categorical equivalence).

Applying Proposition 4.5.4.11, we see that the diagram of simplicial sets

$$\begin{array}{ccc} \overline{\mathcal{F}}(C) & \xrightarrow{\alpha_C} & \overline{\mathcal{F}}'(C) \\ \downarrow \beta_C & & \downarrow \beta'_C \\ \overline{\mathcal{G}}(C) & \xrightarrow{\alpha'_C} & \overline{\mathcal{G}}'(C) \end{array}$$

is a categorical pushout square. Since α_C and β_C are categorical equivalences, it follows that α'_C and β'_C are also categorical equivalences (Proposition 4.5.4.10). Applying Remark 7.5.5.6, we see that $\overline{\mathcal{F}}'$ and $\overline{\mathcal{G}}$ are categorical limit diagrams if and only if $\overline{\mathcal{G}}'$ is a categorical limit diagram. $\square$

Corollary 7.5.5.14. *Let $\mathcal{C}$ be a category, let $\overline{\mathcal{F}}, \overline{\mathcal{F}}' : \mathcal{C}^\Delta \rightarrow \text{Set}_\Delta$ be functors, and let $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{F}}'$ be a natural transformation. Suppose that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{F}}'(C)$ is a categorical equivalence of simplicial sets. Then any two of the following conditions imply the third:* 03C1

- (1) *The functor $\overline{\mathcal{F}}$ is a categorical limit diagram.*
- (2) *The functor $\overline{\mathcal{F}}'$ is a categorical limit diagram.*
- (3) *The natural transformation α induces a categorical equivalence of simplicial sets $\overline{\mathcal{F}}(\mathbf{0}) \rightarrow \overline{\mathcal{F}}'(\mathbf{0})$, where $\mathbf{0}$ denotes the initial object of $\mathcal{C}^\Delta$.*

Proof. Using Proposition 4.1.3.2, we can choose functors $\overline{\mathcal{G}}, \overline{\mathcal{G}}' : \mathcal{C}^\Delta \rightarrow \text{QCat}$ and a commutative diagram

$$\begin{array}{ccc} \overline{\mathcal{F}} & \xrightarrow{\alpha} & \overline{\mathcal{F}}' \\ \downarrow & & \downarrow \\ \overline{\mathcal{G}} & \xrightarrow{\beta} & \overline{\mathcal{G}}' \end{array},$$

where the vertical maps are levelwise categorical equivalences. By virtue of Proposition 7.5.5.13, we can replace α by the natural transformation $\beta : \overline{\mathcal{G}} \rightarrow \overline{\mathcal{G}}'$. In this case, the desired result follows from Remark 7.5.5.6. $\square$

Corollary 7.5.5.15. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\Delta \rightarrow \text{Set}_\Delta$ be a functor. Let $\overline{\mathcal{F}}^{\text{op}} : \mathcal{C}^\Delta \rightarrow \text{Set}_\Delta$ be the functor given on objects by $\overline{\mathcal{F}}^{\text{op}}(C) = \overline{\mathcal{F}}(C)^{\text{op}}$. Then $\overline{\mathcal{F}}$ is a categorical limit diagram if and only if $\overline{\mathcal{F}}^{\text{op}}$ is a categorical limit diagram.* 03C2

Proof. Using Proposition 4.1.3.2, we can choose a functor $\overline{\mathcal{G}} : \mathcal{C}^{\triangleleft} \rightarrow \mathbf{QCat}$ and a levelwise categorical equivalence $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$. By virtue of Corollary 7.5.5.14, it will suffice to show that $\overline{\mathcal{G}}$ is a categorical limit diagram if and only if $\overline{\mathcal{G}}^{\mathrm{op}}$ is a categorical limit diagram. This follows by combining Proposition 7.5.5.7 with Corollary 7.5.4.12. $\square$

7.5.6 The Homotopy Colimit as a Derived Functor

03C3 Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories. In §7.5.3, we showed that the homotopy limit $\mathop{\mathrm{holim}}\nolimits(\mathcal{F})$ can be identified with the limit of an *isofibrant replacement* for $\mathcal{F}$: that is, there exists an isomorphism $\mathop{\mathrm{holim}}\nolimits(\mathcal{F}) \simeq \mathop{\mathrm{lim}}\nolimits(\mathcal{F}^+)$, where $\mathcal{F}^+ : \mathcal{C} \rightarrow \mathbf{QCat}$ is an isofibrant diagram equipped with a levelwise categorical equivalence $\mathcal{F} \hookrightarrow \mathcal{F}^+$ (Construction 7.5.3.3 and Proposition 7.5.3.7). Our goal in this section is to present a parallel treatment of the homotopy colimit functor of Construction 5.3.2.1. More precisely, we show that the homotopy colimit of a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$ can be identified with the colimit of an auxiliary diagram $\mathcal{F}_+ : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$ which is equipped with a levelwise weak homotopy equivalence $\mathcal{F}_+ \rightarrow \mathcal{F}$ (Proposition 7.5.6.12).

We begin by introducing some terminology. Recall that a natural transformation $\beta : \tilde{\mathcal{G}} \rightarrow \mathcal{G}$ is a *levelwise trivial Kan fibration* if, for each object $C \in \mathcal{C}$, the morphism $\beta_C : \tilde{\mathcal{G}}(C) \rightarrow \mathcal{G}(C)$ is a trivial Kan fibration of simplicial sets.

03C4 **Definition 7.5.6.1.** Let $\mathcal{C}$ be a small category. We say that a diagram of simplicial sets $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$ is *projectively cofibrant* if, for every levelwise trivial Kan fibration $\beta : \mathcal{G}' \rightarrow \mathcal{G}$, the induced map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathbf{Set}_{\Delta})}(\mathcal{F}, \mathcal{G}') \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathbf{Set}_{\Delta})}(\mathcal{F}, \mathcal{G})$$

is surjective. That is, every natural transformation $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ factors through β .

03C5 **Example 7.5.6.2.** Let $\mathcal{C}$ be a category and let $U : \mathcal{E} \rightarrow \mathbf{N}_{\bullet}(\mathcal{C})$ be a morphism of simplicial sets. Then the diagram

$$\mathcal{F}_{\mathcal{E}} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta} \quad \mathcal{F}_{\mathcal{E}}(C) = \mathbf{N}_{\bullet}(\mathcal{C}/C) \times_{\mathbf{N}_{\bullet}(C)} \mathcal{E}$$

is projectively cofibrant, in the sense of Definition 7.5.6.1. To prove this, we must show that for every levelwise trivial Kan fibration $\mathcal{G}' \rightarrow \mathcal{G}$ between functors $\mathcal{G}', \mathcal{G} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$, the induced map

$$\theta : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathbf{S})}(\mathcal{F}_{\mathcal{E}}, \mathcal{G}') \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathbf{S})}(\mathcal{F}_{\mathcal{E}}, \mathcal{G})$$

is surjective. Using Proposition 5.3.3.24, we can identify θ with a pullback of the map $\mathrm{Hom}_{\mathbf{Set}_{\Delta}}(\mathcal{E}, \mathbf{N}_{\bullet}^{\mathcal{G}'}(\mathcal{C})) \rightarrow \mathrm{Hom}_{\mathbf{Set}_{\Delta}}(\mathcal{E}, \mathbf{N}_{\bullet}^{\mathcal{G}}(\mathcal{C}))$, which is surjective by virtue of Exercise 5.3.3.11.

03C6 **Exercise 7.5.6.3** (Well-Founded Diagrams). Let $(Q, \leq)$ be a well-founded partially ordered set. Show that a diagram of simplicial sets $\mathcal{F} : Q \rightarrow \mathbf{Set}_{\Delta}$ is projectively cofibrant if and

only if, for each element $q \in Q$, the associated map $\varinjlim_{p < q} \mathcal{F}(p) \rightarrow \mathcal{F}(q)$ is a monomorphism of simplicial sets (compare with Proposition 4.5.6.6).

Example 7.5.6.4 (Projectively Cofibrant Sequences). A sequential diagram of simplicial sets 03C7

$$X(0) \rightarrow X(1) \rightarrow X(2) \rightarrow X(3) \rightarrow \cdots$$

is projectively cofibrant (when regarded as a functor $\mathbf{Z}_{\geq 0} \rightarrow \mathbf{Set}_{\Delta}$) if and only if each of the transition maps $X(n) \rightarrow X(n+1)$ is a monomorphism.

Example 7.5.6.5 (Projectively Cofibrant Squares). A commutative diagram of simplicial sets 03C8

$$\begin{array}{ccc} A & \xrightarrow{f_0} & A_0 \\ \downarrow f_1 & & \downarrow f_1 \\ A_1 & \xrightarrow{f_0} & A_{01} \end{array} \quad (7.58) \quad 03C9$$

is projectively cofibrant (when regarded as a functor $[1] \times [1] \rightarrow \mathbf{Set}_{\Delta}$) if and only if the morphisms

$$f_0 : A \rightarrow A_0 \quad f_1 : A \rightarrow A_1 \quad (f'_1, f'_0) : A_0 \amalg_A A_1 \rightarrow A_{01}$$

are monomorphisms of simplicial sets. Equivalently, (7.58) is projectively cofibrant if it is a pullback square consisting of monomorphisms.

Remark 7.5.6.6 (Relationship to Isofibrant Diagrams). Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$ be a diagram 03CA of simplicial sets, let $\mathcal{D}$ be an ∞ -category, and let $\mathcal{D}^{\mathcal{F}} : \mathcal{C}^{\text{op}} \rightarrow \mathbf{Set}_{\Delta}$ denote the functor given by the construction $C \mapsto \text{Fun}(\mathcal{F}(C), \mathcal{D})$. If $\mathcal{F}$ is projectively cofibrant (in the sense of Definition 7.5.6.1), then $\mathcal{D}^{\mathcal{F}}$ is isofibrant (in the sense of Definition 4.5.6.3). That is, if $\mathcal{E} : \mathcal{C}^{\text{op}} \rightarrow \mathbf{Set}_{\Delta}$ is a diagram of simplicial sets and $\mathcal{E}_0 \subseteq \mathcal{E}$ is a subfunctor for which the equivalence $\mathcal{E}_0 \hookrightarrow \mathcal{E}$ is a levelwise categorical equivalence, then the restriction map

$$\theta : \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathbf{Set}_{\Delta})}(\mathcal{E}, \mathcal{D}^{\mathcal{F}}) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathbf{Set}_{\Delta})}(\mathcal{E}_0, \mathcal{D}^{\mathcal{F}})$$

is surjective. This follows from the observation that θ can be identified with the map

$$\text{Hom}_{\text{Fun}(\mathcal{C}, \mathbf{Set}_{\Delta})}(\mathcal{F}, \mathcal{D}^{\mathcal{E}}) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}, \mathbf{Set}_{\Delta})}(\mathcal{F}, \mathcal{D}^{\mathcal{E}_0})$$

given by composition with the restriction map $\mathcal{D}^{\mathcal{E}} \rightarrow \mathcal{D}^{\mathcal{E}_0}$, which is a levelwise trivial Kan fibration by virtue of Corollary 4.5.5.19.

Proposition 7.5.6.7. Let $\mathcal{C}$ be a small category and let $\alpha : \mathcal{F} \rightarrow \mathcal{G}$ be a natural transformation 03CB between projectively cofibrant diagrams $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathbf{Set}_{\Delta}$. If α is a levelwise categorical

equivalence, then the induced map $\varinjlim(\alpha) : \varinjlim(\mathcal{F}) \rightarrow \varinjlim(\mathcal{G})$ is a categorical equivalence of simplicial sets. If α is a levelwise weak homotopy equivalence, then $\varinjlim(\alpha)$ is a weak homotopy equivalence.

Proof. We will prove the first assertion; the second follows by a similar argument. Assume that α is levelwise categorical equivalence and let $\mathcal{D}$ be an ∞ -category; we wish to show that precomposition with $\varinjlim(\alpha)$ induces an equivalence of ∞ -categories $\alpha^* : \text{Fun}(\varinjlim(\mathcal{G}), \mathcal{D}) \rightarrow \text{Fun}(\varinjlim(\mathcal{F}), \mathcal{D})$. α is a levelwise categorical equivalence, precomposition with α induces a levelwise categorical equivalence $\beta : \mathcal{D}^{\mathcal{G}} \rightarrow \mathcal{D}^{\mathcal{F}}$ in the category $\text{Fun}(\mathcal{C}^{\text{op}}, \text{Set}_{\Delta})$. Unwinding the definitions, we see that α^* can be identified with the limit $\varprojlim(\beta)$. Since $\mathcal{D}^{\mathcal{F}}$ and $\mathcal{D}^{\mathcal{G}}$ are isofibrant diagrams (Remark 7.5.6.6), the functor $\varprojlim(\beta)$ is an equivalence of ∞ -categories (Corollary 4.5.6.17). $\square$

We now show that every diagram of simplicial sets $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_{\Delta}$ admits a weak homotopy equivalence from a projectively cofibrant diagram (for a stronger statement, see Proposition 9.1.6.7).

03CC Construction 7.5.6.8 (Explicit Cofibrant Replacement). Let $\mathcal{C}$ be a small category, let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_{\Delta}$ be a diagram of simplicial sets, and let $\text{holim}(\mathcal{F})$ denote the homotopy colimit of $\mathcal{F}$ (Construction 5.3.2.1). For each object $C \in \mathcal{C}$, we let $\mathcal{F}_+(C)$ denote the simplicial set given by the fiber product

$$\mathbf{N}_{\bullet}(\mathcal{C}_{/C}) \times_{\mathbf{N}_{\bullet}(\mathcal{C})} \text{holim}(\mathcal{F}) = \text{holim}(\mathcal{F}|_{\mathcal{C}_{/C}}).$$

The construction $C \mapsto \mathcal{F}_+(C)$ determines a diagram of simplicial sets $\mathcal{F}_+ : \mathcal{C} \rightarrow \text{Set}_{\Delta}$. This diagram is equipped with a natural transformation $\alpha : \mathcal{F}_+ \rightarrow \mathcal{F}$, which carries each object $C \in \mathcal{C}$ to the comparison map

$$\mathcal{F}_+(C) = \text{holim}(\mathcal{F}|_{\mathcal{C}_{/C}}) \rightarrow \varinjlim(\mathcal{F}|_{\mathcal{C}_{/C}}) \simeq \mathcal{F}(C)$$

of Remark 5.3.2.9.

03CD Proposition 7.5.6.9. *Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_{\Delta}$ be a diagram of simplicial sets. Then the diagram $\mathcal{F}_+ : \mathcal{C} \rightarrow \text{Set}_{\Delta}$ of Construction 7.5.6.8 is projectively cofibrant, and the natural transformation $\alpha : \mathcal{F}_+ \rightarrow \mathcal{F}$ is a levelwise weak homotopy equivalence. Moreover, α is also an epimorphism.*

Proof. Example 7.5.6.2 shows that the diagram $\mathcal{F}_+$ is projectively cofibrant and Remark 5.3.2.9 shows that α is an epimorphism. To complete the proof, it will suffice to show that for each object $C \in \mathcal{C}$, the map $\alpha_C : \mathcal{F}_+(C) \rightarrow \mathcal{F}(C)$ is a weak homotopy equivalence of simplicial sets. Replacing $\mathcal{C}$ by the slice category $\mathcal{C}_{/C}$, we can reduce to the case where C is a final object of $\mathcal{C}$; in this case, we wish to prove that the comparison map

$$\text{holim}(\mathcal{F}) \rightarrow \varinjlim(\mathcal{F}) \simeq \mathcal{F}(C)$$

is a weak homotopy equivalence. Note that this map admits a section, given by the inclusion map

$$\iota : \mathcal{F}(C) \simeq \{C\} \times_{N_\bullet(C)} \operatorname{holim}(\mathcal{F}) \rightarrow \operatorname{holim}(\mathcal{F}).$$

We complete the proof by that our assumption that $C \in \mathcal{C}$ is a final object guarantees that ι is right anodyne (Example 7.2.3.11). $\square$

Warning 7.5.6.10. In the situation of Proposition 7.5.6.9, the natural transformation $\alpha : \mathcal{F}_+ \rightarrow \mathcal{F}$ is usually not a levelwise categorical equivalence. For example, if $\mathcal{F}$ is the constant functor taking the value Δ^0 , then $\mathcal{F}_+$ is given by the construction $C \mapsto N_\bullet(\mathcal{C}/C)$. 03CE

Remark 7.5.6.11. Constructions 7.5.6.8 and 7.5.3.3 are closely related. Let $\mathcal{C}$ be a small category, let $\mathcal{F} : \mathcal{C} \rightarrow \operatorname{Set}_\Delta$ be a diagram of simplicial sets, and let $\mathcal{G} : \mathcal{C} \rightarrow \operatorname{Kan}$ be a diagram of Kan complexes. Combining Corollary 5.3.2.24 with Proposition 5.3.3.24, we obtain canonical isomorphisms of Kan complexes 03CF

$$\begin{aligned} \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta)}(\mathcal{F}, \mathcal{G}^+)_{\bullet} &= \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta)}(\mathcal{F}, \operatorname{sTr}_{N_\bullet^{\mathcal{G}}(\mathcal{C})/C}) \\ &\simeq \operatorname{Fun}_{/N_\bullet(C)}(\operatorname{holim}(\mathcal{F}), N_\bullet^{\mathcal{G}}(\mathcal{C})) \\ &\simeq \operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta)}(\mathcal{F}_+, \mathcal{G})_{\bullet}. \end{aligned}$$

More generally, if $\mathcal{G}$ is a diagram of ∞ -categories, we can identify $\operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta)}(\mathcal{F}, \mathcal{G}^+)_{\bullet}$ with the full subcategory of $\operatorname{Hom}_{\operatorname{Fun}(\mathcal{C}, \operatorname{Set}_\Delta)}(\mathcal{F}_+, \mathcal{G})_{\bullet}$ spanned by those natural transformations $\alpha : \mathcal{F}_+ \rightarrow \mathcal{G}$ having the property that, for each object $C \in \mathcal{C}$, the diagram

$$\alpha_C : \mathcal{F}_+(C) = \operatorname{holim}(\mathcal{F}|_{\mathcal{C}/C}) \rightarrow \mathcal{G}(C)$$

carries horizontal edges of $\operatorname{holim}(\mathcal{F}|_{\mathcal{C}/C})$ to isomorphisms in the ∞ -category $\mathcal{G}(C)$.

Proposition 7.5.6.12. Let $\mathcal{C}$ be a small category, let $\mathcal{F} : \mathcal{C} \rightarrow \operatorname{Set}_\Delta$ be a diagram of simplicial sets, and let $\mathcal{F}_+ : \mathcal{C} \rightarrow \operatorname{Set}_\Delta$ be the diagram of Construction 7.5.6.8. Then there is a canonical isomorphism of simplicial sets $\lambda : \varinjlim(\mathcal{F}_+) \rightarrow \operatorname{holim}(\mathcal{F})$ which is characterized by the following requirement: for each object $C \in \mathcal{C}$, the composition 03CG

$$\begin{aligned} N_\bullet(\mathcal{C}/C) \times_{N_\bullet(C)} \operatorname{holim}(\mathcal{F}) &= \mathcal{F}_+(C) \\ &\rightarrow \varinjlim(\mathcal{F}_+) \\ &\xrightarrow{\lambda} \operatorname{holim}(\mathcal{F}) \end{aligned}$$

is given by projection onto the second factor.

Proof. It follows from the definition of the colimit that there is a unique morphism of simplicial sets $\lambda : \varinjlim(\mathcal{F}_+) \rightarrow \operatorname{holim}(\mathcal{F})$ having the desired property. Using the dual of Lemma 7.5.3.8, we deduce that λ is an isomorphism. $\square$

03CH **Remark 7.5.6.13.** Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_\Delta$ be a diagram of simplicial sets, let $\theta : \operatorname{holim}(\mathcal{F}) \rightarrow \varinjlim(\mathcal{F})$ be the comparison map of Remark 5.3.2.9, and let $\lambda : \varinjlim(\mathcal{F}_+) \xrightarrow{\sim} \operatorname{holim}(\mathcal{F})$ be the isomorphism of Proposition 7.5.6.12. Then the composition $(\theta \circ \lambda) : \varinjlim(\mathcal{F}_+) \rightarrow \varinjlim(\mathcal{F})$ is induced by the natural transformation $\alpha : \mathcal{F}_+ \rightrightarrows \mathcal{F}$ appearing in Construction 7.5.6.8.

03CJ **Corollary 7.5.6.14.** Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}_\Delta$ be a projectively cofibrant diagram of simplicial sets. Then the comparison map $\operatorname{holim}(\mathcal{F}) \rightarrow \varinjlim(\mathcal{F})$ of Remark 5.3.2.9 is a weak homotopy equivalence.

Proof. By virtue of Remark 7.5.6.13, it will suffice to show that the natural transformation $\alpha : \mathcal{F}_+ \rightrightarrows \mathcal{F}$ of Construction 7.5.6.8 induces a weak homotopy equivalence $\varinjlim(\alpha) : \varinjlim(\mathcal{F}_+) \rightarrow \varinjlim(\mathcal{F})$. This is a special case of Proposition 7.5.6.7, since α is a levelwise weak homotopy equivalence between projectively cofibrant diagrams (Proposition 7.5.6.9). $\square$

03CK **Warning 7.5.6.15.** Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a diagram of simplicial sets, let $\alpha : \mathcal{F}_+ \rightrightarrows \mathcal{F}$ be the natural transformation of Construction 7.5.6.8, and let $\lambda : \varinjlim(\mathcal{F}_+) \xrightarrow{\sim} \operatorname{holim}(\mathcal{F})$ be the isomorphism of Proposition 7.5.6.12. Then we have a diagram of simplicial sets

$$\begin{array}{ccc}
 \operatorname{holim}(\mathcal{F}_+) & \xrightarrow{\operatorname{holim}(\alpha)} & \operatorname{holim}(\mathcal{F}) \\
 \downarrow & \nearrow \lambda & \downarrow \\
 \varinjlim(\mathcal{F}_+) & \xrightarrow{\varinjlim(\alpha)} & \varinjlim(\mathcal{F}),
 \end{array}$$

~

where the outer square and the lower right triangle are commutative (Remark 7.5.6.13). Beware that the upper left triangle is usually *not* commutative. That is, $\operatorname{holim}(\mathcal{F})$ and $\varinjlim(\mathcal{F}_+)$ are isomorphic when viewed as abstract simplicial sets, but not when viewed as quotients of the simplicial set $\operatorname{holim}(\mathcal{F}_+)$ (compare with Warning 7.5.3.14).

03CL **Remark 7.5.6.16** (The Homotopy Colimit as a Left Derived Functor). The preceding results can be interpreted in the language of model categories. For every small category $\mathcal{C}$, the category $\mathbf{Fun}(\mathcal{C}, \mathbf{Set}_\Delta)$ can be equipped with a model structure in which the fibrations are levelwise Kan fibrations and weak equivalences are levelwise weak homotopy equivalences (see Example [?]). Combining Propositions 7.5.6.9 and 7.5.6.12, we deduce that the homotopy colimit functor $\operatorname{holim} : \mathbf{Fun}(\mathcal{C}, \mathbf{Set}_\Delta) \rightarrow \mathbf{Set}_\Delta$ can be viewed as a *left derived* functor of the usual colimit $\varinjlim : \mathbf{Fun}(\mathcal{C}, \mathbf{Set}_\Delta) \rightarrow \mathbf{Set}_\Delta$ (see Definition [?]).

7.5.7 Homotopy Colimit Diagrams

Let $\mathcal{C}$ be a (small) category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a (strictly commutative) diagram of Kan complexes indexed by $\mathcal{C}$. Passing to the homotopy coherent nerve, we obtain a functor of ∞ -categories

$$N_{\bullet}^{\mathrm{hc}}(\mathcal{F}) : N_{\bullet}(\mathcal{C}) \rightarrow N_{\bullet}^{\mathrm{hc}}(\mathbf{Kan}) = \mathcal{S}.$$

By virtue of Corollary 7.4.3.3, this functor admits a colimit in the ∞ -category $\mathcal{S}$. This colimit admits a classical description, using the *homotopy colimit* of Construction 5.3.2.1.

Proposition 7.5.7.1. *Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a (strictly commutative) diagram of ∞ -categories indexed by $\mathcal{C}$. Then a Kan complex X is a colimit of the functor $N_{\bullet}^{\mathrm{hc}}(\mathcal{F})$ if and only if it is weakly homotopy equivalent to the homotopy colimit $\mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F})$.* 03CM

Proof. Let $\lambda_t : \mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F}) \rightarrow N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ be the taut scaffold of Construction 5.3.4.11. Then λ_t is a categorical equivalence of simplicial sets (Corollary 5.3.5.9), and therefore a weak homotopy equivalence (Remark 4.5.3.4). The desired result now follows from Corollary 7.4.3.4. $\square$

Example 7.5.7.2. Let $\mathcal{C}$ be a groupoid and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Kan}$ be a diagram of Kan complexes indexed by $\mathcal{C}$. Then the homotopy colimit $\mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F})$ is a Kan complex (Corollary 5.3.4.23). In this case, Proposition 7.5.7.1 guarantees that $\mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F})$ is a colimit of the diagram $N_{\bullet}^{\mathrm{hc}}(\mathcal{F})$ in the ∞ -category $\mathcal{S}$. For example, if X is a Kan complex equipped with an action of a group G , then the homotopy quotient $X_{\mathrm{h}G}$ is a colimit of the associated diagram $B_{\bullet}G \rightarrow \mathcal{S}$ (Example 5.3.4.24). 03CP

Our goal in this section is to formulate a companion to Proposition 7.5.7.1, which provides concrete models for colimit *diagrams* in the ∞ -category $\mathcal{S}$ (rather than colimits in the abstract).

Definition 7.5.7.3. Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a diagram of simplicial sets restriction $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$. We will say that $\overline{\mathcal{F}}$ is a *homotopy colimit diagram* if the composite map 03CQ

$$\mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F}) \twoheadrightarrow \varinjlim(\mathcal{F}) \rightarrow \overline{\mathcal{F}}(\mathbf{1})$$

is a weak homotopy equivalence of simplicial sets. Here $\mathbf{1}$ denotes the final object of the cone $\mathcal{C}^{\triangleright} \simeq \mathcal{C} \star \{\mathbf{1}\}$, and the morphism on the left is the comparison map of Remark 5.3.2.9.

Example 7.5.7.4. Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a colimit diagram in the category of simplicial sets. If the diagram $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$ is projectively cofibrant, then $\overline{\mathcal{F}}$ is a homotopy colimit diagram: this is a reformulation of Corollary 7.5.6.14 (for a stronger statement, see Corollary 7.5.8.7). 03CR

03CS Proposition 7.5.7.5 (Homotopy Invariance). *Let $\mathcal{C}$ be a category and let $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ be a natural transformation between diagrams $\overline{\mathcal{F}}, \overline{\mathcal{G}} : \mathcal{C}^\triangleright \rightarrow \mathbf{Set}_\Delta$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$ is a weak homotopy equivalence of simplicial sets. Then any two of the following conditions imply the third:*

- (1) *The functor $\overline{\mathcal{F}}$ is a homotopy colimit diagram.*
- (2) *The functor $\overline{\mathcal{G}}$ is a homotopy colimit diagram.*
- (3) *The natural transformation α induces a weak homotopy equivalence $\overline{\mathcal{F}}(\mathbf{1}) \rightarrow \overline{\mathcal{G}}(\mathbf{1})$, where $\mathbf{1}$ denotes the cone point of $\mathcal{C}^\triangleright$.*

Proof. Setting $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$ and $\mathcal{G} = \overline{\mathcal{G}}|_{\mathcal{C}}$, we observe that α determines a commutative diagram of simplicial sets

$$\begin{array}{ccc} \underset{\longrightarrow}{\mathrm{holim}}(\mathcal{F}) & \longrightarrow & \underset{\longrightarrow}{\mathrm{holim}}(\mathcal{G}) \\ \downarrow & & \downarrow \\ \overline{\mathcal{F}}(\mathbf{1}) & \longrightarrow & \overline{\mathcal{G}}(\mathbf{1}) \end{array}$$

where the upper horizontal map is a weak homotopy equivalence (Proposition 5.3.2.18). The desired result now follows from the two-out-of-three property (Remark 3.1.6.16). $\square$

There is a close relationship between homotopy colimit diagrams (in the sense of Definition 7.5.7.3) and homotopy limit diagrams (in the sense of Definition 7.5.4.1).

03CT Proposition 7.5.7.6. *Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathbf{Set}_\Delta$ be a diagram of simplicial sets. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram if and only if, for every Kan complex X , the functor*

$$X^{\overline{\mathcal{F}}} : (\mathcal{C}^\triangleright)^{\mathrm{op}} \rightarrow \mathbf{Kan} \quad C \mapsto \mathrm{Fun}(\overline{\mathcal{F}}(C), X)$$

is a homotopy limit diagram.

Proof. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$, let $\mathbf{1}$ denote the final object of $\mathcal{C}^\triangleright$, and let $\theta : \underset{\longrightarrow}{\mathrm{holim}}(\mathcal{F}) \rightarrow \overline{\mathcal{F}}(\mathbf{1})$ be the map appearing in Definition 7.5.7.3. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram if and only if, for every Kan complex X , precomposition with θ induces a homotopy equivalence of Kan complexes

$$\theta^* : \mathrm{Fun}(\overline{\mathcal{F}}(\mathbf{1}), X) \rightarrow \mathrm{Fun}(\underset{\longrightarrow}{\mathrm{holim}}(\mathcal{F}), X).$$

Setting $\mathcal{G} = \mathcal{F}^{\mathrm{op}}$, $\overline{\mathcal{G}} = \overline{\mathcal{F}}^{\mathrm{op}}$, and $Y = X^{\mathrm{op}}$, Example 7.5.1.7 identifies θ^* with the opposite of the restriction map $Y^{\overline{\mathcal{G}}}(\mathbf{1}) \rightarrow \underset{\longleftarrow}{\mathrm{holim}}(Y^{\overline{\mathcal{G}}})$ appearing in Definition 7.5.4.1. In particular, θ^* is a homotopy equivalence if and only if $Y^{\overline{\mathcal{G}}}$ is a homotopy limit diagram of Kan complexes.

By virtue of Corollary 7.5.4.12, this is equivalent to the requirement that $X^{\overline{\mathcal{F}}}$ is a homotopy limit diagram. $\square$

Corollary 7.5.7.7. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram (in the sense of Definition 7.5.7.3) if and only if the induced functor of ∞ -categories* 03CU

$$N_{\bullet}^{\mathrm{hc}}(\overline{\mathcal{F}}) : N_{\bullet}(\mathcal{C}^{\triangleright}) \rightarrow N_{\bullet}^{\mathrm{hc}}(\mathbf{Kan}) = \mathcal{S}$$

is a colimit diagram (in the sense of Variant 7.1.3.5).

Proof. Combine Proposition 7.5.7.6 with Corollary 7.5.4.6 (applied to the simplicial category $\mathbf{Kan}^{\mathrm{op}}$). $\square$

Corollary 7.5.7.8. *Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a functor. Let $\overline{\mathcal{F}}^{\mathrm{op}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be the functor given on objects by $\overline{\mathcal{F}}^{\mathrm{op}}(C) = \overline{\mathcal{F}}(C)^{\mathrm{op}}$. Then $\overline{\mathcal{F}}$ is a homotopy colimit diagram if and only if $\overline{\mathcal{F}}^{\mathrm{op}}$ is a homotopy colimit diagram.* 03CV

Proof. Combine Proposition 7.5.7.6 with Corollary 7.5.7.8. $\square$

Corollary 7.5.7.9. *Suppose we are given a commutative diagram of simplicial sets* 03CW

$$\begin{array}{ccc} A & \longrightarrow & A_0 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A_{01}, \end{array}$$

(7.59) 03CX

which we identify with a functor $\mathcal{F} : [1] \times [1] \rightarrow \mathbf{Set}_{\Delta}$. Then (7.59) is a homotopy pushout square (in the sense of Definition 3.4.2.1) if and only if $\mathcal{F}$ is a homotopy colimit diagram (in the sense of Definition 7.5.7.3).

Proof. Combine Propositions 7.5.7.6 and 7.5.4.13. $\square$

7.5.8 Categorical Colimit Diagrams

In §7.5.7, we introduced the notion of a *homotopy colimit diagram* (Definition 7.5.7.3), and showed that one can use homotopy colimit diagrams to compute colimits in the ∞ -category $\mathcal{S}$ of spaces (Corollary 7.5.7.7). In this section, we introduce the closely related notion of *categorical colimit diagram*, which can be used to compute colimits in the larger ∞ -category $\mathcal{QC} \supset \mathcal{S}$. 03CY

03CZ **Proposition 7.5.8.1.** *Let $\mathcal{C}$ be a small category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a (strictly commutative) diagram of ∞ -categories indexed by $\mathcal{C}$, and let W denote the collection of horizontal edges of the homotopy colimit $\underset{\rightarrow}{\mathrm{holim}}(\mathcal{F})$ (Definition 5.3.4.1). Then an ∞ -category $\mathcal{D}$ is a colimit of the diagram*

$$\mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathcal{F}) : \mathbf{N}_{\bullet}(\mathcal{C}) \rightarrow \mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathbf{QCat}) = \mathcal{QC}$$

if and only if it is a localization of $\underset{\rightarrow}{\mathrm{holim}}(\mathcal{F})$ with respect to W , in the sense of Remark 6.3.2.2.

Proof. Let $U : \mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow \mathbf{N}_{\bullet}(\mathcal{C})$ be the projection map of Definition 5.3.3.1 and let W' denote the collection of all U -cocartesian morphisms of $\mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C})$. Choose a functor of ∞ -categories $T : \mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow \mathcal{D}$ which exhibits $\mathcal{D}$ as a localization of $\mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C})$ with respect to W' . Let $\lambda_t : \underset{\rightarrow}{\mathrm{holim}}(\mathcal{F}) \rightarrow \mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C})$ denote the taut scaffold of Construction 5.3.4.11. Then λ_t is a categorical equivalence of simplicial sets (Corollary 5.3.5.9). Moreover, a morphism of $\mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C})$ belongs to W' if and only if it is isomorphic (as an object of the ∞ -category $\mathrm{Fun}(\Delta^1, \mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C}))$) to an element of $\lambda_t(W)$ (see Corollary 5.3.3.16). It follows that the composite map $\underset{\rightarrow}{\mathrm{holim}}(\mathcal{F}) \xrightarrow{\lambda_t} \mathbf{N}_{\bullet}^{\mathcal{F}}(\mathcal{C}) \xrightarrow{T} \mathcal{D}$ exhibits $\mathcal{D}$ as a localization of $\underset{\rightarrow}{\mathrm{holim}}(\mathcal{F})$ with respect to W . We conclude by observing that $\mathcal{D}$ is a colimit of the diagram $\mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathcal{F})$ (Corollary 7.4.5.5). $\square$

Motivated by Proposition 7.5.8.1, we introduce the following variant of Definition 7.5.7.3:

03D0 **Definition 7.5.8.2.** Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a diagram of simplicial sets. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$, and let W denote the collection of horizontal edges of $\underset{\rightarrow}{\mathrm{holim}}(\mathcal{F})$ (Definition 5.3.4.1). We will say that $\overline{\mathcal{F}}$ is a *categorical colimit diagram* if the composite map

$$\underset{\rightarrow}{\mathrm{holim}}(\mathcal{F}) \twoheadrightarrow \underset{\rightarrow}{\mathrm{lim}}(\mathcal{F}) \rightarrow \overline{\mathcal{F}}(\mathbf{1})$$

exhibits $\overline{\mathcal{F}}(\mathbf{1})$ as a localization of $\underset{\rightarrow}{\mathrm{holim}}(\mathcal{F})$ with respect to W . (see Definition 6.3.1.9). Here $\mathbf{1}$ denotes the final object of the cone $\mathcal{C}^{\triangleright} \simeq \mathcal{C} \star \{\mathbf{1}\}$, and the morphism on the left is the comparison map of Remark 5.3.2.9.

03D1 **Remark 7.5.8.3.** Let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a categorical colimit diagram of simplicial sets. Then $\overline{\mathcal{F}}$ is also a homotopy colimit diagram of simplicial sets, in the sense of Definition 7.5.7.3. This follows from the observation that every localization of simplicial sets is a weak homotopy equivalence (Remark 6.3.1.17).

03D2 **Proposition 7.5.8.4.** *Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a diagram of simplicial sets. The following conditions are equivalent:*

(1) *The diagram $\overline{\mathcal{F}}$ is a categorical colimit diagram.*

(2) For every ∞ -category $\mathcal{D}$, the diagram of ∞ -categories

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \mathbf{QCat} \quad C \mapsto \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})$$

is a categorical limit diagram (Definition 7.5.5.1).

(3) For every ∞ -category $\mathcal{D}$, the diagram of Kan complexes

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \mathbf{Kan} \quad C \mapsto \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})^\simeq$$

is a homotopy limit diagram (Definition 7.5.4.1).

Proof. The equivalence of (1) and (2) follows by combining Example 7.5.2.11 with Corollary 7.5.5.15. The equivalence with (3) follows by combining the same results with Proposition 6.3.1.13 and Example 7.5.2.8. $\square$

Corollary 7.5.8.5. Suppose we are given a commutative diagram of simplicial sets

03D3

$$\begin{array}{ccc} A & \longrightarrow & A_0 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A_{01}, \end{array}$$

03D4

(7.60)

which we identify with a functor $\mathcal{F} : [1] \times [1] \rightarrow \mathbf{Set}_\Delta$. Then (7.60) is a categorical pushout square (in the sense of Definition 4.5.4.1) if and only if $\mathcal{F}$ is a categorical colimit diagram (in the sense of Definition 7.5.8.2).

Corollary 7.5.8.6 (Homotopy Invariance). Let $\mathcal{C}$ be a category and let $\alpha : \overline{\mathcal{F}} \rightarrow \overline{\mathcal{G}}$ be a natural transformation between diagrams $\overline{\mathcal{F}}, \overline{\mathcal{G}} : \mathcal{C}^\triangleright \rightarrow \mathbf{Set}_\Delta$. Assume that, for every object $C \in \mathcal{C}$, the induced map $\alpha_C : \overline{\mathcal{F}}(C) \rightarrow \overline{\mathcal{G}}(C)$ is a categorical equivalence of simplicial sets. Then any two of the following conditions imply the third:

03D5

- (1) The functor $\overline{\mathcal{F}}$ is a categorical colimit diagram.
- (2) The functor $\overline{\mathcal{G}}$ is a categorical colimit diagram.
- (3) The natural transformation α induces a categorical equivalence $\overline{\mathcal{F}}(\mathbf{1}) \rightarrow \overline{\mathcal{G}}(\mathbf{1})$, where $\mathbf{1}$ denotes the cone point of $\mathcal{C}^\triangleright$.

Proof. By virtue of Proposition 7.5.8.4 (and Proposition 4.5.3.8), it will suffice to show that for every ∞ -category $\mathcal{D}$, any two of the following conditions imply the third:

(1_D) The functor

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \mathbf{QCat} \quad C \mapsto \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})$$

is a categorical limit diagram.

(2_D) The functor

$$(\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \mathbf{QCat} \quad C \mapsto \text{Fun}(\overline{\mathcal{G}}(C), \mathcal{D})$$

is a categorical limit diagram.

(3_D) The natural transformation α induces an equivalence of ∞ -categories $\text{Fun}(\overline{\mathcal{G}}(\mathbf{1}), \mathcal{D}) \rightarrow \text{Fun}(\overline{\mathcal{F}}(\mathbf{1}), \mathcal{D})$.

This follows from Remark 7.5.5.6. □

03D6 Corollary 7.5.8.7. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a colimit diagram in the category of simplicial sets. If the diagram $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$ is projectively cofibrant, then $\overline{\mathcal{F}}$ is a categorical colimit diagram.*

Proof. Let $\mathcal{D}$ be an ∞ -category and define $\overline{\mathcal{G}} : (\mathcal{C}^\triangleright)^{\text{op}} \rightarrow \mathbf{QCat}$ by the formula $\overline{\mathcal{G}}(C) = \text{Fun}(\overline{\mathcal{F}}(C), \mathcal{D})$. By virtue of Proposition 7.5.8.4, it will suffice to show that the diagram of Kan complexes $\overline{\mathcal{G}}^\sim$ is a homotopy limit diagram. Setting $\mathcal{G} = \overline{\mathcal{G}}|_{\mathcal{C}^{\text{op}}}$, our assumption that $\mathcal{F}$ is projectively cofibrant guarantees that the diagram $\mathcal{G}$ is isofibrant (Remark 7.5.6.6). It follows that the diagram of Kan complexes $\mathcal{G}^\sim$ is also isofibrant, and that $\overline{\mathcal{G}}^\sim$ is a limit diagram (Corollary 4.5.6.22). The desired result now follows from Example 7.5.4.2. □

03D7 Corollary 7.5.8.8. *Let $\mathcal{F} : \mathcal{C} \rightarrow \text{Set}_\Delta$ be a diagram of simplicial sets, let $\theta : \text{holim}(\mathcal{F}) \rightarrow \varinjlim(\mathcal{F})$ be the comparison map of Remark 5.3.2.9, and let W denote the collection of all horizontal edges of the homotopy colimit $\text{holim}(\mathcal{F})$ (Definition 5.3.4.1). If $\mathcal{F}$ is projectively cofibrant (Definition 7.5.6.1), then θ exhibits $\varinjlim(\mathcal{F})$ as a localization of $\text{holim}(\mathcal{F})$ with respect to W .*

Proof. This is a restatement of Corollary 7.5.8.7. □

03D8 Corollary 7.5.8.9. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathbf{QCat}$ be a diagram of ∞ -categories. Then $\overline{\mathcal{F}}$ is a categorical colimit diagram (in the sense of Definition 7.5.7.3) if and only if the induced functor of ∞ -categories*

$$N_\bullet^{\text{hc}}(\overline{\mathcal{F}}) : N_\bullet(\mathcal{C}^\triangleright) \rightarrow N_\bullet^{\text{hc}}(\mathbf{QCat}) = \mathcal{QC}$$

is a colimit diagram (in the sense of Variant 7.1.3.5).

Proof. Combine Proposition 7.5.8.4 with Corollary 7.5.4.6 (applied to the simplicial category $\mathbf{QCat}^{\text{op}}$). □

Corollary 7.5.8.10. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Kan}$ be a diagram of Kan complexes. Then $\overline{\mathcal{F}}$ is a categorical colimit diagram if and only if it is a homotopy colimit diagram.* 03D9

Proof. Combine Corollary 7.5.8.9, Corollary 7.5.7.7, and Remark 7.4.4.4. $\square$

Corollary 7.5.8.11. *Let $\mathcal{C}$ be a category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a functor. Let $\overline{\mathcal{F}}^{\mathrm{op}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be the functor given on objects by $\overline{\mathcal{F}}^{\mathrm{op}}(C) = \overline{\mathcal{F}}(C)^{\mathrm{op}}$. Then $\overline{\mathcal{F}}$ is a categorical colimit diagram if and only if $\overline{\mathcal{F}}^{\mathrm{op}}$ is a categorical colimit diagram.* 03DA

Proof. Combine Proposition 7.5.8.4 with Corollary 7.5.5.15. $\square$

We close this section with an application of the formalism of categorical colimit diagrams.

Proposition 7.5.8.12 (Rewriting Colimits). *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathbf{Set}_{\Delta}$ be a categorical colimit diagram which carries the final object of $\mathcal{C}^{\triangleright}$ to a simplicial set K . Let $\mathcal{D}$ be an ∞ -category equipped with a diagram $q : K \rightarrow \mathcal{D}$ satisfying the following condition:* 03DB

(*) *For each object $C \in \mathcal{C}$, the composite map*

$$q_C : \overline{\mathcal{F}}(C) \rightarrow K \xrightarrow{q} \mathcal{D}$$

admits a colimit in the ∞ -category $\mathcal{D}$.

Then there exists a functor $Q : \mathbf{N}_{\bullet}(\mathcal{C}) \rightarrow \mathcal{D}$ with the following properties:

- (1) *For each object $C \in \mathcal{C}$, the object $Q(C) \in \mathcal{D}$ is a colimit of the diagram q_C .*
- (2) *An object $X \in \mathcal{D}$ is a colimit of the diagram q if and only if it is a colimit of Q . In particular, the diagram q has a colimit in $\mathcal{D}$ if and only if the diagram Q has a colimit in $\mathcal{D}$.*
- (3) *Let $G : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories which preserves the colimit of each of the diagrams q_C , and suppose that the diagrams q and Q admit colimits in $\mathcal{D}$. Then G preserves the colimit of q if and only if it preserves the colimit of Q .*

Proof. Set $\mathcal{F} = \overline{\mathcal{F}}|_{\mathcal{C}}$, let $U : \mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F}) \rightarrow \mathbf{N}_{\bullet}(\mathcal{C})$ be the projection map, and let W be the collection of all horizontal edges of $\mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F})$. The diagram $\overline{\mathcal{F}}$ then determines a morphism of simplicial sets $T : \mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F}) \rightarrow K$ which exhibits K as a localization of $\mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F})$ with respect to W . It follows from assumption (*) that for each object $C \in \mathcal{C}$, the composite map

$$\mathcal{F}(C) \simeq \{C\} \times_{\mathbf{N}_{\bullet}(\mathcal{C})} \mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F}) \hookrightarrow \mathop{\mathrm{holim}}\limits_{\rightarrow}(\mathcal{F}) \xrightarrow{T} K \xrightarrow{q} \mathcal{D}$$

admits a colimit in $\mathcal{D}$. Applying Corollary 7.3.5.3, we conclude that there is a functor $Q : \mathbf{N}_{\bullet}(\mathcal{C}) \rightarrow \mathcal{D}$ and a natural transformation $\beta : T \circ q \rightarrow Q \circ U$ which exhibits Q as a left

Kan extension of $T \circ q$ along U . We will complete the proof by showing that Q satisfies conditions (1), (2), and (3) of Proposition 7.5.8.12. Condition (1) follows immediately from Remark 7.3.5.4.

We now prove (2). Assume first that $X \in \mathcal{D}$ is a colimit of the diagram Q . For every simplicial set S , we let $\underline{X}_S$ denote the image of X in the ∞ -category $\text{Fun}(S, \mathcal{D})$. Choose a natural transformation $\alpha : Q \rightarrow \underline{X}_{N_\bullet(\mathcal{C})}$ which exhibits $X \in \mathcal{D}$ as a colimit of the diagram Q , let $\tilde{\alpha} : Q \circ U \rightarrow \underline{X}_{\text{holim}(\mathcal{F})}$ denote the image of α in $\text{Fun}(\text{holim}(\mathcal{F}), \mathcal{D})$, and let $\tilde{\gamma} : q \circ T \rightarrow \underline{X}_{\text{holim}(\mathcal{F})} = \underline{X}_K \circ T$ be a composition of β with $\tilde{\alpha}$ in $\text{Fun}(\text{holim}(\mathcal{F}), \mathcal{D})$. Since precomposition with T induces a fully faithful functor $\text{Fun}(K, \mathcal{D}) \rightarrow \text{Fun}(\text{holim}(\mathcal{F}), \mathcal{D})$, we may assume without loss of generality that $\tilde{\gamma}$ is the image of a natural transformation $\gamma : q \rightarrow \underline{X}_K$. Note that $\tilde{\gamma}$ exhibits X as a colimit of the diagram $q \circ T$ (Corollary 7.3.8.25). Since T is right cofinal (Proposition 7.2.1.10), it follows that γ exhibits X as a colimit of the diagram q (Corollary 7.2.2.7).

To prove the reverse implication, it will suffice to show that if the diagram $q : K \rightarrow \mathcal{D}$ admits a colimit, then Q also admits a colimit. Since T is right cofinal, the diagram $q \circ T$ also admits a colimit in $\mathcal{D}$ (Corollary 7.2.2.11), so the desired result is immediate from Corollary 7.3.8.25.

We now prove (3). Let $G : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories which preserves the colimit of the diagram q_C , for each object $C \in \mathcal{C}$. Let $\alpha : Q \rightarrow \underline{X}_{N_\bullet(\mathcal{C})}$ and $\gamma : q \rightarrow \overline{X}_K$ be defined as above; we wish to show that $G(\alpha)$ exhibits $G(X)$ as a colimit of the diagram $G \circ Q$ if and only if $G(\gamma)$ exhibits $G(X)$ as a colimit of the diagram $G \circ q$. Using Corollary 7.2.2.7, we see that latter condition is equivalent to the requirement that $G(\tilde{\gamma})$ exhibits $G(X)$ as a colimit of the diagram $G \circ q \circ T$. By virtue of Corollary 7.3.8.25, we are reduced to showing that the natural transformation $G(\beta)$ exhibits $G \circ Q$ as a left Kan extension of $G \circ q \circ T$ along U . This follows from the criterion of Remark 7.3.5.4. $\square$

03DC Corollary 7.5.8.13. *Let $\mathcal{C}$ be a small category and let $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \text{Set}_\Delta$ be a categorical colimit diagram carrying the final object of $\mathcal{C}^\triangleright$ to a simplicial set K . Let $\mathcal{D}$ be an ∞ -category which admits $N_\bullet(\mathcal{C})$ -indexed colimits and $\overline{\mathcal{F}}(C)$ -indexed colimits, for each object $C \in \mathcal{C}$. Then $\mathcal{D}$ also admits K -indexed colimits. Moreover, if $G : \mathcal{D} \rightarrow \mathcal{E}$ is a functor of ∞ -categories which preserves $N_\bullet(\mathcal{C})$ -indexed colimits and $\overline{\mathcal{F}}(C)$ -indexed colimits for each $C \in \mathcal{C}$, then G also preserves K -indexed colimits.*

7.6 Examples of Limits and Colimits

03E8 Let $\mathcal{C}$ be an ∞ -category. In §7.1, we introduced the notion of limit and colimit for an arbitrary morphism of simplicial sets $\sigma : K \rightarrow \mathcal{C}$. Our goal in this section is to make the general theory more explicit for some special classes of diagrams which arise frequently in

practice.

We begin in §7.6.1 by considering the case where K is a *discrete* simplicial set. In this case, specifying a functor $\sigma : K \rightarrow \mathcal{C}$ is equivalent to specifying a collection of objects $\{Y_k \in \mathcal{C}\}_{k \in K}$, indexed by the collection of vertices of K . We say that an object of $\mathcal{C}$ is a *product* of the collection $\{Y_k\}_{k \in K}$ if it is a limit of the diagram σ , and a *coproduct* of the collection $\{Y_k\}_{k \in K}$ if it is a colimit of the diagram σ . These conditions can be formulated purely in terms of the homotopy category $\mathbf{h}\mathcal{C}$, provided that we regard $\mathbf{h}\mathcal{C}$ as enriched over the homotopy category of Kan complexes $\mathbf{h}\mathbf{Kan}$ (see Remark 7.6.1.5). In particular, the forgetful functor from $\mathcal{C}$ to (the nerve of) its homotopy category $\mathbf{h}\mathcal{C}$ preserves products and coproducts (Warning 7.6.1.2).

In §7.6.2, we study limit and colimit diagrams indexed by the simplicial set $K = \Delta^1 \times \Delta^1$. Let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a functor of ∞ -categories, which we depict as a diagram

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X. \end{array}$$

We say that σ is a *pullback square* if it is a limit diagram, and a *pushout square* if it is a colimit diagram (Definition 7.6.2.1). Beware that these conditions cannot be formulated at the level of the homotopy category $\mathbf{h}\mathcal{C}$, even if its $\mathbf{h}\mathbf{Kan}$ -enrichment is accounted for: see Warning 7.6.2.3 Example 7.6.2.4.

It follows from Proposition 7.5.4.13 that a (strictly commutative) diagram of Kan complexes

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array}$$

determines a pullback square in the ∞ -category $\mathcal{S}$ if and only if it is a homotopy pullback square. However, not every pullback square in the ∞ -category $\mathcal{S}$ arises in this way. In §7.6.3, we give a detailed classification of *all* pullback squares in the ∞ -category $\mathcal{S}$ (Corollary 7.6.3.10). In particular, for every pair of morphisms of Kan complexes $f_0 : X_0 \rightarrow X$ and

$f_1 : X_1 \rightarrow X$, we construct a pullback diagram

$$\begin{array}{ccc} X_0 \times_X^h X_1 & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in the ∞ -category $\mathcal{S}$ (Example 7.6.3.12); beware that this diagram usually does not commute in the ordinary category of simplicial sets. Our analysis can be applied more generally to any ∞ -category which arises as the homotopy coherent nerve of a locally Kan simplicial category (Corollary 7.6.3.14); in particular, it can be applied to the ∞ -category $\mathcal{C} = \mathcal{QC}$ of small ∞ -categories (see Proposition 7.6.3.8 and Corollary 7.6.3.9).

Let $(\bullet \rightrightarrows \bullet)$ denote the simplicial set given by the coproduct $\Delta^1 \coprod_{\partial \Delta^1} \Delta^1$ (Notation 7.6.4.1). In §7.6.4, we study limits and colimits of diagrams indexed by $(\bullet \rightrightarrows \bullet)$. For any ∞ -category $\mathcal{C}$, functors $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{C}$ can be identified with pairs $f_0, f_1 : Y \rightarrow X$ of morphisms in $\mathcal{C}$ having the same source and target. In this case, we denote a limit of σ (if it exists) by $\mathrm{Eq}(f_0, f_1)$, and a colimit of σ (if it exists) by $\mathrm{Coeq}(f_0, f_1)$ (Notation 7.6.4.5). We refer to $\mathrm{Eq}(f_0, f_1)$ as an *equalizer* of the pair (f_0, f_1) , and to $\mathrm{Coeq}(f_0, f_1)$ as a *coequalizer* of (f_0, f_1) (Definition 7.6.4.4). Beware that, as with pullbacks and pushouts, the notions of equalizer and coequalizer cannot be formulated purely in terms of the homotopy category $\mathrm{h}\mathcal{C}$; in particular, the forgetful functor from $\mathcal{C}$ to (the nerve of) its homotopy category need not preserve equalizers and coequalizers.

Let $\mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, endowed with its usual linear ordering. In §7.6.5, we study colimits of diagram $X : \mathbf{N}_{\bullet}(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$, which we represent informally as

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

In the special case where $\mathcal{C} = \mathcal{S}$ is the ∞ -category of spaces, we show that the colimit $\varinjlim X(n)$ (formed in the ordinary category of simplicial sets, using the transition morphisms f_i) is also a colimit in the ∞ -category $\mathcal{S}$ (Variant 7.6.5.9). Similarly, if $Y : \mathbf{N}_{\bullet}(\mathbf{Z}_{\geq 0}^{\mathrm{op}}) \rightarrow \mathcal{S}$ is a diagram which we depict informally as

$$\cdots \rightarrow Y(4) \xrightarrow{g_3} Y(3) \xrightarrow{g_2} Y(2) \xrightarrow{g_1} Y(1) \xrightarrow{g_0} Y(0),$$

then the usual inverse limit $\varprojlim Y(n)$ (formed in the category of simplicial sets, using the transition morphisms g_n) is also a limit in the ∞ -category $\mathcal{S}$, provided that each of the maps g_n is a Kan fibration (Variant 7.6.5.11). These assertions have counterparts for sequential limits and colimits in the ∞ -category $\mathcal{QC}$: see Examples 7.6.5.8 and 7.6.5.10.

Though the classes of diagrams we study in this section are of a very restricted type, they are nonetheless useful for analyzing limits and colimits in general. If K is a complicated

simplicial set which can be decomposed into simpler constituents, then we can often use Proposition 7.5.8.12 to reduce questions about K -indexed (co)limits to questions about (co)limits indexed by those constituents. We will consider several variants on this theme:

- If a simplicial set K decomposes as a disjoint union $\coprod_{j \in J} K_j$, then we can often rewrite K -indexed limits as products; see Proposition 7.6.1.20.
- If a simplicial set K fits into a categorical pushout diagram

$$\begin{array}{ccc} K_{01} & \longrightarrow & K_0 \\ \downarrow & & \downarrow \\ K_1 & \longrightarrow & K, \end{array}$$

then we can often rewrite K -indexed limits as pullbacks; see Proposition 7.6.2.29.

- If $\mathcal{C}$ is an ∞ -category which admits finite products, then an equalizer of a pair of morphisms $f_0, f_1 : Y \rightarrow X$ (if it exists) is characterized by the existence of a pullback diagram

$$\begin{array}{ccc} \mathrm{Eq}(f_0, f_1) & \longrightarrow & Y \\ \downarrow & & \downarrow (f_0, f_1) \\ X & \xrightarrow{\delta_X} & X \times X; \end{array}$$

see Proposition 7.6.4.22.

- If $\mathcal{C}$ is an ∞ -category which admits finite products, then a pullback of a diagram $X_0 \xrightarrow{f_0} X \xleftarrow{f_1} X_1$ can be rewritten as the equalizer of a diagram $X_0 \times X_1 \rightrightarrows X$ (Proposition 7.6.4.23).
- If $\mathcal{C}$ is an ∞ -category which admits countable products, then the limit of a tower

$$\cdots \rightarrow X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0)$$

can be rewritten as an equalizer $\mathrm{Eq}(f, \mathrm{id}_X)$, where X is the product $\prod_{n \geq 0} X(n)$ and $f : X \rightarrow X$ is the endomorphism of X determined by the sequence $\{f_n\}_{n \geq 0}$; see Proposition 7.6.5.16.

- If K is a simplicial set which can be written as the colimit of a sequence

$$K(0) \rightarrow K(1) \rightarrow K(2) \rightarrow K(3) \rightarrow \cdots,$$

then we can often rewrite K -indexed limits as sequential limits (Corollary 7.6.5.14).

By applying these observations iteratively, one can build arbitrarily complicated limits (and colimits) out of the constructions studied in this section. For example, we show that an ∞ -category $\mathcal{C}$ admits finite limits if and only if it admits pullbacks and has a final object (Corollary 7.6.2.30).

7.6.1 Products and Coproducts

03E9 We now study limits and colimits of diagrams which are indexed by *discrete* simplicial sets. In this case, the definitions of limit and colimit can be formulated entirely at the level of the (enriched) homotopy category.

03EA **Definition 7.6.1.1.** Let $\mathbf{hKan}$ denote the homotopy category of Kan complexes and let $\mathcal{C}$ be an $\mathbf{hKan}$ -enriched category. We say that a collection of morphisms $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ of $\mathcal{C}$ *exhibits Y as an $\mathbf{hKan}$ -enriched product of the collection $\{Y_i\}_{i \in I}$* if, for every object $X \in \mathcal{C}$, the collection of maps $\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y) \xrightarrow{q_i \circ} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y_i)$ induces an isomorphism

$$\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y_i)$$

in the homotopy category $\mathbf{hKan}$.

We say that a collection of morphisms $\{e_i : Y_i \rightarrow Y\}_{i \in I}$ *exhibits Y as an $\mathbf{hKan}$ -enriched coproduct of the collection $\{Y_i\}_{i \in I}$* if, for every object $Z \in \mathcal{C}$, the collection of maps $\underline{\mathrm{Hom}}_{\mathcal{C}}(Y, Z) \xrightarrow{e_i \circ} \underline{\mathrm{Hom}}_{\mathcal{C}}(Y_i, Z)$ induces an isomorphism

$$\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y_i)$$

03EB **Warning 7.6.1.2.** Let $\mathcal{C}$ be an $\mathbf{hKan}$ -enriched category, and let $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection of morphisms in $\mathcal{C}$. If $\{q_i\}_{i \in I}$ exhibits Y as an $\mathbf{hKan}$ -enriched product of $\{Y_i\}_{i \in I}$, then it also exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the underlying category $\mathcal{C}$ (where we neglect its $\mathbf{hKan}$ -enrichment). Beware that the converse is false in general (see Warning 7.6.1.12).

03EC **Definition 7.6.1.3.** Let $\mathcal{C}$ be an ∞ -category. We say that a collection of morphisms $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ in $\mathcal{C}$ *exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$* if the collection of homotopy classes $\{[q_i] : Y \rightarrow Y_i\}_{i \in I}$ exhibits Y as an $\mathbf{hKan}$ -enriched product $\{Y_i\}_{i \in I}$ in the homotopy category $\mathbf{hC}$ (equipped with the $\mathbf{hKan}$ -enrichment described in Construction 4.6.9.13). In other words, the collection of morphisms $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection of objects $\{Y_i\}_{i \in I}$ if, for every object $X \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(X, Y_i)$$

is a homotopy equivalence of Kan complexes. Similarly, we say that a collection of morphisms $\{e_i : Y_i \rightarrow Y\}_{i \in I}$ of $\mathcal{C}$ *exhibits Y as a coproduct of the collection $\{Y_i\}_{i \in I}$* if, for every object

$Z \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, Z) \rightarrow \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(Y_i, Z)$$

is a homotopy equivalence of Kan complexes.

Remark 7.6.1.4. Let $\{f_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection of morphisms in an ∞ -category $\mathcal{C}$. 03ED Then the collection $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the category $\mathcal{C}$ if and only if it exhibits Y as a coproduct of the collection $\{Y_i\}_{i \in I}$ in the opposite ∞ -category $\mathcal{C}^{\mathrm{op}}$.

Remark 7.6.1.5. Let $\mathcal{C}$ be an ∞ -category and let $\{Y_i\}_{i \in I}$ be a collection of objects of $\mathcal{C}$, 03EE which we will identify with a diagram

$$F : I \rightarrow \mathcal{C} \quad F(i) = Y_i$$

indexed by the constant simplicial set associated to I (Remark 1.1.5.3). Suppose we are given another object $Y \in \mathcal{C}$ together with a collection of morphisms $\{q_i : Y \rightarrow Y_i\}_{i \in I}$. The following conditions are equivalent:

- (1) The collection of morphisms $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$, in the sense of Definition 7.6.1.3.
- (2) Let $\underline{Y} : I \rightarrow \mathcal{C}$ denote the constant diagram taking the value Y , so that the collection $\{q_i\}_{i \in I}$ can be identified with a natural transformation $q : \underline{Y} \rightarrow F$. Then q exhibits Y as a limit of the diagram F , in the sense of Definition 7.1.1.1.
- (3) Let $\overline{F} : I^{\triangleleft} \rightarrow \mathcal{C}$ be the diagram carrying each edge $\{i\}^{\triangleleft} \subseteq I^{\triangleleft}$ to the morphism q_i . Then $\overline{F}$ is a limit diagram in $\mathcal{C}$, in the sense of Definition 7.1.3.4.

The equivalence (1) $\Leftrightarrow$ (2) is immediate from the definitions (see Remark 4.6.1.9) and the equivalence (2) $\Leftrightarrow$ (3) follows from Remark 7.1.3.6.

Remark 7.6.1.6. Let $\mathcal{C}$ be an ordinary category, and let $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection 03EF of morphisms in $\mathcal{C}$. Then $\{q_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the category $\mathcal{C}$ (in the sense of classical category theory) if and only if it exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $\mathbf{N}_{\bullet}(\mathcal{C})$ (in the sense of Definition 7.6.1.3).

Notation 7.6.1.7. Let $\mathcal{C}$ be an ∞ -category and let $\{Y_i\}_{i \in I}$ be a collection of objects of 03EG $\mathcal{C}$. We will say that an object $Y \in \mathcal{C}$ is a *product* of the collection $\{Y_i\}_{i \in I}$ if there exists a collection of morphisms $\{q_i : Y \rightarrow Y_i\}$ which exhibits Y as a product of $\{Y_i\}_{i \in I}$. If this condition is satisfied, then the object Y is uniquely determined up to isomorphism (see Proposition 7.1.1.12). To emphasize this uniqueness, we will sometimes denote the object Y

by $\prod_{i \in I} Y_i$, and refer to it as *the* product of the collection $\{Y_i\}_{i \in I}$. Similarly, we say that Y is a *coproduct* of the collection $\{Y_i\}_{i \in I}$ if there exists a collection of morphisms $\{e_i : Y_i \rightarrow Y\}_{i \in I}$ which exhibits Y as a coproduct of $\{Y_i\}_{i \in I}$. In this case, we sometimes denote the object Y by $\coprod_{i \in I} Y_i$ and refer to it as *the* coproduct of the collection $\{Y_i\}_{i \in I}$.

03EH Example 7.6.1.8 (Initial and Final Objects). Let $\mathcal{C}$ be an ∞ -category. An object $Y \in \mathcal{C}$ is initial (in the sense of Definition 4.6.7.1) if and only if it is the coproduct of the empty collection of objects of $\mathcal{C}$ (see Example 7.1.1.6). Similarly, Y is final if and only if it is a product of the empty collection of objects.

03EJ Example 7.6.1.9 (Isomorphisms). Let $f : X \rightarrow Y$ be a morphism in an ∞ -category $\mathcal{C}$. The following conditions are equivalent:

- (1) The morphism f is an isomorphism.
- (2) The morphism f exhibits X as a product of the one-element collection of objects $\{Y\}$.
- (3) The morphism f exhibits Y as a coproduct of the one-element collection of objects $\{X\}$.

03F4 Example 7.6.1.10. Let $\mathcal{C}$ be an ∞ -category containing objects X and Y , and suppose we are given a collection of morphisms $\{f_j : X \rightarrow Y\}_{j \in J}$ indexed by a set J . If we abuse notation by identifying J with the corresponding discrete simplicial set, then the collection $\{f_j\}_{j \in J}$ can be identified with a map $e : J \rightarrow \mathrm{Hom}_{\mathcal{C}}(X, Y)$. In this case:

- The morphism e exhibits X as a power of Y by J (in the sense of Definition 7.1.2.1) if and only if the collection $\{f_j\}_{j \in J}$ exhibits X as a product of the collection $\{Y\}_{j \in J}$ (in the sense of Definition 7.6.1.3). Stated more informally, we have a canonical isomorphism $Y^J \simeq \prod_{j \in J} Y$ (provided that either side is defined).
- The morphism e exhibits Y as a copower of X by J (in the sense of Definition 7.1.2.1) if and only if the collection $\{f_j\}_{j \in J}$ exhibits Y as a coproduct of the collection $\{X\}_{j \in J}$ (in the sense of Definition 7.6.1.3). Stated more informally, we have a canonical isomorphism $J \otimes X \simeq \coprod_{j \in J} X$ (provided that either side is defined).

03EK Notation 7.6.1.11. In practice, we will use Definition 7.6.1.3 most often in the case where the set I has exactly two elements, so that the collection $\{Y_i\}_{i \in I}$ can be identified with an ordered pair (Y_0, Y_1) of objects of $\mathcal{C}$. In this case, we say that morphisms $q_0 : Y \rightarrow Y_0$ and $q_1 : Y \rightarrow Y_1$ *exhibit* Y as a *product* of Y_0 with Y_1 if they satisfy the requirement of Definition 7.6.1.3: that is, for every object $X \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathrm{Hom}_{\mathcal{C}}(X, Y_0) \times \mathrm{Hom}_{\mathcal{C}}(X, Y_1)$$

is a homotopy equivalence. If this condition is satisfied, then we will often denote the object Y by $Y_0 \times Y_1$ and refer to it as *the* product of Y_0 with Y_1 . Similarly, we say that a pair of

morphisms $e_0 : Y_0 \rightarrow Y$ and $e_1 : Y_1 \rightarrow Y$ exhibit Y as a coproduct of Y_0 with Y_1 if, for every object $Z \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\mathcal{C}}(Y, Z) \rightarrow \mathrm{Hom}_{\mathcal{C}}(Y_0, Z) \times \mathrm{Hom}_{\mathcal{C}}(Y_1, Z)$$

is a homotopy equivalence; in this case, we denote Y by $Y_0 \amalg Y_1$ and refer to it as *the* coproduct of Y_0 with Y_1 .

Warning 7.6.1.12. Let $\mathcal{C}$ be an ∞ -category. if $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ is a collection of morphisms of $\mathcal{C}$ which exhibits Y as a product of the collection of objects $\{Y_i\}_{i \in I}$ in the ∞ -category $\mathcal{C}$, then the collection of homotopy classes $\{[q_i] : Y \rightarrow Y_i\}_{i \in I}$ exhibits Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ordinary category $\mathrm{h}\mathcal{C}$. The converse holds if the collection $\{Y_i\}_{i \in I}$ admits a products in the ∞ -category $\mathcal{C}$. However, the converse need not hold in general, even in the special case where the set I is empty: see Warning 4.6.7.19. 03EL

Notation 7.6.1.13 (Diagonal Morphisms). Let $\mathcal{C}$ be an ∞ -category, let X be an object of $\mathcal{C}$, and suppose that there exists a diagram 04K4

$$X \xleftarrow{\pi} X \times X \xrightarrow{\pi'} X$$

which exhibits $X \times X$ as a product of X with itself. Then there exists a morphism $\delta : X \rightarrow X \times X$ with the property that the compositions $\pi \circ \delta$ and $\pi' \circ \delta$ are homotopic to id_X . Moreover, the morphism δ is uniquely determined up to homotopy. For this reason, we will often denote δ by δ_X and refer to it as the *diagonal morphism* of the object X .

Proposition 7.6.1.14. Let $\mathcal{C}$ be an ∞ -category containing an object X . The following conditions are equivalent: 04Q7

- (1) For every object $Y \in \mathcal{C}$, there exists a product of $X \times Y$ in the ∞ -category $\mathcal{C}$.
- (2) The forgetful functor $U : \mathcal{C}_{/Y} \rightarrow \mathcal{C}$ admits a right adjoint.

If these conditions are satisfied, then the right adjoint of U is given on objects by the construction $Y \mapsto X \times Y$.

Proof. If Y is an object of $\mathcal{C}$, then a product $X \times Y$ (if it exists) can be identified with a final object of the ∞ -category $\mathcal{C}_{/X} \times_{\mathcal{C}} \mathcal{C}_{/Y}$. The equivalence of (1) and (2) is therefore a special case of the criterion of Corollary 6.2.6.2. □

Example 7.6.1.15 (Homotopy Products). Let $\mathcal{C}$ be a locally Kan simplicial category, and let $\{q_i : Y \rightarrow Y_i\}_{i \in I}$ be a collection of morphisms in $\mathcal{C}$. By virtue of Theorem 4.6.8.5 (and Proposition 4.6.9.19), the following conditions are equivalent: 03EM

- (1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $N_{\bullet}^{\text{hc}}(\mathcal{C})$.
- (2) For every object $X \in \mathcal{C}$, composition with the morphisms q_i determines a homotopy equivalence of Kan complexes

$$\text{Hom}_{\mathcal{C}}(X, Y)_{\bullet} \rightarrow \prod_{i \in I} \text{Hom}_{\mathcal{C}}(X, Y_i)_{\bullet}.$$

03EN Example 7.6.1.16 (Products in $\mathcal{S}$). Let $\{Y_i\}_{i \in I}$ be a collection of Kan complexes and let $Y = \prod_{i \in I} Y_i$ denote their product, formed in the ordinary category of simplicial sets. For each $i \in I$, let $q_i : Y \rightarrow Y_i$ denote the projection map. Applying Example 7.6.1.15 to the simplicial category Kan , we deduce that the morphisms q_i also exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category of spaces $\mathcal{S} = N_{\bullet}^{\text{hc}}(\text{Kan})$. Similarly, if $Y' = \coprod_{i \in I} Y_i$ is the coproduct of the collection $\{Y_i\}_{i \in I}$ in the ordinary category of simplicial sets, then the inclusion maps $Y_i \hookrightarrow Y'$ exhibit Y' as a coproduct of $\{Y_i\}_{i \in I}$ in the ∞ -category $\mathcal{S}$.

03EP Example 7.6.1.17 (Products in $\mathcal{QC}$). Let $\{\mathcal{C}_i\}_{i \in I}$ be a collection of ∞ -categories and let $\mathcal{C} = \prod_{i \in I} \mathcal{C}_i$ denote their product, formed in the ordinary category of simplicial sets. For each $i \in I$, let $q_i : \mathcal{C} \rightarrow \mathcal{C}_i$ denote the projection map. Applying Example 7.6.1.15 to the simplicial category QCat (see Construction 5.5.4.1), we deduce that the morphisms q_i also exhibit $\mathcal{C}$ as a product of the collection $\{\mathcal{C}_i\}_{i \in I}$ in the ∞ -category $\mathcal{QC} = N_{\bullet}^{\text{hc}}(\text{QCat})$ (this is a special case of the diffraction criterion of Theorem 7.4.4.6). Similarly, if $\mathcal{C}' = \coprod_{i \in I} \mathcal{C}_i$ is the coproduct of the collection $\{\mathcal{C}_i\}_{i \in I}$ in the ordinary category of simplicial sets, then the inclusion maps $\mathcal{C}_i \hookrightarrow \mathcal{C}'$ exhibit $\mathcal{C}'$ as a coproduct of $\{\mathcal{C}_i\}_{i \in I}$ in the ∞ -category QCat (this is a special case of the refraction criterion of Theorem 7.4.5.13).

03EQ Example 7.6.1.18 (Products in a Duskin Nerve). Let $\mathcal{C}$ be a $(2, 1)$ -category and let $\{q_i : Y \rightarrow Y_i\}$ be a collection of 1-morphisms in $\mathcal{C}$. Then the following conditions are equivalent:

- (1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $N_{\bullet}^{\text{D}}(\mathcal{C})$.
- (2) For every object $X \in \mathcal{C}$, horizontal composition with the 1-morphisms q_i induces an equivalence of categories

$$\underline{\text{Hom}}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \underline{\text{Hom}}_{\mathcal{C}}(X, Y_i).$$

This follows from the explicit description of pinched morphism spaces in $N_{\bullet}^{\text{D}}(\mathcal{C})$ supplied by Example 4.6.5.13.

Example 7.6.1.19 (Products in a Differential Graded Nerve). Let $\mathcal{C}$ be a differential graded 03ER category and let $\{q_i : Y \rightarrow Y_i\}$ be a collection of morphisms in the underlying category of $\mathcal{C}$ (that is, each q_i is a 0-cycle of the chain complex $\text{Hom}_{\mathcal{C}}(Y, Y_i)_*$). Using Example 4.6.5.15 (together with Exercise 3.2.2.22), we see that the following conditions are equivalent:

- (1) The morphisms q_i exhibit Y as a product of the collection $\{Y_i\}_{i \in I}$ in the ∞ -category $\mathbf{N}_{\bullet}^{\text{dg}}(\mathcal{C})$.
- (2) For every object $X \in \mathcal{C}$, the map of chain complexes

$$\text{Hom}_{\mathcal{C}}(X, Y)_* \rightarrow \prod_{i \in I} \text{Hom}_{\mathcal{C}}(X, Y_i)_*$$

induces an isomorphism on homology in degrees ≥ 0 .

Proposition 7.6.1.20 (Rewriting Limits as Products). *Let $\mathcal{C}$ be an ∞ -category, and let 03ES $\{f_i : K_i \rightarrow \mathcal{C}\}_{i \in I}$ be a collection of diagrams, each of which admits a limit $X_i = \varprojlim (f_i)$. Set $K = \coprod_{i \in I} K_i$, so that the collection $\{f_i\}_{i \in I}$ determines a diagram $f : K \rightarrow \mathcal{C}$. Then an object of $\mathcal{C}$ is a limit of the diagram f if it is a product of the collection of objects $\{X_i\}_{i \in I}$.*

Proof. This is a special case of (the dual of) Proposition 7.5.8.12. $\square$

Remark 7.6.1.21. In the situation of Proposition 7.6.1.20, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor 03ET which preserves the limits of each of the diagrams f_i . Suppose that the collection $\{X_i\}_{i \in I}$ admits a product in $\mathcal{C}$. Then the product of $\{X_i\}_{i \in I}$ is preserved by the functor F if and only if the limit of f is preserved by the functor F .

Corollary 7.6.1.22. *Let $\{K_i\}_{i \in I}$ be a collection of simplicial sets having coproduct $K = 03EU \coprod_{i \in I} K_i$, and let $\mathcal{C}$ be an ∞ -category. Suppose that $\mathcal{C}$ admits I -indexed products and K_i -indexed limits for each $i \in I$. Then $\mathcal{C}$ admits K -indexed limits. Moreover, if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor which preserves I -indexed products and K_i -indexed colimits for each $i \in I$, then F also preserves K -indexed limits.*

Corollary 7.6.1.23. *Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ admits finite products if and only if 03EV it satisfies the following pair of conditions:*

- (1) *The ∞ -category $\mathcal{C}$ has a final object $\mathbf{1}$.*
- (2) *The ∞ -category $\mathcal{C}$ admits pairwise products. That is, every pair of objects $X, Y \in \mathcal{C}$ have a product $X \times Y$ in $\mathcal{C}$.*

Proof. The necessity of conditions (1) and (2) is clear (see Example 7.6.1.8). Conversely, suppose that (1) and (2) are satisfied, and let I be a finite set. We wish to show that $\mathcal{C}$ admits I -indexed limits. We proceed by induction on the cardinality of I . If I is empty, then the desired result follows from assumption (1). If I is a singleton, then the desired result

is obvious (see Example 7.6.1.9). Otherwise, we can write I as a disjoint union of proper subsets $I_-, I_+ \subset I$. Our inductive hypothesis then guarantees that $\mathcal{C}$ admits I_- -indexed limits and I_+ -indexed limits. Combining assumption (2) with Corollary 7.6.1.22, we deduce that $\mathcal{C}$ admits limits indexed by $I = I_- \amalg I_+$. $\square$

03EW Remark 7.6.1.24. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{C}$ admits finite products. Then F preserves finite products if and only if it preserves final objects and pairwise products.

7.6.2 Pullback and Pushout Squares

03FE Let $\mathcal{C}$ be an ∞ -category. Recall that a *commutative square* in $\mathcal{C}$ is a morphism of simplicial sets $\Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ which we represent informally by a diagram

$$\begin{array}{ccc} X' & \longrightarrow & Y' \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y \end{array}$$

(see Example 1.5.2.15). Note that the simplicial set $\Delta^1 \times \Delta^1 \simeq N_\bullet([1] \times [1])$ can be regarded both as a left cone (on the nerve of the partially ordered set $[1] \times [1] \setminus \{(0, 0)\}$) and as a right cone (on the nerve of the partially ordered set $[1] \times [1] \setminus \{(1, 1)\}$).

03FF Definition 7.6.2.1. Let $\mathcal{C}$ be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square. We say that σ is a *pullback square* if it is a limit diagram in $\mathcal{C}$ (see Definition 7.1.3.4), and that σ is a *pushout square* if it is a colimit diagram in $\mathcal{C}$.

03FG Example 7.6.2.2. Let $\mathcal{C}$ be an ordinary category. Then diagram $\sigma : [1] \times [1] \rightarrow \mathcal{C}$ is a pullback square in $\mathcal{C}$ (in the sense of classical category theory) if and only if the induced map

$$N_\bullet(\sigma) : \Delta^1 \times \Delta^1 \rightarrow N_\bullet(\mathcal{C})$$

is a pullback square in the ∞ -category $N_\bullet(\mathcal{C})$ (in the sense of Definition 7.6.2.1); this follows from Example 7.1.1.4 and Remark 7.1.3.6. Similarly, σ is a pushout square in $\mathcal{C}$ if and only if $N_\bullet(\sigma)$ is a pushout square in the ∞ -category $N_\bullet(\mathcal{C})$.

03FH Warning 7.6.2.3. Let $\mathcal{C}$ be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a morphism, which we depict as a diagram

$$\begin{array}{ccc} X_{01} & \xrightarrow{g_0} & X_0 \\ \downarrow g_1 & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X. \end{array}$$

Beware that, if σ is a pullback square in the ∞ -category $\mathcal{C}$, then the associated diagram

$$\begin{array}{ccc} X_{01} & \xrightarrow{[g_0]} & X_0 \\ \downarrow [g_1] & & \downarrow [f_0] \\ X_1 & \xrightarrow{[f_1]} & X \end{array}$$

need not be a pullback square in the homotopy category $\mathrm{h}\mathcal{C}$ (see Example 7.6.2.4 and Exercise 7.6.2.5). If Y is an object of $\mathcal{C}$, then the map of sets

$$\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X_{01}) \xrightarrow{([g_0], [g_1])^\circ} \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X_0) \times_{\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X)} \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(Y, X_1)$$

is surjective, but need not be injective. Given a commutative diagram

$$\begin{array}{ccc} Y & \xrightarrow{[g_0]} & X_0 \\ \downarrow [g_1] & & \downarrow [f_0] \\ X_1 & \xrightarrow{[f_1]} & X \end{array} \tag{7.61}$$
03FJ

in the homotopy category $\mathrm{h}\mathcal{C}$, we can always find a morphism $g_{01} : Y \rightarrow X_{01}$ satisfying $g_{01} : Y \rightarrow X_{01}$ satisfying $[g_0] = [f'_0] \circ [g_{01}]$ and $[g_1] = [f'_1] \circ [g_{01}]$. However, the homotopy class $[g_{01}]$ is not uniquely determined: roughly speaking, to construct g_{01} , we need to lift (7.61) to a commutative diagram in the ∞ -category $\mathcal{C}$. Such a lift always exists (Exercise 1.5.2.10), but is not unique (even up to homotopy).

Example 7.6.2.4. Let $q : X \rightarrow S$ be a Kan fibration between Kan complexes, let $s \in S$ be a vertex, and let X_s denote the fiber $\{s\} \times_S X$. Then the commutative diagram of simplicial sets

03FK

$$\begin{array}{ccc} X_s & \longrightarrow & X \\ \downarrow & & \downarrow q \\ \{s\} & \longrightarrow & S \end{array} \tag{7.62}$$
03FL

is a homotopy pullback square (Example 3.4.1.3), and therefore induces a pullback square in the ∞ -category $\mathcal{S} = \mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan})$ (see Example 7.6.3.2). However, if X is contractible and X_s is not, then (7.62) is not a pullback square in the homotopy category hKan .

03FM **Exercise 7.6.2.5.** Let G be a group and let $H \subseteq G$ be a commutative normal subgroup, so that we have a commutative diagram of Kan complexes

$$\begin{array}{ccc}
 B_{\bullet}H & \longrightarrow & B_{\bullet}G \\
 \downarrow & & \downarrow \\
 \Delta^0 & \longrightarrow & B_{\bullet}(G/H)
 \end{array} \tag{7.63}$$

- Show that (7.63) is a pullback diagram in the ordinary category of Kan complexes, and that it determines a pullback diagram in the ∞ -category $\mathcal{S} = \mathbf{N}_{\bullet}^{\text{hc}}(\text{Kan})$ (see Example 7.6.3.2).
- Show that, if H is contained in the center of G , then the diagram (7.63) is also pullback square in the homotopy category hKan .
- Show that, if H is not contained in the center of G , then the diagram $B_{\bullet}G \rightarrow B_{\bullet}(G/H) \leftarrow \Delta^0$ does not have a limit in the homotopy category hKan . In particular, the diagram (7.63) is not a pullback square in hKan .

048C **Variant 7.6.2.6.** Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. We say that a diagram $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ is a *U-pullback square* if it is a U -limit diagram in $\mathcal{C}$ (Definition 7.1.6.1). We say that σ is a *U-pushout square* if it is a U -colimit diagram in the ∞ -category $\mathcal{C}$.

048D **Remark 7.6.2.7.** Let $\mathcal{C}$ be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square in $\mathcal{C}$. Then σ is a pullback square if and only if it is U -pullback square, where $U : \mathcal{C} \rightarrow \Delta^0$ is the projection map (see Example 7.1.6.3).

03FP **Remark 7.6.2.8** (Symmetry). Let $\mathcal{C}$ be an ∞ -category, let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square in $\mathcal{C}$, and let $\sigma' : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ denote the commutative square which is obtained from σ by precomposing with the automorphism of $\Delta^1 \times \Delta^1$ given by permuting the factors. Then σ is a pullback square if and only if σ' is a pullback square, and σ is a pushout square if and only if σ' is a pushout square.

More generally, if $U : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories, then σ is a U -pullback square if and only if σ' is a U -pullback square, and σ is a U -pushout square if and only if σ' is a U -pushout square.

03FQ **Remark 7.6.2.9.** Let $\mathcal{C}$ be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative diagram in $\mathcal{C}$. Then σ is a pushout diagram in $\mathcal{C}$ if and only if the opposite diagram $\sigma^{\text{op}} : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}^{\text{op}}$ is a pullback diagram in the ∞ -category $\mathcal{C}^{\text{op}}$; here we implicitly identify the simplicial set $\Delta^1 \times \Delta^1$ with its opposite (beware that there are two possible identifications we could choose, but the choice does not matter by virtue of Remark 7.6.2.8).

More generally, if $U : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories, then σ is a U -pushout diagram if and only if σ^{op} is a U^{op} -pullback diagram.

Remark 7.6.2.10. Let $\mathcal{C}$ be an ∞ -category and let $\sigma, \sigma' : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be square diagrams 03FR which are isomorphic (when viewed as objects of the ∞ -category $\text{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$). Then σ is a pullback square if and only if σ' is a pullback square, and a pushout square if and only if σ' is a pushout square.

More generally, if $U : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories, then σ is a U -pullback square if and only if σ' is a U -pullback square, and σ is a U -pushout square if and only if σ' is a U -pushout square (see Proposition 7.1.6.9).

Notation 7.6.2.11 (Fiber Products). Let $\mathcal{C}$ be an ∞ -category, and suppose we are given a 03FS pair of morphisms $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ of $\mathcal{C}$ having the same target. It follows from Proposition 7.1.1.12 that if there exists a pullback diagram

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in $\mathcal{C}$, then the object X_{01} is determined up to isomorphism by f_0 and f_1 . To emphasize this, we will often denote the object X_{01} by $X_0 \times_X X_1$ and refer to it as the *fiber product of X_0 with X_1 over X* . Similarly, if there exists a pushout diagram

$$\begin{array}{ccc} Y & \xrightarrow{g_0} & Y_0 \\ \downarrow g_1 & & \downarrow \\ Y_1 & \longrightarrow & Y_{01} \end{array}$$

in $\mathcal{C}$, then the object Y_{01} is determined up to isomorphism by g_0 and g_1 . To emphasize this, we often denote the object Y_{01} by $Y_0 \amalg_Y Y_1$ and refer to it as the *pushout of Y_0 with Y_1 along Y* .

Definition 7.6.2.12. Let $\mathcal{C}$ be an ∞ -category. We will say that $\mathcal{C}$ *admits pullbacks* if, for 03FT every pair of morphisms $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ having the same target, there exists

a pullback diagram

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X. \end{array}$$

We say that a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ *preserves pullbacks* if, for every pullback square $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ in the ∞ -category $\mathcal{C}$, the composition $(F \circ \sigma) : \Delta^1 \times \Delta^1 \rightarrow \mathcal{D}$ is a pullback square in the ∞ -category $\mathcal{D}$.

We say that $\mathcal{C}$ *admits pushouts* if, for every pair of morphisms $g_0 : Y \rightarrow Y_0$ and $g_1 : Y \rightarrow Y_1$ having the same source, there exists a pushout diagram

$$\begin{array}{ccc} Y & \xrightarrow{g_0} & Y_0 \\ \downarrow g_1 & & \downarrow \\ Y_1 & \longrightarrow & Y_{01}. \end{array}$$

We say that a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ *preserves pushouts* if, for every pushout square $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ in the ∞ -category $\mathcal{C}$, the composition $(F \circ \sigma) : \Delta^1 \times \Delta^1 \rightarrow \mathcal{D}$ is a pushout square in the ∞ -category $\mathcal{D}$.

04Q8 Remark 7.6.2.13. Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a right fibration of ∞ -categories, and suppose that $\mathcal{D}$ admits pullbacks. Then $\mathcal{C}$ also admits pullbacks, and the functor U preserves pullbacks. See Corollary 7.1.7.5.

03FU Proposition 7.6.2.14. Let $\mathcal{C}$ be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, which we represent by a diagram

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X. \end{array}$$

Then σ is a pullback diagram in $\mathcal{C}$ if and only if it exhibits X_{01} as a product of X_0 with X_1 in the slice ∞ -category $\mathcal{C}_{/X}$.

Proof. This is a special case of Remark 7.1.3.12. □

Notation 7.6.2.15 (Relative Diagonals). Let $\mathcal{C}$ be an ∞ -category and let $f : Y \rightarrow X$ be a morphism in $\mathcal{C}$. Suppose that there exists a pullback square

$$\begin{array}{ccc} Y \times_X Y & \xrightarrow{\pi} & Y \\ \downarrow \pi' & & \downarrow f \\ Y & \xrightarrow{f} & X \end{array} \quad (7.64) \quad 04K6$$

in the ∞ -category $\mathcal{C}$. Let us abuse notation by identifying Y with an object of the slice ∞ -category $\mathcal{C}_{/X}$, so that $Y \times_X Y$ can be viewed as a product of Y with itself in $\mathcal{C}_{/X}$ (Proposition 7.6.2.14). Applying the construction of Notation 7.6.1.13, we obtain a morphism $\delta_{Y/X} : Y \rightarrow Y \times_X Y$, which we will refer to as the *relative diagonal of f* . It is characterized (up to homotopy) by the requirement that (7.64) can be extended to a commutative diagram

$$\begin{array}{ccccc} Y & & & & \\ & \searrow \delta_{Y/X} & & \searrow \text{id}_Y & \\ & & Y \times_X Y & \xrightarrow{\pi} & Y \\ & \searrow \text{id}_Y & \downarrow \pi' & & \downarrow f \\ & & Y & \xrightarrow{f} & X, \end{array}$$

where the outer square is the commutative diagram given by the composition

$$\Delta^1 \times \Delta^1 \xrightarrow{(i,j) \mapsto ij} \Delta^1 \xrightarrow{f} \mathcal{C}.$$

Variant 7.6.2.16 (Relative Codiagonals). Let $\mathcal{C}$ be an ∞ -category, let $f : Y \rightarrow X$ be a morphism of $\mathcal{C}$, and suppose that there exists a pushout square

$$\begin{array}{ccc} Y & \xrightarrow{f} & X \\ \downarrow f & & \downarrow \\ X & \longrightarrow & X \amalg_Y X. \end{array}$$

Applying the construction of Notation 7.6.2.15 in the opposite ∞ -category $\mathcal{C}^{\text{op}}$, we obtain a morphism $\gamma_{Y/X} : X \amalg_Y X \rightarrow X$ which we will refer to as the *relative codiagonal* of the morphism f .

Stated more informally, a fiber product $X_0 \times_X X_1$ (formed in an ∞ -category $\mathcal{C}$) is a product of X_0 with X_1 in the ∞ -category $\mathcal{C}_{/X}$.

03FV Corollary 7.6.2.17. *Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ admits pullbacks if and only if, for each object $X \in \mathcal{C}$, the slice ∞ -category $\mathcal{C}_{/X}$ admits finite products.*

Proof. By virtue of Proposition 7.6.2.14, the ∞ -category $\mathcal{C}$ admits pullbacks if and only if, for every object $X \in \mathcal{C}$, the ∞ -category $\mathcal{C}_{/X}$ admits pairwise products. Since $\mathcal{C}_{/X}$ has an initial object (given by the identity morphism $\text{id}_X : X \rightarrow X$; see Proposition 4.6.7.23), this is equivalent to the requirement that $\mathcal{C}_{/X}$ admits finite products (Corollary 7.6.1.23). $\square$

03FW Remark 7.6.2.18. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between ∞ -categories, where $\mathcal{C}$ admits pullbacks. Then F preserves pullbacks if and only if, for each object $X \in \mathcal{C}$, the induced functor $\mathcal{C}_{/X} \rightarrow \mathcal{D}_{/F(X)}$ preserves finite products.

03FX Corollary 7.6.2.19. *Let $\mathcal{C}$ be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, which we represent by a diagram*

$$\begin{array}{ccc} X & \xrightarrow{f_0} & X_0 \\ \downarrow f_1 & & \downarrow \\ X_1 & \longrightarrow & \mathbf{1}. \end{array}$$

Suppose that $\mathbf{1}$ is a final object of $\mathcal{C}$. Then σ is a pullback square if and only if the morphisms f_0 and f_1 exhibit X as a product of X_0 with X_1 in the ∞ -category $\mathcal{C}$.

Proof. The assumption that $\mathbf{1}$ is final guarantees that the projection map $\mathcal{C}_{/\mathbf{1}} \rightarrow \mathcal{C}$ is a trivial Kan fibration (Proposition 4.6.7.11), so that the desired result follows from the criterion of Proposition 7.6.2.14. $\square$

It will sometimes be convenient to work with an alternative characterization of fiber products. Recall that, if $\mathcal{C}$ is an ∞ -category, then the evaluation functor

$$\text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C} \quad (f : X \rightarrow Y) \mapsto Y$$

is a cocartesian fibration (Example 5.3.7.5), whose fiber over each object $X \in \mathcal{C}$ is the oriented fiber product $\mathcal{C} \tilde{\times}_{\mathcal{C}} \{X\}$ (which is equivalent to the slice ∞ -category $\mathcal{C}_{/X}$).

05S7 Proposition 7.6.2.20. *Let $\mathcal{C}$ be an ∞ -category, let $\text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ be the functor given by evaluation at the vertex $1 \in \Delta^1$, and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a diagram, which we*

display informally as

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

be a diagram in $\mathcal{C}$. The following conditions are equivalent:

- (1) The diagram σ is a pullback square (Definition 7.6.2.1).
- (2) Let $u : f' \rightarrow f$ be the morphism in $\mathrm{Fun}(\Delta^1, \mathcal{C})$ determined by σ . Then u is ev_1 -cartesian.
- (3) The morphism $u : f' \rightarrow f$ is locally ev_1 -cartesian.

Remark 7.6.2.21. In the formulation of Proposition 7.6.2.20, the diagram σ can also 05S8 be viewed as a morphism $v : g' \rightarrow g$ in the ∞ -category $\mathrm{Fun}(\Delta^1, \mathcal{C})$ (by interchanging the factors of $\Delta^1 \times \Delta^1$). Combining Proposition 7.6.2.20 with Remark 7.6.2.8, we see that u is ev_1 -cartesian if and only if v is ev_1 -cartesian.

Proof of Proposition 7.6.2.20. Since the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is a co-cartesian fibration (Example 5.3.7.5), the equivalence (2) $\Leftrightarrow$ (3) is a special case of Lemma 6.2.5.5. We will prove that (1) $\Leftrightarrow$ (2). Let K denote the nerve of the partially ordered set $\{(0, 1) < (1, 1) > (1, 0)\}$, which we regard as a full subcategory of $\Delta^1 \times \Delta^1$, and let $U : \mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C}) \rightarrow \mathrm{Fun}(K, \mathcal{C})$ be the restriction map. Then σ is a pullback diagram in $\mathcal{C}$ if and only if it is U -final when viewed as an object of the ∞ -category $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$ (Proposition 7.1.6.13). Unwinding the definitions, we have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathrm{Fun}(\Delta^1, \mathcal{C}) \tilde{\times}_{\mathrm{Fun}(\Delta^1, \mathcal{C})} \{f\} & \longrightarrow & \mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C}) \\ \downarrow U_0 & & \downarrow U \\ \mathcal{C} \tilde{\times}_{\mathcal{C}} \{Y\} & & \mathrm{Fun}(K, \mathcal{C}), \end{array}$$

and the morphism u is ev_1 -cartesian if and only if it is U_0 -final when viewed as an object of the ∞ -category $\mathrm{Fun}(\Delta^1, \mathcal{C}) \tilde{\times}_{\mathrm{Fun}(\Delta^1, \mathcal{C})} \{f\}$ (Example 7.1.7.2). The equivalence (1) $\Leftrightarrow$ (2) now follows from the criterion of Corollary 7.1.5.21, since U is a cocartesian fibration (Corollary 5.3.7.4). $\square$

Definition 7.6.2.22. Let $\mathcal{C}$ be an ∞ -category and let $f : X \rightarrow Y$ be a morphism of $\mathcal{C}$. We 04Q9 will say that a functor $f^* : \mathcal{C}_{/Y} \rightarrow \mathcal{C}_{/X}$ is given by pullback along f if it is a right adjoint to

the functor $\mathcal{C}_{/X} \rightarrow \mathcal{C}_{/Y}$ given by postcomposition with f (see Example 4.3.6.15). Note that this condition characterizes the functor f^* up to isomorphism (see Remark 6.2.1.19).

05S9 Variant 7.6.2.23. Let $\mathcal{C}$ be an ∞ -category and let $f : X \rightarrow Y$ be a morphism of $\mathcal{C}$. By virtue of Example 5.3.7.5, the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is a cocartesian fibration of ∞ -categories, and therefore determines a covariant transport functor

$$f_! : \mathcal{C} \tilde{\times}_{\mathcal{C}} \{X\} \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{Y\}.$$

We say that a functor

$$f^* : \mathcal{C} \tilde{\times}_{\mathcal{C}} \{Y\} \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{X\}$$

is given by pullback along f if it is right adjoint to the functor $f_!$. By virtue of Proposition 5.3.7.6, this is equivalent to the existence of a homotopy commutative diagram

$$\begin{array}{ccc} \mathcal{C}_{/Y} & \dashrightarrow & \mathcal{C}_{/X} \\ \downarrow \sim \delta_{/Y} & & \downarrow \sim \delta_{/X} \\ \mathcal{C} \tilde{\times}_{\mathcal{C}} \{Y\} & \xrightarrow{f^*} & \mathcal{C} \tilde{\times}_{\mathcal{C}} \{X\}, \end{array}$$

where the vertical maps are the pinch inclusion equivalences of Corollary 4.6.4.20 and the upper horizontal map is given by pullback along f (in the sense of Definition 7.6.2.22).

04QB Proposition 7.6.2.24. Let $\mathcal{C}$ be an ∞ -category and let $f : X \rightarrow Y$ be a morphism of $\mathcal{C}$. The following conditions are equivalent:

- (1) There exists a functor $f^* : \mathcal{C}_{/Y} \rightarrow \mathcal{C}_{/X}$ given by pullback along f (in the sense of Definition 7.6.2.22).
- (2) There exists a functor $f^* : \mathcal{C} \tilde{\times}_{\mathcal{C}} \{Y\} \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{X\}$ given by pullback along f (in the sense of Variant 7.6.2.23).
- (3) The left vertical map of the pullback square

$$\begin{array}{ccc} \Delta^1 \times_{\mathcal{C}} \Delta^1 & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}) \\ \downarrow & & \downarrow \mathrm{ev}_1 \\ \Delta^1 & \xrightarrow{f} & \mathcal{C} \end{array}$$

is a cartesian fibration of ∞ -categories.

(4) For every morphism $u : Y' \rightarrow Y$, there exists a pullback diagram

$$\begin{array}{ccc} X' & \longrightarrow & Y' \\ \downarrow & & \downarrow u \\ X & \xrightarrow{f} & Y \end{array}$$

in the ∞ -category $\mathcal{C}$.

Moreover, if these conditions are satisfied, then both pullback functors are given on objects by the construction $Y' \mapsto X \times_Y Y'$.

Proof. The equivalence (1) $\Leftrightarrow$ (2) follows from Proposition 5.3.7.6, the equivalence (2) $\Leftrightarrow$ (3) from Proposition 6.2.5.4, and the equivalence (3) $\Leftrightarrow$ (4) from Propositions 7.6.2.20. $\square$

Corollary 7.6.2.25. *Let $\mathcal{C}$ be an ∞ -category. The following conditions are equivalent:* 05SA

(1) For every morphism $f : X \rightarrow Y$ of $\mathcal{C}$, the composition functor

$$\mathcal{C}_{/X} \rightarrow \mathcal{C}_{/Y} \quad e \mapsto (f \circ e)$$

of Example 4.3.6.15 admits a right adjoint.

(2) For every morphism $f : X \rightarrow Y$ of $\mathcal{C}$, the composition functor

$$\mathcal{C} \tilde{\times}_{\mathcal{C}} \{X\} \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{Y\} \quad e \mapsto (f \circ e)$$

admits a right adjoint.

(3) The evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is a locally cartesian fibration of ∞ -categories.

(3') The evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is a cartesian fibration of ∞ -categories.

(4) The ∞ -category $\mathcal{C}$ admits pullbacks.

Proof. The equivalences (1) $\Leftrightarrow$ (2) $\Leftrightarrow$ (3) $\Leftrightarrow$ (4) follow from Proposition 7.6.2.24 by allowing the morphism f to vary. The equivalence of (3) and (3') follows from Proposition 7.6.2.20. $\square$

Proposition 7.6.2.26. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of ∞ -categories and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, represented informally by the diagram* 048E

$$\begin{array}{ccc} X' & \xrightarrow{f'} & Y' \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y. \end{array}$$

Then:

- (1) If f is U -cartesian, then σ is a U -pullback square if and only if f' is also U -cartesian.
- (2) If f' is U -cocartesian, then σ is a U -pushout square if and only if f is also U -cocartesian.

Proof. We will prove (1); the proof of (2) is similar. Note that σ restricts to a diagram

$$\sigma_0 : N_{\bullet}(\{(0,1) < (1,1) > (1,0)\}) \rightarrow \mathcal{C}$$

satisfying $\sigma_0(0,1) = X$, $\sigma_0(1,1) = Y$, and $\sigma_0(1,0) = Y'$. The assumption that f is U -cartesian guarantees that σ_0 is U -right Kan extended from the full subcategory

$$\{1\} \times \Delta^1 \subseteq N_{\bullet}(\{(0,1) < (1,1) > (1,0)\}).$$

It follows that σ is a U -pullback diagram if and only if the restriction $\sigma|_{N_{\bullet}(\{(0,0) < (1,0) < (1,1)\})}$ is a U -limit diagram (Proposition 7.3.8.1) By virtue of Corollary 7.2.2.5, this is equivalent to the requirement that f' is U -cartesian. $\square$

048F **Corollary 7.6.2.27.** Let $\mathcal{C}$ be an ∞ -category and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a commutative square, represented informally by the diagram

$$\begin{array}{ccc} X' & \xrightarrow{f'} & Y' \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y. \end{array}$$

Then:

- (1) If f is an isomorphism, then σ is a pullback square if and only if f' is also an isomorphism.
- (2) If f' is an isomorphism, then σ is a pushout square if and only if f is also an isomorphism.

Proof. Combine Proposition 7.6.2.26 with Remark 7.6.2.7 (and Example 5.1.1.4). $\square$

03FZ **Proposition 7.6.2.28** (Transitivity). Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\sigma : \Delta^2 \times \Delta^1 \rightarrow \mathcal{C}$ be diagram, which we depict informally as

03G0

$$\begin{array}{ccccc} X' & \longrightarrow & Y' & \longrightarrow & Z' \\ \downarrow & & \downarrow & & \downarrow \\ X & \longrightarrow & Y & \longrightarrow & Z. \end{array}$$

(7.65)

Then:

- (1) Assume that the right square of (7.65) is a U -pullback. Then the left square is a U -pullback if and only if the outer rectangle is a U -pullback.
- (2) Assume that the left square of (7.65) is a U -pushout. Then the right square is a U -pushout if and only if the outer rectangle is a U -pushout.

Proof. We will prove (1); the proof of (2) is similar. Let A denote the partially ordered set $([2] \times [1]) \setminus \{(0, 0)\}$. Note that the inclusion maps

$$A \setminus \{(2, 0), (2, 1)\} \hookrightarrow A \quad A \setminus \{(1, 0), (1, 1)\} \hookrightarrow A \setminus \{(1, 0)\}$$

admit right adjoints, and therefore induce left cofinal morphisms

$$N_{\bullet}(A \setminus \{(2, 0), (2, 1)\}) \hookrightarrow N_{\bullet}(A) \quad N_{\bullet}(A \setminus \{(1, 0), (1, 1)\}) \hookrightarrow N_{\bullet}(A \setminus \{(1, 0)\})$$

(Corollary 7.2.3.7). Applying Corollary 7.2.2.2, we obtain the following:

- The left square of (7.65) is a U -pullback diagram if and only if σ is a U -limit diagram.
- The outer rectangle of (7.65) is a U -pullback diagram if and only if the restriction $\sigma|_{N_{\bullet}(([2] \times [1]) \setminus \{(1, 0)\})}$ is a U -limit diagram.

If the right square of (7.65) is a U -pullback diagram, then $\sigma|_{N_{\bullet}(A)}$ is U -right Kan extended from $\sigma|_{N_{\bullet}(A \setminus \{(1, 0)\})}$, so the desired equivalence follows from Proposition 7.3.8.1. $\square$

Proposition 7.6.2.29 (Rewriting Limits as Pullbacks). *Suppose we are given a categorical pushout square of simplicial sets* 03G1

$$\begin{array}{ccc} K & \longrightarrow & K_0 \\ \downarrow & & \downarrow \\ K_1 & \longrightarrow & K_{01}. \end{array}$$

Let $\mathcal{C}$ be an ∞ -category which admits pullbacks. If $\mathcal{C}$ admits K -indexed limits, K_0 -indexed limits, and K_1 -indexed limits, then it also admits K_{01} -indexed limits. Moreover, if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories which preserves pullback squares, K -indexed limits, K_0 -indexed limits, and K_1 -indexed limits, then F also preserves K -indexed limits.

Proof. Combine Corollary 7.5.8.5 with (the dual of) Corollary 7.5.8.13. $\square$

Corollary 7.6.2.30. *Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ admits finite limits if and only if it admits pullbacks and has a final object. If these conditions are satisfied, then a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves finite limits if and only if it preserves pullbacks and final objects.* 03G2

Proof. We will prove the first assertion; the second follows by a similar argument. Assume that the ∞ -category $\mathcal{C}$ admits pullbacks and has a final object; we wish to show that $\mathcal{C}$ admits K -indexed limits for every finite simplicial set K (the converse is immediate from the definitions). We proceed by induction on the dimension of K . If K is empty, then the desired result follows from our assumption that $\mathcal{C}$ has a final object. Let us therefore assume that K has dimension $n \geq 0$, and proceed also by induction on the number of nondegenerate n -simplices of K . It follows from Proposition 1.1.4.12 that there exists a pushout square of simplicial sets

$$\begin{array}{ccc} \partial\Delta^n & \longrightarrow & \Delta^n \\ \downarrow & & \downarrow \\ K' & \longrightarrow & K, \end{array}$$

where K' is a simplicial subset of K . Since the horizontal maps are monomorphisms, this pushout square is also a categorical pushout square (Example 4.5.4.12). By virtue of Proposition 7.6.2.29, it will suffice to show that the ∞ -category $\mathcal{C}$ admits K' -indexed limits, $\partial\Delta^n$ -indexed limits, and Δ^n -indexed limits. In the first two cases, this follows from our inductive hypothesis. To handle the third case, we observe that the inclusion $\{0\} \hookrightarrow \Delta^n$ is left cofinal (Example 4.3.7.11). Using Corollary 7.2.2.12, we are reduced to proving that $\mathcal{C}$ admits Δ^0 -indexed limits, which is immediate (see Example 7.1.1.5). $\square$

05E4 Example 7.6.2.31. Let $\mathcal{C}$ be an ∞ -category which admits pullbacks. Then, for every object $X \in \mathcal{C}$, the slice ∞ -category $\mathcal{C}_{/X}$ admits finite limits. This follows from Corollary 7.6.2.30, since $\mathcal{C}_{/X}$ also admits finite pullbacks (Remark 7.6.2.13), and has a final object given by the identity morphism $\mathrm{id}_X : X \rightarrow X$ (Proposition 4.6.7.23). Similarly, if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor which preserves pullbacks, then the induced functor $F_{/X} : \mathcal{C}_{/X} \rightarrow \mathcal{D}_{/F(X)}$ preserves finite limits.

7.6.3 Examples of Pullback and Pushout Squares

03G3 We now give some examples of ∞ -categorical pullback diagrams.

03G4 Proposition 7.6.3.1. Let $\mathcal{C}$ be a locally Kan simplicial category and let $\sigma :$

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array}$$

be a commutative diagram in $\mathcal{C}$. The following conditions are equivalent:

(1) The composite map

$$\Delta^1 \times \Delta^1 \xrightarrow{N_\bullet(\sigma)} N_\bullet(\mathcal{C}) \hookrightarrow N_\bullet^{\text{hc}}(\mathcal{C})$$

is a pullback square in the ∞ -category $N_\bullet^{\text{hc}}(\mathcal{C})$ (in the sense of Definition 7.6.2.1).

(2) For every object $Y \in \mathcal{C}$, the diagram of Kan complexes

$$\begin{array}{ccc} \text{Hom}_{\mathcal{C}}(Y, X_{01})_\bullet & \longrightarrow & \text{Hom}_{\mathcal{C}}(Y, X_0)_\bullet \\ \downarrow & & \downarrow \\ \text{Hom}_{\mathcal{C}}(Y, X_1)_\bullet & \longrightarrow & \text{Hom}_{\mathcal{C}}(Y, X)_\bullet \end{array}$$

is a homotopy pullback square (in the sense of Definition 3.4.1.1).

Proof. Combine Corollary 7.5.4.6 with Proposition 7.5.4.13. □

Example 7.6.3.2. A (strictly) commutative diagram of Kan complexes

03G5

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array}$$

is a homotopy pullback square (in the sense of Definition 3.4.1.1) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow N_\bullet^{\text{hc}}(\text{Kan}) = \mathcal{S}$ is a pullback square in the ∞ -category of spaces $\mathcal{S}$. This follows by combining Propositions 7.5.4.13 and 7.5.4.5.

Example 7.6.3.3. A (strictly) commutative diagram of Kan complexes

03G6

$$\begin{array}{ccc} A & \longrightarrow & A_0 \\ \downarrow & & \downarrow \\ A_1 & \longrightarrow & A_{01} \end{array}$$

is a homotopy pushout square (in the sense of Definition 3.4.2.1) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow N_\bullet^{\text{hc}}(\text{Kan}) = \mathcal{S}$ is a pushout square in the ∞ -category of spaces $\mathcal{S}$. This follows by combining Corollaries 7.5.7.7 and 7.5.7.9.

03G7 **Example 7.6.3.4.** A (strictly) commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C}_{01} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow \\ \mathcal{C}_1 & \longrightarrow & \mathcal{C} \end{array}$$

is a categorical pullback square (in the sense of Definition 4.5.2.8) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow \mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathbf{QCat}) = \mathcal{QC}$ is a pullback square in the ∞ -category $\mathcal{QC}$. This follows by combining Corollaries 7.5.5.8 and 7.5.5.10.

03G8 **Example 7.6.3.5.** A (strictly) commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C} & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow \\ \mathcal{C}_1 & \longrightarrow & \mathcal{C}_{01} \end{array}$$

is a categorical pushout square (in the sense of Definition 4.5.4) if and only if the induced diagram $\Delta^1 \times \Delta^1 \rightarrow \mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathbf{QCat}) = \mathcal{QC}$ is a pushout square in the ∞ -category $\mathcal{QC}$. This follows by combining Corollaries 7.5.8.5 and 7.5.8.9.

Recall that the ∞ -category of spaces $\mathcal{S}$ admits small limits and colimits (Corollaries 7.4.1.3 and 7.4.3.3). In particular, if $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ are morphisms of Kan complexes, then there exists a pullback diagram σ :

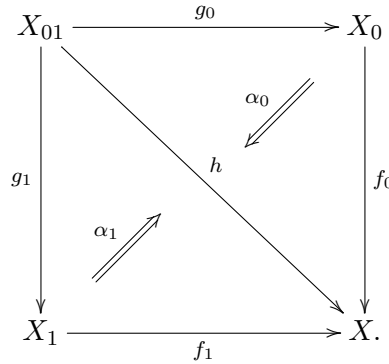

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in the ∞ -category $\mathcal{S}$. However, it is not always possible to obtain σ from a commutative diagram in the ordinary category $\mathbf{Kan}$. It will therefore be useful to have a generalization of Proposition 7.6.3.1, which applies to *homotopy coherent* squares.

03G9 **Remark 7.6.3.6** (Homotopy Coherent Squares). Let $\mathcal{C}$ be a simplicial category and let $\mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})$ denote the homotopy coherent nerve of $\mathcal{C}$. Combining Examples 1.5.2.9, 2.4.3.9, and 2.4.3.10, we see that morphisms from $\Delta^1 \times \Delta^1$ to $\mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})$ can be identified with the following data:

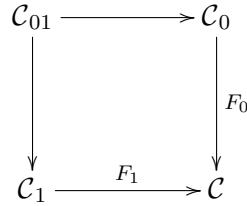

- (a) A collection of objects X_{01} , X_0 , X_1 , and X of the category $\mathcal{C}$.
- (b) A collection of morphisms $f_0 : X_0 \rightarrow X$, $f_1 : X_1 \rightarrow X$, $g_0 : X_{01} \rightarrow X_0$, $g_1 : X_{01} \rightarrow X_1$.
- (c) A morphism $h : X_{01} \rightarrow X$ in $\mathcal{C}$ together with a pair of edges $\alpha_0 : f_0 \circ g_0 \rightarrow h$ and $\alpha_1 : f_1 \circ g_1 \rightarrow h$ in the simplicial set $\text{Hom}_{\mathcal{C}}(X_{01}, X)_\bullet$.

We can summarize this data in a diagram

Here we can regard (a) and (b) as supplying a (potentially) non-commutative square diagram in the category $\mathcal{C}$, and (c) as supplying a witness to the fact that it commutes up to homotopy.

Example 7.6.3.7 (Square Diagrams in $\mathcal{QC}$). Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors 03GA of ∞ -categories. Using Remark 7.6.3.6, we see that the data of a commutative diagram

in the ∞ -category $\mathcal{QC}$ is equivalent to the data of an ∞ -category $\mathcal{C}_{01}$ equipped with functors

$$G_0 : \mathcal{C}_{01} \rightarrow \mathcal{C}_0 \quad G_1 : \mathcal{C}_{01} \rightarrow \mathcal{C}_1 \quad H : \mathcal{C}_{01} \rightarrow \mathcal{C}$$

together with natural isomorphisms $\alpha_0 : (F_0 \circ G_0) \xrightarrow{\sim} H$ and $\alpha_1 : (F_1 \circ G_1) \xrightarrow{\sim} H$. In this case, we can identify the data of the tuple $(G_0, \alpha_0, G_1, \alpha_1, H)$ with a single functor of ∞ -categories

$$G : \mathcal{C}_{01} \rightarrow \mathcal{C}_0 \times_{\mathcal{C}}^h (\mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C}).$$

03GB **Proposition 7.6.3.8.** *Suppose we are given a commutative diagram*

$$\begin{array}{ccc}
 \mathcal{C}_{01} & \longrightarrow & \mathcal{C}_0 \\
 \downarrow & & \downarrow F_0 \\
 \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C}
 \end{array} \tag{7.66}$$

in the ∞ -category $\mathcal{QC}$, corresponding to a functor

$$G : \mathcal{C}_{01} \rightarrow \mathcal{C}_0 \times_{\mathcal{C}}^{\mathbf{h}} (\mathcal{C}_1 \times_{\mathcal{C}}^{\mathbf{h}} \mathcal{C}).$$

Then (7.66) is a pullback square in $\mathcal{QC}$ if and only if the functor G is an equivalence of ∞ -categories.

Proof. Let us identify the diagram (7.66) with a functor of simplicial categories $\mathcal{F} : \text{Path}[[1] \times [1]]_{\bullet} \rightarrow \mathbf{QCat}$. Using Corollary 4.5.2.24, we can factor the functor F_0 as a composition $\mathcal{C}_0 \xrightarrow{T} \mathcal{C}'_0 \xrightarrow{F'_0} \mathcal{C}$, where T is an equivalence of ∞ -categories and F'_0 is an isofibration. Let $\mathcal{C}'_{01}$ denote the iterated homotopy fiber product $\mathcal{C}'_0 \times_{\mathcal{C}}^{\mathbf{h}} (\mathcal{C}_1 \times_{\mathcal{C}}^{\mathbf{h}} \mathcal{C})$. Then Example 7.6.3.7 supplies a commutative diagram

$$\begin{array}{ccc}
 \mathcal{C}'_{01} & \longrightarrow & \mathcal{C}'_0 \\
 \downarrow & & \downarrow F'_0 \\
 \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C}
 \end{array} \tag{7.67}$$

in the ∞ -category $\mathcal{QC}$, which we view as a functor of simplicial categories $\mathcal{F}' : \text{Path}[[1] \times [1]]_{\bullet} \rightarrow \mathbf{QCat}$. The morphisms G and T determine a natural transformation of simplicial functors $\mathcal{F} \rightarrow \mathcal{F}'$, which induces a natural transformation from the diagram (7.66) to the diagram (7.67) in the ∞ -category $\text{Fun}(\Delta^1 \times \Delta^1, \mathcal{QC})$. By virtue of Corollary 4.5.2.21, this natural transformation is an isomorphism of diagrams if and only if the functor G is an equivalence of ∞ -categories. Consequently, Proposition 7.6.3.8 is equivalent to the assertion that (7.67) is a pullback square in the ∞ -category $\mathcal{QC}$ (see Proposition 7.1.3.14).

Note that we have a (strictly) commutative diagram of simplicial sets

$$\begin{array}{ccc}
 \mathcal{C}'_0 \times_{\mathcal{C}} \mathcal{C}_1 & \longrightarrow & \mathcal{C}'_0 \\
 \downarrow & & \downarrow F'_0 \\
 \mathcal{C}_1 & \xrightarrow{F'_1} & \mathcal{C},
 \end{array} \tag{7.68}$$

which determines a subfunctor $\mathcal{F}'' \subseteq \mathcal{F}'$. Since F'_0 is an isofibration, it follows from Corollaries 4.5.2.29, 4.5.2.23, and 4.5.2.30 that the inclusion maps

$$\begin{aligned} \mathcal{C}'_0 \times_{\mathcal{C}} \mathcal{C}_1 &\hookrightarrow \mathcal{C}'_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \\ &\hookrightarrow \mathcal{C}'_0 \times_{\mathcal{C}}^h (\mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C}) \end{aligned}$$

are equivalences of ∞ -categories. Consequently, the inclusion $\mathcal{F}'' \hookrightarrow \mathcal{F}'$ is a levelwise categorical equivalence of simplicial functors and therefore induces an isomorphism from the diagram (7.68) to the diagram (7.67) in the ∞ -category $\text{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$. By virtue of Proposition 7.1.3.14, it will suffice to show that the diagram (7.68) is a pullback square in the ∞ -category $\mathcal{QC}$. This is a special case of Example 7.6.3.4, since (7.68) is a categorical pullback square (see Corollary 4.5.2.28). $\square$

Corollary 7.6.3.9. *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories, let $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ denote the homotopy fiber product of Construction 4.5.2.1, and let* 03GF

$$G_0 : \mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \rightarrow \mathcal{C}_0 \quad G_1 : \mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \rightarrow \mathcal{C}_1$$

denote the projection maps, so that we have a canonical isomorphism $\alpha : F_0 \circ G_0 \rightarrow F_1 \circ G_1$ in the ∞ -category $\text{Fun}(\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1, \mathcal{C})$. Then the diagram

$$\begin{array}{ccc} \mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1 & \xrightarrow{G_0} & \mathcal{C}_0 \\ \downarrow G_1 & \searrow F_1 \circ G_1 & \downarrow F_0 \\ \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C} \end{array}$$

α (diagonal arrow from top-left to bottom-right)
 id (diagonal arrow from bottom-left to top-right)

corresponds to a pullback square in the ∞ -category $\mathcal{QC}$. In particular, $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ is a fiber product of $\mathcal{C}_0$ with $\mathcal{C}_1$ over $\mathcal{C}$ in the ∞ -category $\mathcal{QC}$.

Proof. By virtue of Proposition 7.6.3.8, it will suffice to show that the inclusion

$$\delta : \mathcal{C}_1 \simeq \mathcal{C}_1 \times_{\mathcal{C}} \mathcal{C} \hookrightarrow \mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C}$$

induces an equivalence of homotopy fiber products

$$\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1 \hookrightarrow \mathcal{C}_0 \times_{\mathcal{C}}^h (\mathcal{C}_1 \times_{\mathcal{C}}^h \mathcal{C}).$$

This is a special case of Corollary 4.5.2.21, since δ is an equivalence of ∞ -categories (Corollary 4.5.2.23). $\square$

03GG **Corollary 7.6.3.10.** *Suppose we are given a commutative diagram*

$$\begin{array}{ccc} X_{01} & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array} \quad (7.69)$$

in the ∞ -category $\mathcal{S}$, classified by a map of Kan complexes

$$g : X_{01} \rightarrow X_0 \times_X^h (X_1 \times_X^h X).$$

Then (7.69) is a pullback square in $\mathcal{S}$ if and only if g is a homotopy equivalence.

Proof. Combine Proposition 7.6.3.8 with Remark 7.4.4.4. □

05E5 **Corollary 7.6.3.11.** *Let n be an integer and suppose we are given a pullback diagram*

$$\begin{array}{ccc} X' & \longrightarrow & X \\ \downarrow f' & & \downarrow f \\ Y' & \longrightarrow & Y \end{array}$$

in the ∞ -category $\mathcal{S}$. If f is n -truncated, then f' is n -truncated. If f is n -connective, then f' is n -connective.

Proof. Combine Corollaries 7.6.3.10, 3.5.9.12, and 3.5.1.25. □

03GJ **Example 7.6.3.12.** Let $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ be morphisms of Kan complexes. Applying the construction of Corollary 7.6.3.9, we obtain a pullback square

$$\begin{array}{ccc} X_0 \times_X^h X_1 & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array}$$

in the ∞ -category $\mathcal{S}$.

04K8 **Exercise 7.6.3.13.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, so that Corollary 7.6.3.9 supplied an identification of $\mathcal{C} \times_{\mathcal{D}}^h \mathcal{C}$ with the fiber product of $\mathcal{C}$ with itself over $\mathcal{D}$ in the

∞ -category $\mathcal{QC}$. Show that, under this identification, the relative diagonal of F (in the sense of Notation 7.6.2.15) is represented by the inclusion map $\mathcal{C} \hookrightarrow \mathcal{C} \times_{\mathcal{D}}^h \mathcal{C}$. Moreover, if F is an isofibration, then we can replace the homotopy fiber product $\mathcal{C} \times_{\mathcal{D}}^h \mathcal{C}$ with the fiber product $\mathcal{C} \times_{\mathcal{D}} \mathcal{C}$ (formed in the ordinary category of simplicial sets); see Corollary 4.5.2.28.

Corollary 7.6.3.14. *Let $\mathcal{C}$ be a locally Kan simplicial category, and suppose we are given a commutative diagram $\sigma : \Delta^1 \times \Delta^1 \rightarrow N_{\bullet}^{\text{hc}}(\mathcal{C})$, corresponding to a diagram*

$$\begin{array}{ccc}
 X_{01} & \xrightarrow{g_0} & X_0 \\
 g_1 \downarrow & \searrow h & \downarrow f_0 \\
 & \alpha_0 \swarrow & \\
 X_1 & \xrightarrow{f_1} & X \\
 & \alpha_1 \nearrow & \\
 & &
 \end{array}$$

in the ∞ -category $\mathcal{C}$ (see Remark 7.6.3.6). Then σ is a pullback square in the ∞ -category $N_{\bullet}^{\text{hc}}(\mathcal{C})$ if and only if, for every object $Y \in \mathcal{C}$, the induced map

$$\text{Hom}_{\mathcal{C}}(Y, X_{01})_{\bullet} \rightarrow \text{Hom}_{\mathcal{C}}(Y, X_0)_{\bullet} \times_{\text{Hom}_{\mathcal{C}}(Y, X)_{\bullet}}^h (\text{Hom}_{\mathcal{C}}(Y, X_1)_{\bullet} \times_{\text{Hom}_{\mathcal{C}}(Y, X)_{\bullet}}^h \text{Hom}_{\mathcal{C}}(Y, X)_{\bullet})$$

is a homotopy equivalence of Kan complexes.

Proof. Combine Corollary 7.6.3.10 with Proposition 7.4.1.18. □

7.6.4 Equalizers and Coequalizers

We now study (co)limits of a particularly simple shape.

03GL

Notation 7.6.4.1. Let $(\bullet \rightrightarrows \bullet)$ denote the simplicial set given by the pushout $\Delta^1 \coprod_{\partial \Delta^1} \Delta^1$. For any ∞ -category $\mathcal{C}$, we will identify morphisms from $(\bullet \rightrightarrows \bullet)$ to $\mathcal{C}$ with pairs (f_0, f_1) , where $f_0 : Y \rightarrow X$ and $f_1 : Y \rightarrow X$ are morphisms of $\mathcal{C}$ having the same source and target.

Remark 7.6.4.2. The simplicial set $(\bullet \rightrightarrows \bullet)$ of Notation 7.6.4.1 is isomorphic to the nerve of its homotopy category $\mathcal{J}$, which can be described concretely as follows:

- The category $\mathcal{J}$ has exactly two objects Y and X .
- There are exactly two non-identity morphisms in $\mathcal{J}$, both of which have source Y and target X .

03GP **Remark 7.6.4.3.** There is a tautological epimorphism of simplicial sets

$$\begin{aligned} (\bullet \rightrightarrows \bullet) &= \Delta^1 \coprod_{\partial \Delta^1} \Delta^1 \\ &\twoheadrightarrow \Delta^1 \coprod_{\partial \Delta^1} \Delta^0 \\ &= \Delta^1 / \partial \Delta^1. \end{aligned}$$

It follows from Example 6.3.2.6 that this epimorphism exhibits $\Delta^1 / \partial \Delta^1$ as a localization of $(\bullet \rightrightarrows \bullet)$. In particular, it is both left and right cofinal (Proposition 7.2.1.10).

03GQ **Definition 7.6.4.4** (Equalizers and Coequalizers). Let $\mathcal{C}$ be an ∞ -category and let $f_0, f_1 : Y \rightarrow X$ be morphisms of $\mathcal{C}$ having the same source and target, which we identify with functor $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{C}$. An *equalizer* of f_0 and f_1 is a limit of the diagram σ . A *coequalizer* of f_0 and f_1 is a colimit of the diagram σ . We say that the ∞ -category $\mathcal{C}$ *admits equalizers* if every pair of morphisms $f_0, f_1 : Y \rightarrow X$ have an equalizer in $\mathcal{C}$, and that $\mathcal{C}$ *admits coequalizers* if every pair of morphisms $f_0, f_1 : Y \rightarrow X$ have a coequalizer in $\mathcal{C}$.

03GR **Notation 7.6.4.5.** Let $\mathcal{C}$ be an ∞ -category and let $f_0, f_1 : Y \rightarrow X$ be morphisms of $\mathcal{C}$ having the same source and target. If there exists an object $Z \in \mathcal{C}$ which is an equalizer of f_0 and f_1 , then Z is uniquely determined up to isomorphism (Proposition 7.1.1.12). To emphasize this uniqueness, we denote the object Z (if it exists) by $\mathrm{Eq}(f_0, f_1)$. Similarly, if there exists an object $W \in \mathcal{C}$ which is a coequalizer of f_0 and f_1 , then W is uniquely determined up to isomorphism; to emphasize this, we denote W by $\mathrm{Coeq}(f_0, f_1)$.

03GS **Remark 7.6.4.6** (Duality). The simplicial set $(\bullet \rightrightarrows \bullet)$ is canonically isomorphic to its opposite $(\bullet \rightrightarrows \bullet)^{\mathrm{op}}$. Consequently, if $f_0, f_1 : Y \rightarrow X$ are morphisms in an ∞ -category $\mathcal{C}$ which admit an equalizer $Z = \mathrm{Eq}(f_0, f_1)$, then Z can be regarded as a coequalizer of f_0 and f_1 in the opposite ∞ -category $\mathcal{C}^{\mathrm{op}}$.

03GT **Remark 7.6.4.7** (Symmetry). The simplicial set $(\bullet \rightrightarrows \bullet)$ has a unique nontrivial automorphism, which exchanges its nondegenerate edges. It follows that, if $f_0, f_1 : Y \rightarrow X$ are a pair of morphisms in an ∞ -category $\mathcal{C}$, then we can identify (co)equalizers of the pair (f_0, f_1) with (co)equalizers of the pair (f_1, f_0) .

03GU **Example 7.6.4.8** (Fixed Points of Endomorphisms). Let $\mathcal{C}$ be an ∞ -category and let X be an object of $\mathcal{C}$. An *endomorphism* of X is a morphism $f : X \rightarrow X$ from the object X to itself. Note that the pair (X, f) can be identified with a morphism of simplicial sets $\sigma : (\Delta^1 / \partial \Delta^1) \rightarrow \mathcal{C}$. It follows from Remark 7.6.4.3 (together with Corollary 7.2.2.11) that an object of $\mathcal{C}$ is a limit of the diagram σ if and only if it is an equalizer of the pair of morphisms $f, \mathrm{id}_X : X \rightarrow X$. Similarly, an object of $\mathcal{C}$ is a colimit of σ if and only if it is a coequalizer of the pair (f, id_X) .

Variant 7.6.4.9. Let $\mathbf{Z}_{\geq 0}$ denote the collection of nonnegative integers, which we regard as 03GV a commutative monoid under addition, and let $B_{\bullet}\mathbf{Z}_{\geq 0}$ denote the classifying simplicial set of Construction 1.3.2.5. The simplicial set $B_{\bullet}\mathbf{Z}_{\geq 0}$ is an ∞ -category which contains a (unique) object X , and the generator $1 \in \mathbf{Z}_{\geq 0}$ determines an endomorphism $e : X \rightarrow X$. We can regard $B_{\bullet}\mathbf{Z}_{\geq 0}$ as *freely generated* by the endomorphism e : more precisely, the pair (X, e) determines a morphism of simplicial sets $\sigma : \Delta^1 / \partial\Delta^1 \hookrightarrow B_{\bullet}\mathbf{Z}_{\geq 0}$ which is inner anodyne (see Example 1.5.7.11), and therefore induces a trivial Kan fibration $\mathrm{Fun}(B_{\bullet}\mathbf{Z}_{\geq 0}, \mathcal{C}) \rightarrow \mathrm{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C})$ for every ∞ -category $\mathcal{C}$. In particular, the morphism σ is both left and right cofinal (Proposition 7.2.1.3).

If $F : B_{\bullet}\mathbf{Z}_{\geq 0} \rightarrow \mathcal{C}$ is a functor of ∞ -categories, then Corollary 7.2.2.11 guarantees that an object of $\mathcal{C}$ is a limit of the functor F if and only if it is a limit of the diagram $F \circ \sigma$: that is, if and only if it is an equalizer of the pair of morphisms $F(e), \mathrm{id}_{F(X)} : F(X) \rightarrow F(X)$ (see Example 7.6.4.8). Similarly, an object of $\mathcal{C}$ is a colimit of the functor F if and only if it is a coequalizer of the pair $(F(e), \mathrm{id}_{F(X)})$.

Definition 7.6.4.10 (Equalizer and Coequalizer Diagrams). Let $\mathcal{C}$ be an ∞ -category. An 03GW *equalizer diagram in $\mathcal{C}$* is a limit diagram $(\bullet \rightrightarrows \bullet)^{\triangleleft} \rightarrow \mathcal{C}$. A *coequalizer diagram* is a colimit diagram $(\bullet \rightrightarrows \bullet)^{\triangleright} \rightarrow \mathcal{C}$.

Warning 7.6.4.11. Let $\mathcal{C}$ be an ∞ -category and suppose we are given an equalizer diagram 03GX

$$Z \xrightarrow{g} Y \xrightleftharpoons[f_1]{f_0} X \quad (7.70) \quad 03GY$$

in $\mathcal{C}$. Then the image of (7.70) in the homotopy category $\mathrm{h}\mathcal{C}$ need not be an equalizer diagram. In other words, the forgetful functor $\mathcal{C} \rightarrow \mathbf{N}_{\bullet}(\mathrm{h}\mathcal{C})$ does not preserve equalizer diagrams in general.

Example 7.6.4.12. Let X be a Kan complex containing vertices x and y . Then there 03GZ exists an equalizer diagram

$$\{x\} \times_X^{\mathrm{h}} \{y\} \xrightarrow{f} \Delta^0 \xrightleftharpoons[y]{x} X \quad (7.71) \quad 03H0$$

in the ∞ -category $\mathcal{S}$ (for a more general statement, see Corollary 7.6.4.21). However, unless the homotopy fiber product $\{x\} \times_X^{\mathrm{h}} \{y\}$ is either empty or contractible, the image of (7.71) in the homotopy category hKan is not an equalizer diagram (since the homotopy class $[f]$ is a monomorphism in hKan).

Exercise 7.6.4.13. Let $\mathcal{C}$ be an ∞ -category and suppose we are given an equalizer diagram 03H1

$$Z \xrightarrow{g} Y \xrightleftharpoons[f_1]{f_0} X \quad (7.72) \quad 03H2$$

in $\mathcal{C}$. Show that, for every object $C \in \mathcal{C}$, the map of sets

$$\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Z) \xrightarrow{[g] \circ} \mathrm{Eq}(\mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, Y) \rightrightarrows \mathrm{Hom}_{\mathrm{h}\mathcal{C}}(C, X))$$

is surjective (though it is generally not injective).

We now give some examples of (co)equalizer diagrams.

03H3 Proposition 7.6.4.14. *Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, and let $G : \mathcal{E} \rightarrow \mathcal{D}$ be a functor of ∞ -categories satisfying $F_0 \circ G = F_1 \circ G$. The following conditions are equivalent:*

(1) *The resulting diagram of ∞ -categories $(\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$ is an equalizer diagram.*

(2) *The commutative diagram*

03H4

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{G} & \mathcal{D} \\ \downarrow & & \downarrow (F_0, F_1) \\ \mathcal{C} & \xrightarrow{(\mathrm{id}, \mathrm{id})} & \mathcal{C} \times \mathcal{C} \end{array} \quad (7.73)$$

is a categorical pullback square (Definition 4.5.2.8).

Proof. Let us identify the pair (F_0, F_1) with a functor of ordinary categories $\mathcal{F} : \mathcal{J} \rightarrow \mathcal{QCat}$, where $\mathcal{J}$ is the category described in Remark 7.6.4.2. The functor G then induces a map $\mathcal{E} \rightarrow \mathrm{holim}_{\leftarrow}(\mathcal{F})$, which can be identified with the map

$$\mathcal{E} \rightarrow \mathcal{C} \times_{(\mathcal{C} \times \mathcal{C})}^{\mathrm{h}} \mathcal{D}$$

determined by the diagram (7.73). Proposition 7.6.4.14 now follows from the criterion of Corollary 7.5.5.8. $\square$

03H5 Corollary 7.6.4.15. *Let $f_0, f_1 : Y \rightarrow X$ be morphisms of Kan complexes and let $g : Z \rightarrow Y$ be a morphism of Kan complexes satisfying $f_0 \circ g = f_1 \circ g$. The following conditions are equivalent:*

(1) *The resulting diagram of ∞ -categories $(\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{S}$ is an equalizer diagram.*

(2) *The commutative diagram of Kan complexes*

$$\begin{array}{ccc} Z & \xrightarrow{g} & Y \\ \downarrow & & \downarrow (f_0, f_1) \\ X & \xrightarrow{(\mathrm{id}, \mathrm{id})} & X \times X \end{array}$$

is a homotopy pullback square.

Proof. Combine Proposition 7.6.4.14 with Remark 7.4.4.4. $\square$

Corollary 7.6.4.16. *Let $\mathcal{C}$ be a locally Kan simplicial category and suppose we are given 03H6 morphisms*

$$Z \xrightarrow{g} Y \xrightleftharpoons[f_1]{f_0} X$$

in $\mathcal{C}$ satisfying $f_0 \circ g = f_1 \circ g$. The following conditions are equivalent:

- (1) *The induced diagram $(\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathbf{N}_\bullet^{\text{hc}}(\mathcal{C})$ is an equalizer diagram in the ∞ -category $\mathbf{N}_\bullet^{\text{hc}}(\mathcal{C})$, in the sense of Definition 7.6.4.10.*
- (2) *For every object $C \in \mathcal{C}$, the diagram of Kan complexes*

$$\begin{array}{ccc} \text{Hom}_{\mathcal{C}}(C, Z)_\bullet & \xrightarrow{\quad} & \text{Hom}_{\mathcal{C}}(C, Y)_\bullet \\ \downarrow g & & \downarrow \\ \text{Hom}_{\mathcal{C}}(C, X)_\bullet & \xrightarrow{(f_0, f_1)} & \text{Hom}_{\mathcal{C}}(C, X)_\bullet \times \text{Hom}_{\mathcal{C}}(C, X)_\bullet \end{array}$$

is a homotopy pullback square.

Proof. Combine Corollary 7.6.4.15 with Proposition 7.4.1.18. $\square$

Let $f_0, f_1 : Y \rightarrow X$ be morphisms of Kan complexes. By virtue of Corollary 7.4.1.3, the morphisms f_0 and f_1 have an equalizer in the ∞ -category $\mathcal{S}$. Beware that this equalizer generally cannot be obtained from Corollary 7.6.4.15. For example, if f_0 and f_1 have disjoint images, then the existence of a morphism $g : Z \rightarrow Y$ satisfying $f_0 \circ g = f_1 \circ g$ guarantees that the simplicial set Z is empty. In such cases, to extend the pair (f_0, f_1) to an equalizer diagram in $\mathcal{S}$, we are forced to consider homotopy coherent diagrams which do not strictly commute.

Remark 7.6.4.17. Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, which we identify with 03H7 a diagram $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{QC}$. Unwinding the definitions, we see that extensions of σ to a diagram $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$ can be identified with the following data:

- An ∞ -category $\mathcal{E}$ equipped with functors $G : \mathcal{E} \rightarrow \mathcal{D}$ and $H : \mathcal{E} \rightarrow \mathcal{C}$.
- Isomorphisms $\alpha_0 : F_0 \circ G \xrightarrow{\sim} H$ and $\alpha_1 : F_1 \circ G \xrightarrow{\sim} H$ in the ∞ -category $\text{Fun}(\mathcal{E}, \mathcal{C})$.

In this case, we can identify the quadruple $(G, H, \alpha_0, \alpha_1)$ with a single functor of ∞ -categories

$$U : \mathcal{E} \rightarrow \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^{\text{h}} \mathcal{C}.$$

03H8 **Proposition 7.6.4.18.** *Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, which we identify with a diagram $\sigma : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{QC}$. Suppose we are given an extension $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$ of σ , corresponding to a functor of ∞ -categories*

$$T : \mathcal{E} \rightarrow \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^{\mathbf{h}} \mathcal{C}.$$

Then $\bar{\sigma}$ is an equalizer diagram in the ∞ -category $\mathcal{QC}$ if and only if T is an equivalence of ∞ -categories.

Proof. We proceed as in the proof of Proposition 7.6.3.8, with minor modifications. Let $\mathcal{A}$ denote the simplicial path category of $(\bullet \rightrightarrows \bullet)^\triangleleft$, so that we can identify $\bar{\sigma}$ with a simplicial functor $\mathcal{F} : \mathcal{A} \rightarrow \mathbf{QCat}$. Using Corollary 4.5.2.24, we can factor the functor $(F_0, F_1) : \mathcal{D} \rightarrow \mathcal{C} \times \mathcal{C}$ as a composition

$$\mathcal{D} \xrightarrow{U} \mathcal{D}' \xrightarrow{(F'_0, F'_1)} \mathcal{C} \times \mathcal{C},$$

where U is an equivalence of ∞ -categories and (F'_0, F'_1) is an isofibration. The pair (F'_0, F'_1) can be identified with a morphism of simplicial sets $\sigma' : (\bullet \rightrightarrows \bullet) \rightarrow \mathcal{QC}$. Applying Remark 7.6.4.17, we can extend σ' to a diagram $\bar{\sigma}' : (\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$, carrying the cone point to the ∞ -category $\mathcal{E}' = \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})}^{\mathbf{h}} \mathcal{C}$. The diagram $\bar{\sigma}'$ corresponds to a simplicial functor $\mathcal{F}' : \mathcal{A} \rightarrow \mathbf{QCat}$. The morphisms T and U determine a natural transformation of simplicial functors $\mathcal{F} \rightarrow \mathcal{F}'$, hence also a morphism $\bar{\sigma} \rightarrow \bar{\sigma}'$ in the ∞ -category $\mathbf{Fun}((\bullet \rightrightarrows \bullet)^\triangleleft, \mathcal{QC})$. By virtue of Corollary 4.5.2.21, this natural transformation is an isomorphism of diagrams if and only if the functor T is an equivalence of ∞ -categories. Consequently, Proposition 7.6.4.18 is equivalent to the assertion that $\bar{\sigma}'$ is an equalizer diagram in $\mathcal{QC}$ (Proposition 7.1.3.14).

Invoking Remark 7.6.4.17 again, we obtain another diagram $\bar{\sigma}''$ extending σ' , which carries the cone point of $(\bullet \rightrightarrows \bullet)^\triangleleft$ to the equalizer $\mathrm{Eq}(F'_0, F'_1) = \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})} \mathcal{C}$ (formed in the category of simplicial sets). The diagram $\bar{\sigma}''$ corresponds to another simplicial functor $\mathcal{F}'' : \mathcal{A} \rightarrow \mathbf{QCat}$. Note that there is a natural inclusion map $\mathcal{F}'' \hookrightarrow \mathcal{F}'$, which carries the cone point to the inclusion

$$\iota : \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})} \mathcal{C} \subseteq \mathcal{D}' \times_{(\mathcal{C} \times \mathcal{C})}^{\mathbf{h}} \mathcal{C}.$$

Since (F'_0, F'_1) is an isofibration, the functor ι is an equivalence of ∞ -categories (Corollary 4.5.2.29). It follows that the inclusion $\mathcal{F}'' \hookrightarrow \mathcal{F}'$ induces an isomorphism $\bar{\sigma}'' \rightarrow \bar{\sigma}'$ in the ∞ -category $\mathbf{Fun}((\bullet \rightrightarrows \bullet)^\triangleleft, \mathcal{QC})$. By virtue of Proposition 7.1.3.14, we are reduced to showing that $\bar{\sigma}''$ is an equalizer diagram in $\mathcal{QC}$. This follows from the criterion of Proposition 7.6.4.14 (since ι is an equivalence of ∞ -categories). $\square$

It follows from Proposition 7.6.4.18 that, if $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ are functors of ∞ -categories, then the homotopy fiber product $\mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^{\mathbf{h}} \mathcal{C}$ is an equalizer of F_0 and F_1 in the ∞ -category

$\mathcal{QC}$ (this can also be viewed as a special case of Proposition 7.5.2.6). However, it is possible to be more efficient.

Construction 7.6.4.19 (The Homotopy Equalizer). Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories, and form a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathrm{hEq}(F_0, F_1) & \longrightarrow & \mathrm{Isom}(\mathcal{C}) \\ \downarrow G & & \downarrow \\ \mathcal{D} & \xrightarrow{(F_0, F_1)} & \mathcal{C} \times \mathcal{C}. \end{array}$$

Note that the right vertical map is an isofibration (Corollary 4.4.5.5), so the left vertical map is also an isofibration; in particular, $\mathrm{hEq}(F_0, F_1)$ is an ∞ -category. We will refer to $\mathrm{hEq}(F_0, F_1)$ as the *homotopy equalizer* of the functors F_0 and F_1 . By construction, objects of $\mathrm{hEq}(F_0, F_1)$ can be identified with pairs (X, u) , where X is an object of $\mathcal{D}$ and $u : F_0(X) \rightarrow F_1(X)$ is an isomorphism in the ∞ -category $\mathcal{C}$.

Set $H = G \circ F_1$, so that the construction $(X, u) \mapsto u$ determines an isomorphism $\alpha_0 : G \circ F_0 \xrightarrow{\sim} H$ in the ∞ -category $\mathrm{Fun}(\mathrm{Eq}(F_0, F_1), \mathcal{C})$. Taking α_1 to be the identity morphism $\mathrm{id} : G \circ F_1 \xrightarrow{\sim} H$, we see that the quadruple $(G, H, \alpha_0, \alpha_1)$ determines a diagram $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$, carrying the cone point to the homotopy equalizer $\mathrm{hEq}(F_0, F_1)$ (see Remark 7.6.4.17).

Corollary 7.6.4.20. *Let $F_0, F_1 : \mathcal{D} \rightarrow \mathcal{C}$ and $F_1 : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories. Then the morphism $\bar{\sigma} : (\bullet \rightrightarrows \bullet)^\triangleleft \rightarrow \mathcal{QC}$ of Construction 7.6.4.19 is an equalizer diagram. In particular, the homotopy equalizer $\mathrm{hEq}(F_0, F_1)$ is an equalizer of F_0 and F_1 in the ∞ -category $\mathcal{QC}$.*

Proof. The diagram $\bar{\sigma}$ can be identified with a functor $U : \mathrm{hEq}(F_0, F_1) \rightarrow \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^{\mathrm{h}} \mathcal{C}$. By virtue of Proposition 7.6.4.18, it will suffice to show that U is an equivalence of ∞ -categories. Unwinding the definitions, we see that U fits into a commutative diagram

$$\begin{array}{ccccc} \mathrm{hEq}(F_0, F_1) & \xrightarrow{U} & \mathcal{D} \times_{(\mathcal{C} \times \mathcal{C})}^{\mathrm{h}} \mathcal{C} & \longrightarrow & \mathcal{D} \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C} \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{D} & \longrightarrow & \mathcal{D} \times_{\mathcal{C}}^{\mathrm{h}} \mathcal{C} & \longrightarrow & \mathcal{D} \times \mathcal{C}, \end{array}$$

where the homotopy fiber product on the upper right is formed using the functor F_0 , and the homotopy fiber product on the lower middle is formed using the functor F_1 . Each of the

squares in this diagram is a pullback, and the right vertical map is an isofibration (Remark 4.5.2.2). It follows that the left side of the diagram is a categorical pullback square (Corollary 4.5.2.28). Since the functor on the lower left is an equivalence of ∞ -categories (Corollary 4.5.2.23), it follows that U is an equivalence of ∞ -categories. $\square$

03HB Corollary 7.6.4.21. *Let $f_0, f_1 : Y \rightarrow X$ be morphisms of Kan complexes. Then the homotopy equalizer $\mathrm{hEq}(f_0, f_1)$ is a Kan complex, which is an equalizer of f_0 and f_1 in the ∞ -category $\mathcal{S}$.*

Proof. Combine Corollary 7.6.4.20 with Remark 7.4.4.4. $\square$

Corollaries 7.6.4.20 and 7.6.4.21 illustrate a general phenomenon: if $\mathcal{C}$ is an ∞ -category which admits pairwise products, then equalizers in $\mathcal{C}$ can be viewed as a special kind of fiber product.

03HC Proposition 7.6.4.22 (Rewriting Equalizers as Pullbacks). *Let $\mathcal{C}$ be an ∞ -category, let $f_0, f_1 : Y \rightarrow X$ be morphisms of $\mathcal{C}$. Let $X \times X$ be a product of X with itself in the ∞ -category $\mathcal{C}$, so that f_0 and f_1 determine a morphism $(f_0, f_1) : Y \rightarrow X \times X$, and let $\delta_X : X \rightarrow X \times X$ be the diagonal map (Notation 7.6.1.13). Then an object of $\mathcal{C}$ is an equalizer of f_0 and f_1 if and only if it is a fiber product of Y with X over $X \times X$.*

Proof. Let $\mathcal{K}$ denote the simplicial set given by the product $(\bullet \rightrightarrows \bullet)^\triangleleft \times \Delta^1$. Then $\mathcal{K}$ is an ∞ -category, which we depict informally by the diagram

$$\begin{array}{ccccc} z & \longrightarrow & y & \rightrightarrows & x \\ \downarrow & & \downarrow & & \downarrow \\ z' & \longrightarrow & y' & \rightrightarrows & x' \end{array}$$

We now proceed in several steps.

- Let $\mathcal{K}_0$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x and y . Then $\mathcal{K}_0$ is isomorphic to the simplicial set $(\bullet \rightrightarrows \bullet)$. In particular, the pair of morphisms $f_0, f_1 : Y \rightarrow X$ can be identified with a functor $\sigma_0 : \mathcal{K}_0 \rightarrow \mathcal{C}$, satisfying $\sigma_0(x) = X$ and $\sigma_0(y) = Y$. By definition, an object of $\mathcal{C}$ is an equalizer of the pair (f_0, f_1) if and only if it is a limit of the diagram σ_0 .
- Let $\mathcal{K}_1$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x, x' , and y . Note that the identity map $\mathrm{id}_{\mathcal{K}_0}$ extends uniquely to a retraction $r : \mathcal{K}_1 \rightarrow \mathcal{K}_0$, carrying the object $x' \in \mathcal{K}_1$ to $x \in \mathcal{K}_0$. Let $\sigma_1 : \mathcal{K}_1 \rightarrow \mathcal{C}$ be the composition $\sigma_0 \circ r$. Note that the inclusion map $\mathcal{K}_0 \hookrightarrow \mathcal{K}_1$ admits a right adjoint (given by the retraction r), and is

therefore left cofinal (Corollary 7.2.3.7). It follows that an object of $\mathcal{C}$ is a limit of the diagram σ_0 if and only if it is a limit of the diagram σ_1 (Corollary 7.2.2.11).

- Choose a pair of morphisms $\pi_0, \pi_1 : X \times X \rightarrow X$ in the ∞ -category $\mathcal{C}$ which exhibit $X \times X$ as a product of X with itself. The morphism $(f_0, f_1) : Y \rightarrow X$ is characterized (up to homotopy) by the requirement that there exist 2-simplices σ_0 and σ_1 of $\mathcal{C}$, where σ_i exhibits f_i as a composition of π_i with (f_0, f_1) . Let $\mathcal{K}_2$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x, x', y , and y' . Then the pair (σ_0, σ_1) determines an extension of σ_1 to a functor $\sigma_2 : \mathcal{K}_2 \rightarrow \mathcal{C}$ satisfying $\sigma_2(y') = X \times X$.
- The diagonal morphism $\delta_X : X \rightarrow X \times X$ is characterized (up to homotopy) by the requirement that there exist 2-simplices τ_0 and τ_i of $\mathcal{C}$, where τ_i exhibits id_X as a composition of π_i with δ_X . Let $\mathcal{K}_3$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x, x', y , and y' , and z' . Then the pair (τ_0, τ_1) determines an extension of σ_2 to a functor $\sigma_3 : \mathcal{K}_3 \rightarrow \mathcal{C}$ satisfying $\sigma_3(z') = X$. The diagram σ_3 can be represented informally by the diagram

$$\begin{array}{ccccc}
 \bullet & \xrightarrow{\quad \quad \quad} & Y & \xrightleftharpoons[f_1]{f_0} & X \\
 \downarrow & & \downarrow (f_0, f_1) & & \downarrow \text{id}_X \\
 X & \xrightarrow{\delta_X} & X \times X & \xrightleftharpoons[\pi_1]{\pi_0} & X.
 \end{array}$$

Note that σ_3 is right Kan extended from the full subcategory $\mathcal{K}_1 \subseteq \mathcal{K}_3$. Consequently, an object of $\mathcal{C}$ is a limit of the diagram σ_1 if and only if it is a limit of the diagram σ_3 (Remark 7.3.8.20).

- Let $\mathcal{K}_4$ denote the full subcategory of $\mathcal{K}$ spanned by the objects x', y, y' , and z' . Note that the functor σ_3 is right Kan extended from $\mathcal{K}_4$. It follows that an object of $\mathcal{C}$ is a limit of the functor σ_3 if and only if it is a limit of the functor $\sigma_4 = \sigma_3|_{\mathcal{K}_4}$.
- Let $\mathcal{K}_5$ denote the full subcategory of $\mathcal{K}$ spanned by the objects y, y' , and z' . Using the criterion of Theorem 7.2.3.1, we see that the inclusion $\mathcal{K}_5 \hookrightarrow \mathcal{K}_4$ is left cofinal. It follows that an object of $\mathcal{C}$ is a limit of the diagram σ_4 if and only if it is a limit of the diagram $\sigma_5 = \sigma_4|_{\mathcal{K}_5}$ (Corollary 7.2.2.11).

Combining these steps, we deduce that an object of $\mathcal{C}$ is an equalizer of f_0 and f_1 if and only if it is a limit of the diagram σ_5 ; that is, if and only if it is a fiber product of Y with X over $X \times X$ (along the morphisms (f_0, f_1) and δ_X). $\square$

In an ∞ -category which admits finite products, we can use a similar argument to describe pullbacks in terms of equalizers.

03HD **Proposition 7.6.4.23** (Rewriting Pullbacks as Equalizers). *Let $\mathcal{C}$ be an ∞ -category and let $f_0 : X_0 \rightarrow X$ and $f_1 : X_1 \rightarrow X$ be morphisms of $\mathcal{C}$. Suppose that X_0 and X_1 admit a product $X_0 \times X_1$, and let $\pi_0 : X_0 \times X_1 \rightarrow X_0$ and $\pi_1 : X_0 \times X_1 \rightarrow X_1$ denote the projection maps. For $i \in \{0, 1\}$, let $g_i : X_0 \times X_1 \rightarrow X$ denote a composition of π_i with f_i in the ∞ -category $\mathcal{C}$. Then an object of $\mathcal{C}$ is a pullback of X_0 with X_1 over X if and only if it is an equalizer of the pair of morphisms (g_0, g_1) .*

Proof. Let $\mathcal{K}$ denote the category which is freely generated by a non-commutative square, as indicated in the diagram

$$\begin{array}{ccc} Y_{01} & \xrightarrow{\quad} & Y_0 \\ \downarrow & \searrow & \downarrow \\ Y_1 & \xrightarrow{\quad} & Y. \end{array}$$

Note that the upper right and lower left regions of this diagram determine monomorphisms $\tau_0, \tau_1 : \Delta^2 \hookrightarrow N_\bullet(\mathcal{K})$. The images of τ_0 and τ_1 are simplicial subsets of $N_\bullet(\mathcal{K})$, whose union is $N_\bullet(\mathcal{K})$ and whose intersection is the discrete simplicial set $\{Y_{01}, Y\}$. It follows that τ_0 and τ_1 induce an isomorphism of simplicial sets $(\tau_0, \tau_1) : \Delta^2 \coprod_{\{0,2\}} \Delta^2 \simeq N_\bullet(\mathcal{K})$.

For $i \in \{0, 1\}$, let σ_i be a 2-simplex of $\mathcal{C}$ which witnesses g_i as a composition of π_i with f_i (in the sense of Definition 1.4.4.1). Then there is a unique morphism of simplicial sets $q : N_\bullet(\mathcal{K}) \rightarrow \mathcal{C}$ satisfying $q \circ \tau_i = \sigma_i$, which we indicate as a diagram

$$\begin{array}{ccc} X_0 \times X_1 & \xrightarrow{\pi_0} & X_0 \\ \downarrow \pi_1 & \searrow g_0 & \downarrow f_0 \\ & g_1 & \\ X_1 & \xrightarrow{f_1} & X. \end{array}$$

Let $\mathcal{K}_+ \subseteq \mathcal{K}$ denote the full subcategory spanned by the objects Y_{01} and Y . Then the nerve $N_\bullet(\mathcal{K}_+)$ can be identified with the simplicial set $(\bullet \rightrightarrows \bullet)$ of Notation 7.6.4.1, and the restriction $q_+ = q|_{N_\bullet(\mathcal{K}_+)}$ corresponds to the pair of morphisms $g_0, g_1 : X_0 \times X_1 \rightarrow X$. Note that the full subcategory $N_\bullet(\mathcal{K}_+) \subset N_\bullet(\mathcal{K})$ is coreflective, so the inclusion map $N_\bullet(\mathcal{K}_+) \hookrightarrow N_\bullet(\mathcal{K})$ is left cofinal (Corollary 7.2.3.7). It follows that an object of $\mathcal{C}$ is an equalizer of g_0 and g_1 if and only if it is a limit of the diagram q (Corollary 7.2.2.11).

To complete the proof, it will suffice to show that an object of $\mathcal{C}$ is a limit of q if and only if it is a fiber product of X_0 with X_1 over X . Let $\mathcal{K}_- \subseteq \mathcal{K}$ denote the full subcategory

spanned by the objects Y_0 , Y_1 , and Y . By virtue of Corollaries 7.3.8.3 and 7.3.8.19, it will suffice to show that the functor q is right Kan extended from $N_\bullet(\mathcal{K}_-)$. Equivalently, we wish to show that the natural map

$$N_\bullet(\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/})^\triangleleft \rightarrow N_\bullet(\mathcal{K}) \xrightarrow{q} \mathcal{C}$$

is a limit diagram in $\mathcal{C}$. Unwinding the definitions, we see that $\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/}$ can be written as a disjoint union of subcategories having initial objects Y_0 and Y_1 , respectively. In particular, the inclusion map

$$\{Y_0, Y_1\} \hookrightarrow N_\bullet(\mathcal{K}_- \times_{\mathcal{K}} \mathcal{K}_{Y_{01}/})$$

is left cofinal. The desired result now follows from Corollary 7.2.2.3, together with our assumption that the maps π_0 and π_1 exhibit $X_0 \times X_1$ as a product of X_0 with X_1 . $\square$

Exercise 7.6.4.24. In the situation of Proposition 7.6.4.23, suppose that X_0 and X_1 admit 03HE a fiber product over X . Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which preserves the product of X_0 and X_1 (that is, $F(\pi_0)$ and $F(\pi_1)$ exhibit $F(X_0 \times X_1)$ as a product of $F(X_0)$ with $F(X_1)$ in the ∞ -category $\mathcal{D}$). Show that F preserves the fiber product of X_0 with X_1 over X if and only if it preserves the equalizer of the morphisms g_0 and g_1 .

Corollary 7.6.4.25. Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ admits finite limits if and only if 03HF it admits finite products and equalizers. If these conditions are satisfied, then a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves finite limits if and only if it preserves finite products and equalizers.

Proof. Combine Corollary 7.6.2.30 with Proposition 7.6.4.23 (and Exercise 7.6.4.24). $\square$

7.6.5 Sequential Limits and Colimits

Throughout this section, we let $\mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, endowed 03HG with its usual ordering.

Definition 7.6.5.1 (Towers). Let $\mathcal{C}$ be an ∞ -category. A *tower* in $\mathcal{C}$ is a functor $N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow$ 03HH $\mathcal{C}$. We say that $\mathcal{C}$ is *sequentially complete* if every tower in $\mathcal{C}$ has a limit, and that $\mathcal{C}$ is *sequentially cocomplete* if every diagram $N_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$ has a colimit. We say that a functor of ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ *preserves sequential limits* if it preserves limits indexed by the simplicial set $N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}})$, and that it *preserves sequential colimits* if it preserves colimits indexed by the simplicial set $N_\bullet(\mathbf{Z}_{\geq 0})$.

Notation 7.6.5.2. Let $\mathcal{C}$ be an ∞ -category. We will generally abuse notation by identifying 03HJ a functor $X : N_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$ with the collection of objects $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n+1) \rightarrow X(n)$ obtained by the evaluating X on the edges of $N_\bullet(\mathbf{Z}_{\geq 0})$ corresponding

to ordered pairs of the form $(n, n + 1)$; we will depict the pair $(\{X(n)\}_{n \geq 0}, \{f_n\}_{n \geq 0})$ as a diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

Similarly, we abuse notation by identifying towers $X : \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$ with diagrams

$$\cdots \rightarrow X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

Beware that the convention of Notation 7.6.5.2 is slightly abusive: the simplicial set $\mathbf{N}_\bullet(\mathbf{Z}_{\geq 0})$ has nondegenerate simplices in every dimension, so a functor $X : \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$ is not literally determined by its underlying diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

However, the abuse is essentially harmless:

03HK Remark 7.6.5.3. Let $\text{Spine}[\mathbf{Z}_{\geq 0}]$ denote the simplicial subset of $\mathbf{N}_\bullet(\mathbf{Z}_{\geq 0})$ whose k -simplices are sequences of nonnegative integers $(n_0, n_1, \dots, n_k)$ satisfying $n_0 \leq n_1 \leq \cdots \leq n_k \leq n_0 + 1$. Then $\text{Spine}[\mathbf{Z}_{\geq 0}]$ is a 1-dimensional simplicial set, which corresponds (under the equivalence of Proposition 1.1.6.9) to the directed graph G indicated in the diagram

$$0 \rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow \cdots.$$

Moreover, the linearly ordered set $(\mathbf{Z}_{\geq 0}, \leq)$ can be identified with the path category $\text{Path}[G]$ of Construction 1.3.7.1. It follows that the inclusion map $\text{Spine}[\mathbf{Z}_{\geq 0}] \hookrightarrow \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0})$ is inner anodyne (Proposition 1.5.7.3).

In particular, for any ∞ -category $\mathcal{C}$, the restriction map

$$\text{Fun}(\mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}), \mathcal{C}) \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}_{\geq 0}], \mathcal{C})$$

is a trivial Kan fibration (Theorem 1.5.7.1). Stated more informally, every sequence of composable morphisms

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

admits an *essentially unique* extension to a functor $\mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{C}$.

03HL Example 7.6.5.4. Let $\mathcal{C}$ be a locally Kan simplicial category, and suppose we are given a collection of objects $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n) \rightarrow X(n + 1)$ in $\mathcal{C}$. It follows from Remark 7.6.5.3 that the diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \xrightarrow{f_3} X(4) \rightarrow \cdots$$

can be extended to a functor $\mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathbf{N}_\bullet^{\text{hc}}(\mathcal{C})$. In fact, there is a preferred choice of such an extension, which is uniquely determined by the requirement that it factors through the inclusion map $\mathbf{N}_\bullet(\mathcal{C}) \hookrightarrow \mathbf{N}_\bullet^{\text{hc}}(\mathcal{C})$.

Remark 7.6.5.5. Let $\mathcal{C}$ be an ∞ -category, and suppose we are given a tower $X : \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$, which we depict as a diagram

$$\cdots \rightarrow X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0),$$

having a limit $\varprojlim(X)$. Then, for every object $Y \in \mathcal{C}$, the map of sets

$$\theta : \text{Hom}_{\text{h}\mathcal{C}}(Y, \varprojlim(X)) \rightarrow \varprojlim(\text{Hom}_{\text{h}\mathcal{C}}(Y, X(n)))$$

is surjective. To prove this, suppose we are given a collection of morphisms $g_n : Y \rightarrow X(n)$ satisfying $[f_n] \circ [g_{n+1}] = [g_n]$ in the homotopy category $\text{h}\mathcal{C}$. Then, for each $n \geq 0$, we can choose a 2-simplex σ_n in $\mathcal{C}$ as indicated in the diagram

$$\begin{array}{ccc} & X(n+1) & \\ g_{n+1} \nearrow & & \searrow f_n \\ Y & \xrightarrow{g_n} & X(n). \end{array}$$

Let X_0 denote the restriction of X to the spine $\text{Spine}[\mathbf{Z}_{\geq 0}^{\text{op}}] \subset \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}})$. Then the collection of 2-simplices $\{\sigma_n\}_{n \geq 0}$ determines an extension of X_0 to a diagram $\bar{X}_0 : \text{Spine}[\mathbf{Z}_{\geq 0}^{\text{op}}]^\triangleleft \rightarrow \mathcal{C}$ carrying the cone point to the object Y . The isomorphism class of this extension can be identified with a morphism $[g] : Y \rightarrow \varprojlim(X_0) \simeq \varprojlim(X)$ in the homotopy category $\text{h}\mathcal{C}$, which is a preimage of the sequence $\{[g_n]\}_{n \geq 0}$ under the function θ .

Warning 7.6.5.6. In the situation of Remark 7.6.5.5, the map

03HN

$$\theta : \text{Hom}_{\text{h}\mathcal{C}}(Y, \varprojlim(X)) \rightarrow \varprojlim(\text{Hom}_{\text{h}\mathcal{C}}(Y, X(n)))$$

need not be injective. That is, the forgetful functor $\mathcal{C} \rightarrow \mathbf{N}_\bullet(\text{h}\mathcal{C})$ generally does not preserve sequential limits (or colimits).

Example 7.6.5.7. Fix a prime number p . For every integer $n \geq 0$, let $p^n \mathbf{Z}$ denote the cyclic subgroup of $\mathbf{Z}$ generated by p^n , so that we have a tower of classifying simplicial sets

$$\cdots \longrightarrow B_\bullet(p^3 \mathbf{Z}) \longrightarrow B_\bullet(p^2 \mathbf{Z}) \longrightarrow B_\bullet(p \mathbf{Z}) \longrightarrow B_\bullet(\mathbf{Z}). \quad (7.74) \quad 03HQ$$

Then:

- The tower (7.74) has a limit in the ordinary category of simplicial sets, given by the simplicial set Δ^0 (which we can identify with the classifying simplicial set for the trivial group $(0) = \bigcap_{n \geq 0} p^n \mathbf{Z}$).

- The simplicial set Δ^0 is also a limit of the tower (7.74) in the homotopy category $\mathbf{hKan}$.
- In the ∞ -category $\mathcal{S}$, the tower (7.74) has a different limit, which has uncountably many connected components (see Remark [?]).

We now give some easy examples of sequential limits and colimits.

03HR Example 7.6.5.8 (Sequential Colimits in $\mathcal{QC}$). Suppose we are given a collection of ∞ -categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n) \rightarrow \mathcal{C}(n+1)$, which we view as a diagram

$$\mathcal{C}(0) \xrightarrow{F_0} \mathcal{C}(1) \xrightarrow{F_1} \mathcal{C}(2) \xrightarrow{F_2} \mathcal{C}(3) \rightarrow \cdots$$

Let $\varinjlim_n \mathcal{C}(n)$ denote the colimit of this diagram (formed in the ordinary category of simplicial sets). Then $\varinjlim_n \mathcal{C}(n)$ is also an ∞ -category, which is also a colimit of the associated diagram $N_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{QC}$. This is a special case of Corollary 9.1.6.3.

03HS Variant 7.6.5.9 (Sequential Colimits in $\mathcal{S}$). Suppose we are given a collection of Kan complexes $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n) \rightarrow X(n+1)$, which we view as a diagram

$$X(0) \xrightarrow{f_0} X(1) \xrightarrow{f_1} X(2) \xrightarrow{f_2} X(3) \rightarrow \cdots$$

Let $\varinjlim_n X(n)$ denote the colimit of this diagram (formed in the ordinary category of simplicial sets). Then $\varinjlim_n X(n)$ is also a Kan complex, which is also a colimit of the associated diagram $N_\bullet(\mathbf{Z}_{\geq 0}) \rightarrow \mathcal{S}$. See Variant 9.1.6.4.

03HT Example 7.6.5.10 (Towers of Isofibrations). Suppose we are given a collection of ∞ -categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n+1) \rightarrow \mathcal{C}(n)$, which we view as a tower

$$\cdots \rightarrow \mathcal{C}(4) \xrightarrow{F_3} \mathcal{C}(3) \xrightarrow{F_2} \mathcal{C}(2) \xrightarrow{F_1} \mathcal{C}(1) \xrightarrow{F_0} \mathcal{C}(0)$$

If each of the functors F_n is an isofibration, then the limit $\varprojlim_n \mathcal{C}(n)$ (formed in the ordinary category of simplicial sets) is also an ∞ -category, which can be also be viewed as a limit of the associated tower $N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{QC}$. This follows by combining Example 4.5.6.8, Example 7.5.5.3, and Proposition 7.5.5.7.

03HU Variant 7.6.5.11 (Towers of Kan Fibrations). Suppose we are given a collection of Kan complexes $\{X(n)\}_{n \geq 0}$ and morphisms $f_n : X(n+1) \rightarrow X(n)$, which we view as a tower

$$\cdots \rightarrow X(4) \xrightarrow{f_3} X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

If each of the morphisms f_n is a Kan fibration, then the limit $\varprojlim_n X(n)$ (formed in the ordinary category of simplicial sets) is also a Kan complex, which can be also be viewed as a limit of the associated tower $N_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{S}$ (combine Example 7.6.5.10 with Remark 7.4.4.4).

Variante 7.6.5.12 (Limits of General Towers). Suppose we are given a sequence of ∞ -categories $\{\mathcal{C}(n)\}_{n \geq 0}$ and functors $F_n : \mathcal{C}(n+1) \rightarrow \mathcal{C}(n)$, which we view as a tower

$$\cdots \rightarrow \mathcal{C}(4) \xrightarrow{F_3} \mathcal{C}(3) \xrightarrow{F_2} \mathcal{C}(2) \xrightarrow{F_1} \mathcal{C}(1) \xrightarrow{F_0} \mathcal{C}(0) \quad (7.75) \quad \text{03HW}$$

If the functors F_n are not assumed to be isofibrations, then the limit $\varprojlim_n \mathcal{C}(n)$ (formed in the ordinary category of simplicial sets) might not be a limit of the associated tower in $\mathcal{QC}$ (for example, $\varprojlim_n \mathcal{C}(n)$ might fail to be an ∞ -category). Nevertheless, we can always compute the relevant limit in $\mathcal{QC}$ by replacing (7.75) by a levelwise equivalent diagram of ∞ -categories in which the transition functors are isofibrations. For example, we can replace (7.75) by the isofibrant tower of iterated homotopy fiber products

$$\cdots \rightarrow \mathcal{C}(2) \times_{\mathcal{C}(1)}^h (\mathcal{C}(1) \times_{\mathcal{C}(0)}^h \mathcal{C}(0)) \rightarrow \mathcal{C}(1) \times_{\mathcal{C}(0)}^h \mathcal{C}(0) \rightarrow \mathcal{C}(0).$$

Let us denote the limit of this tower (in the category of simplicial sets) by

$$\cdots \times_{\mathcal{C}(3)}^h \mathcal{C}(3) \times_{\mathcal{C}(2)}^h \mathcal{C}(2) \times_{\mathcal{C}(1)}^h \mathcal{C}(1) \times_{\mathcal{C}(0)}^h \mathcal{C}(0).$$

It is an ∞ -category whose objects can be identified with sequences of pairs $\{(C_n, \alpha_n)\}_{n \geq 0}$, where each C_n is an object of the ∞ -category $\mathcal{C}(n)$ and each $\alpha_n : F_n(C_{n+1}) \xrightarrow{\sim} C_n$ is an isomorphism in the ∞ -category $\mathcal{C}(n)$. Combining Example 7.6.5.10 with Remark 7.1.1.8, we see that it can be identified with a limit of the diagram (7.75) in the ∞ -category $\mathcal{QC}$.

Sequential limits are useful for building more complicated types of limits.

Proposition 7.6.5.13. *Suppose we are given a diagram of simplicial sets*

03HX

$$K(0) \rightarrow K(1) \rightarrow K(2) \rightarrow K(3) \rightarrow \cdots$$

having colimit K . Let $\mathcal{C}$ be an ∞ -category and let $f : K \rightarrow \mathcal{C}$ be a diagram, corresponding to a compatible sequence of diagrams $f_n : K(n) \rightarrow \mathcal{C}$. Suppose that each of the diagrams f_n admits a limit in $\mathcal{C}$. Then there exists a tower $X : \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$ with the following properties:

- (1) For each $n \geq 0$, the object $X(n) \in \mathcal{C}$ is a limit of the diagram f_n .
- (2) An object of $\mathcal{C}$ is a limit of the diagram f if and only if it is a limit of the tower X . In particular, the diagram f has a limit if and only if the tower X has a limit.
- (3) Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which preserves the limits of each of the diagrams f_n . Then F preserves limits of the diagram f if and only if it preserves limits of the tower X .

Proof. Combine Propositions 7.5.8.12 and 9.1.6.1. □

03HY **Corollary 7.6.5.14.** *Suppose we are given a diagram of simplicial sets*

$$K(0) \rightarrow K(1) \rightarrow K(2) \rightarrow K(3) \rightarrow \cdots$$

having colimit K , and let $\mathcal{C}$ be a sequentially complete ∞ -category which admits $K(n)$ -indexed limits, for each $n \geq 0$. Then $\mathcal{C}$ admits K -indexed colimits. If $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories which preserves sequential limits and $K(n)$ -indexed limits for each $n \geq 0$, then it also preserves K -indexed limits.

03HZ **Example 7.6.5.15.** Let $\mathcal{C}$ be an ∞ -category which admits finite products. If $\mathcal{C}$ is sequentially complete, then it also admits countable products. More precisely, for any countable collection of objects $\{X_n\}_{n \geq 0}$ of $\mathcal{C}$, the product $\prod_{n \geq 0} X_n$ can be computed as the limit of a tower

$$\cdots \rightarrow X_2 \times X_1 \times X_0 \rightarrow X_1 \times X_0 \rightarrow X_0.$$

We now establish a partial converse to Example 7.6.5.15. Let $\mathcal{C}$ be an ∞ -category which admits countable products, and suppose that we are given a tower

$$\cdots \rightarrow X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0)$$

in $\mathcal{C}$. Then the collection of morphisms $\{f_n\}_{n \geq 0}$ determine an endomorphism f of the product $P = \prod_{n \geq 0} X(n)$, given informally by the composition

$$\begin{aligned} P &= \prod_{n \geq 0} X(n) \\ &\rightarrow \prod_{n > 0} X(n) \\ &= \prod_{m \geq 0} X(m+1) \\ &\xrightarrow{\prod_{m \geq 0} f_m} \prod_{m \geq 0} X(m) \\ &= P. \end{aligned}$$

In this case, we can identify limits of the tower X with equalizers of the pair of morphisms $f, \text{id}_P : P \rightarrow P$. We can formulate this assertion more precisely as follows:

03J0 **Proposition 7.6.5.16** (Sequential Limits as Equalizers). *Let $\mathcal{C}$ be an ∞ -category and let $X : \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow \mathcal{C}$ be a tower, which we identify with the diagram*

$$\cdots \rightarrow X(3) \xrightarrow{f_2} X(2) \xrightarrow{f_1} X(1) \xrightarrow{f_0} X(0).$$

Suppose that there exists an object $P \in \mathcal{C}$ equipped with morphisms $\{q_n : P \rightarrow X(n)\}_{n \geq 0}$ which exhibits P as a product of the collection $\{X(n)\}_{n \geq 0}$. Then:

(1) *There exists a morphism $f : P \rightarrow P$ with the property that, for each $n \geq 0$, the diagram*

$$\begin{array}{ccc}
 P & \xrightarrow{[f]} & P \\
 \downarrow [q_{n+1}] & & \downarrow [q_n] \\
 X(n+1) & \xrightarrow{[f_n]} & X(n)
 \end{array}
 \tag{7.76}$$

commutes in the homotopy category $\mathbf{hC}$. Moreover, the morphism f is uniquely determined up to homotopy.

(2) *An object of $\mathcal{C}$ is a limit of the tower X if and only if it is an equalizer of the pair of morphisms $f, \text{id}_P : P \rightarrow P$.*

Proof. Assertion (1) follows immediately from the definitions (see Warning 7.6.1.12). To prove (2), let $M = \mathbf{Z}_{\geq 0}$ denote the set of nonnegative integers, which we regard as a commutative monoid with respect to addition. Let BM denote the associated category (consisting of a single object E having endomorphism monoid $\text{Hom}_{BM}(E, E) = M$) and let $B_\bullet M$ denote the nerve of BM (Construction 1.3.2.5). There is a functor of ordinary categories $(\mathbf{Z}_{\geq 0}, \leq)^{\text{op}} \rightarrow BM$ which is characterized by the requirement that, for every pair of nonnegative integers $m \leq n$, the induced map

$$\text{Hom}_{\mathbf{Z}_{\geq 0}}(m, n) \rightarrow \text{Hom}_{BM}(E, E) = M$$

carries the unique element of $\text{Hom}_{\mathbf{Z}_{\geq 0}}(m, n)$ to the difference $n - m \in M$. Passing to nerves, we obtain a functor of ∞ -categories $U : \mathbf{N}_\bullet(\mathbf{Z}_{\geq 0}^{\text{op}}) \rightarrow B_\bullet M$. The functor U is a cartesian fibration, whose fiber over the vertex $E \in B_\bullet M$ can be identified with the discrete simplicial set $\{0, 1, 2, \dots\}$. Applying Corollary 7.3.4.8, we deduce that there exists a functor $Y : B_\bullet M \rightarrow \mathcal{C}$ and a natural transformation $\alpha : Y \circ U \rightarrow X$ which exhibits Y as a right Kan extension of X along U .

For every nonnegative integer n , α induces a morphism $\alpha_n : Y(E) \rightarrow X(n)$ in the ∞ -category $\mathcal{C}$. Using the criterion of Proposition 7.3.4.1, we see that the collection of morphisms $\{\alpha_n\}_{n \geq 0}$ exhibit $Y(E)$ as a product of the collection of objects $\{X(n)\}_{n \geq 0}$. We may therefore assume without loss of generality that $P = Y(E)$ and $q_n = \alpha_n$, for each $n \geq 0$. Let $f : P \rightarrow P$ be the morphism obtained by evaluating the functor Y on the generator $1 \in M$. For each $n \geq 0$, the natural transformation α carries the edge $n+1 \rightarrow n$ of $\mathbf{N}_\bullet(\mathbf{Z}_{\geq 0})$

to a commutative diagram

$$\begin{array}{ccc} P & \xrightarrow{f} & P \\ \downarrow q_{n+1} & & \downarrow q_n \\ X(n+1) & \xrightarrow{f_n} & X(n) \end{array}$$

in the ∞ -category $\mathcal{C}$, which witnesses the commutativity of the diagram (7.76) in the homotopy category $\mathrm{h}\mathcal{C}$. Moreover, an object $C \in \mathcal{C}$ is an equalizer of the pair of morphisms $f, \mathrm{id}_P : P \rightarrow P$ if and only if it is a limit of the diagram Y (Variant 7.6.4.9). To prove (2), it suffices to observe that this is equivalent to the requirement that C is a limit of the tower X , which follows from Corollary 7.3.8.25. $\square$

03J2 **Remark 7.6.5.17.** In the situation of Proposition 7.6.5.16, suppose that $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories which preserves the product of the collection $\{X(n)\}_{n \geq 0}$. Then F preserves limits of the tower X if and only if it preserves equalizers of the pair of morphisms $f, \mathrm{id}_P : P \rightarrow P$.

7.6.6 Completeness and Cocompleteness

03UC We now study ∞ -categories which have an abundant supply of limits and colimits.

06B7 **Definition 7.6.6.1.** Let $\mathcal{C}$ be an ∞ -category. We say that $\mathcal{C}$ is *complete* if it admits K -indexed limits, for every small simplicial set K . We say that $\mathcal{C}$ is *cocomplete* if it admits K -indexed colimits, for every small simplicial set K .

06B8 **Example 7.6.6.2.** Let $\mathcal{S}$ denote the ∞ -category of spaces (Construction 5.5.1.1). Then $\mathcal{S}$ is complete (Corollary 7.4.1.3) and cocomplete (Corollary 7.4.3.3).

06B9 **Example 7.6.6.3.** Let $\mathcal{QC}$ denote the ∞ -category of (small) ∞ -categories (Construction 5.5.4.1). Then $\mathcal{QC}$ is complete (Corollary 7.4.4.3) and cocomplete (Corollary 7.4.5.3).

Definition 7.6.6.1 has a counterpart for functors between ∞ -categories:

06BA **Definition 7.6.6.4.** Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories. We say that a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is *continuous* if it preserves K -indexed limits, for every small simplicial set K . We say that F is *cocontinuous* if it preserves K -indexed colimits, for every small simplicial set K .

06BB **Notation 7.6.6.5.** Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories. We let $\mathrm{Fun}^{\mathrm{cont}}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by the continuous functors from $\mathcal{C}$ to $\mathcal{D}$, and $\mathrm{Fun}^{\mathrm{cocont}}(\mathcal{C}, \mathcal{D})$ the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by the cocontinuous functors from $\mathcal{C}$ to $\mathcal{D}$.

It will sometimes be useful to consider generalizations of Definitions 7.6.6.1 and 7.6.6.4.

Definition 7.6.6.6. Let κ be an infinite cardinal. We say that an ∞ -category $\mathcal{C}$ is κ -complete 03UD if it admits K -indexed limits, for every κ -small simplicial set K . We say that $\mathcal{C}$ is κ -cocomplete if it admits K -indexed colimits, for every κ -small simplicial set K .

We say that a functor of ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ is κ -continuous if it preserves K -indexed limits, for every κ -small simplicial set K . We say that F is κ -cocontinuous if it preserves K -indexed colimits, for every κ -small simplicial set K .

Notation 7.6.6.7. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories and let κ be an infinite cardinal. We 04BC let $\mathrm{Fun}^{\kappa\text{-cont}}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by the κ -continuous functors from $\mathcal{C}$ to $\mathcal{D}$, and $\mathrm{Fun}^{\kappa\text{-cocont}}(\mathcal{C}, \mathcal{D})$ the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by the κ -cocontinuous functors from $\mathcal{C}$ to $\mathcal{D}$.

Example 7.6.6.8. An ∞ -category $\mathcal{C}$ admits finite limits if and only if it is $\aleph_0$ -complete, in 03UF the sense of Definition 7.6.6.6. Similarly, a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ preserves finite limits if and only if it is $\aleph_0$ -continuous.

Example 7.6.6.9. Following the convention of Remark 4.7.0.5, an ∞ -category $\mathcal{C}$ is complete 06BC (in the sense of Definition 7.6.6.1) if and only if it is Ω -complete (in the sense of Definition 7.6.6.6), where Ω is a fixed strongly inaccessible cardinal. Similarly, a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is continuous (in the sense of Definition 7.6.6.4) if and only if it is Ω -continuous.

Example 7.6.6.10. Let λ be an uncountable cardinal and let $\kappa = \mathrm{cf}(\lambda)$ denote its cofinality. 03UK Let $\mathcal{S}_{<\lambda}$ denote the ∞ -category of λ -small spaces (Variant 5.5.4.13) and let $\mathcal{QC}_{<\lambda}$ denote the ∞ -category of λ -small ∞ -categories (Variant 5.5.4.11). Then the ∞ -categories $\mathcal{S}_{<\lambda}$ and $\mathcal{QC}_{<\lambda}$ are κ -cocomplete. Moreover, for every cardinal $\mu \geq \lambda$, the inclusion functors

$$\mathcal{S}_{<\lambda} \hookrightarrow \mathcal{S}_{<\mu} \quad \mathcal{QC}_{<\lambda} \hookrightarrow \mathcal{QC}_{<\mu}$$

are κ -cocontinuous. See Corollaries 7.4.5.22 and 7.4.3.8.

Example 7.6.6.11. Let λ be an uncountable cardinal and let $\kappa = \mathrm{ecf}(\lambda)$ be its exponential 03UG cofinality (see Definition 4.7.3.16). Then the ∞ -categories $\mathcal{S}_{<\lambda}$ and $\mathcal{QC}_{<\lambda}$ are κ -complete. Moreover, for every cardinal $\mu \geq \lambda$, the inclusion functors

$$\mathcal{S}_{<\lambda} \hookrightarrow \mathcal{S}_{<\mu} \quad \mathcal{QC}_{<\lambda} \hookrightarrow \mathcal{QC}_{<\mu}$$

are κ -continuous. See Variants 7.4.1.15 and 7.4.4.14.

Remark 7.6.6.12. Let $\mathcal{C}$ be an ∞ -category and let λ be an infinite cardinal. If $\mathcal{C}$ is λ - 03UE complete, then it is also κ -complete for each infinite cardinal $\kappa < \lambda$. Similarly, if $F : \mathcal{C} \rightarrow \mathcal{D}$ is λ -continuous, then it is also κ -continuous for each $\kappa < \lambda$. The converse assertions hold if λ is an uncountable limit cardinal (since, in that case, every λ -small simplicial set K is κ -small for some $\kappa < \lambda$).

03UH **Remark 7.6.6.13.** Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category. The following conditions are equivalent:

- The ∞ -category $\mathcal{C}$ is κ -complete: that is, it admits K -indexed limits for every κ -small simplicial set K .
- The ∞ -category $\mathcal{C}$ admits K -indexed limits, for every simplicial set K which is essentially κ -small.

Moreover, in either case, it suffices to consider the case where K is an ∞ -category. See Remark 7.1.1.16 and Proposition 4.7.5.5. Similarly, a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is κ -continuous if and only if it preserves K -indexed limits, for every simplicial set K which is essentially κ -small (and it again suffices to consider the case where K is an ∞ -category).

03UL **Proposition 7.6.6.14.** *Let $\mathcal{C}$ be an ∞ -category and let κ be an infinite cardinal. Then $\mathcal{C}$ is κ -complete if and only if it satisfies the following conditions:*

- (1) *The ∞ -category $\mathcal{C}$ admits κ -small products. That is, every collection of objects $\{X_j\}_{j \in J}$ indexed by a κ -small set J admits a product in $\mathcal{C}$.*
- (2) *The ∞ -category $\mathcal{C}$ admits finite limits.*

Proof. Assume that $\mathcal{C}$ satisfies conditions (1) and (2); we wish to show that $\mathcal{C}$ is κ -complete (the converse is immediate from the definitions). Let S be a κ -small simplicial set; we wish to show that $\mathcal{C}$ admits S -indexed limits. If $\kappa = \aleph_0$, this follows immediately from assumption (2) (Example 7.6.6.8). We may therefore assume that κ is uncountable, so that $\mathcal{C}$ admits countable products.

For each $n \geq 0$, let $\mathrm{sk}_n(S)$ denote the n -skeleton of S (Construction 1.1.4.1), so that $S = \bigcup_n \mathrm{sk}_n(S)$. It follows from Proposition 7.6.5.16 that $\mathcal{C}$ is sequentially complete. Consequently, to show that $\mathcal{C}$ admits S -indexed limits, it will suffice to show that it admits $\mathrm{sk}_n(S)$ -indexed limits, for each $n \geq 0$ (Corollary 7.6.5.14). We may therefore assume without loss of generality that the simplicial set S has finite dimension. We proceed by induction on the dimension n of S . If $n = -1$, then S is empty and the desired result is immediate. Assume that $n \geq 0$ and let $\{\sigma_j\}_{j \in J}$ denote the collection of nondegenerate n -simplices of S , so that Proposition 1.1.4.12 supplies a pushout diagram of simplicial sets

$$\begin{array}{ccc} \coprod_{j \in J} \partial \Delta^n & \longrightarrow & \coprod_{j \in J} \Delta^n \\ \downarrow & & \downarrow \\ \mathrm{sk}_{n-1}(S) & \longrightarrow & \mathrm{sk}_n(S). \end{array}$$

Since the horizontal maps in this diagram are monomorphisms, it is also a categorical pushout square (Example 4.5.4.12). By virtue of Proposition 7.6.2.29, it will suffice to show that $\mathcal{C}$ admits limits indexed by the simplicial sets $\mathrm{sk}_{n-1}(S)$, $J \times \partial\Delta^n$, and $J \times \Delta^n$. In the first two cases, this follows from our inductive hypothesis. To handle the third case, we can use assumption (1) and Corollary 7.6.1.22 to reduce to showing that the ∞ -category $\mathcal{C}$ admits Δ^n -indexed limits. This is clear, since the simplicial set Δ^n is an ∞ -category containing an initial object (see Corollary 7.2.2.12). $\square$

Remark 7.6.6.15. In the situation of Proposition 7.6.6.14, we can replace (2) by either of the following *a priori* weaker conditions:

(2') The ∞ -category $\mathcal{C}$ admits pullbacks.

(2'') The ∞ -category $\mathcal{C}$ admits equalizers.

See Corollary 7.6.2.30 and 7.6.4.25.

Exercise 7.6.6.16. Let κ be an infinite cardinal, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and suppose that $\mathcal{C}$ is κ -complete. Show that F is κ -continuous if and only if it preserves finite limits and κ -small products.

Corollary 7.6.6.17. Let $\mathcal{C}$ be an ∞ -category and let λ be an infinite cardinal which is not regular. The following conditions are equivalent:

(1) The ∞ -category $\mathcal{C}$ is λ -complete.

(2) For every infinite cardinal $\kappa < \lambda$, the ∞ -category $\mathcal{C}$ is κ -complete.

(3) The ∞ -category $\mathcal{C}$ is λ^+ -complete, where λ^+ denotes the successor cardinal of λ .

By virtue of Corollary 7.6.6.17, little information is lost by restricting the use of Definition 7.6.6.6 to the case where κ is a regular cardinal.

Proof of Corollary 7.6.6.17. The equivalence (1) $\Leftrightarrow$ (2) and the implication (3) $\Rightarrow$ (1) follow from Remark 7.6.6.12. We will complete the proof by showing that (1) implies (3). Assume that $\mathcal{C}$ is λ -complete; we wish to show that it is λ^+ -complete. By virtue of Proposition 7.6.6.14, it will suffice to show that every collection of objects $\{X_i\}_{i \in I}$ admits a product in $\mathcal{C}$, provided that the index set I has cardinality $\leq \lambda$. Our assumption that λ is not regular guarantees that we can decompose I as a disjoint union of λ -small subsets $\{I_j \subseteq I\}_{j \in J}$, where the index set J is λ -small. It follows from (1) that $\mathcal{C}$ admits J -indexed products and also that it admits I_j -indexed products for each $j \in J$, and therefore admits I -indexed products by virtue of Corollary 7.6.1.22. $\square$

The existence of κ -small limits can be used to prove the existence of a large class of Kan extensions.

03UP Proposition 7.6.6.18. *Let κ be an uncountable regular cardinal and let K be a simplicial set which is essentially κ -small. Suppose we are given a pair of ∞ -categories $\mathcal{C}$ and $\mathcal{D}$, together with diagrams $\delta : K \rightarrow \mathcal{C}$ and $F_0 : K \rightarrow \mathcal{D}$. Suppose that $\mathcal{C}$ is locally κ -small and that $\mathcal{D}$ is κ -complete. Then F_0 admits a right Kan extension along δ .*

Proof. By virtue of Proposition 7.3.5.1, it will suffice to show that for every object $C \in \mathcal{C}$, the composite map

$$K \times_{\mathcal{C}} \mathcal{C}_{C/} \rightarrow K \xrightarrow{F_0} \mathcal{D}$$

admits a limit in the ∞ -category $\mathcal{D}$. Note that the projection map $K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is a left fibration of simplicial sets (Proposition 4.3.6.1), whose fiber over each vertex $x \in K$ can be identified with the Kan complex $\mathrm{Hom}_{\mathcal{C}}^{\mathrm{L}}(C, \delta(x))$. Invoking Proposition 4.6.5.10, we see that $\mathrm{Hom}_{\mathcal{C}}^{\mathrm{L}}(C, \delta(x))$ is homotopy equivalent to the morphism space $\mathrm{Hom}_{\mathcal{C}}(C, \delta(x))$, and is therefore essentially κ -small (by virtue of our assumption that $\mathcal{C}$ is locally κ -small). Since K is essentially κ -small, Corollary 5.6.7.7 implies that the simplicial set $K \times_{\mathcal{C}} \mathcal{C}_{C/}$ is essentially κ -small. The desired result now follows from our assumption that $\mathcal{D}$ is κ -complete (Remark 7.6.6.13). $\square$

For later use, we record a further generalization of Definition 7.6.6.6.

06BD Definition 7.6.6.19. Let $\mathbb{K}$ be a collection of simplicial sets. We say that an ∞ -category $\mathcal{C}$ is $\mathbb{K}$ -complete if it admits K -indexed limits, for each $K \in \mathbb{K}$. We say that $\mathcal{C}$ is $\mathbb{K}$ -cocomplete if it admits K -indexed colimits, for each $K \in \mathbb{K}$.

048G Remark 7.6.6.20. Let $\mathbb{K}$ be a collection of simplicial sets and let $\mathcal{C}$ be an ∞ -category which is $\mathbb{K}$ -complete. Then, for every simplicial set B , the diagram ∞ -category $\mathrm{Fun}(B, \mathcal{C})$ is also $\mathbb{K}$ -complete. Similarly, if $\mathcal{C}$ is $\mathbb{K}$ -cocomplete, then $\mathrm{Fun}(B, \mathcal{C})$ is also $\mathbb{K}$ -cocomplete. See Proposition 7.1.8.2.

06BE Definition 7.6.6.21. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories and let $\mathbb{K}$ be a collection of simplicial sets. We say that a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ is $\mathbb{K}$ -continuous if it preserves K -indexed limits, for each $K \in \mathbb{K}$. We say that F is $\mathbb{K}$ -cocontinuous if it preserves K -indexed colimits, for each $K \in \mathbb{K}$. We let $\mathrm{Fun}^{\mathbb{K}\text{-cont}}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by the $\mathbb{K}$ -continuous functors from $\mathcal{C}$ to $\mathcal{D}$, and $\mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\mathcal{C}, \mathcal{D})$ the full subcategory spanned by the $\mathbb{K}$ -cocontinuous functors from $\mathcal{C}$ to $\mathcal{D}$.

06BF Remark 7.6.6.22 (Limits of Continuous Functors). Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories, let $\mathbb{K}$ be a collection of simplicial sets, and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor which is the levelwise limit of a diagram

$$B \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \quad b \mapsto F_b.$$

If each of the functors $F_b : \mathcal{C} \rightarrow \mathcal{D}$ is $\mathbb{K}$ -continuous, then F is also $\mathbb{K}$ -continuous. Stated more informally, the collection of $\mathbb{K}$ -continuous functors is closed under (levelwise) limits in $\text{Fun}(\mathcal{C}, \mathcal{D})$. Similarly, the collection of $\mathbb{K}$ -cocontinuous functors is closed under (levelwise) colimits in $\text{Fun}(\mathcal{C}, \mathcal{D})$. See Corollary 7.3.8.7.

The following is a reformulation of Corollary 7.4.4.17:

Proposition 7.6.6.23. *Let λ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which arises as the limit of a diagram* 06BG

$$A \rightarrow \mathcal{QC} \quad (\alpha \in A) \mapsto \mathcal{C}_\alpha.$$

Assume that:

- (a) For each vertex $\alpha \in A$, the ∞ -category $\mathcal{C}_\alpha$ is $\mathbb{K}$ -complete.
- (b) For each edge $e : \alpha \rightarrow \alpha'$ of A , the transition map $\mathcal{C}_\alpha \rightarrow \mathcal{C}_{\alpha'}$ is a $\mathbb{K}$ -continuous functor.

Then the ∞ -category $\mathcal{C}$ is $\mathbb{K}$ -complete. Moreover, a functor of ∞ -categories $F : \mathcal{D} \rightarrow \mathcal{C}$ is $\mathbb{K}$ -continuous if and only if, for each vertex $\alpha \in A$, the composite functor $F : \mathcal{D} \rightarrow \mathcal{C} \rightarrow \mathcal{C}_\alpha$ is $\mathbb{K}$ -continuous.

Remark 7.6.6.24. In the statement of Proposition 7.6.6.23, we have implicitly assumed that the ∞ -categories $\mathcal{C}$ and $\mathcal{C}_\alpha$ are small. However, the same conclusion holds if we replace $\mathcal{QC}$ by the ∞ -category $\mathcal{QC}_{<\lambda}$ of λ -small ∞ -categories, for any uncountable cardinal λ (which need not be small). 06BH

Proposition 7.6.6.23 can be reformulated as a continuity result.

Notation 7.6.6.25. Let λ be an uncountable cardinal, and let $\mathcal{QC}_{<\lambda}$ denote the ∞ -category of λ -small ∞ -categories (Variant 5.5.4.11). For every collection of simplicial sets $\mathbb{K}$, we define a subcategory $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-comp}} \subseteq \mathcal{QC}_{<\lambda}$ as follows: 060V

- An object $\mathcal{C} \in \mathcal{QC}_{<\lambda}$ belongs to the subcategory $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-comp}}$ if and only if $\mathcal{C}$ is $\mathbb{K}$ -complete.
- A morphism $F : \mathcal{C} \rightarrow \mathcal{D}$ of $\mathcal{QC}_{<\lambda}$ belongs to the subcategory $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-comp}}$ if and only if it is $\mathbb{K}$ -continuous.

Similarly, we let $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-ccomp}} \subseteq \mathcal{QC}_{<\lambda}$ denote the subcategory whose objects are $\mathbb{K}$ -cocomplete ∞ -categories and whose morphisms are $\mathbb{K}$ -cocontinuous functors.

We will sometimes be interested in the special case where $\mathbb{K}$ is the collection of all κ -small simplicial sets, for some infinite cardinal κ . In this case, we denote the ∞ -categories $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-comp}}$ and $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-ccomp}}$ by $\mathcal{QC}_{<\lambda}^{\kappa\text{-comp}}$ and $\mathcal{QC}_{<\lambda}^{\kappa\text{-ccomp}}$, respectively. In the case where $\mathbb{K}$ is the collection of all small simplicial sets, we denote these by $\mathcal{QC}_{<\lambda}^{\text{comp}}$ and $\mathcal{QC}_{<\lambda}^{\text{ccomp}}$, respectively.

06BJ **Proposition 7.6.6.26.** *Let κ be an infinite cardinal, let λ be an uncountable cardinal of exponential cofinality $\geq \kappa$, and let $\mathbb{K}$ be any collection of simplicial sets. Then:*

(1) *The ∞ -categories $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-comp}}$ and $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-ccomp}}$ are κ -complete.*

(2) *The inclusion functors*

$$\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-comp}} \hookrightarrow \mathcal{QC}_{<\lambda} \hookleftarrow \mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-ccomp}}$$

are κ -continuous.

Proof. Our assumption that λ has exponential cofinality $\geq \kappa$ guarantees that the ∞ -category $\mathcal{QC}_{<\lambda}$ is κ -complete (Remark 7.4.4.13). The assertions regarding $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cont}}$ are a reformulation of Proposition 7.6.6.23, and the dual assertions for $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}$ are a formal consequence (see §8.6.7). $\square$

It will sometimes be useful to consider a relative version of Definition 7.6.6.19.

05KC **Definition 7.6.6.27.** Let $\mathbb{K}$ be a collection of simplicial sets. We will say that an inner fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$ is $\mathbb{K}$ -cocomplete if the following condition is satisfied:

(*) For each $K \in \mathbb{K}$ and each vertex $C \in \mathcal{C}$, every diagram

$$f : K \rightarrow \mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$$

admits an extension $\bar{f} : K^{\triangleright} \rightarrow \mathcal{E}_C$ which is an edgewise U -colimit diagram, in the sense of Definition 7.1.7.9.

06BK **Variant 7.6.6.28.** Some special cases of Definition 7.6.6.27 are sufficiently important to deserve their own terminology:

- If κ is an infinite cardinal, we say that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is κ -cocomplete if it is $\mathbb{K}$ -cocomplete, where $\mathbb{K}$ is the collection of all κ -small simplicial sets.
- We say that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is *finitely cocomplete* if it is $\mathbb{K}$ -cocomplete, where $\mathbb{K}$ is the collection of all finite simplicial sets.
- We say that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is *cocomplete* if it is $\mathbb{K}$ -cocomplete, where $\mathbb{K}$ is the collection of all small simplicial sets.

Note that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is finitely cocomplete if and only if it is $\aleph_0$ -cocomplete. Following the convention of Remark 4.7.0.5, U is cocomplete if and only if it is Ω -cocomplete, where Ω is some fixed strongly inaccessible cardinal.

Example 7.6.6.29. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cartesian fibration of simplicial sets. Then U is a $\mathbb{K}$ -cocomplete (in the sense of Definition 7.6.6.27) if and only if, for each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is $\mathbb{K}$ -cocomplete (in the sense of Definition 7.6.6.19). See Example 7.1.7.10. 05KH

Example 7.6.6.30. Let $\mathbb{K}$ be a collection of simplicial sets. Then an ∞ -category $\mathcal{E}$ is $\mathbb{K}$ -cocomplete (in the sense of Definition 7.6.6.19) if and only if the projection map $U : \mathcal{E} \rightarrow \Delta^0$ is a $\mathbb{K}$ -cocomplete inner fibration (in the sense of Definition 7.6.6.27). This is a special case of Example 7.6.6.29, since U is locally cartesian. 05KD

Example 7.6.6.31. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a locally cartesian fibration of simplicial sets. Then U is a $\mathbb{K}$ -cocomplete (in the sense of Definition 7.6.6.27) if and only if the following conditions are satisfied: 06BL

- For each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is $\mathbb{K}$ -cocomplete (in the sense of Definition 7.6.6.19).
- For each edge $e : C \rightarrow C'$ of $\mathcal{C}$, the covariant transport functor $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ is $\mathbb{K}$ -cocontinuous.

See Example 7.1.7.12.

Example 7.6.6.32. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Choose an uncountable cardinal λ for which U is essentially λ -small, so that U admits a covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{QC}_{<\lambda}$. Then the cocartesian fibration U is $\mathbb{K}$ -cocomplete if and only if $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ factors through the subcategory $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}} \subseteq \mathcal{QC}_{<\lambda}$ of Notation 7.6.6.25. This is a reformulation of Example 7.6.6.31. 06BM

Example 7.6.6.33. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. Then U is $\mathbb{K}$ -cocomplete if and only if satisfies the following condition: 06BN

- For each $K \in \mathbb{K}$ and each object $C \in \mathcal{C}$, every diagram $f : K \rightarrow \mathcal{E}_C$ can be extended to a colimit diagram $\bar{f} : K^{\triangleright} \rightarrow \mathcal{E}_C$, which is also a U -colimit diagram in the ∞ -category $\mathcal{E}$.

See Proposition 7.1.7.14.

Example 7.6.6.34. Let $\mathbb{K}$ be a collection of weakly contractible simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. Then U is $\mathbb{K}$ -cocomplete if and only if it satisfies the following condition: 06BP

- For each object $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C$ is $\mathbb{K}$ -cocomplete and the inclusion functor $\mathcal{E}_C \hookrightarrow \mathcal{E}$ is $\mathbb{K}$ -cocontinuous.

This is a reformulation of Example 7.6.6.33, since a diagram $K^\triangleright \rightarrow \mathcal{E}_C$ is a U -colimit diagram in $\mathcal{E}$ if and only if it is a colimit diagram in $\mathcal{E}$ when K is weakly contractible (see Corollary 7.1.6.12 and Example 7.3.9.5).

06BQ Example 7.6.6.35. Let $\mathbb{K}$ be a collection of weakly contractible simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an isofibration of ∞ -categories. If $\mathcal{E}$ is $\mathbb{K}$ -cocomplete and U is $\mathbb{K}$ -cocontinuous, then U is $\mathbb{K}$ -cocomplete. To prove this, we must show that for every object $C \in \mathcal{C}$, the fiber $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is $\mathbb{K}$ -cocomplete and the inclusion functor $\iota : \mathcal{E}_C \hookrightarrow \mathcal{E}$ is $\mathbb{K}$ -cocontinuous (Example 7.6.6.34). This follows by applying Proposition 7.1.9.8 to the commutative diagram

$$\begin{array}{ccc} \mathcal{E}_C & \xrightarrow{\iota} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \{C\} & \longrightarrow & \mathcal{C}, \end{array}$$

which is a categorical pullback square by virtue of Corollary 4.5.2.28.

06BR Example 7.6.6.36. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Then U is $\mathbb{K}$ -cocomplete if and only if it satisfies the following condition:

(*) For $K \in \mathbb{K}$, every lifting problem

$$\begin{array}{ccc} K & \xrightarrow{\quad} & \mathcal{E} \\ \downarrow & \nearrow \bar{q} & \downarrow U \\ K^\triangleright & \xrightarrow{\quad} & \mathcal{C} \end{array}$$

admits a solution where $\bar{q}$ is a U -colimit diagram in the ∞ -category $\mathcal{E}$.

By virtue of Example 7.6.6.31, this is a reformulation of Proposition 7.3.9.1.

06BS Remark 7.6.6.37 (Base Change). Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. The following conditions are equivalent:

- (1) The inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is $\mathbb{K}$ -cocomplete.

(2) For every pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E}' & \longrightarrow & \mathcal{E} \\ \downarrow U' & & \downarrow U \\ \mathcal{C}' & \longrightarrow & \mathcal{C}, \end{array}$$

the inner fibration U' is $\mathbb{K}$ -cocomplete.

(3) For every edge $\Delta^1 \rightarrow \mathcal{C}$, the inner fibration $\Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \Delta^1$ is $\mathbb{K}$ -cocomplete.

In particular, if U is a $\mathbb{K}$ -cocomplete inner fibration, then every fiber $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is a $\mathbb{K}$ -cocomplete ∞ -category (Example 7.6.6.30). The converse holds if U is locally cartesian (Example 7.6.6.29), but not in general (Example 7.6.6.31).

Proposition 7.6.6.38 (Transitivity). *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{D} \rightarrow \mathcal{C}$ and $V : \mathcal{E} \rightarrow \mathcal{D}$ be $\mathbb{K}$ -cocomplete inner fibrations of simplicial sets. If V is a cocartesian fibration, then the composition $(U \circ V) : \mathcal{E} \rightarrow \mathcal{C}$ is also $\mathbb{K}$ -cocomplete.* 06BT

Proof. By virtue of Remark 7.6.6.37, we may assume without loss of generality that $\mathcal{C}$ is an ∞ -category (or even that $\mathcal{C} = \Delta^1$), so that $\mathcal{D}$ and $\mathcal{E}$ are also ∞ -categories. Fix an object $C \in \mathcal{C}$, a simplicial set $K \in \mathbb{K}$, and a diagram $q : K \rightarrow \mathcal{E}_C$; we will show that q admits an extension $\bar{q} : K^{\triangleright} \rightarrow \mathcal{E}_C$ which is a $(U \circ V)$ -colimit diagram in the ∞ -category $\mathcal{E}$. Set $q_0 = V \circ q$. Our assumption that U is $\mathbb{K}$ -cocomplete guarantees that q_0 admits an extension $\bar{q}_0 : K^{\triangleright} \rightarrow \mathcal{D}_C$ which is a U -colimit diagram. Using Example 7.6.6.36, we see that the lifting problem

$$\begin{array}{ccc} K & \xrightarrow{q} & \mathcal{E} \\ \downarrow & \nearrow \bar{q} & \downarrow V \\ K^{\triangleright} & \xrightarrow{\bar{q}_0} & \mathcal{D} \end{array}$$

admits a solution, where $\bar{q}$ is a V -colimit diagram in the ∞ -category $\mathcal{E}$. Applying Proposition 7.1.6.10, we conclude that $\bar{q}$ is also a $(V \circ U)$ -colimit diagram. $\square$

Proposition 7.6.6.39. *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, where $\mathcal{C}$ is $\mathbb{K}$ -cocomplete. The following conditions are equivalent:* 06BU

- (1) *The cocartesian fibration U is $\mathbb{K}$ -cocomplete, in the sense of Definition 7.6.6.27.*
- (2) *The ∞ -category $\mathcal{E}$ is $\mathbb{K}$ -cocomplete and U is $\mathbb{K}$ -cocontinuous.*

Proof. We first show that (1) implies (2). Assume that U is $\mathbb{K}$ -cocomplete and suppose we are given a diagram $q : K \rightarrow \mathcal{E}$ for some $K \in \mathbb{K}$. We wish to show that q can be extended to a colimit diagram $K^\triangleright \rightarrow \mathcal{E}$ which is preserved by the functor U . Set $q_0 = U \circ q$. Since $\mathcal{C}$ is $\mathbb{K}$ -cocomplete, we can extend q_0 to a colimit diagram $\bar{q}_0 : K^\triangleright \rightarrow \mathcal{C}$. It follows from Example 7.6.6.36 that the lifting problem

$$\begin{array}{ccc} K & \xrightarrow{q} & \mathcal{E} \\ \downarrow & \nearrow \bar{q} & \downarrow U \\ K^\triangleright & \xrightarrow{\bar{q}_0} & \mathcal{C} \end{array}$$

admits a solution where $\bar{q}$ is a U -colimit diagram. Applying Corollary 7.1.6.12, we see that $\bar{q}$ is a colimit diagram which is preserved by the functor U .

We now prove the converse. Assume that $\mathcal{E}$ is $\mathbb{K}$ -cocomplete and that U is $\mathbb{K}$ -cocontinuous. Fix an object $C \in \mathcal{C}$, a simplicial set $K \in \mathbb{K}$, and a diagram $q : K \rightarrow \mathcal{E}_C$; we will complete the proof by showing that q admits an extension $K^\triangleright \rightarrow \mathcal{E}_C$ which is a U -colimit diagram in the ∞ -category $\mathcal{E}$ (Example 7.6.6.33). Using assumption (2), we can extend q to a colimit diagram $\bar{q} : K^\triangleright \rightarrow \mathcal{E}$ such that $\bar{q}_0 = U \circ \bar{q}$ is a colimit diagram in $\mathcal{C}$. Let $\bar{q}'_0 : K^\triangleright \rightarrow \mathcal{C}$ be the constant functor taking the value C . Since $\bar{q}_0$ is a colimit diagram, we can choose a natural transformation $\alpha : \bar{q}_0 \rightarrow \bar{q}'_0$ which is the identity when restricted to K . Using Proposition 5.2.1.3, we can lift α to a U -cocartesian natural transformation $\tilde{\alpha} : \bar{q} \rightarrow \bar{q}'$, where $\bar{q}' : K^\triangleright \rightarrow \mathcal{E}_C$ is an extension of q and $\tilde{\alpha}$ is the identity when restricted to K . Since $\bar{q}$ is a U -colimit diagram (Corollary 7.1.6.12), Proposition 7.3.9.3 guarantees that $\bar{q}'$ is also a U -colimit diagram. $\square$

Using the terminology of Definition 7.6.6.27, we can restate Corollary 7.1.10.4 as follows:

06BV **Proposition 7.6.6.40.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a $\mathbb{K}$ -cocomplete inner fibration of simplicial sets. Then:*

- *The ∞ -category of sections $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is $\mathbb{K}$ -cocomplete.*
- *For $K \in \mathbb{K}$, a morphism $\bar{f} : K^\triangleright \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ is a colimit diagram if and only if, for each $C \in \mathcal{C}$, the composite map*

$$K^\triangleright \xrightarrow{\bar{f}} \mathrm{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E}) \xrightarrow{\mathrm{ev}_C} \mathrm{Fun}_{/\mathcal{C}}(\{C\}, \mathcal{E}) = \mathcal{E}_C$$

is a colimit diagram in the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$.

7.7 Universality of Colimits

Recall that the set $\mathbf{Z}$ of integers forms a commutative ring: in particular, addition and multiplication are related by the distributive law 05SB

$$(x \cdot y) + (x \cdot z) = x \cdot (y + z). \quad (7.77) \quad 05SC$$

Now suppose that x , y , and z are given as the cardinalities of finite sets X , Y , and Z . Then the sum $y + z$ is the cardinality of the disjoint union $Y \amalg Z$, so the right hand side of (7.77) is the cardinality of the cartesian product $X \times (Y \amalg Z)$. Equation (7.77) then follows from observation that $X \times (Y \amalg Z)$ factors as a disjoint union of subsets $X \times Y$ and $X \times Z$, having cardinalities $x \cdot y$ and $x \cdot z$. More precisely, for any sets X , Y , and Z , there is a canonical isomorphism

$$(X \times Y) \amalg (X \times Z) \xrightarrow{\sim} X \times (Y \amalg Z), \quad (7.78) \quad 05SD$$

which *categorifies* the equation (7.77) in the case where X , Y , and Z are finite.

The isomorphism (7.78) is a special case of a more general phenomenon. Let $\mathcal{K}$ be a small category and let $\mathcal{F} : \mathcal{K} \rightarrow \mathbf{Set}$ be a $\mathcal{K}$ -indexed diagram of sets, and suppose we are given a function $\varinjlim(\mathcal{F}) \rightarrow S$. Then, for any function $S' \rightarrow S$, the fiber product $S' \times_S \varinjlim(\mathcal{F})$ identifies with the colimit of another diagram $\mathcal{F}' : \mathcal{K} \rightarrow \mathbf{Set}$, given on objects by the formula $\mathcal{F}'(k) = S' \times_S \mathcal{F}(k)$. In this section, we study ∞ -categories where an analogous phenomenon occurs.

Definition 7.7.0.1. Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and let $\mathcal{F} : K \rightarrow \mathcal{C}$ 05SE be a diagram. Suppose that $\mathcal{F}$ admits a colimit: that is, there exists an object $C \in \mathcal{C}$ and a natural transformation $\beta : \mathcal{F} \rightarrow \underline{C}$ which exhibits C as a colimit of $\mathcal{F}$. We say that *the colimit of $\mathcal{F}$ is universal* if the following condition is satisfied:

(*) For every morphism $f : C' \rightarrow C$ of $\mathcal{C}$ and every levelwise pullback square

$$\begin{array}{ccc} \mathcal{F}' & \xrightarrow{\beta'} & \underline{C'} \\ \downarrow & & \downarrow f \\ \mathcal{F} & \xrightarrow{\beta} & \underline{C} \end{array}$$

in the ∞ -category $\mathbf{Fun}(K, \mathcal{C})$, the natural transformation β' exhibits C' as a colimit of $\mathcal{F}'$.

We say that *K -indexed colimits in $\mathcal{C}$ are universal* if, for every diagram $\mathcal{F} : K \rightarrow \mathcal{C}$ which admits a colimit, the colimit of $\mathcal{F}$ is universal.

05SF Remark 7.7.0.2 (Distributivity). Let $\mathcal{C}$ be an ∞ -category and let K be a simplicial set. Assume that $\mathcal{C}$ admits pullbacks and K -indexed colimits. Let $\mathcal{F} : K \rightarrow \mathcal{C}$ be a diagram equipped with a natural transformation $\beta : \mathcal{F} \rightarrow \underline{C}$. Then β determines a map $u : \varinjlim(\mathcal{F}) \rightarrow C$, which is characterized (up to homotopy) by the existence of a 2-simplex σ :

$$\begin{array}{ccc} & \varinjlim(\mathcal{F}) & \\ \alpha \nearrow & & \searrow u \\ \mathcal{F} & \xrightarrow{\beta} & \underline{C} \end{array}$$

where α denotes a fixed natural transformation exhibiting $\varinjlim(\mathcal{F})$ as a colimit of $\mathcal{F}$. Suppose we are given morphism $f : C' \rightarrow C$ of $\mathcal{C}$. Since $\mathcal{C}$ admits pullbacks, we can form a pullback square τ :

$$\begin{array}{ccc} C' \times_C \varinjlim(\mathcal{F}) & \longrightarrow & C' \\ \downarrow f' & & \downarrow f \\ \varinjlim(\mathcal{F}) & \xrightarrow{f} & C. \end{array}$$

In the ∞ -category $\text{Fun}(K, \mathcal{C})$, we can then choose a (levelwise) limit diagram

$$\begin{array}{ccccc} \mathcal{F}' & \xrightarrow{\alpha'} & C' \times_C \varinjlim(\mathcal{F}) & \longrightarrow & C' \\ \downarrow & & \downarrow & & \downarrow f \\ \mathcal{F} & \xrightarrow{\alpha} & \varinjlim(\mathcal{F}) & \xrightarrow{u} & \underline{C}, \end{array}$$

where restriction to the bottom half of the diagram is given by σ and the right side is the image of τ under the diagonal map $\mathcal{C} \rightarrow \text{Fun}(K, \mathcal{C})$. Since the outer rectangle is a fiberwise pullback square (Proposition 7.6.2.28), we can identify α' with a comparison map

$$\theta : \varinjlim(\mathcal{F}') = \varinjlim_{k \in K} (C' \times_C \mathcal{F}(k)) \rightarrow C' \times_C (\varinjlim_{k \in K} \mathcal{F}(k)).$$

If the colimit of $\mathcal{F}$ is universal, then θ is an isomorphism.

05SG Example 7.7.0.3. Small colimits are universal in (the nerve of) the category of sets. In fact, this is true even for colimits which are not small, in cases where they exist (Corollary 7.7.3.21).

It will often be useful to work with a reformulation of Definition 7.7.0.1. Fix a simplicial set K and an ∞ -category $\mathcal{C}$ which admits pullbacks and K -indexed colimits. Suppose we are given a diagram $\mathcal{F} : K \rightarrow \mathcal{C}$ having a colimit $C = \varinjlim(\mathcal{F})$. For each vertex $x \in X$, the tautological map $\beta_x : \mathcal{F}(x) \rightarrow C$ determines a pullback map

$$\beta_x^* : \mathcal{C}_{/C} \rightarrow \mathcal{C}_{/\mathcal{F}(x)} \quad C' \mapsto C' \times_C \mathcal{F}(x)$$

(see Proposition 7.6.2.24). Allowing x to vary, these pullback maps can be organized into a comparison functor

$$T_{\mathcal{F}} : \mathcal{C}_{/C} \rightarrow \varprojlim_{x \in K} \mathcal{C}_{/\mathcal{F}(x)}.$$

In §7.7.2, we show that the colimit of $\mathcal{F}$ is universal if and only if the functor $T_{\mathcal{F}}$ is fully faithful (Theorem 7.7.2.8). If the functor $T_{\mathcal{F}}$ is an equivalence of ∞ -categories, we will say that *the colimit of $\mathcal{F}$ is strongly universal* (see Definition 7.7.2.15 for a more precise formulation). Our primary objective in this section is to establish the following homotopy-theoretic counterpart of Example 7.7.0.3:

Theorem 7.7.0.4. *Let $\mathcal{S}$ denote the ∞ -category of spaces (Construction 5.5.1.1). Then the colimit of any small diagram $K \rightarrow \mathcal{S}$ is strongly universal.* 05SH

Warning 7.7.0.5. Theorem 7.7.0.4 is stronger than its classical counterpart: in the category of sets, small colimits are universal but are generally not strongly universal (see Example 7.7.2.22). In fact, Theorem 7.7.0.4 is in some sense the defining feature of unstable homotopy theory: we will return to this point in Chapter [?]. 05SJ

In this section, we will give two different proofs of Theorem 7.7.0.4, and one additional proof of the weaker assertion that colimits in $\mathcal{S}$ are universal:

- Let $\mathcal{C}$ be an ∞ -category which admits finite limits. We say that $\mathcal{C}$ is *locally cartesian closed* if, for every morphism $f : X \rightarrow Y$ of $\mathcal{C}$, the pullback functor

$$f^* : \mathcal{C}_{/Y} \rightarrow \mathcal{C}_{/X} \quad C \mapsto C \times_Y X$$

has a right adjoint (see Definition 7.7.3.14 and Proposition 7.7.3.19). In §7.7.3, we show that the ∞ -category $\mathcal{S}$ is locally cartesian closed (Proposition 7.7.3.17). Our proof is based the observation that, for every Kan complex X , the ∞ -category $\mathcal{S}_{/X}$ has an explicit model as the homotopy coherent nerve of a simplicially enriched category $\mathbf{KFib}(X)$ of Kan fibrations over X , where there is good supply of internal function objects. As a consequence, we deduce that K -indexed colimits in $\mathcal{S}$ are universal for every simplicial set K (even when K is not small): see Corollary 7.7.3.23.

- Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and small colimits. In §7.7.5, we explain that the (strong) universality of colimits in $\mathcal{C}$ follows from the (strong) universality of coproducts and pushouts (Corollary 7.7.5.9). In the case $\mathcal{C} = \mathcal{S}$, the case of coproducts is easy to handle directly (Corollary 7.7.4.12). The strong universality of pushouts is a reformulation of the Mather cube theorems (Theorems 3.4.3.3 and Theorem 3.4.4.4), which we discussed in Chapter 3.
- Recall that the ∞ -category $\mathcal{S}$ classifies left fibrations: that is, we can identify (isomorphism classes of) diagrams $\mathcal{F} : K \rightarrow \mathcal{C}$ with (equivalence classes of) essentially small left fibrations $\widetilde{K} \rightarrow K$ (Corollary 5.6.0.6). In §7.7.6, we use this perspective to reformulate Theorem 7.7.0.4 as a statement about left fibrations, which we prove directly (Proposition 7.7.6.2).

For later use, we record the following consequence of Theorem 7.7.0.4:

05SK Corollary 7.7.0.6. *Let $\mathcal{F} : K \rightarrow \mathcal{S}$ be a small diagram. Suppose we are given a Kan complex $X \in \mathcal{S}$ and a natural transformation $\beta : \mathcal{F} \rightarrow \underline{X}$. The following conditions are equivalent:*

- (1) *The natural transformation β exhibits C as a colimit of the diagram $\mathcal{F}$.*
- (2) *For every map of Kan complexes $f : X' \rightarrow X$ and every levelwise pullback square*

$$\begin{array}{ccc} \mathcal{F}' & \xrightarrow{\beta'} & \underline{X'} \\ \downarrow & & \downarrow f \\ \mathcal{F} & \xrightarrow{\beta} & \underline{X} \end{array}$$

the natural transformation β' exhibits X' as a colimit of $\mathcal{F}'$.

- (3) *For every vertex $x \in X$ and every levelwise pullback square*

$$\begin{array}{ccc} \mathcal{F}' & \xrightarrow{\beta'} & \underline{\{x\}} \\ \downarrow & & \downarrow \\ \mathcal{F} & \xrightarrow{\beta} & \underline{X} \end{array}$$

the natural transformation β' exhibits $\{x\}$ as a colimit of $\mathcal{F}'$ (here the right vertical map is induced by the inclusion $\{x\} \hookrightarrow X$).

(4) For every vertex $x \in X$, the diagram $\mathcal{F}' = \{x\} \times_X \mathcal{F}$ has a contractible colimit in $\mathcal{S}$.

Proof. The implication (1) $\Rightarrow$ (2) follows from the universality of colimits in $\mathcal{S}$ (Theorem 7.7.0.4) and the implications (2) $\Rightarrow$ (3) $\Rightarrow$ (4) are immediate. We will complete the proof by showing that (4) implies (1). Choose a Kan complex $Y = \varinjlim(\mathcal{F})$ and a natural transformation $\alpha : \mathcal{F} \rightarrow \underline{Y}$ which exhibits Y as a colimit of $\mathcal{F}$. The natural transformation β induces a morphism of Kan complexes $f : Y \rightarrow X$, which is characterized (up to homotopy) by the existence of a commutative diagram

$$\begin{array}{ccc} & \underline{Y} & \\ \alpha \nearrow & & \searrow f \\ \mathcal{F} & \xrightarrow{\beta} & \underline{X} \end{array}$$

in the ∞ -category $\text{Fun}(K, \mathcal{S})$. To prove (1), we must show that f is a homotopy equivalence. By virtue of Remark 3.4.0.6, this is equivalent to the requirement that for each vertex $x \in X$, the homotopy fiber $Y_x = \{x\} \times_X^h Y$ is a contractible Kan complex. Using Example 7.6.3.12, we see that there is a pullback diagram τ :

$$\begin{array}{ccc} Y_x & \longrightarrow & \{x\} \\ \downarrow & & \downarrow \\ Y & \xrightarrow{f} & X \end{array}$$

in the ∞ -category $\mathcal{S}$. As in Remark 7.7.0.2, we can choose a commutative diagram

$$\begin{array}{ccccc} \mathcal{F}' & \xrightarrow{\alpha'} & \underline{Y_x} & \longrightarrow & \underline{\{x\}} \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{F} & \xrightarrow{\alpha} & \underline{Y} & \xrightarrow{f} & \underline{X}, \end{array}$$

in the ∞ -category $\text{Fun}(K, \mathcal{S})$, where the bottom row is given by the 2-simplex σ , the right side of the diagram is the image of τ under the diagonal map $\mathcal{S} \rightarrow \text{Fun}(K, \mathcal{S})$, and the left side of the diagram is a levelwise pullback square. It follows that the outer rectangle is also a levelwise pullback square (Proposition 7.6.2.28), so condition (4) guarantees that the colimit of $\mathcal{F}'$ is a contractible Kan complex. Since K -indexed colimits in $\mathcal{S}$ are universal (Theorem 7.7.0.4), the natural transformation α' exhibits Y_x as a colimit of $\mathcal{F}'$, so that Y_x is contractible as desired. $\square$

7.7.1 Cartesian Natural Transformations

05SL We begin by introducing some terminology.

05SM **Definition 7.7.1.1.** Let $\mathcal{C}$ be an ∞ -category and let $\mathcal{F}, \mathcal{G} : K \rightarrow \mathcal{C}$ be a pair of diagrams indexed by the same simplicial set K . We say that a natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ is *cartesian* if, for every edge $e : x \rightarrow y$ of the simplicial set K , the corresponding diagram

$$\begin{array}{ccc} \mathcal{F}(x) & \xrightarrow{\mathcal{F}(e)} & \mathcal{F}(y) \\ \downarrow \gamma_x & & \downarrow \gamma_y \\ \mathcal{G}(x) & \xrightarrow{\mathcal{G}(e)} & \mathcal{G}(y) \end{array} \quad (7.79)$$

is a pullback square in the ∞ -category $\mathcal{C}$.

05SP **Example 7.7.1.2.** In the situation of Definition 7.7.1.1, suppose that the natural transformation γ is an isomorphism. Then, for every edge $e : x \rightarrow y$ of K , the diagram (7.79) is automatically a pullback square, since the vertical maps are isomorphisms (see Corollary 7.6.2.27). It follows that every isomorphism in the ∞ -category $\text{Fun}(K, \mathcal{C})$ is a cartesian natural transformation. In particular, for every diagram $\mathcal{F} : K \rightarrow \mathcal{C}$, the identity transformation $\text{id} : \mathcal{F} \rightarrow \mathcal{F}$ is cartesian.

05SQ **Remark 7.7.1.3.** Let $\mathcal{F}, \mathcal{G} : K \rightarrow \mathcal{C}$ be as in Definition 7.7.1.1, and let e be an edge of the simplicial set K . If $\mathcal{F}(e)$ and $\mathcal{G}(e)$ are both isomorphisms in the ∞ -category $\mathcal{C}$, then the diagram (7.79) is automatically a pullback square (see Corollary 7.6.2.27). In particular, to verify that a natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ is cartesian, it suffices to check that (7.79) is a pullback square when e is a nondegenerate edge of K .

05SR **Example 7.7.1.4.** Let $\mathcal{C}$ be an ∞ -category, let f and g be morphisms in $\mathcal{C}$, and let $\gamma : f \rightarrow g$ be a morphism in the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$. Then γ is cartesian (in the sense of Definition 7.7.1.1) if and only if it corresponds to a pullback diagram $\Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$.

05SS **Example 7.7.1.5.** Let $\mathcal{C}$ be an ∞ -category and suppose we are given a pair of diagrams $\mathcal{F}, \mathcal{G} : K \rightarrow \mathcal{C}$ indexed by the same simplicial set K . If either K or $\mathcal{C}$ is a Kan complex, then every natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ is cartesian.

05ST **Example 7.7.1.6.** Let $\mathcal{C}$ be an ∞ -category and let $f : C \rightarrow D$ be a morphism of $\mathcal{C}$. Then, for every simplicial set K , the induced map of constant diagrams $\underline{f} : \underline{C} \rightarrow \underline{D}$ is a cartesian natural transformation.

Remark 7.7.1.7. Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and suppose we are 01RL given a commutative diagram

$$\begin{array}{ccc} & \mathcal{G} & \\ \alpha \nearrow & & \searrow \beta \\ \mathcal{F} & \xrightarrow{\gamma} & \mathcal{H} \end{array}$$

in the ∞ -category $\mathrm{Fun}(K, \mathcal{C})$, where the natural transformation β is cartesian. Then α is cartesian if and only if γ is cartesian (see Proposition 7.6.2.28). In particular, the collection of cartesian natural transformations is closed under composition in $\mathrm{Fun}(K, \mathcal{C})$.

Remark 7.7.1.8. Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and suppose we are 05SU given morphisms $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ and $\gamma' : \mathcal{F}' \rightarrow \mathcal{G}'$ in the ∞ -category $\mathrm{Fun}(K, \mathcal{C})$ which are isomorphic when viewed as objects of $\mathrm{Fun}(\Delta^1 \times K, \mathcal{C})$. Then γ is cartesian if and only if γ' is cartesian (see Remark 7.6.2.10). In particular, the condition that a natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ is cartesian depends only on the homotopy class $[\gamma]$.

Remark 7.7.1.9 (Change of Target). Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{F}, \mathcal{G} : K \rightarrow \mathcal{C}$ be diagrams 05SV indexed by the same simplicial set K , and let $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ be a natural transformation. Suppose we are given a functor of ∞ -categories $U : \mathcal{C} \rightarrow \mathcal{C}'$ which preserves pullback squares. Set $\mathcal{F}' = U \circ \mathcal{F}$ and $\mathcal{G}' = U \circ \mathcal{G}$, so that γ induces a natural transformation $\gamma' : \mathcal{F}' \rightarrow \mathcal{G}'$ of K -indexed diagrams in the ∞ -category $\mathcal{C}'$. If γ is cartesian, then γ' is cartesian. The converse holds if the functor U is conservative (see Proposition 7.1.4.16).

Remark 7.7.1.10 (Change of Source). Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{F}, \mathcal{G} : K \rightarrow \mathcal{C}$ be 05SW diagrams indexed by the same simplicial set K , and let $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ be a natural transformation. Suppose we are given a morphism of simplicial sets $u : K' \rightarrow K$. Set $\mathcal{F}' = \mathcal{F} \circ u$ and $\mathcal{G}' = \mathcal{G} \circ u$, so that γ induces a natural transformation $\gamma' : \mathcal{F}' \rightarrow \mathcal{G}'$ of K' -indexed diagrams in $\mathcal{C}$. If γ is cartesian, then γ' is cartesian. The converse holds if γ is surjective on edges.

Remark 7.7.1.11. Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and suppose we are 05SX given a diagram σ :

$$\begin{array}{ccc} \mathcal{F} & & \mathcal{F}' \\ \downarrow \gamma & & \downarrow \gamma' \\ \mathcal{G} & \xrightarrow{\quad} & \mathcal{G}' \end{array}$$

in the ∞ -category $\text{Fun}(K, \mathcal{C})$ which is a levelwise pullback square: that is, for each vertex $x \in K$, the induced diagram σ_x :

$$\begin{array}{ccc} \mathcal{F}(x) & \longrightarrow & \mathcal{F}'(x) \\ \downarrow \gamma_x & & \downarrow \gamma'_x \\ \mathcal{G}(x) & \longrightarrow & \mathcal{G}'(x) \end{array}$$

is a pullback square in the ∞ -category $\mathcal{C}$. If the natural transformation γ' is cartesian, then the natural transformation γ is also cartesian. To prove this, we must show that for each edge $e : x \rightarrow y$ of K , the left side of the diagram

$$\begin{array}{ccccc} \mathcal{F}(x) & \xrightarrow{\mathcal{F}(e)} & \mathcal{F}(y) & \longrightarrow & \mathcal{F}'(y) \\ \downarrow \gamma_x & & \downarrow \gamma_y & & \downarrow \gamma'_y \\ \mathcal{G}(x) & \xrightarrow{\mathcal{G}(e)} & \mathcal{G}(y) & \longrightarrow & \mathcal{G}'(y) \end{array}$$

is a pullback square. Since the right side is a pullback square by virtue of our hypothesis on σ , this is equivalent to the requirement that the outer rectangle is a pullback square (Proposition 7.6.2.28). This also appears as the outer rectangle in a commutative diagram

$$\begin{array}{ccccc} \mathcal{F}(x) & \longrightarrow & \mathcal{F}'(x) & \xrightarrow{\mathcal{F}'(e)} & \mathcal{F}'(y) \\ \downarrow \gamma_x & & \downarrow \gamma'_x & & \downarrow \gamma'_y \\ \mathcal{G}(x) & \longrightarrow & \mathcal{G}'(x) & \xrightarrow{\mathcal{G}'(e)} & \mathcal{G}'(y) \end{array}$$

where our hypothesis on σ guarantees that the left side is a pullback diagram. Applying Proposition 7.6.2.28, we are reduced to showing that the right side is also a pullback diagram, which follows from our assumption that γ' is cartesian.

05SY Remark 7.7.1.12 (Cartesian Transformations as Cartesian Sections). Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{G} : K \rightarrow \mathcal{C}$ be a diagram, and let $\mathcal{C} \tilde{\times}_{\mathcal{C}} K$ denote the oriented fiber product of Definition 4.6.4.1. Then projection onto the second factor determines a cocartesian fibration of simplicial sets $U : \mathcal{C} \tilde{\times}_{\mathcal{C}} K \rightarrow \mathcal{C}$. By construction, sections of U can be identified with pairs $(\mathcal{F}, \gamma)$, where $\mathcal{F} : K \rightarrow \mathcal{C}$ is a diagram and $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ is a natural transformation. In this case, the natural transformation γ is cartesian (in the sense of Definition 7.7.1.1) if and only if the corresponding section of U is cartesian: that is, it carries each edge of K to a U -cartesian edge of $\mathcal{C} \tilde{\times}_{\mathcal{C}} K$. This is a reformulation of Proposition 7.6.2.20.

For diagrams indexed by a cone $K^\triangleright$, Definition 7.7.1.1 can be simplified. Let $\mathcal{C}$ be an ∞ -category, and suppose we are given a natural transformation $\bar{\gamma} : \bar{\mathcal{F}} \rightarrow \bar{\mathcal{G}}$ between diagrams $\bar{\mathcal{F}}, \bar{\mathcal{G}} : K^\triangleright \rightarrow \mathcal{C}$. Set $\mathcal{F} = \bar{\mathcal{F}}|_K$ and $\mathcal{G} = \bar{\mathcal{G}}|_K$, so that $\bar{\gamma}$ restricts to a natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{G}$. Let C and D denote the values of $\bar{\mathcal{F}}$ and $\bar{\mathcal{G}}$ at the cone point of $K^\triangleright$, so that $\bar{\gamma}$ determines a morphism $f : C \rightarrow D$ of $\mathcal{C}$. Precomposition with the canonical map

$$\Delta^1 \times K \rightarrow K \diamond \Delta^0 \twoheadrightarrow K \star \Delta^0 = K^\triangleright$$

carries $\bar{\gamma}$ to a morphism in the ∞ -category $\text{Fun}(\Delta^1 \times K, \mathcal{C})$, which we can identify with a commutative diagram

$$\begin{array}{ccc} \mathcal{F} & \xrightarrow{\quad} & C \\ \downarrow \gamma & & \downarrow f \\ \mathcal{G} & \xrightarrow{\quad} & D \end{array} \quad \begin{array}{l} \text{05SZ} \\ (7.80) \end{array}$$

of K -indexed diagrams in $\mathcal{C}$.

Proposition 7.7.1.13. *Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and let $\bar{\gamma} : \bar{\mathcal{F}} \rightarrow \bar{\mathcal{G}}$ 05T0 be a natural transformation between diagrams $\bar{\mathcal{F}}, \bar{\mathcal{G}} : K^\triangleright \rightarrow \mathcal{C}$. The following conditions are equivalent:*

- (1) *The natural transformation $\bar{\gamma}$ is cartesian.*
- (2) *The diagram (7.80) is a levelwise pullback square.*

Proof. For each vertex $x \in K$, let e_x denote the edge of $K^\triangleright$ given by the map $\Delta^1 \simeq \{x\}^\triangleright \hookrightarrow K^\triangleright$. Note that $\bar{\gamma}$ carries e_x to a commutative diagram

$$\begin{array}{ccc} \mathcal{F}(x) & \xrightarrow{\quad} & C \\ \downarrow \gamma_x & & \downarrow f \\ \mathcal{G}(x) & \xrightarrow{\quad} & D \end{array}$$

in the ∞ -category $\mathcal{C}$, which is obtained from (7.80) by evaluating at x . It follows that (1) implies (2). Conversely, suppose that condition (2) is satisfied, and let $e : x \rightarrow y$ be any edge of $K^\triangleright$; we wish to show that $\bar{\gamma}$ carries e to a pullback square in $\mathcal{C}$. Without loss of generality, we may assume that e is nondegenerate (Remark 7.7.1.3). If y is the cone point of $K^\triangleright$, then x belongs to K and $e = e_x$, so the desired result follows from assumption (2). We are therefore reduced to the case where e is an edge of K : that is, to showing that the natural transformation $\gamma : \mathcal{F} \rightarrow \mathcal{G}$ is cartesian. This follows from Remark 7.7.1.11, since γ is a pullback of the cartesian natural transformation $f : C \rightarrow D$ (Example 7.7.1.6). $\square$

05T1 **Variant 7.7.1.14.** Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and suppose we are given a natural transformation $\bar{\gamma} : \bar{\mathcal{F}} \rightarrow \bar{\mathcal{G}}$ between diagrams $\bar{\mathcal{F}}, \bar{\mathcal{G}} : K^\triangleright \rightarrow \mathcal{C}$. If there exists a morphism $f : C \rightarrow D$ of $\mathcal{C}$ and a levelwise pullback square σ :

$$\begin{array}{ccc}
 \bar{\mathcal{F}} & \longrightarrow & C \\
 \downarrow \bar{\gamma} & & \downarrow f \\
 \bar{\mathcal{G}} & \longrightarrow & D,
 \end{array} \tag{7.81}$$

in $\text{Fun}(K^\triangleright, \mathcal{C})$, then $\bar{\gamma}$ is cartesian (see Remark 7.7.1.11 and Example 7.7.1.6). Conversely, suppose that $\bar{\gamma}$ is cartesian. Let v denote the cone point of $K^\triangleright$ and set $C = \bar{\mathcal{F}}(v)$ and $D = \bar{\mathcal{G}}(v)$, so that $\bar{\gamma}$ determines a morphism $f : C \rightarrow D$. There is a unique morphism of simplicial sets $h : \Delta^1 \times K^\triangleright \rightarrow K^\triangleright$ such that $h|_{\{0\} \times K^\triangleright}$ is the identity and $h|_{\{1\} \times K^\triangleright}$ is the constant map taking the value v . Precomposition with h carries $\bar{\gamma}$ to a morphism in the ∞ -category $\text{Fun}(\Delta^1 \times K^\triangleright, \mathcal{C})$, which we can identify with a levelwise pullback square of the form (7.81).

05T3 **Definition 7.7.1.15.** Let $\mathcal{C}$ be an ∞ -category and let K be a simplicial set. We say that a morphism $\bar{\mathcal{F}} : K^\triangleright \rightarrow \mathcal{C}$ is a *universal colimit diagram* if, for every cartesian natural transformation $\bar{\mathcal{F}}' \rightarrow \bar{\mathcal{F}}$, the morphism $\bar{\mathcal{F}}' : K^\triangleright \rightarrow \mathcal{C}$ is a colimit diagram in the ∞ -category $\mathcal{C}$.

05T4 **Remark 7.7.1.16.** Let $\mathcal{C}$ be an ∞ -category. If $\bar{\mathcal{F}} : K^\triangleright \rightarrow \mathcal{C}$ is a universal colimit diagram, then it is a colimit diagram. This follows immediately from the definition, since the identity transformation $\text{id} : \bar{\mathcal{F}} \rightarrow \bar{\mathcal{F}}$ is cartesian (Example 7.7.1.2).

05T5 **Example 7.7.1.17.** Let $\mathcal{C}$ be an ∞ -category and let $K = \emptyset$ be the empty simplicial set. Then we can identify a diagram $\bar{\mathcal{F}} : K^\triangleright \rightarrow \mathcal{C}$ with an object $C \in \mathcal{C}$. In this case, the following conditions are equivalent:

- (a) The morphism $\bar{\mathcal{F}}$ is a universal colimit diagram.
- (b) For every morphism $u : C' \rightarrow C$ of $\mathcal{C}$, the object $C' \in \mathcal{C}$ is initial.
- (c) The object $C \in \mathcal{C}$ is initial and every morphism $u : C' \rightarrow C$ is an isomorphism.

If these conditions are satisfied, we say that C is a *universal initial object* of $\mathcal{C}$.

05T6 **Remark 7.7.1.18.** Let $\mathcal{C}$ be an ∞ -category and let $Y \in \mathcal{C}$ be a universal initial object (in the sense of Example 7.7.1.17). Then any morphism $f : Y \rightarrow Z$ in $\mathcal{C}$ is a monomorphism. That is, if X is another object of $\mathcal{C}$, then the composition map $\text{Hom}_{\mathcal{C}}(X, Y) \xrightarrow{[f]^\circ} \text{Hom}_{\mathcal{C}}(X, Z)$

induces a homotopy equivalence from $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ to a summand of $\mathrm{Hom}_{\mathcal{C}}(X, Z)$. This follows the observation that if the morphism space $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is nonempty, then X is isomorphic to Y ; it follows that X is also initial, so that the morphism spaces $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ and $\mathrm{Hom}_{\mathcal{C}}(X, Z)$ are both contractible.

Let $\mathcal{C}$ be an ∞ -category and let $\overline{\mathcal{F}} : K^{\triangleright} \rightarrow \mathcal{C}$ be a diagram carrying the cone point of $K^{\triangleright}$ to an object $C \in \mathcal{C}$. Recall that $\overline{\mathcal{F}}$ determines a natural transformation β from $\mathcal{F} = \overline{\mathcal{F}}|_K$ to the constant diagram $\underline{C}$, given by the composition

$$\Delta^1 \times K \simeq K \star_K K \rightarrow K \star_{\Delta^0} \Delta^0 = K^{\triangleright} \xrightarrow{\overline{\mathcal{F}}} \mathcal{C}.$$

Moreover, $\overline{\mathcal{F}}$ is a colimit diagram in $\mathcal{C}$ if and only if the natural transformation β exhibits C as a colimit of $\mathcal{F}$ (Remark 7.1.3.6). This observation has a counterpart for universal colimit diagrams:

Proposition 7.7.1.19. *Let $\mathcal{C}$ be an ∞ -category, let $\overline{\mathcal{F}} : K^{\triangleright} \rightarrow \mathcal{C}$ be a morphism, and define $\beta : \mathcal{F} \rightarrow \underline{C}$ as above. The following conditions are equivalent:* 05T7

- (1) *The morphism $\overline{\mathcal{F}}$ is a universal colimit diagram, in the sense of Definition 7.7.1.15.*
- (2) *For every morphism $u : C' \rightarrow C$ in $\mathcal{C}$ and every levelwise pullback diagram*

$$\begin{array}{ccc} \mathcal{F}' & \xrightarrow{\beta'} & \underline{C'} \\ \downarrow & & \downarrow \underline{u} \\ \mathcal{F} & \xrightarrow{\beta} & \underline{C} \end{array} \quad \begin{array}{l} \text{05T8} \\ (7.82) \end{array}$$

in the ∞ -category $\mathrm{Fun}(K, \mathcal{C})$, the natural transformation β' exhibits C' as a colimit of $\mathcal{F}'$

Proof. The implication (2) $\Rightarrow$ (1) follows from Remark 7.1.3.6 and Proposition 7.7.1.13. To prove the converse, it suffices to observe that every diagram of the form (7.82) is isomorphic to one which is obtained from a natural transformation $\overline{\mathcal{F}'} \rightarrow \overline{\mathcal{F}}$ of $K^{\triangleright}$ -indexed diagrams in $\mathcal{C}$. This follows from the fact that the comparison map $K \diamond \Delta^0 \rightarrow K \star \Delta^0$ of Theorem 4.5.8.8 is a categorical equivalence of simplicial sets. $\square$

Corollary 7.7.1.20. *Let $\mathcal{C}$ be an ∞ -category and let K be a simplicial set. The following conditions are equivalent:* 05T9

- (1) *Every colimit diagram $\overline{\mathcal{F}} : K^{\triangleright} \rightarrow \mathcal{C}$ is a universal colimit diagram.*
- (2) *In the ∞ -category $\mathcal{C}$, K -indexed colimits are universal.*

Proof. The implication (2) $\Rightarrow$ (1) follows from Proposition 7.7.1.19. The reverse implication follows from the observation that, if $\mathcal{F} : K \rightarrow \mathcal{C}$ is a diagram, then every natural transformation from $\mathcal{F}$ to a constant diagram is homotopic to one which arises from a diagram $\overline{\mathcal{F}} : K^\triangleright \rightarrow \mathcal{C}$ extending $\mathcal{F}$ (see Theorem 4.6.4.19). $\square$

05TA **Definition 7.7.1.21.** Let $\mathcal{C}$ be an ∞ -category and let K be a simplicial set. We say that a diagram $\mathcal{F} : K \rightarrow \mathcal{C}$ has a universal colimit if there exists a universal colimit diagram $\overline{\mathcal{F}} : K^\triangleright \rightarrow \mathcal{C}$ satisfying $\overline{\mathcal{F}}|_K = \mathcal{F}$.

05TB **Remark 7.7.1.22.** Let $\mathcal{C}$ be an ∞ -category and let $\mathcal{F} : K \rightarrow \mathcal{C}$ be a diagram which has a universal colimit. Then, if $\overline{\mathcal{F}} : K^\triangleright \rightarrow \mathcal{C}$ is any colimit diagram extending $\mathcal{F}$, then $\overline{\mathcal{F}}$ is a universal colimit diagram. This follows from the observation that $\overline{\mathcal{F}}$ is unique up to isomorphism.

7.7.2 Descent Diagrams

05TC Let $\mathcal{C}$ be an ∞ -category which admits fiber products. Then every morphism $f : C' \rightarrow C$ of $\mathcal{C}$ determines a pullback functor $f^* : \mathcal{C}_{/C} \rightarrow \mathcal{C}_{/C'}$, given on objects by the construction $D \mapsto C' \times_C D$ (see Definition 7.6.2.22 and Proposition 7.6.2.24). If we regard the object C as fixed, then the functor f^* depends functorially on C' (as an object of the slice ∞ -category $\mathcal{C}_{/C}$). Consequently, every diagram $F : K^\triangleright \rightarrow \mathcal{C}$ carrying the cone point of $K^\triangleright$ to $C \in \mathcal{C}$ determines a comparison functor $\mathcal{C}_{/C} \rightarrow \varprojlim_{x \in K} \mathcal{C}_{/F(x)}$. Our goal in this section is to show that, under mild hypotheses, this comparison functor is fully faithful if and only if F is a universal colimit diagram (Theorem 7.7.2.8). We begin by articulating this condition more precisely.

05TD **Notation 7.7.2.1.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets. For every morphism of simplicial sets $F : K \rightarrow \mathcal{C}$, recall that the simplicial set $\mathrm{Fun}_{/\mathcal{C}}(K, \mathcal{E})$ is an ∞ -category (Corollary 4.1.4.8), whose objects are given by morphisms $\tilde{F} : K \rightarrow \mathcal{E}$ satisfying $U \circ \tilde{F} = F$. We let $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{A}\mathrm{Cart}}(K, \mathcal{E})$ denote the full subcategory spanned by those objects where $\tilde{F}$ carries every edge of K to a U -cartesian edge of $\mathcal{E}$.

05TE **Remark 7.7.2.2.** In the situation of Notation 7.7.2.1, there is a canonical isomorphism $\mathrm{Fun}_{/\mathcal{C}}(K, \mathcal{E}) \xleftarrow{\sim} \mathrm{Fun}_{/K}(K, K \times_{\mathcal{C}} \mathcal{E})$ of simplicial sets, which restricts to an isomorphism of $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{A}\mathrm{Cart}}(K, \mathcal{E})$ with the full subcategory

$$\mathrm{Fun}_{/K}^{\mathrm{Cart}}(K, K \times_{\mathcal{C}} \mathcal{E}) \subseteq \mathrm{Fun}_{/K}(K, K \times_{\mathcal{C}} \mathcal{E})$$

of Variant 5.3.1.11.

05TF **Remark 7.7.2.3.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets whose fibers are essentially small ∞ -categories, and let

$$\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{QC} \quad C \mapsto \mathcal{E}_C$$

be a contravariant transport representation for U (Definition 8.6.8.1). If K is a small simplicial set equipped with a morphism $F : K \rightarrow \mathcal{C}$, then $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{ACart}}(K, \mathcal{E})$ can be identified with a limit of the composite diagram $K^{\mathrm{op}} \xrightarrow{F^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}} \xrightarrow{\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}} \mathcal{QC}$ (Proposition 8.6.8.11). More generally, if κ is an uncountable cardinal for which the cartesian fibration U is essentially κ -small and the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{ACart}}(K, \mathcal{E})$ is essentially κ -small, then $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{ACart}}(K, \mathcal{E})$ can be realized as the limit of $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} \circ F^{\mathrm{op}}$ in the ∞ -category $\mathcal{QC}_{<\kappa}$; see Proposition 8.6.8.11.

Remark 7.7.2.4 (Isomorphism Invariance). In the situation of Notation 7.7.2.1, suppose 05TG that $\mathcal{C}$ is an ∞ -category. Then the condition that $F : K^{\triangleright} \rightarrow \mathcal{C}$ is an effective descent diagram for U depends only on the isomorphism class of F (as an object of the ∞ -category $\mathrm{Fun}(K^{\triangleright}, \mathcal{C})$). This follows from the characterization given in Remark 7.7.2.3 (together with Corollary 7.1.3.15).

Example 7.7.2.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets and let 05TH $F : K^{\triangleright} \rightarrow \mathcal{C}$ be a diagram, carrying the cone point of $K^{\triangleright}$ to a vertex $C \in \mathcal{C}$. Then evaluation at the cone point of $K^{\triangleright}$ induces a trivial Kan fibration $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{ACart}}(K^{\triangleright}, \mathcal{E}) \rightarrow \mathcal{E}_C$. See Proposition 5.3.1.21.

Definition 7.7.2.6. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets. We say that a 05TJ morphism of simplicial sets $F : K^{\triangleright} \rightarrow \mathcal{C}$ is a *descent diagram for U* if the restriction map

$$\theta : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{ACart}}(K^{\triangleright}, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{ACart}}(K, \mathcal{E}) \quad \tilde{F} \mapsto \tilde{F}|_K$$

is fully faithful. We say that F is an *effective descent diagram for U* if θ is an equivalence of ∞ -categories.

Remark 7.7.2.7. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets, and let 05TK $F : K^{\triangleright} \rightarrow \mathcal{C}$ be a morphism carrying the cone point to a vertex $C \in \mathcal{C}$. For every vertex $x \in K$, the restriction of F to $\{x\}^{\triangleright}$ determines an edge $e_x : F(x) \rightarrow C$ of $\mathcal{C}$, which has an associated contravariant transport functor $e_x^* : \mathcal{E}_C \rightarrow \mathcal{E}_{F(x)}$ (Definition 5.2.2.15). Using Remark 7.7.2.3 and Example 7.7.2.5, we can identify the restriction map θ appearing in Definition 7.7.2.6 with a comparison functor $\mathcal{E}_C \rightarrow \varprojlim_{x \in K} (\mathcal{E}_{F(x)})$, given informally by the construction $(E \text{ in } \mathcal{E}_C) \mapsto \{e_x^* E \in \mathcal{E}_{F(x)}\}_{x \in K}$. The morphism F is an effective descent diagram for $\mathcal{C}$ if and only if this comparison functor is an equivalence of ∞ -categories. More precisely, if κ is an uncountable cardinal for which U is essentially κ -small, then F is an effective descent diagram for $\mathcal{C}$ if and only if the composition

$$(K^{\triangleright})^{\mathrm{op}} \xrightarrow{F^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}} \xrightarrow{\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}} \mathcal{QC}_{<\kappa}$$

is a limit diagram in the ∞ -category $\mathcal{QC}_{<\kappa}$; here $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ denotes a contravariant transport representation for the cartesian fibration U (Proposition 8.6.8.13).

We can now formulate the main result of this section. Recall that an ∞ -category $\mathcal{C}$ admits pullbacks if and only if the evaluation functor

$$\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C} \quad (u : C' \rightarrow C) \mapsto C$$

is a cartesian fibration of ∞ -categories (Corollary 7.6.2.25).

05TL Theorem 7.7.2.8. *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let $F : K^\triangleright \rightarrow \mathcal{C}$ be a morphism of simplicial sets. If F is a universal colimit diagram (Definition 7.7.1.15), then F is a descent diagram for the cartesian fibration $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$. The converse holds if $\mathcal{C}$ admits K -indexed colimits or if $\mathcal{C}$ has a final object.*

We will give the proof of Theorem 7.7.2.8 at the end of this section.

05TM Warning 7.7.2.9. Beware that the second assertion of Theorem 7.7.2.8 is generally false if we do not assume either that $\mathcal{C}$ has K -indexed colimits or a final object. For example, suppose that $\mathcal{C}$ is a Kan complex. Then the evaluation map $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is a trivial Kan fibration (Corollary 3.1.3.6), so every morphism $F : K^\triangleright \rightarrow \mathcal{C}$ is an (effective) descent diagram for ev_1 .

05TN Notation 7.7.2.10. Let $\mathcal{C}$ be an ∞ -category and let $F : K \rightarrow \mathcal{C}$ be a diagram, which we identify with an object of the ∞ -category $\mathrm{Fun}(K, \mathcal{C})$. By definition, objects of the slice ∞ -category $\mathrm{Fun}(K, \mathcal{C})_{/F}$ can be identified with pairs (F', γ) , where $F' : K \rightarrow \mathcal{C}$ is a diagram and $\gamma : F' \rightarrow F$ is a natural transformation. We let $\mathrm{Fun}(K, \mathcal{C})_{/F}^{\mathrm{Cart}}$ denote the full subcategory of $\mathrm{Fun}(K, \mathcal{C})_{/F}$ spanned by those pairs (F', γ) where γ is cartesian, in the sense of Definition 7.7.1.1.

Let $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ be the functor given by evaluation at $1 \in \Delta^1$. Then the slice diagonal morphism of Construction 4.6.4.15) induces an equivalence of ∞ -categories

$$\iota : \mathrm{Fun}(K, \mathcal{C})_{/F} \hookrightarrow \mathrm{Fun}(K, \mathcal{C}) \tilde{\times}_{\mathrm{Fun}(K, \mathcal{C})} \{F\} \simeq \mathrm{Fun}_{/\mathcal{C}}(K, \mathrm{Fun}(\Delta^1, \mathcal{C}))$$

(see Corollary 4.6.4.20). If $\mathcal{C}$ admits pullbacks, then ev_1 is a cartesian fibration, and ι restricts to an equivalence of full subcategories $\mathrm{Fun}(K, \mathcal{C})_{/F}^{\mathrm{Cart}} \hookrightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{ACart}}(K, \mathrm{Fun}(\Delta^1, \mathcal{C}))$ (see Remark 7.7.1.12).

05TP Remark 7.7.2.11. Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let

$$\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$$

denote the cartesian fibration given by evaluation at the vertex $1 \in \Delta^1$. It follows from Notation 7.7.2.10 that a morphism $F : K^\triangleright \rightarrow \mathcal{C}$ is a descent diagram for ev_1 if and only if the restriction functor

$$\theta : \mathrm{Fun}(K^\triangleright, \mathcal{C})_{/F}^{\mathrm{Cart}} \rightarrow \mathrm{Fun}(K, \mathcal{C})_{/F|K}^{\mathrm{Cart}}$$

is fully faithful. Similarly F is an effective descent diagram for ev_1 if and only if θ is an equivalence of ∞ -categories.

Corollary 7.7.2.12. *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let K be a simplicial set. If K -indexed colimits in $\mathcal{C}$ are universal, then the restriction functor* 05TQ

$$\mathrm{Fun}(K^\triangleright, \mathcal{C})_{/F}^{\mathrm{Cart}} \rightarrow \mathrm{Fun}(K, \mathcal{C})_{/F|_K}^{\mathrm{Cart}}$$

for every colimit diagram $F : K^\triangleright \rightarrow \mathcal{C}$. The converse holds $\mathcal{C}$ admits K -indexed colimits or has a final object.

Proof. Combine Theorem 7.7.2.8 with Remark 7.7.2.11. □

Definition 7.7.2.13. Let K be a simplicial set and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits. We say that a morphism $F : K^\triangleright \rightarrow \mathcal{C}$ is a *strongly universal colimit diagram* if the restriction map $\mathrm{Fun}(K^\triangleright, \mathcal{C})_{/F}^{\mathrm{Cart}} \rightarrow \mathrm{Fun}(K, \mathcal{C})_{/F|_K}^{\mathrm{Cart}}$ is an equivalence of ∞ -categories: that is, if F is an effective descent diagram for the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ (Remark 7.7.2.11). 05TR

Remark 7.7.2.14. Let K be a simplicial set and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits. It follows from Theorem 7.7.2.8 that if $F : K^\triangleright \rightarrow \mathcal{C}$ is a strongly universal colimit diagram, then it is a universal colimit diagram (and therefore a colimit diagram). 05TS

Definition 7.7.2.15. Let K be a simplicial set and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits. Then, for every diagram $F : K \rightarrow \mathcal{C}$, we can choose a colimit diagram $\overline{F} : K^\triangleright \rightarrow \mathcal{C}$ satisfying $\overline{F}|_K = F$. We say that *the colimit of F is strongly universal* if $\overline{F}$ is a strongly universal colimit diagram, in the sense of Definition 7.7.2.13. By virtue of Remark 7.7.2.4, this condition depends only the diagram F (and not on the choice of extension $\overline{F} : K^\triangleright \rightarrow \mathcal{C}$). 05TT

We say that *K -indexed colimits in $\mathcal{C}$ are strongly universal* if, for every diagram $F : K \rightarrow \mathcal{C}$, the colimit of F is strongly universal.

Example 7.7.2.16. Let $\mathcal{C}$ be an ∞ -category which admits pullbacks. Then a colimit of the empty diagram $F : \emptyset \rightarrow \mathcal{C}$ can be identified with an initial object $C \in \mathcal{C}$. In this case, C is a universal colimit of F if and only if it is a strongly universal colimit of F : both conditions are equivalent to the requirement that the projection map $\mathcal{C}_{/C} \rightarrow \Delta^0$ is an equivalence of ∞ -categories, or that every morphism $C' \rightarrow C$ is an isomorphism. See Example 7.7.1.17. 05TU

Remark 7.7.2.17. Definition 7.7.2.15 is an ∞ -categorical counterpart of the notion of *van Kampen colimit*, introduced by Heindel and Sobociński in [58]. See also [10]. 05TV

Remark 7.7.2.18. Let K be a simplicial set, and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits, and let $F : K \rightarrow \mathcal{C}$ be a diagram having colimit $\varinjlim(F)$. 05TW

Stated more informally, Theorem 7.7.2.8 asserts that the colimit of F is universal if and only if the formation of pullbacks induces a fully faithful functor

$$\mathcal{C}_{/\varinjlim(F)} \rightarrow \varprojlim_{x \in K} \mathcal{C}_{/F(x)} \quad E \mapsto \{F(x) \times_{\varinjlim(F)} E\}_{x \in K}$$

(see Remark 7.7.2.7). Similarly, the colimit of F is strongly universal if and only if this functor is an equivalence of ∞ -categories. More precisely, if κ is an uncountable cardinal for which $\mathcal{C}$ is essentially small, then the colimit of F is strongly universal if and only if it is preserved by the functor

$$\mathcal{C} \rightarrow \mathcal{QC}_{<\kappa}^{\text{op}} \quad C \mapsto \mathcal{C}_{/C}$$

given by contravariant transport for the evaluation functor $\text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$.

05TX Corollary 7.7.2.19. *Let K be a simplicial set and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits. Then a morphism $F : K^\triangleright \rightarrow \mathcal{C}$ is a strongly universal colimit diagram if and only if it satisfies the following condition:*

(*) *A natural transformation $\gamma : G \rightarrow F$ in $\text{Fun}(K^\triangleright, \mathcal{C})$ is cartesian if and only if the restriction $\gamma|_K : G|_K \rightarrow F|_K$ is cartesian and G is a colimit diagram.*

Proof. Assume first that F is a strongly universal colimit diagram. Then F is a universal colimit diagram (Remark 7.7.2.14). Consequently, if we are given cartesian natural transformation $\gamma : G \rightarrow F$, then $G : K^\triangleright \rightarrow \mathcal{C}$ is a colimit diagram. Conversely, suppose we are given a natural transformation $\gamma : G \rightarrow F$ where G is a colimit diagram and $\gamma|_K$ is cartesian. Our assumption that F is a strongly universal colimit diagram guarantees that we can lift $\gamma|_K$ to a cartesian natural transformation $\gamma' : G' \rightarrow F$. Since F is a universal colimit diagram, G' is a colimit diagram. It follows that the identity transformation $\text{id} : G|_K \rightarrow G|_K$ admits an essentially unique lift to a natural transformation $G' \rightarrow G$. Our assumption that G is a colimit diagram guarantees that this natural transformation is an isomorphism (Proposition 7.1.3.14). We may therefore assume without loss of generality that $G' = G$. In this case, to show that γ is cartesian, it will suffice to show that it is homotopic to the γ' . By construction γ and γ' have the same image under the restriction map

$$\rho : \text{Hom}_{\text{Fun}(K^\triangleright, \mathcal{C})}(G, F) \rightarrow \text{Hom}_{\text{Fun}(K, \mathcal{C})}(G|_K, F|_K).$$

The desired result now follows from the observation that ρ is a homotopy equivalence (since G is a colimit diagram; see Proposition 7.1.6.13).

We now prove the converse. Assume that condition (*) is satisfied; we wish to show that the restriction functor $\text{Fun}(K^\triangleright, \mathcal{C})_{/F}^{\text{Cart}} \rightarrow \text{Fun}(K, \mathcal{C})_{/F|_K}^{\text{Cart}}$ is an equivalence of ∞ -categories. It follows from Theorem 7.7.2.8 that the functor θ is fully faithful. Consequently, to show that it is an equivalence of ∞ -categories, it will suffice to show that it is surjective on objects

(Theorem 4.6.2.21). Fix a diagram $G_0 : K \rightarrow \mathcal{C}$ and a cartesian natural transformation $\gamma_0 : G_0 \rightarrow F|_K$. Our assumption that $\mathcal{C}$ admits K -indexed colimits guarantees that we can extend G_0 to a colimit diagram $G : K^\triangleright \rightarrow \mathcal{C}$. As above, the restriction map ρ is a homotopy equivalence, hence a trivial Kan fibration; we can therefore extend γ_0 to a natural transformation $\gamma : G \rightarrow F$. Condition $(*)$ then guarantees that γ is cartesian, so that the pair (G, γ) is a lift of (G_0, γ_0) to the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{C})_{/F}^{\text{Cart}}$. $\square$

Remark 7.7.2.20. Let K be a simplicial set, let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits, and suppose we are given a diagram $\overline{F} : K^\triangleright \rightarrow \mathcal{C}$, carrying the cone point of $K^\triangleright$ to an object $C \in \mathcal{C}$. Set $F = \overline{F}|_K$, so that $\overline{F}$ determines a natural transformation $\beta : F \rightarrow \underline{C}$. By virtue of Proposition 7.7.1.13 and Remark 7.1.3.6, $\overline{F}$ is a universal colimit diagram if and only if the following condition is satisfied:

(a) Let $u : C' \rightarrow C$ be a morphism in $\mathcal{C}$ and let $\sigma :$

$$\begin{array}{ccc} F' & \xrightarrow{\beta'} & C' \\ \downarrow \gamma & & \downarrow u \\ F & \xrightarrow{\beta} & \underline{C} \end{array}$$

be a diagram in $\text{Fun}(K, \mathcal{C})$. If σ is a levelwise pullback square, then β' exhibits C' as a colimit of F' .

Suppose this condition is satisfied. Corollary 7.7.2.19 then asserts that $\overline{F}$ is a strongly universal colimit diagram if and only if it satisfies the following converse of (a):

(b) For every diagram σ as above, if β' exhibits C' as a colimit of F' and γ is cartesian, then σ is a levelwise pullback square.

Remark 7.7.2.21. Let K be a simplicial set, let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits, and let $F : K \rightarrow \mathcal{C}$ be a diagram. Stated more informally, Remark 7.7.2.20 asserts that the colimit of F is strongly universal if and only if the following conditions are satisfied:

(a') For every morphism $C' \rightarrow C = \varinjlim (F)$ in $\mathcal{C}$, the comparison map

$$\varinjlim_{x \in K} (C' \times_C F(x)) \rightarrow C' \times_C \varinjlim_{x \in K} (F(x)) \simeq C'$$

is an isomorphism.

(b') For every cartesian natural transformation $\gamma : F' \rightarrow F$, the diagram

$$\begin{array}{ccc} F'(x) & \longrightarrow & \varinjlim(F) \\ \downarrow & & \downarrow \\ F(x) & \longrightarrow & \varinjlim(F) \end{array}$$

is a pullback square for each vertex $x \in K$.

05U0 **Example 7.7.2.22.** Let $\mathcal{C}$ be (the nerve of) the category of sets, and let $K = B_\bullet G$ be the classifying simplicial set of a group G (see Construction 1.3.2.5). Then a diagram $F : K \rightarrow \mathcal{C}$ can be identified with a set X equipped with an action of the group G , and the colimit $\varinjlim(F)$ can be identified with the quotient set X/G . This colimit is always universal (Example 7.7.0.3). Applying Remark 7.7.2.21, we see that the colimit of F is strongly universal if and only if the following condition is satisfied:

(*) For every set X' with an action of G and every G -equivariant map $f : X' \rightarrow X$, the diagram of sets

$$\begin{array}{ccc} X' & \longrightarrow & X'/G \\ \downarrow f & & \downarrow \\ X & \longrightarrow & X/G \end{array}$$

is a pullback square.

Beware that this condition is not automatic: it is satisfied if and only if G acts freely on X .

05U1 **Corollary 7.7.2.23.** *Let K be a simplicial set and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and K -indexed colimits. Then K -indexed colimits in $\mathcal{C}$ are strongly universal if and only if the following condition is satisfied:*

(*) *Let $\gamma : G \rightarrow F$ be a natural transformation between diagrams $G, F : K^\triangleright \rightarrow \mathcal{C}$, where F is a colimit diagram and $\gamma|_K$ is cartesian. Then γ is cartesian if and only if G is a colimit diagram.*

We now turn to the proof of Theorem 7.7.2.8. We will need some terminology.

05U2 **Definition 7.7.2.24.** Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and let $F : K^\triangleright \rightarrow \mathcal{C}$ be a diagram carrying the cone point of $K^\triangleright$ to an object $C \in \mathcal{C}$. Then the composite map

$$(K^\triangleright)^\triangleright \simeq K \star \Delta^1 \twoheadrightarrow K \star \Delta^0 = K^\triangleright \xrightarrow{F} \mathcal{C}$$

determines a lift of F to a diagram $\tilde{F} : K^\triangleright \rightarrow \mathcal{C}_{/C}$. We say that F is a *weak colimit diagram* if $\tilde{F}$ is a colimit diagram in the ∞ -category $\mathcal{C}_{/C}$.

Remark 7.7.2.25. Let $\mathcal{C}$ be an ∞ -category, let $F : K^\triangleright \rightarrow \mathcal{C}$ be a diagram carrying the cone point of $K^\triangleright$ to an object $C \in \mathcal{C}$, and let $\tilde{C}$ be the object of $\mathcal{C}_{/C}$ corresponding to the identity morphism $\text{id}_C : C \rightarrow C$. Let $\tilde{F} : K^\triangleright \rightarrow \mathcal{C}_{/C}$ be as in Definition 7.7.2.24 and let $\tilde{F}_0 = \tilde{F}|_K$, so that $\tilde{F}$ determines a natural transformation β from $\tilde{F}_0$ to the constant diagram taking the value $\tilde{C}$. The following conditions are equivalent:

- (1) The morphism F is a weak colimit diagram: that is, $\tilde{F}$ is a colimit diagram in the ∞ -category $\mathcal{C}_{/C}$.
- (2) The natural transformation β exhibits $\tilde{C}$ as a colimit of the diagram $\tilde{F}_0$ in the ∞ -category $\mathcal{C}_{/C}$.
- (3) There exists a final object $X \in \mathcal{C}_{/C}$ and a natural transformation $\tilde{F}_0 \rightarrow \underline{X}$ which exhibits X as a colimit of $\tilde{F}_0$.
- (4) For any final object $X \in \mathcal{C}_{/C}$, any natural transformation $\tilde{F}_0 \rightarrow \underline{X}$ exhibits X as a colimit of $\tilde{F}_0$.

The equivalence (1) $\Leftrightarrow$ (2) follows from Remark 7.1.3.6 and the implications (2) $\Rightarrow$ (3) and (4) $\Rightarrow$ (2) follow from the observation that $X = \tilde{C}$ is a final object of $\mathcal{C}_{/C}$ (Proposition 4.6.7.23). The implication (3) $\Rightarrow$ (4) follows from the observation that if X is a final object of $\mathcal{C}_{/C}$, then the constant diagram $\underline{X}$ is a final object of the diagram ∞ -category $\text{Fun}(K, \mathcal{C})$ (Proposition 7.1.8.2).

Proposition 7.7.2.26. Let $\mathcal{C}$ be an ∞ -category, let K be a simplicial set, and let $F : K^\triangleright \rightarrow \mathcal{C}$ be a morphism. If F is a colimit diagram, then it is a weak colimit diagram. The converse holds if $\mathcal{C}$ admits finite products or if $\mathcal{C}$ admits K -indexed colimits.

Proof. The first assertion follows from the observation that the forgetful functor $U : \mathcal{C}_{/C} \rightarrow \mathcal{C}$ is conservative and creates colimits (Proposition 7.1.4.21). To prove the converse, it will suffice to show that the functor U preserves K -indexed colimits. If $\mathcal{C}$ admits K -indexed colimits, this follows from Corollary 7.1.4.22. If $\mathcal{C}$ admits finite products, then the functor U has a right adjoint (given on objects by the construction $X \mapsto X \times C$; see Proposition 7.6.1.14) and therefore preserves K -indexed colimits by virtue of Corollary 7.1.4.23. $\square$

Warning 7.7.2.27. The converse of Proposition 7.7.2.26 is false in general: a weak colimit diagram in an ∞ -category $\mathcal{C}$ need not be a colimit diagram. For a counterexample, see Warning 7.7.2.9.

Corollary 7.7.2.28. Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let $F : K^\triangleright \rightarrow \mathcal{C}$ be a morphism of simplicial sets. The following conditions are equivalent:

- (1) *The morphism F is a weak colimit diagram.*
- (2) *For any object $C \in \mathcal{C}$, any lift of F to a morphism $\tilde{F} : K^\triangleright \rightarrow \mathcal{C}_{/C}$ is a colimit diagram in the slice ∞ -category $\mathcal{C}_{/C}$.*
- (3) *There exists an object $C \in \mathcal{C}$ and a lift of F to a colimit diagram $\tilde{F} : K^\triangleright \rightarrow \mathcal{C}_{/C}$.*

Proof. The implication $(2) \Rightarrow (1) \Rightarrow (3)$ are immediate from the definitions. To prove the reverse implications, we note that if $\tilde{F} : K^\triangleright \rightarrow \mathcal{C}_{/C}$ is a lift of F , then $\tilde{F}$ is a weak colimit diagram in $\mathcal{C}_{/C}$ if and only if F is a weak colimit diagram in $\mathcal{C}$. It will therefore suffice to show that this condition is satisfied if and only if $\tilde{F}$ is a colimit diagram in $\mathcal{C}_{/C}$. This follows from Proposition 7.7.2.26, since the ∞ -category $\mathcal{C}_{/C}$ admits finite products (Corollary 7.6.2.17). $\square$

05U7 **Remark 7.7.2.29.** In the formulation of Corollary 7.7.2.28, we can replace the slice ∞ -category $\mathcal{C}_{/C}$ by the oriented fiber product $\mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\}$ (see Corollary 4.6.4.20).

05U8 **Corollary 7.7.2.30.** *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks, let K be a simplicial set, and let $\beta : F' \rightarrow F$ be a natural transformation between diagrams $F', F : K^\triangleright \rightarrow \mathcal{C}$. Then F' is a weak colimit diagram if and only if it satisfies the following condition:*

- (*) *Let $\gamma : G \rightarrow F$ be a cartesian natural transformation in $\text{Fun}(K, \mathcal{C})$. Then the restriction map*

$$\text{Hom}_{\text{Fun}(K^\triangleright, \mathcal{C})_{/F}}(F', G) \rightarrow \text{Hom}_{\text{Fun}(K, \mathcal{C})_{/F|_K}}(F'|_K, G|_K)$$

is a homotopy equivalence of Kan complexes.

Proof. Let $C \in \mathcal{C}$ be the value of the diagram F at the cone point of $K^\triangleright$, and let $\underline{C} : K^\triangleright \rightarrow \mathcal{C}$ denote the constant diagram taking the value C . By virtue of Variant 7.7.1.14, a natural transformation $\gamma : G \rightarrow F$ is cartesian if and only if there exists a morphism $u : D \rightarrow C$ of $\mathcal{C}$ and a pullback diagram

$$\begin{array}{ccc} G & \xrightarrow{\quad} & D \\ \gamma \downarrow & & \downarrow u \\ F & \xrightarrow{\quad} & \underline{C}. \end{array}$$

We may therefore assume without loss of generality that $F = \underline{C}$ is a constant diagram, and consider only constant natural transformations $\underline{u} : \underline{D} \rightarrow \underline{C}$ in the formulation of condition (*).

Let $\tilde{\mathcal{C}}$ denote the oriented fiber product $\mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\}$. Then the pair (F', β) can then be identified with a diagram $\tilde{F}' : K^\triangleright \rightarrow \tilde{\mathcal{C}}$. β then determines a lift of F' to a diagram $\tilde{F} : K^\triangleright \rightarrow \tilde{\mathcal{C}}$. Let us abuse notation by writing $\underline{D}$ for the constant diagram $K^\triangleright \rightarrow \tilde{\mathcal{C}}$ taking

the value D (regarded as an object of $\mathcal{D}$ via the morphism u). Recall that Corollary 4.6.4.20 supplies an equivalence of the slice ∞ -category $\mathrm{Fun}(K^\triangleright, \mathcal{C})_{/G}$ with the oriented fiber product

$$\mathrm{Fun}(K^\triangleright, \mathcal{C}) \tilde{\times}_{\mathrm{Fun}(K^\triangleright, \mathcal{C})} \{G\} \simeq \mathrm{Fun}(K^\triangleright, \mathcal{D})$$

and $\mathrm{Fun}(K, \mathcal{C})_{/G|_K}$ by $\mathrm{Fun}(K, \mathcal{D})$. We can therefore reformulate condition $(*)$ as follows:

$(*)'$ For every object $D \in \mathcal{D}$, the restriction map

$$\mathrm{Hom}_{\mathrm{Fun}(K^\triangleright, \mathcal{D})}(\tilde{F}', \underline{D}) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{D})}(\tilde{F}'|_K, \underline{D}|_K)$$

is a homotopy equivalence.

Using Corollary 7.1.6.18, we see that condition $(*)'$ is satisfied if and only if $\tilde{F}'$ is a colimit diagram in the ∞ -category $\mathcal{D}$. By virtue of Corollary 7.7.2.28 (and Remark 7.7.2.29), this is equivalent to the condition that F is a weak colimit diagram. $\square$

Corollary 7.7.2.31. *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let*

05U9

$$\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$$

be the cartesian fibration given by evaluation at $1 \in \Delta^1$. Then a morphism $F : K^\triangleright \rightarrow \mathcal{C}$ satisfies descent for ev_1 if and only if, for every cartesian natural transformation $\beta : F' \rightarrow F$, the morphism $F' : K^\triangleright \rightarrow \mathcal{C}$ is a weak colimit diagram.

Proof. By virtue of Remark 7.7.2.11, F is a descent diagram for ev_1 if and only if, for every pair of cartesian transformations $\beta : F' \rightarrow F$ and $\gamma : G \rightarrow F$, the restriction map

$$\mathrm{Hom}_{\mathrm{Fun}(K^\triangleright, \mathcal{C})_{/F}}(F', G) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(K, \mathcal{C})_{/F|_K}}(F'|_K, G|_K)$$

is a homotopy equivalence. If we regard β as fixed and allow γ to vary, this is equivalent to the requirement that F' is a weak colimit diagram. Corollary 7.7.2.31 now follows by allowing β to vary. $\square$

Proof of Theorem 7.7.2.8. Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let $F : K^\triangleright \rightarrow \mathcal{C}$ be a universal colimit diagram. Then, for every cartesian natural transformation $\beta : F' \rightarrow F$, the morphism $F' : K^\triangleright \rightarrow \mathcal{C}$ is a colimit diagram, and therefore a weak colimit diagram (Proposition 7.7.2.26). Applying Corollary 7.7.2.31, we deduce that F is a descent diagram for the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$. The converse holds whenever every weak colimit diagram $F' : K^\triangleright \rightarrow \mathcal{C}$ is a colimit diagram. By virtue of Proposition 7.7.2.26, this condition is satisfied if $\mathcal{C}$ admits K -indexed colimits or finite products (which follows from the existence of a final object of $\mathcal{C}$, since $\mathcal{C}$ admits pullbacks: see Corollary 7.6.2.30). $\square$

We close this section by recording a few other consequences of Corollary 7.7.2.31.

05UA **Corollary 7.7.2.32.** *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let $F : K^\triangleright \rightarrow \mathcal{C}$ be a morphism. Then F is a descent diagram for $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ if and only if the following condition is satisfied:*

(*) *For every morphism $u : C' \rightarrow C$ of $\mathcal{C}$ and every lift of F to a diagram $\tilde{F} : K^\triangleright \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\}$, the composite map*

$$K^\triangleright \xrightarrow{\tilde{F}} \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\} \xrightarrow{u^*} \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C'\}$$

is a colimit diagram in the ∞ -category $\mathcal{C} \tilde{\times}_{\mathcal{C}} \{C'\}$.

Proof. Assume first that F is a descent diagram for ev_1 . Fix a morphism $u : C' \rightarrow C$ and a lift of F to a diagram $\tilde{F} : K^\triangleright \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\}$, which we can identify with a natural transformation $\beta : F \rightarrow \underline{C}$. Then $u^* \circ \tilde{F}$ can be identified with a diagram $F' : K^\triangleright \rightarrow \mathcal{C}$ equipped with a natural transformation $\beta' : F' \rightarrow \underline{C}'$. Using the description of u^* given by Proposition 7.6.2.20, we see that there is a levelwise pullback diagram

$$\begin{array}{ccc} F' & \xrightarrow{\beta'} & \underline{C}' \\ \downarrow \gamma & & \downarrow u \\ F & \xrightarrow{\beta} & \underline{C} \end{array}$$

in the ∞ -category $\mathrm{Fun}(K, \mathcal{C})$. It follows from Remark 7.7.1.11 and Example 7.7.1.6 that the natural transformation γ is cartesian, so that F' is a weak colimit diagram (Corollary 7.7.2.31). Applying Remark 7.7.2.29, we conclude that $u^* \circ \tilde{F}$ is a colimit diagram in the ∞ -category $\mathcal{C} \tilde{\times}_{\mathcal{C}} \{C'\}$.

We now prove the converse. Assume that condition (*) is satisfied; we wish to show that F is a descent diagram for ev_1 . By virtue of Corollary 7.7.2.31, it will suffice to show that for every cartesian natural transformation $\gamma : F' \rightarrow F$, the morphism $F' : K^\triangleright \rightarrow \mathcal{C}$ is a weak colimit diagram. Let $u : C' \rightarrow C$ denote the morphism of $\mathcal{C}$ obtained by evaluating γ at the cone point of $K^\triangleright$, so that Variant 7.7.1.14 supplies a levelwise pullback square σ :

05UB

$$\begin{array}{ccc} F' & \xrightarrow{\beta'} & \underline{C}' \\ \downarrow & & \downarrow u \\ F & \xrightarrow{\beta} & \underline{C} \end{array}$$

(7.83)

in the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{C})$. Let us identify the lower and upper halves of (7.83) with diagrams $\tilde{F} : K^\triangleright \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C\}$ and $\tilde{F}' : K^\triangleright \rightarrow \mathcal{C} \tilde{\times}_{\mathcal{C}} \{C'\}$. Since σ is a levelwise pullback square, we can identify $\tilde{F}'$ with the composition $u^* \circ \tilde{F}$ (Proposition 7.6.2.20). Invoking assumption (*), we see that $\tilde{F}'$ is a colimit diagram in the ∞ -category $\mathcal{C} \tilde{\times}_{\mathcal{C}} \{C'\}$: that is, F' is a weak colimit diagram. $\square$

Corollary 7.7.2.33. *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let K be a simplicial set. The following conditions are equivalent:* 05UC

- (1) *Every weak colimit diagram $F : K^\triangleright \rightarrow \mathcal{C}$ is a descent diagram for the evaluation functor $\text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$.*
- (2) *For every morphism $u : C' \rightarrow C$ of $\mathcal{C}$, the pullback functor*

$$u^* : \mathcal{C}_{/C} \rightarrow \mathcal{C}_{/C'} \quad X \mapsto C' \times_C X$$

preserves K -indexed colimits.

Corollary 7.7.2.34. *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and let K be a simplicial set. Assume either that $\mathcal{C}$ has a final object or that $\mathcal{C}$ admits K -indexed colimits. Then the following conditions are equivalent:* 05UD

- (1) *Every colimit diagram $F : K^\triangleright \rightarrow \mathcal{C}$ is a universal colimit diagram.*
- (2) *For every morphism $u : C' \rightarrow C$ of $\mathcal{C}$, the pullback functor*

$$u^* : \mathcal{C}_{/C} \rightarrow \mathcal{C}_{/C'} \quad X \mapsto C' \times_C X$$

preserves K -indexed colimits.

Proof. Combine Corollary 7.7.2.33 with Proposition 7.7.2.26 and Theorem 7.7.2.8. $\square$

7.7.3 Cartesian Closed ∞ -Categories

We begin by recalling some classical definitions. 05UE

Definition 7.7.3.1. Let $\mathcal{C}$ be a category which admits finite products and let X , Y , and M be objects of $\mathcal{C}$. We say that a morphism $e : M \times X \rightarrow Y$ *exhibits M as an exponential of Y by X* if, for every object $C \in \mathcal{C}$, the composite map 05UF

$$\text{Hom}_{\mathcal{C}}(C, M) \xrightarrow{\times X} \text{Hom}_{\mathcal{C}}(C \times X, M \times X) \xrightarrow{e \circ} \text{Hom}_{\mathcal{C}}(C \times X, Y)$$

is a bijection.

We say that a category $\mathcal{C}$ is *cartesian closed* if it admits finite products and, for every pair of objects $X, Y \in \mathcal{C}$, there exists an object $M \in \mathcal{C}$ and a morphism $e : M \times X \rightarrow Y$ which exhibits M as an exponential of Y by X .

05UG **Example 7.7.3.2.** Let X and Y be sets, and let $M = \text{Hom}_{\text{Set}}(X, Y)$ denote the set of functions from X to Y . Then the evaluation map

$$\text{ev} : M \times X \rightarrow Y \quad (f, x) \mapsto f(x)$$

exhibits M as an exponential of Y by X in the category of sets. In particular, the category of sets is cartesian closed.

05UH **Example 7.7.3.3.** Let X and Y be simplicial sets and let $M = \text{Fun}(X, Y)$ be the simplicial set introduced in Construction 1.5.3.1. Then the evaluation map $\text{ev} : M \times X \rightarrow Y$ exhibits M as an exponential of Y by X in the category of simplicial sets (Proposition 1.5.3.2). In particular, the category of simplicial sets is cartesian closed. More generally, if $\mathcal{C} \subseteq \text{Set}_\Delta$ is any full subcategory which is closed under the formation of finite products and the operation $(X, Y) \mapsto \text{Fun}(X, Y)$, then $\mathcal{C}$ is also cartesian closed. For example, the category of Kan complexes Kan is cartesian closed (Corollary 3.1.3.4), and the category QCat of ∞ -category is cartesian closed (Theorem 1.5.3.7).

Definition 7.7.3.1 has an obvious ∞ -categorical counterpart.

05UJ **Definition 7.7.3.4.** Let $\mathcal{C}$ be an ∞ -category category which admits finite products and let X, Y , and M be objects of $\mathcal{C}$. We say that a morphism $e : M \times X \rightarrow Y$ *exhibits M as an exponential of Y by X* if, for every object $C \in \mathcal{C}$, the composite map

$$\text{Hom}_{\mathcal{C}}(C, M) \xrightarrow{\times X} \text{Hom}_{\mathcal{C}}(C \times X, M \times X) \xrightarrow{[e] \circ} \text{Hom}_{\mathcal{C}}(C \times X, Y)$$

is a homotopy equivalence of Kan complexes.

We say that an ∞ -category $\mathcal{C}$ is *cartesian closed* if it admits finite products and, for every pair of objects $X, Y \in \mathcal{C}$, there exists an object $M \in \mathcal{C}$ and a morphism $e : M \times X \rightarrow Y$ which exhibits M as an exponential of Y by X .

05UK **Remark 7.7.3.5.** Let $\mathcal{C}$ be an ∞ -category category which admits finite products and let X and Y be objects of $\mathcal{C}$. Then an object $M \in \mathcal{C}$ is an exponential of Y by X if and only if it represents the functor

$$\mathcal{C} \rightarrow \mathcal{S} \quad C \mapsto \text{Hom}_{\mathcal{C}}(C \times X, Y).$$

In particular, the object M is unique up to isomorphism and depends functorially on X and Y . To emphasize this dependence, we sometimes denote the object M by Y^X .

05UL **Warning 7.7.3.6.** Let $\mathcal{C}$ be an ∞ -category and let Y be an object of $\mathcal{C}$. We have now assigned two different meanings to the notation Y^X :

- If X is an object of $\mathcal{C}$, then Y^X can denote an exponential of Y by X (Definition 7.7.3.4), characterized by the existence of natural homotopy equivalences

$$\text{Hom}_{\mathcal{C}}((-), Y^X) \xrightarrow{\sim} \text{Hom}_{\mathcal{C}}((-) \times X, Y).$$

- If X is a simplicial set, then Y^X can denote a power of Y by X (Definition 7.1.2.1), characterized by the existence of natural homotopy equivalences

$$\mathrm{Hom}_{\mathcal{C}}((-), Y^X) \xrightarrow{\sim} \mathrm{Fun}(X, \mathrm{Hom}_{\mathcal{C}}((-), Y)).$$

Note that these are distinct notions in general. However, they agree in the special case where $\mathcal{C} = \mathcal{S}$ and X is a Kan complex. Beware that they do not agree in the special case where $\mathcal{C} = \mathcal{QC}$ and X is an ∞ -category which is not a Kan complex.

Example 7.7.3.7. Let $\mathcal{C}$ be a category which admits finite products, and let $e : M \times X \rightarrow Y$ be a morphism of $\mathcal{C}$. Then e exhibits M as an exponential of Y by X (in the sense of Definition 7.7.3.1). if and only if it exhibits M as an exponential of Y by X in the ∞ -category $\mathbf{N}_{\bullet}(\mathcal{C})$ (in the sense of Definition 7.7.3.4). In particular, the category $\mathcal{C}$ is cartesian closed if and only if the ∞ -category $\mathbf{N}_{\bullet}(\mathcal{C})$ is cartesian closed. 05UM

Remark 7.7.3.8. Let $\mathcal{C}$ be an ∞ -category which admits finite products and let $e : M \times X \rightarrow Y$ be a morphism of $\mathcal{C}$. If e exhibits M as an exponential of Y by X (in the sense of Definition 7.7.3.4, then the homotopy class $[e]$ exhibits M as an exponential of Y by X in the homotopy category $\mathrm{h}\mathcal{C}$ (in the sense of Definition 7.7.3.1). In particular, if the ∞ -category $\mathcal{C}$ is cartesian closed, then the homotopy category $\mathrm{h}\mathcal{C}$ is cartesian closed. Beware that the converse is false in general. 05UN

Remark 7.7.3.9. Let $\mathcal{C}$ be a cartesian closed category. Suppose that $\mathcal{C}$ is equipped with a simplicial enrichment having the following properties: 05UP

- (1) The simplicial category $\mathcal{C}$ is locally Kan: that is, for every pair of objects $C, X \in \mathcal{C}$, the simplicial set $\mathrm{Hom}_{\mathcal{C}}(C, X)_{\bullet}$ is a Kan complex.
- (2) For every object $C \in \mathcal{C}$ and every finite collection of objects $\{X_i\}_{i \in I}$ having product $X = \prod_{i \in I} X_i$, the canonical map

$$\mathrm{Hom}_{\mathcal{C}}(C, X)_{\bullet} \rightarrow \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(C, X_i)_{\bullet}$$

is an isomorphism of simplicial sets (rather than merely bijective on vertices).

- (3) Let X and Y be objects of $\mathcal{C}$, and let $e : Y^X \times X \rightarrow Y$ exhibit Y^X as an exponential of Y by X . Then, for every object $C \in \mathcal{C}$, the composite map

$$\mathrm{Hom}_{\mathcal{C}}(C, Y^X)_{\bullet} \xrightarrow{\times^X} \mathrm{Hom}_{\mathcal{C}}(C \times X, Y^X \times X)_{\bullet} \xrightarrow{e \circ} \mathrm{Hom}_{\mathcal{C}}(C \times X, Y)_{\bullet}$$

is an isomorphism of simplicial sets (rather than merely bijective on vertices).

Then the homotopy coherent nerve $\mathcal{D} = N_{\bullet}^{\text{hc}}(\mathcal{C})$ is a cartesian closed ∞ -category. Condition (1) guarantees that $\mathcal{D}$ is an ∞ -category (Theorem 2.4.5.1), condition (2) guarantees that the inclusion map $\iota : N_{\bullet}(\mathcal{C}) \hookrightarrow N_{\bullet}^{\text{hc}}(\mathcal{C}) = \mathcal{D}$ preserves finite products (Example 7.6.1.15), and condition (3) guarantees that ι carries exponentials to exponentials (see Theorem 4.6.8.5).

05UQ Example 7.7.3.10. Let $\mathbf{Kan}$ denote the category of Kan complexes. Then $\mathbf{Kan}$ is a cartesian closed category (Example 7.7.3.3), and carries a simplicial enrichment which satisfies the hypotheses of Remark 7.7.3.9. It follows that the ∞ -category of spaces $\mathcal{S} = N_{\bullet}^{\text{hc}}(\mathbf{Kan})$ is cartesian closed.

05UR Example 7.7.3.11. Let $\mathbf{QCat}$ denote the (cartesian closed) category of (small) ∞ -categories (Example 7.7.3.3). Let us regard $\mathbf{QCat}$ as equipped with the simplicial enrichment given in Construction 5.5.4.1, with morphism spaces given by the formula

$$\mathrm{Hom}_{\mathbf{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet} = \mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}.$$

This simplicial enrichment satisfies the hypotheses of Remark 7.7.3.9, so the ∞ -category $\mathcal{QC} = N_{\bullet}^{\text{hc}}(\mathbf{QCat})$ is cartesian closed.

05US Remark 7.7.3.12. Let $\mathcal{C}$ be an ∞ -category and let X be an object of $\mathcal{C}$. If $\mathcal{C}$ admits finite products, then the forgetful functor $F : \mathcal{C}_{/X} \rightarrow \mathcal{C}$ admits a right adjoint $G : \mathcal{C} \rightarrow \mathcal{C}_{/X}$ (Proposition 7.6.1.14). Moreover, the composition $(F \circ G) : \mathcal{C} \rightarrow \mathcal{C}$ is given on objects by the construction $C \mapsto C \times X$. Applying Corollary 6.2.6.2, we see that the following conditions are equivalent:

- (1) For every object $Y \in \mathcal{C}$, there exists an exponential $Y^X \in \mathcal{C}$.
- (2) The functor $(F \circ G) : \mathcal{C} \rightarrow \mathcal{C}$ admits a right adjoint $E : \mathcal{C} \rightarrow \mathcal{C}$.

Moreover, if these conditions are satisfied, then the functor $E : \mathcal{C} \rightarrow \mathcal{C}$ is given on objects by the construction $Y \mapsto Y^X$.

05UT Proposition 7.7.3.13. *Let $\mathcal{C}$ be an ∞ -category which admits finite limits, let X be an object of $\mathcal{C}$, let $F : \mathcal{C}_{/X} \rightarrow \mathcal{C}$ be the forgetful functor, and let $G : \mathcal{C} \rightarrow \mathcal{C}_{/X}$ be the right adjoint to F . The following conditions are equivalent:*

- (1) *For every object $Y \in \mathcal{C}$, there exists an exponential Y^X .*
- (2) *The functor G admits a right adjoint $H : \mathcal{C}_{/X} \rightarrow \mathcal{C}$.*

Proof. If condition (2) is satisfied, then the composite functor $(F \circ G) : \mathcal{C} \rightarrow \mathcal{C}$ also admits a right adjoint, given by the composition $(H \circ G) : \mathcal{C}_{/X} \rightarrow \mathcal{C}_{/X}$ (Remark 6.2.1.8). Consequently, the implication (2) $\Rightarrow$ (1) follows from Remark 7.7.3.12 (and does not require the assumption that $\mathcal{C}$ admits finite limits). We now prove the converse. Assume that condition (1) is

satisfied; we wish to show that the functor $G : \mathcal{C} \rightarrow \mathcal{C}_{/X}$ admits a right adjoint. Let $\mathcal{D} \subseteq \mathcal{C}_{/X}$ denote the full subcategory spanned by those objects $\tilde{Y}$ for which the functor $C \mapsto \text{Hom}_{\mathcal{C}_{/X}}(G(C), \tilde{Y})$ is representable by an object of $\mathcal{C}$. By virtue of Corollary 6.2.6.2, it will suffice to show that $\mathcal{D}$ contains every object $\tilde{Y}$ of $\mathcal{D}$.

Let us identify $\tilde{Y}$ with a morphism $u : Y \rightarrow X$ in the ∞ -category $\mathcal{C}$. Then u lifts to a morphism $\tilde{u} : \tilde{Y} \rightarrow \tilde{X}$ of $\mathcal{C}_{/X}$, corresponding to the degenerate 2-simplex

$$\begin{array}{ccc} & X & \\ u \nearrow & & \searrow \text{id} \\ Y & \xrightarrow{u} & X \end{array}$$

in the ∞ -category $\mathcal{C}$. Let $\eta : \text{id}_{\mathcal{C}_{/X}} \rightarrow G \circ F$ and $\epsilon : (F \circ G) \rightarrow \text{id}_{\mathcal{C}}$ be compatible unit and counit for an adjunction between G and F . Then we have a commutative diagram

$$\begin{array}{ccc} \tilde{Y} & \xrightarrow{\eta_{\tilde{Y}}} & (G \circ F)(\tilde{Y}) \\ \downarrow \tilde{u} & & \downarrow (G \circ F)(\tilde{u}) \\ \tilde{X} & \xrightarrow{\eta_{\tilde{X}}} & (G \circ F)(\tilde{X}) \end{array} \quad \begin{array}{l} 05UU \\ (7.84) \end{array}$$

in the ∞ -category $\mathcal{C}_{/X}$. Note that the image of (7.84) under the functor F can be identified with the left side of a commutative diagram

$$\begin{array}{ccccc} Y & \longrightarrow & Y \times X & \xrightarrow{\epsilon_Y} & Y \\ \downarrow u & & \downarrow & & \downarrow u \\ X & \longrightarrow & X \times X & \longrightarrow & X, \end{array}$$

where the left square and outer rectangle are pullback squares. It follows from Proposition 7.6.2.28 that the left square is also a pullback, so that (7.84) is a pullback square in the ∞ -category $\mathcal{C}_{/X}$ (Corollary 7.1.7.4). Our assumption that $\mathcal{C}$ admits finite limits guarantees that the subcategory $\mathcal{D} \subseteq \mathcal{C}_{/X}$ is closed under finite limits (Proposition 7.4.1.18). Consequently, to prove that $\tilde{Y}$ belongs to $\mathcal{D}$, it will suffice to show that the objects $\tilde{X}$, $(G \circ F)(\tilde{Y})$, and $(G \circ F)(\tilde{X})$ are contained in $\mathcal{D}$. Note that each of these objects belongs to the essential image of the functor G (the object $\tilde{X}$ can be obtained by applying G to a final object of $\mathcal{C}$). We are therefore reduced to proving that, for each object $Z \in \mathcal{C}$, the functor

$$C \mapsto \text{Hom}_{\mathcal{C}_{/X}}(G(C), G(Z)) \simeq \text{Hom}_{\mathcal{C}}((F \circ G)(C), Z) \simeq \text{Hom}_{\mathcal{C}}(C \times X, Z)$$

is representable by an object of $\mathcal{C}$, which is a reformulation of assumption (1). $\square$

We now consider a variant of Definition 7.7.3.4.

05UV Definition 7.7.3.14. Let $\mathcal{C}$ be an ∞ -category. We say that $\mathcal{C}$ is *locally cartesian closed* if, for every object $Y \in \mathcal{C}$, the slice ∞ -category $\mathcal{C}_{/Y}$ is cartesian closed.

05UW Remark 7.7.3.15. Let $\mathcal{C}$ be an ∞ -category which is locally cartesian closed. Then, for every object $Y \in \mathcal{C}$, the slice ∞ -category $\mathcal{C}_{/Y}$ is cartesian closed, and therefore admits finite products. Applying Corollary 7.6.2.17, we conclude that $\mathcal{C}$ admits pullbacks.

05UX Remark 7.7.3.16. Let $\mathcal{C}$ be an ∞ -category which is locally cartesian closed. If $\mathcal{C}$ has a final object C , then it is equivalent to the slice ∞ -category $\mathcal{C}_{/C}$, and is therefore cartesian closed. Conversely, if $\mathcal{C}$ is cartesian closed, then it has a final object (since it admits finite products). Beware that these conditions are not automatic: for example, the empty ∞ -category $\mathcal{C} = \emptyset$ is locally cartesian closed, but is not cartesian closed.

05UY Proposition 7.7.3.17. *The ∞ -category of spaces $\mathcal{S}$ is locally cartesian closed.*

Proof. Let S be a Kan complex; we wish to show that the slice ∞ -category $\mathcal{S}_{/S}$ is cartesian closed. Let $(\text{Set}_\Delta)_{/S}$ denote the category of simplicial sets X equipped with a map $f : X \rightarrow S$ and let $\text{KFib}(S)$ denote the full subcategory of $(\text{Set}_\Delta)_{/S}$ spanned by those objects where f is a Kan fibration. We regard $\text{KFib}(S)$ as a (locally Kan) simplicial category, whose homotopy coherent nerve can be identified with $(\mathcal{S})_{/S}$ (see Example 5.5.2.23). We will show that the simplicial category $\text{KFib}(S)$ satisfies the hypotheses of Remark 7.7.3.9.

Note that the category $(\text{Set}_\Delta)_{/S}$ is cartesian closed. If X and Y are simplicial sets equipped with morphisms $f : X \rightarrow S$ and $g : Y \rightarrow S$, then there is an exponential $M = Y^X$ in the category $(\text{Set}_\Delta)_{/S}$, whose n -simplices are given by pairs (σ, ρ) , where $\sigma : \Delta^n \rightarrow S$ is an n -simplex of S and $\rho : \Delta^n \times_S X \rightarrow \Delta^n \times_S Y$ is a morphism which is compatible with the projection to Δ^n . To complete the proof, it will suffice to show that if f and g are Kan fibrations, then the projection map $M \rightarrow S$ is also a Kan fibration. Let $\iota : A \hookrightarrow B$ be an anodyne morphism of simplicial sets; we wish to show that every lifting problem

05UZ

$$\begin{array}{ccc} A & \xrightarrow{\quad} & M \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ B & \xrightarrow{\quad} & S \end{array}$$

(7.85)

admits a solution. Invoking the universal property of M , we can rewrite (7.85) as a lifting

problem

$$\begin{array}{ccc}
 A \times_S X & \longrightarrow & Y \\
 \downarrow \iota_X & \nearrow & \downarrow g \\
 B \times_S X & \longrightarrow & S.
 \end{array}$$

Since g is a Kan fibration, we are reduced to showing that the morphism ι_X is a weak homotopy equivalence. This follows from Proposition 3.4.0.2, since ι is a weak homotopy equivalence and f is a Kan fibration. $\square$

Warning 7.7.3.18. The ∞ -category $\mathcal{QC}$ of small ∞ -categories is cartesian closed (Example 05V0 7.7.3.11), but is not locally cartesian closed.

Proposition 7.7.3.19. *Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ is locally cartesian closed if and only if it admits pullbacks and, for every morphism $f : X \rightarrow Y$ of $\mathcal{C}$, the pullback functor $f^* : \mathcal{C}_{/Y} \rightarrow \mathcal{C}_{/X}$ admits a right adjoint.* 05V1

Proof. By virtue of Remark 7.7.3.15, we may assume that $\mathcal{C}$ admits pullbacks. Then, for every object $Y \in \mathcal{C}$, the slice ∞ -category $\mathcal{C}_{/Y}$ admits finite limits (Example 7.6.2.31). Applying Proposition 7.7.3.13, we conclude that $\mathcal{C}_{/Y}$ is cartesian closed if and only if, for every morphism $f : X \rightarrow Y$ of $\mathcal{C}$, the pullback functor $f^* : \mathcal{C}_{/Y} \rightarrow \mathcal{C}_{/X}$ admits a right adjoint. Proposition 7.7.3.19 now follows by allowing the object Y to vary. $\square$

Corollary 7.7.3.20. *Let $\mathcal{C}$ be an ∞ -category which is locally cartesian closed. Then every weak colimit diagram $K^\triangleright \rightarrow \mathcal{C}$ is a descent diagram for the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$.* 05V2

Proof. By virtue of Corollary 7.7.2.33, it will suffice to show that for every morphism $f : X \rightarrow Y$ of $\mathcal{C}$, the pullback functor $f^* : \mathcal{C}_{/Y} \rightarrow \mathcal{C}_{/X}$ preserves K -indexed colimits. This follows from Corollary 7.1.4.23, since the functor f^* has a right adjoint (Proposition 7.7.3.19). $\square$

Corollary 7.7.3.21. *Let $\mathcal{C}$ be an ∞ -category which is locally cartesian closed and let K be a simplicial set. Assume either that $\mathcal{C}$ has a final object or that it admits K -indexed colimits. Then K -indexed colimits in $\mathcal{C}$ are universal.* 05V3

Proof. Combine Corollary 7.7.3.20 with Theorem 7.7.2.8. $\square$

Remark 7.7.3.22. We will see later that the converse of Corollary 7.7.3.21 is true if the ∞ -category $\mathcal{C}$ satisfies suitable set-theoretic assumptions; see Proposition [?]. 05V4

Corollary 7.7.3.23. *Colimits are universal in the ∞ -category of spaces $\mathcal{S}$.* 05V5

Proof. Combine Proposition 7.7.3.17 with Corollary 7.7.3.21. $\square$

7.7.4 Disjoint Coproducts

05V6 Let $\mathcal{C}$ be a category containing a collection of objects $\{X_i\}_{i \in I}$. Recall that a *coproduct* of $\{X_i\}_{i \in I}$ is an object $X \in \mathcal{C}$ equipped with a collection of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ satisfying the following universal property: for every object $Y \in \mathcal{C}$, the map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \prod_{i \in I} \mathrm{Hom}_{\mathcal{C}}(X_i, Y) \quad g \mapsto \{g \circ f_i\}_{i \in I}$$

is a bijection. In the special case where $\mathcal{C} = \mathbf{Set}$ is the category of sets, this is equivalent to requirement that the functions $\{f_i\}_{i \in I}$ exhibit X as a disjoint union of the collection $\{X_i\}_{i \in I}$ in the following sense:

- (1) Each of the functions f_i is injective, and therefore identifies X_i with a subset $\mathrm{im}(f_i) \subseteq X$.
- (2) The functions f_i have disjoint images: for $i \neq j$, the intersection $\mathrm{im}(f_i) \cap \mathrm{im}(f_j)$ is empty.
- (3) The union $\bigcup_{i \in I} \mathrm{im}(f_i)$ coincides with X .

Note that the first two of these conditions can be formulated in purely categorical terms: condition (1) asserts that each f_i is a monomorphism in the category $\mathcal{C} = \mathbf{Set}$, and condition (2) asserts that the fiber product $X_i \times_X X_j$ is an initial object of $\mathcal{C} = \mathbf{Set}$ for $i \neq j$. This motivates the following:

05V7 **Definition 7.7.4.1.** Let $\mathcal{C}$ be an ∞ -category. We say that a collection of objects $\{X_i\}_{i \in I}$ have a *disjoint coproduct* if the following conditions are satisfied:

- (0) There exists an object $X \in \mathcal{C}$ and a collection of morphisms $\{f_i : X_i \rightarrow X\}$ which exhibit X as a coproduct of the collection $\{X_i\}_{i \in I}$ (Definition 7.6.1.3).
- (1) For each $i \in I$, the morphism $f_i : X_i \rightarrow X$ is a monomorphism (Definition 9.6.4.1).
- (2) For every pair of distinct elements $i, j \in I$, there exists a pullback $X_i \times_X X_j$, which is an initial object of $\mathcal{C}$.

05V8 **Remark 7.7.4.2.** Let $\mathcal{C}$ be an ∞ -category and let $\{X_i\}_{i \in I}$ be a collection of objects of $\mathcal{C}$. If there exists a collection of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ which exhibits X as a coproduct of $\{X_i\}_{i \in I}$, then the collection $\{f_i\}_{i \in I}$ is uniquely determined up to isomorphism (as an object of the ∞ -category $\mathcal{C} \times \prod_{i \in I} \mathcal{C} \prod_{i \in I} \mathcal{C}_{/X_i}$). Consequently, conditions (1) and (2) of Definition 7.7.4.1 depend only on the collection $\{X_i\}_{i \in I}$, and not on the choice of the morphisms f_i .

05V9 **Remark 7.7.4.3.** Let $\mathcal{C}$ be an ∞ -category which admits an initial object $\emptyset$. Then, for every pair of morphisms $f_- : X_- \rightarrow X$ and $f_+ : X_+ \rightarrow X$, we can choose a commutative diagram

$\sigma :$

$$\begin{array}{ccc} \emptyset & \longrightarrow & X_- \\ \downarrow & & \downarrow f_- \\ X_+ & \xrightarrow{f_+} & X \end{array}$$

in $\mathcal{C}$. Moreover, the diagram σ is essentially unique: it is characterized up to isomorphism by the requirement that it is a left Kan extension of the subdiagram obtained by omitting the upper left hand corner. Consequently, we can replace condition (2) of Definition 7.7.4.1 by either of the following:

(2') For every pair of distinct elements $i, j \in I$, there exists a pullback diagram

$$\begin{array}{ccc} \emptyset & \longrightarrow & X_i \\ \downarrow & & \downarrow f_i \\ X_j & \xrightarrow{f_j} & X \end{array}$$

in the ∞ -category $\mathcal{C}$.

(2'') For every pair of distinct elements $i, j \in I$, every commutative diagram

$$\begin{array}{ccc} \emptyset & \longrightarrow & X_i \\ \downarrow & & \downarrow f_i \\ X_j & \xrightarrow{f_j} & X \end{array}$$

is a pullback diagram in the ∞ -category $\mathcal{C}$.

Remark 7.7.4.4. Let $\mathcal{C}$ be an ∞ -category which contains an initial object $\emptyset$, and let X_0 05VA and X_1 be objects of $\mathcal{C}$. Then an object X of $\mathcal{C}$ is a coproduct of X_0 with X_1 if and only if there exists a pushout square

$$\begin{array}{ccc} \emptyset & \longrightarrow & X_0 \\ \downarrow & & \downarrow f_0 \\ X_1 & \xrightarrow{f_1} & X \end{array} \tag{7.86} \quad \text{05VB}$$

(see Corollary 7.6.2.19). In this case, the coproduct is disjoint if and only if (7.86) is also a pullback square, and the morphisms f_i and f_j are monomorphisms.

05VC **Definition 7.7.4.5.** Let $\mathcal{C}$ be an ∞ -category. We say that $\mathcal{C}$ *has disjoint coproducts* if it has an initial object and every pair of objects $X_0, X_1 \in \mathcal{C}$ have a disjoint coproduct.

05VD **Example 7.7.4.6.** Let $\mathcal{C}$ be (the nerve of) the category of sets. Then $\mathcal{C}$ has disjoint coproducts.

05VE **Example 7.7.4.7.** Let $\mathcal{S}$ be the ∞ -category of spaces (Construction 5.5.1.1). The ∞ -category $\mathcal{S}$ has disjoint coproducts: if X_0 and X_1 are Kan complexes, then the disjoint union $X = X_0 \amalg X_1$ is a coproduct of X_0 and X_1 in the ∞ -category $\mathcal{S}$ (Example 7.6.1.16). Here the inclusion maps $\iota_0 : X_0 \hookrightarrow X$ and $\iota_1 : X_1 \hookrightarrow X$ are monomorphisms in the ∞ -category $\mathcal{S}$ (Example 9.6.4.10), and the pullback diagram of simplicial sets

$$\begin{array}{ccc} \emptyset & \longrightarrow & X_0 \\ \downarrow & & \downarrow \\ X_1 & \longrightarrow & X \end{array}$$

is also homotopy pullback square (Example 3.4.1.3), and therefore determines a pullback diagram in the ∞ -category $\mathcal{S}$ (Example 7.6.3.2).

05VF **Variant 7.7.4.8.** Let $\mathcal{QC}$ denote the ∞ -category of (small) ∞ -categories (Construction 5.5.4.1). The ∞ -category $\mathcal{QC}$ has disjoint coproducts: if $\mathcal{C}_0$ and $\mathcal{C}_1$ are small ∞ -categories, then the disjoint union $\mathcal{C} = \mathcal{C}_0 \amalg \mathcal{C}_1$ is a coproduct of $\mathcal{C}_0$ with $\mathcal{C}_1$ in the ∞ -category $\mathcal{QC}$ (Example 7.6.1.17). The inclusion functors $\iota_0 : \mathcal{C}_0 \hookrightarrow \mathcal{C}$ and $\iota_1 : \mathcal{C}_1 \hookrightarrow \mathcal{C}$ are fully faithful, and are therefore monomorphisms in the ∞ -category $\mathcal{QC}$ (Corollary 9.6.4.34). Moreover, the pullback diagram of simplicial sets

$$\begin{array}{ccc} \emptyset & \longrightarrow & \mathcal{C}_0 \\ \downarrow & & \downarrow \iota_0 \\ \mathcal{C}_1 & \xrightarrow{\iota_1} & \mathcal{C} \end{array}$$

is also categorical pullback square (Corollary 4.5.2.28), and therefore determines a pullback diagram in the ∞ -category $\mathcal{QC}$ (Example 7.6.3.4).

Note that Definition 7.7.4.5 refers only to pairwise coproducts in the ∞ -category $\mathcal{C}$. However, it guarantees the corresponding condition for infinitary coproducts, provided that they exist:

Proposition 7.7.4.9. *Let $\mathcal{C}$ be an ∞ -category which has disjoint coproducts. Suppose that $\mathcal{C}$ also admits I -indexed coproducts, for some set I . Then every collection of objects $\{X_i\}_{i \in I}$ of $\mathcal{C}$ admits a disjoint coproduct.* 05VG

Proof. Since $\mathcal{C}$ admits I -indexed coproducts, we can choose an object $X \in \mathcal{C}$ and a collection of morphisms $\{f_i : X_i \rightarrow X\}_{i \in I}$ which exhibits X as a coproduct of $\{X_i\}_{i \in I}$. We first claim that, for each $i \in I$, the morphism f_i is a monomorphism. Note that the collection $\{X_j\}_{j \neq i}$ also has a coproduct $Y \in \mathcal{C}$ (since it can be written as I -indexed coproduct, where we take one summand to be the initial object $\emptyset \in \mathcal{C}$). The morphisms $\{f_j\}_{j \neq i}$ then determine a map $g : Y \rightarrow X$, and the morphisms f_i and g exhibit X as a coproduct of X_i with Y . Our assumption that $\mathcal{C}$ has disjoint coproducts then guarantees f_i and g are monomorphisms.

To complete the proof, it will suffice to show that if i and j are distinct elements of I , then every commutative diagram

$$\begin{array}{ccc} \emptyset & \longrightarrow & X_i \\ \downarrow & & \downarrow f_i \\ X_j & \xrightarrow{f_j} & X \end{array} \quad (7.87) \quad 05VH$$

is a pullback square (Remark 7.7.4.3). Note that (7.87) admits an essentially unique extension to a commutative diagram

$$\begin{array}{ccccc} \emptyset & \xrightarrow{\quad} & & \xrightarrow{\quad} & X_i \\ & & & \searrow & \downarrow f_i \\ & & X_i \amalg X_j & \xrightarrow{h} & X \\ & \nearrow & \downarrow & \nearrow & \\ X_j & \xrightarrow{f_j} & & \xrightarrow{\quad} & X \end{array}$$

where the upper left region is a pushout square. Our assumption that coproducts in $\mathcal{C}$ are disjoint guarantees that the upper left region is also a pullback square. Arguing as above, we see that h exhibits $X_i \amalg X_j$ as a summand of X , and is therefore a monomorphism. The desired result now follows from Variant 9.6.4.20. $\square$

Proposition 7.7.4.10. *Let I be a set and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and I -indexed coproducts. Assume that I -indexed coproducts in $\mathcal{C}$ are universal and that* 05VJ

$\mathcal{C}$ has a universal initial object $\emptyset$. Then the coproduct of a collection of objects $\{X_i\}_{i \in I}$ is strongly universal (in the sense of Definition 7.7.2.15) if and only if it is disjoint (Definition 7.7.4.1).

Proof. Choose a collection of morphisms $f_i : X_i \rightarrow X$ which exhibit X as a coproduct of $\{X_i\}_{i \in I}$. Using Corollary 7.7.2.19, we see that the coproduct is strongly universal if and only if the following condition is satisfied:

(*) Suppose we are given a morphism $u : Y \rightarrow X$ and a collection of diagrams σ_i :

$$\begin{array}{ccc} Y_i & \xrightarrow{g_i} & Y \\ \downarrow & & \downarrow u \\ X_i & \xrightarrow{f_i} & X \end{array}$$

in the ∞ -category $\mathcal{C}$. If the morphisms g_i exhibit Y as a coproduct of $\{Y_i\}_{i \in I}$, then each σ_i is a pullback square.

Assume first that condition (*) is satisfied. Fix an element $j \in I$, and let σ_j denote the commutative diagram

$$\begin{array}{ccc} X_j & \xrightarrow{\text{id}} & X_j \\ \downarrow \text{id} & & \downarrow f_j \\ X_j & \xrightarrow{f_j} & X. \end{array}$$

For each $i \neq j$, we can choose a commutative diagram

$$\begin{array}{ccc} \emptyset & \xrightarrow{\quad} & X_j \\ \downarrow & & \downarrow f_j \\ X_i & \xrightarrow{f_i} & X. \end{array}$$

Applying (*) to the collection $\{\sigma_i\}_{i \in I}$, we conclude that each σ_i is a pullback square. In the case $i = j$, we conclude that f_j is a monomorphism (Remark 9.6.4.18), and for $i \neq j$ we conclude that the fiber product $X_i \times_X X_j$ is an initial object of $\mathcal{C}$. Allowing j to vary, we conclude that the morphisms $\{f_i : X_i \rightarrow X\}$ exhibit X as a disjoint coproduct of $\{X_i\}_{i \in I}$.

Now assume that the morphisms f_i exhibit X as a disjoint coproduct of $\{X_i\}_{i \in I}$, and suppose we are given a collection of commutative diagrams $\{\sigma_i\}_{i \in I}$ as in (*). For each index

$i \in I$, the diagram σ_i determines a comparison map $u : Y_i \rightarrow X_i \times_X Y$, and we wish to show that u is an isomorphism. For each j , let $g'_j : X_i \times_X Y_j \rightarrow X_i \times_X Y$ be the morphism obtained from g_j by pullback along f_i . Then u factors as a composition

$$Y_i \xrightarrow{u'} X_i \times_X Y_i \xrightarrow{g'_i} X_i \times_X Y,$$

and our assumption that f_i is a monomorphism guarantees that u' is an isomorphism (see Variant 9.6.4.20). Consequently, to show that u is an isomorphism, it will suffice to show that g'_i is an isomorphism. Since I -indexed coproducts are universal, the morphisms $\{g'_j\}_{j \in I}$ exhibit $X_i \times_X Y$ as a coproduct of the collection $\{X_i \times_X Y_j\}_{j \in I}$. It will therefore suffice to show that, for $j \neq i$, the fiber product $X_i \times_X Y_j$ is an initial object of $\mathcal{C}$. Since $X_i \times_X Y_j$ admits a morphism to the initial object $X_i \times_X X_j$, this follows from our assumption that the initial object of $\mathcal{C}$ is universal (Example 7.7.1.17). $\square$

Corollary 7.7.4.11. *Let κ be an infinite cardinal and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and κ -small coproducts. The following conditions are equivalent:* 05VK

- (1) *In the ∞ -category $\mathcal{C}$, κ -small coproducts are strongly universal.*
- (2) *In the ∞ -category $\mathcal{C}$, κ -small coproducts are universal and finite coproducts are strongly universal.*
- (3) *In the ∞ -category $\mathcal{C}$, κ -small coproducts are universal and coproducts are disjoint.*

Corollary 7.7.4.12. *Small coproducts are strongly universal in the ∞ -categories $\mathcal{S}$ and $\mathcal{QC}$.* 05VL

Proof. We will give the proof for $\mathcal{QC}$; the analogous statement for the ∞ -category $\mathcal{S}$ is similar (but easier). By virtue of Variant 7.7.4.8, the ∞ -category $\mathcal{QC}$ has disjoint coproducts. It will therefore suffice to show that small coproducts in $\mathcal{QC}$ are universal. Let $\{\mathcal{C}_i\}_{i \in I}$ be a small collection of ∞ -categories and let $\mathcal{C} = \coprod_{i \in I} \mathcal{C}_i$ denote their coproduct, formed in the category of simplicial sets. For each $i \in I$, let $f_i : \mathcal{C}_i \hookrightarrow \mathcal{C}$ be the inclusion map. The collection $\{f_i\}_{i \in I}$ determines a morphism $f : \{\mathcal{C}_i\}_{i \in I} \rightarrow \underline{\mathcal{C}}$ in the ∞ -category $\text{Fun}(I, \mathcal{QC})$, which exhibits $\mathcal{C}$ as a coproduct of $\{\mathcal{C}_i\}_{i \in I}$ in the ∞ -category $\mathcal{QC}$ (Example 7.6.1.17).

Suppose we are given a functor of ∞ -categories $\mathcal{C}' \rightarrow \mathcal{C}$. For each $i \in I$, let $\mathcal{C}'_i$ denote the inverse image of $\mathcal{C}_i$ in $\mathcal{C}'$, so that we have a pullback diagram

$$\begin{array}{ccc} \mathcal{C}'_i & \xrightarrow{f'_i} & \mathcal{C}' \\ \downarrow & & \downarrow \\ \mathcal{C}_i & \xrightarrow{f_i} & \mathcal{C} \end{array}$$

in the category of simplicial sets. Since f_i is an isofibration, this diagram is also a categorical pullback square (Corollary 4.5.2.28), and therefore determines a pullback diagram in the ∞ -category $\mathcal{QC}$ (Example 7.6.3.4). Allowing i to vary, we obtain a levelwise pullback diagram

$$\begin{array}{ccc} \{C'_i\}_{i \in I} & \xrightarrow{f'} & C' \\ \downarrow & & \downarrow \\ \{C_i\}_{i \in I} & \xrightarrow{f} & C \end{array}$$

in the ∞ -category $\mathrm{Fun}(I, \mathcal{QC})$. To complete the proof, it will suffice to show that f' exhibits C' as a coproduct of $\{C'_i\}_{i \in I}$ in the ∞ -category $\mathcal{QC}$, which follows from Example 7.6.1.17. $\square$

7.7.5 The Mather Cube Theorem Revisted

05VM We now study the (strong) universality of diagrams indexed by the ∞ -category $\Delta^1 \times \Delta^1$.

05VN **Definition 7.7.5.1.** Let $\mathcal{C}$ be an ∞ -category. We say that $\mathcal{C}$ *satisfies the first Mather cube theorem* if, for every cubical diagram

$$\begin{array}{ccccc} \overline{A} & \xrightarrow{\quad} & \overline{B} & & \\ & \searrow & & \searrow & \\ & & \overline{C} & \xrightarrow{\quad} & \overline{D} \\ & & \downarrow & & \downarrow \\ A & \xrightarrow{\quad} & B & & \\ & \searrow & & \searrow & \\ & & C & \xrightarrow{\quad} & D \end{array}$$

(7.88)

having the property that the back and left faces

$$\begin{array}{ccc} \overline{A} & \xrightarrow{\quad} & \overline{B} \\ \downarrow & & \downarrow \\ A & \xrightarrow{\quad} & B \end{array} \qquad \begin{array}{ccc} \overline{A} & \xrightarrow{\quad} & \overline{C} \\ \downarrow & & \downarrow \\ A & \xrightarrow{\quad} & C \end{array}$$

are pullback squares and the top and bottom faces

$$\begin{array}{ccc} \overline{A} & \longrightarrow & \overline{B} \\ \downarrow & & \downarrow \\ \overline{C} & \longrightarrow & \overline{D} \end{array} \qquad \begin{array}{ccc} A & \longrightarrow & B \\ \downarrow & & \downarrow \\ C & \longrightarrow & D \end{array}$$

are pushout squares, then the front and right faces

$$\begin{array}{ccc} \overline{C} & \longrightarrow & \overline{D} \\ \downarrow & & \downarrow \\ C & \longrightarrow & D \end{array} \qquad \begin{array}{ccc} \overline{B} & \longrightarrow & \overline{D} \\ \downarrow & & \downarrow \\ B & \longrightarrow & D \end{array}$$

are also pullback squares.

We say that $\mathcal{C}$ *satisfies the second Mather cube theorem* if, for every cubical diagram (7.88) where the front, back, left, and right faces are pullback squares and the bottom face is a pushout square, the top face is also a pushout square.

Remark 7.7.5.2. In the situation of Definition 7.7.5.1, a cubical diagram can be regarded 05VQ as a natural transformation from the top face to the bottom face, which is cartesian if and only if the remaining faces are pullback squares (see Proposition 7.6.2.28). It follows that:

- The ∞ -category $\mathcal{C}$ satisfies the second Mather cube theorem if and only if every pushout square in $\mathcal{C}$ is a universal pushout square.
- If $\mathcal{C}$ admits pushouts, then it satisfies both Mather cube theorems if and only if every pushout square in $\mathcal{C}$ is a strongly universal pushout square (Corollary 7.7.2.19).

Example 7.7.5.3. Let $\mathcal{S}$ denote the ∞ -category of spaces. Then $\mathcal{S}$ satisfies both the first 05VR and second Mather cube theorem. To prove this, we can assume without loss of generality that (7.88) arises from a commutative diagram in the ordinary category of Kan complexes (Corollary 5.6.5.18). In this case, a face of the diagram (7.88) is a pullback square in $\mathcal{S}$ if and only if it is a homotopy pullback square (Example 7.6.3.2), and a pushout square in $\mathcal{S}$ if and only if it is a homotopy pushout square (Example 7.6.3.3). The first Mather cube theorem is now a restatement of Theorem 3.4.4.4, while the second cube theorem is a restatement of Theorem 3.4.3.3.

Example 7.7.5.4. Let $\mathcal{C}$ be (the nerve of) the category of sets. Then $\mathcal{C}$ satisfies the second 05VS Mather cube theorem (Exercise 3.4.3.1), but does not satisfy the first Mather cube theorem (Warning 3.4.4.2).

05VT **Example 7.7.5.5.** The ∞ -category $\mathcal{QC}$ satisfies neither the first nor the second Mather cube theorem.

05VU **Proposition 7.7.5.6.** *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and finite colimits. Then finite colimits in $\mathcal{C}$ are universal if and only if $\mathcal{C}$ satisfies the following pair of conditions:*

- (a) *Pushouts in $\mathcal{C}$ are universal: that is, $\mathcal{C}$ satisfies the second Mather cube theorem (Remark 7.7.5.2).*
- (b) *The initial object $\emptyset \in \mathcal{C}$ is universal: that is, every morphism $C \rightarrow \emptyset$ is an isomorphism (Example 7.7.1.17).*

Proof. According to Corollary 7.7.2.34, finite colimits in $\mathcal{C}$ are universal if and only if, for every morphism $f : C' \rightarrow C$ of $\mathcal{C}$, the pullback functor

$$f^* : \mathcal{C}_{/C} \rightarrow \mathcal{C}_{/C'} \quad X \mapsto C' \times_C X$$

preserves finite colimits. By virtue of Corollary 7.6.2.30, this is equivalent to the requirement that f^* preserves both pushouts and initial objects. The desired result follows by allowing f to vary (and using Corollary 7.7.2.34 again). $\square$

05VV **Variant 7.7.5.7.** Let κ be an infinite cardinal, and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and κ -small colimits. Then κ -small colimits in $\mathcal{C}$ are universal if and only if κ -small coproducts in $\mathcal{C}$ are universal and $\mathcal{C}$ satisfies the second Mather cube theorem. This follows from the proof of Proposition 7.7.5.6, using Exercise 7.6.6.16 in place of Corollary 7.6.2.30.

05VW **Proposition 7.7.5.8.** *Let $\mathcal{C}$ be an ∞ -category which admits pullbacks and finite colimits. Then finite colimits in $\mathcal{C}$ are strongly universal if and only if the following conditions are satisfied:*

- (a) *The ∞ -category $\mathcal{C}$ satisfies the first and second Mather cube theorems.*
- (b) *The initial object $\emptyset \in \mathcal{C}$ is universal: that is, every morphism $C \rightarrow \emptyset$ is an isomorphism.*

Proof. Choose an uncountable cardinal λ for which $\mathcal{C}$ is essentially λ -small, and let

$$\mathrm{Tr} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{QC}_{<\lambda} \quad C \mapsto \mathcal{C}_{/C}$$

be a contravariant transport representation for the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$. Then finite colimits in $\mathcal{C}$ are strongly universal if and only if the functor Tr preserves finite limits (Remark 7.7.2.18). By virtue of Corollary 7.6.2.30, this is equivalent to the requirement that Tr preserves pullback squares and final objects. The case of pullback squares is a reformulation of condition (a) (Remark 7.7.5.2), and the case of final objects is a reformulation of condition (b) (Example 7.7.2.16). $\square$

Corollary 7.7.5.9. *Let κ be an infinite cardinal and let $\mathcal{C}$ be an ∞ -category which admits pullbacks and κ -small colimits. Then κ -small colimits in $\mathcal{C}$ are strongly universal if and only if the following conditions are satisfied:* 05VX

- (a) *The ∞ -category $\mathcal{C}$ satisfies both Mather cube theorems.*
- (b) *In the ∞ -category $\mathcal{C}$, κ -small coproducts are universal.*

Proof. By virtue of Proposition 7.7.5.8, we may assume without loss of generality that finite colimits in $\mathcal{C}$ are universal, so that $\mathcal{C}$ satisfies both Mather cube theorems. Choose an uncountable cardinal λ for which $\mathcal{C}$ is essentially λ -small, and let

$$\mathrm{Tr} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{QC}_{<\lambda} \quad C \mapsto \mathcal{C}_{/C}$$

be a contravariant transport representation for the evaluation functor $\mathrm{ev}_1 : \mathrm{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$. Then κ -small colimits in $\mathcal{C}$ are strongly universal if and only if the functor Tr preserves κ -small limits (Remark 7.7.2.18). By virtue of Exercise 7.6.6.16, this is equivalent to the requirement that Tr preserves κ -small products: that is, that κ -small coproducts in $\mathcal{C}$ are strongly universal. Using Corollary 7.7.4.11, we see that this is equivalent to condition (b). $\square$

Corollary 7.7.5.10. *Small colimits are strongly universal in the ∞ -category $\mathcal{S}$.* 05VY

Proof. By virtue of Example 7.7.5.3, the ∞ -category $\mathcal{S}$ satisfies both Mather cube theorems. Consequently, to show that small colimits in $\mathcal{S}$ are strongly universal, it will suffice to show that small coproducts in $\mathcal{S}$ are universal (Corollary 7.7.5.9). This follows from Corollary 7.7.4.12. $\square$

7.7.6 Descent in the ∞ -Category of Spaces

Let $\mathcal{S}$ denote the ∞ -category of spaces (Construction 5.5.1.1). In §7.7.5, we showed that small colimits in the ∞ -category $\mathcal{S}$ are strongly universal (Corollary 7.7.5.10). Our goal in this section is to give an alternative proof of this result, which emphasizes the role of the ∞ -category $\mathcal{S}$ as a classifying object for left fibrations (rather than its explicit construction as a homotopy coherent nerve). For the convenience of the reader, we restate the result as follows:

Theorem 7.7.6.1. *Let $\mathcal{C}$ be a small simplicial set and let $\overline{\mathcal{F}} : \mathcal{C}^{\triangleright} \rightarrow \mathcal{S}$ be a colimit diagram. Then $\overline{\mathcal{F}}$ is a strongly universal colimit diagram.* 05W0

The essential content of Theorem 7.7.6.1 is that, for every cartesian natural transformation $\gamma : \mathcal{F}' \rightarrow \mathcal{F}$ between functors $\mathcal{F}, \mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$, the diagram

$$\begin{array}{ccc} \mathcal{F}'(C) & \longrightarrow & \varinjlim(\mathcal{F}') \\ \downarrow & & \downarrow \\ \mathcal{F}(C) & \longrightarrow & \varinjlim(\mathcal{F}) \end{array}$$

is a pullback square for each $C \in \mathcal{C}$ (see Remark 7.7.2.21). Beware that this phenomenon has no classical counterpart: the analogous statement fails for the category of sets (see Example 7.7.2.22).

We will give the proof of Theorem 7.7.6.1 at the end of this section. The main idea is to use the theory of covariant transport representations to reduce Theorem 7.7.6.1 to the following more concrete statement about left fibrations:

05W1 **Proposition 7.7.6.2.** *Suppose we are given a commutative diagram of simplicial sets*

05W2

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{\iota'} & \overline{\mathcal{E}'} \\ \downarrow U & & \downarrow \overline{U} \\ \mathcal{E} & \xrightarrow{\iota} & \overline{\mathcal{E}} \\ \downarrow & & \downarrow \\ \mathcal{C} & \longrightarrow & \mathcal{C}^\triangleright \end{array} \quad (7.89)$$

satisfying the following conditions:

- (a) Both squares in the diagram (7.89) are pullback squares, and the vertical maps are left fibrations.
- (b) The morphism U is a Kan fibration.
- (c) The morphism ι is a weak homotopy equivalence.

Then ι' is a weak homotopy equivalence if and only if $\overline{U}$ is a Kan fibration.

Proof. Assume that ι' is a weak homotopy equivalence; we will show that $\overline{U}$ is a Kan fibration (the converse is a special case of Corollary 3.3.7.4). Using Proposition 3.1.7.1, we can factor

$\iota \circ U$ as a composition $\mathcal{E}' \xrightarrow{\iota''} \bar{\mathcal{E}}'' \xrightarrow{\bar{V}} \bar{\mathcal{E}}$, where ι'' is inner anodyne and V is a Kan fibration. Our assumption that ι' is a weak homotopy equivalence guarantees that the lifting problem

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{\quad} & \bar{\mathcal{E}}'' \\ \downarrow \iota' & \nearrow F & \downarrow V \\ \bar{\mathcal{E}}' & \xrightarrow{\bar{U}} & \bar{\mathcal{E}} \end{array}$$

admits a solution. To show that $\bar{U}$ is a Kan fibration, it will suffice to show that F is an equivalence of left fibrations over $\bar{\mathcal{E}}$ (Proposition 5.1.7.14). Using the criterion of Corollary 5.1.7.16, we are reduced to proving that for every vertex $X \in \bar{\mathcal{E}}$, the induced map

$$F_X : \{X\} \times_{\bar{\mathcal{E}}} \bar{\mathcal{E}}' \rightarrow \{X\} \times_{\bar{\mathcal{E}}} \bar{\mathcal{E}}''$$

is a homotopy equivalence. We consider two cases:

- Suppose that X belongs to the image of ι . In this case, the desired result follows by applying Proposition 3.2.8.1 to the diagram

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{\iota''} & \bar{\mathcal{E}}'' \\ \downarrow U & & \downarrow V \\ \mathcal{E} & \xrightarrow{\iota} & \bar{\mathcal{E}}, \end{array}$$

since the vertical maps are Kan fibrations and the horizontal maps are weak homotopy equivalences.

- Suppose that X does not belong to the image of ι : that is, it lies over the cone point $C \in \mathcal{C}^\triangleright$. Set $\bar{\mathcal{E}}_C = \{C\} \times_{\mathcal{C}^\triangleright} \bar{\mathcal{E}}$ and define $\bar{\mathcal{E}}'_C$ and $\bar{\mathcal{E}}''_C$ similarly, so that we have a commutative diagram

$$\begin{array}{ccc} \bar{\mathcal{E}}'_C & \xrightarrow{F_C} & \bar{\mathcal{E}}''_C \\ \downarrow U_C & & \downarrow V_C \\ \bar{\mathcal{E}}_C & \xlongequal{\quad} & \bar{\mathcal{E}}_C \end{array}$$

The morphisms U_C and V_C are pullbacks of U and V respectively, and are therefore left fibrations. Assumption (a) guarantees that the simplicial set $\bar{\mathcal{E}}_C$ is a Kan complex

(Proposition 4.4.2.1), so that U and V are Kan fibrations (Corollary 4.4.3.8). Consequently, to show that F_X is a homotopy equivalence, it will suffice to show that F_C is a homotopy equivalence (Proposition 3.2.8.1). By construction, we have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \bar{\mathcal{E}}'_C & \xrightarrow{F_C} & \bar{\mathcal{E}}''_C \\ \downarrow & & \downarrow \\ \bar{\mathcal{E}}' & \xrightarrow{F} & \bar{\mathcal{E}}'', \end{array}$$

where F is a weak homotopy equivalence by construction. We are therefore reduced to showing that the vertical maps in this diagram are weak homotopy equivalences. In fact, the vertical maps are right anodyne, since they arise as the pullback of the right anodyne inclusion $\{C\} \hookrightarrow \mathcal{C}^\triangleright$ along left fibrations (Corollary 7.2.3.13).

□

Our goal for the rest of this section is to explain why Proposition 7.7.6.2 is a reformulation of Theorem 7.7.6.1. We begin with some general remarks.

05W3 **Lemma 7.7.6.3.** *Suppose we are given a commutative diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{\Gamma} & \mathcal{E} \\ & \searrow U' & \swarrow U \\ & \mathcal{C}, & \end{array}$$

where U and U' are left fibrations. Then Γ is an isofibration if and only if it is a left fibration.

Proof. Assume that Γ is an isofibration; we will show that it is a left fibration (the reverse implication follows from Corollary 5.6.7.5). Let $\iota : A \hookrightarrow B$ be a left anodyne map of simplicial sets; we wish to show that every lifting problem

05W4

$$\begin{array}{ccc} A & \xrightarrow{\quad} & \mathcal{E}' \\ \downarrow \iota & \nearrow \text{dashed} & \downarrow \Gamma \\ B & \xrightarrow{\quad} & \mathcal{E} \end{array}$$

(7.90)

admits a solution. Let us regard the upper horizontal map and the underlying morphism $B \rightarrow \mathcal{C}$ as fixed, and let

$$V : \mathrm{Fun}_{A//\mathcal{C}}(B, \mathcal{E}') \rightarrow \mathrm{Fun}_{A//\mathcal{C}}(B, \mathcal{E})$$

be the morphism given by composition with Γ . Since U and U' are left fibrations, the source and target of V are contractible Kan complexes (Proposition 4.2.5.4); in particular, V is a categorical equivalence of simplicial sets. Since Γ is an isofibration, V is also an isofibration (see Proposition 4.5.5.14), and is therefore a trivial Kan fibration (Proposition 4.5.5.20). In particular, V is surjective on vertices, which guarantees that the lifting problem (7.90) admits a solution. $\square$

Remark 7.7.6.4. In the situation of Lemma 7.7.6.3, the assumption that Γ is an isofibration 05W5 is essentially harmless. More precisely, we can always factor Γ as a composition

$$\mathcal{E}' \xrightarrow{T} \mathcal{E}'_0 \xrightarrow{\Gamma_0} \mathcal{E},$$

where T is an equivalence of left fibrations over $\mathcal{C}$ and Γ_0 is an isofibration (and therefore a left fibration, by virtue of Lemma 7.7.6.3). To prove this, we can use Corollary 5.6.7.3 to reduce to the case where $\mathcal{C}$ is an ∞ -category. In this case, $\mathcal{E}$ and $\mathcal{E}'$ are also ∞ -categories. We can therefore use Corollary 4.5.2.24 to factor Γ as a composition $\mathcal{E}' \xrightarrow{T} \mathcal{E}'_0 \xrightarrow{\Gamma_0} \mathcal{E}$, where Γ_0 is an isofibration and T is an equivalence of ∞ -categories. In this case, both U' and $U \circ \Gamma_0$ are isofibrations, so T is an equivalence of inner fibrations over $\mathcal{C}$ (Proposition 5.1.7.5); Proposition 5.1.7.14 then guarantees that $(U \circ \Gamma_0) : \mathcal{E}_0 \rightarrow \mathcal{C}$ is a left fibration.

Proposition 7.7.6.5. Suppose we are given a commutative diagram of simplicial sets 05W6

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{\Gamma} & \mathcal{E} \\ & \searrow U' & \swarrow U \\ & \mathcal{C} & \end{array}$$

where U and U' are left fibrations and Γ is an isofibration. Let $\mathcal{F} = \mathrm{Tr}_{\mathcal{E}/\mathcal{C}}$ and $\mathcal{F}' = \mathrm{Tr}_{\mathcal{E}'/\mathcal{C}}$ be covariant transport representations for U and U' , respectively, and suppose that Γ is compatible with a natural transformation $\gamma : \mathcal{F}' \rightarrow \mathcal{F}$ (see Definition 7.4.2.2). The following conditions are equivalent:

- (1) The morphism Γ is a Kan fibration of simplicial sets.
- (2) Composition with Γ induces a trivial Kan fibration

$$\theta : \mathrm{Fun}(\Delta^1, \mathcal{E}') \rightarrow \mathrm{Fun}(\{1\}, \mathcal{E}') \times_{\mathrm{Fun}(\{1\}, \mathcal{E})} \mathrm{Fun}(\Delta^1, \mathcal{E}).$$

(3) For every edge u of $\mathcal{C}$, composition with Γ induces a homotopy equivalence

$$\theta_u : \mathrm{Fun}_{/\mathcal{C}}(\Delta^1, \mathcal{E}') \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\{1\}, \mathcal{E}') \times_{\mathrm{Fun}_{/\mathcal{C}}(\{1\}, \mathcal{E})} \mathrm{Fun}_{/\mathcal{C}}(\Delta^1, \mathcal{E}).$$

(4) For every edge u of $\mathcal{C}$, the diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Fun}_{/\mathcal{C}}(\Delta^1, \mathcal{E}') & \xrightarrow{\Gamma \circ} & \mathrm{Fun}_{/\mathcal{C}}(\Delta^1, \mathcal{E}) \\ \downarrow & & \downarrow \\ \mathrm{Fun}_{/\mathcal{C}}(\{1\}, \mathcal{E}') & \xrightarrow{\Gamma \circ} & \mathrm{Fun}_{/\mathcal{C}}(\{1\}, \mathcal{E}) \end{array} \quad (7.91)$$

(5) The natural transformation γ is cartesian.

Proof. It follows from Lemma 7.7.6.3 that Γ is a left fibration of simplicial sets. Consequently, it is a Kan fibration if and only if it also a right fibration (Example 4.2.1.5). The equivalence of (1) and (2) now follows from Proposition 4.2.6.1. Note that the morphism θ is automatically a left fibration of simplicial sets (Proposition 4.2.5.1), and is therefore a trivial Kan fibration if and only if it has contractible fibers (Proposition 4.4.2.14). Note that every fiber of θ also appears as a fiber of θ_u , for some edge $u : C \rightarrow D$ of $\mathcal{C}$. Consequently, condition (2) is equivalent to the requirement that each of the morphisms θ_u has contractible fibers. Note that the restriction map $\mathrm{Fun}_{/\mathcal{C}}(\Delta^1, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\{1\}, \mathcal{E})$ is a left fibration whose target is a Kan complex, and is therefore a Kan fibration (Corollary 4.4.3.8). The equivalence (3) $\Leftrightarrow$ (4) now follows from Example 3.4.1.3. It also follows that the fiber product $\mathrm{Fun}_{/\mathcal{C}}(\{1\}, \mathcal{E}') \times_{\mathrm{Fun}_{/\mathcal{C}}(\{1\}, \mathcal{E})} \mathrm{Fun}_{/\mathcal{C}}(\Delta^1, \mathcal{E})$ is a Kan complex, so that θ_u is a Kan fibration (Corollary 4.4.3.8). The equivalence (2) $\Leftrightarrow$ (3) now follows from Proposition 3.2.7.2.

To complete the proof, it will suffice to show that for each edge $u : C \rightarrow D$ as above, the following conditions are equivalent:

(4_u) The diagram of Kan complexes (7.91) is a homotopy pullback square.

(5_u) The natural transformation γ carries u to a pullback diagram

$$\begin{array}{ccc} \mathcal{F}(C) & \xrightarrow{\gamma_C} & \mathcal{F}'(C) \\ \downarrow \mathcal{F}(u) & & \downarrow \mathcal{F}'(u) \\ \mathcal{F}(D) & \xrightarrow{\gamma_D} & \mathcal{F}'(D) \end{array} \quad (7.92)$$

in the ∞ -category $\mathcal{S}$ of spaces.

To see this, we may assume without loss of generality that $\mathcal{C} = \Delta^1$ and that u is the nondegenerate edge of $\mathcal{C}$. In particular, $\mathcal{C}$ can be identified with the nerve of the ordinary category $\mathcal{C}_0 = [1]$. Applying Example 7.4.2.12, we may assume that γ is given by applying the (homotopy coherent) nerve construction to the map of strict transport representations $\mathrm{sTr}_{\mathcal{E}'/\mathcal{C}_0} \rightarrow \mathrm{sTr}_{\mathcal{E}/\mathcal{C}_0}$ determined by Γ . In particular, the diagram (7.92) in the ∞ -category $\mathcal{S}$ is obtained from the strictly commutative diagram of Kan complexes (7.91). The equivalence $(4_u) \Leftrightarrow (5_u)$ now follows from Example 7.6.3.2. $\square$

Following the convention of Remark 4.7.0.5, we can regard Theorem 7.7.6.1 as a special case of the following:

Proposition 7.7.6.6. *Let λ be an uncountable cardinal, let $\kappa = \mathrm{cf}(\lambda)$ be its cofinality, and 05W9 let $\mathcal{C}$ be a κ -small simplicial set. Then every colimit diagram $\overline{\mathcal{F}} : \mathcal{C}^\triangleright \rightarrow \mathcal{S}_{<\lambda}$ is strongly universal.*

In the situation of Proposition 7.7.6.6, our assumption that $\mathcal{C}$ is κ -small guarantees that the ∞ -category $\mathcal{S}_{<\lambda}$ admits $\mathcal{C}$ -indexed colimits (Corollary 7.4.3.8). By virtue of Corollary 7.7.2.19, we can restate Proposition 7.7.6.6 as follows:

Proposition 7.7.6.7. *Let λ be an uncountable cardinal, let $\kappa = \mathrm{cf}(\lambda)$ be its cofinality, and 05WA let $\mathcal{C}$ be a κ -small simplicial set. Suppose we are given a natural transformation $\overline{\gamma} : \overline{\mathcal{F}}' \rightarrow \overline{\mathcal{F}}$ between diagrams $\overline{\mathcal{F}}, \overline{\mathcal{F}}' : \mathcal{C}^\triangleright \rightarrow \mathcal{S}_{<\lambda}$. Assume that $\overline{\mathcal{F}}$ is a colimit diagram and that the natural transformation $\gamma = \overline{\gamma}|_{\mathcal{C}}$ is cartesian. Then $\overline{\mathcal{F}}'$ is a colimit diagram if and only if the natural transformation $\overline{\gamma}$ is cartesian.*

Proof. Write $\overline{\mathcal{F}}$ and $\overline{\mathcal{F}}'$ as the covariant transport representations of left fibrations $\overline{U} : \overline{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ and $\overline{U}' : \overline{\mathcal{E}}' \rightarrow \mathcal{C}^\triangleright$, respectively. By virtue of Theorem 7.4.2.4, there exists a morphism $\overline{\Gamma} \in \mathrm{Fun}_{/\mathcal{C}^\triangleright}(\overline{\mathcal{E}}', \overline{\mathcal{E}})$ which is compatible with $\overline{\gamma}$, in the sense of Definition 7.4.2.2. Replacing $\overline{U}'$ with an equivalent left fibration if necessary, we may assume that $\overline{\Gamma}$ is an isofibration (Remark 7.7.6.4), and therefore a left fibration (Lemma 7.7.6.3). Set $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^\triangleright} \overline{\mathcal{E}}$ and $\mathcal{E}' = \mathcal{C} \otimes_{\mathcal{C}^\triangleright} \overline{\mathcal{E}}'$, so that $\overline{\Gamma}$ restricts to a left fibration $\Gamma : \mathcal{E}' \rightarrow \mathcal{E}$. Since γ is cartesian, Proposition 7.7.6.5 guarantees that Γ is a Kan fibration; moreover, $\overline{\gamma}$ is cartesian if and only if $\overline{\Gamma}$ is also a Kan fibration. Since $\overline{\mathcal{F}}$ is a colimit diagram, Corollary 7.4.3.14 guarantees that the inclusion map $\iota : \mathcal{E} \hookrightarrow \overline{\mathcal{E}}$ is a weak homotopy equivalence; moreover, $\overline{\mathcal{F}}'$ is a colimit diagram if and only if the inclusion map $\iota' : \mathcal{E}' \hookrightarrow \overline{\mathcal{E}}'$ is a weak homotopy equivalence. We are therefore reduced to showing that ι' is a weak homotopy equivalence if and only if $\overline{\Gamma}$ is a Kan fibration, which is a restatement of Proposition 7.7.6.2. $\square$

7.7.7 Digression: Commutation of Limits and Colimits

Let K be a simplicial set, and let $\mathcal{C}$ be an ∞ -category which admits K -indexed colimits. Then, for every simplicial set L , the ∞ -category $\mathrm{Fun}(L, \mathcal{C})$ also admits K -indexed colimits, which can be computed levelwise (Proposition 7.1.8.2). Assume that $\mathcal{C}$ also admits L -indexed limits, so that the formation of limits determines a functor $\varprojlim : \mathrm{Fun}(L, \mathcal{C}) \rightarrow \mathcal{C}$. Suppose we are given a morphism $K \rightarrow \mathrm{Fun}(L, \mathcal{C})$, which we identify with a diagram $\mathcal{F} : K \times L \rightarrow \mathcal{C}$. Applying Remark 7.1.4.10, we obtain a comparison map

$$\gamma : \varinjlim_{k \in K} \varprojlim_{\ell \in L} \mathcal{F}(k, \ell) \rightarrow \varprojlim_{\ell \in L} \varinjlim_{k \in K} \mathcal{F}(k, \ell)$$

in the ∞ -category $\mathcal{C}$. In this section, we study situations in which γ is an isomorphism. This condition has several equivalent formulations.

05XH Proposition 7.7.7.1. *Let K and L be simplicial sets, and let $\mathcal{C}$ be an ∞ -category which admits K -indexed colimits and L -indexed limits. The following conditions are equivalent:*

- (1) *The limit functor $\varprojlim : \mathrm{Fun}(L, \mathcal{C}) \rightarrow \mathcal{C}$ preserves K -indexed colimits.*
- (2) *The full subcategory of $\mathrm{Fun}(L^\triangleleft, \mathcal{C})$ spanned by the limit diagrams is closed under the formation of K -indexed colimits.*
- (3) *The colimit functor $\varinjlim : \mathrm{Fun}(K, \mathcal{C}) \rightarrow \mathcal{C}$ preserves L -indexed limits.*
- (4) *The full subcategory of $\mathrm{Fun}(K^\triangleright, \mathcal{C})$ spanned by the colimit diagrams is closed under the formation of L -indexed limits.*

Proof. We will show that (1) $\Leftrightarrow$ (2) and that (4) $\Rightarrow$ (2); the implications (3) $\Leftrightarrow$ (4) and (2) $\Rightarrow$ (4) then follow by applying the same arguments to the opposite ∞ -category $\mathcal{C}^{\mathrm{op}}$. In what follows, we let u and v denote the cone points of the simplicial sets $K^\triangleright$ and $L^\triangleleft$, respectively.

We first show that (1) $\Leftrightarrow$ (2). Let $\mathrm{Fun}'(L^\triangleleft, \mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(L^\triangleleft, \mathcal{C})$ spanned by the limit diagrams in $\mathcal{C}$. Since $\mathcal{C}$ admits L -indexed limits, the restriction functor

$$\mathrm{Fun}'(L^\triangleleft, \mathcal{C}) \rightarrow \mathrm{Fun}(L, \mathcal{C}) \quad \bar{u} \mapsto \bar{u}|_L$$

is a trivial Kan fibration, and therefore admits a section $s : \mathrm{Fun}(L, \mathcal{C}) \rightarrow \mathrm{Fun}'(L^\triangleleft, \mathcal{C})$ which is an equivalence of ∞ -categories. In particular, the ∞ -category $\mathrm{Fun}'(L^\triangleleft, \mathcal{C})$ admits K -indexed colimits, so condition (2) is equivalent to the requirement that the inclusion functor $\mathrm{Fun}'(L^\triangleleft, \mathcal{C}) \hookrightarrow \mathrm{Fun}(L^\triangleleft, \mathcal{C})$ preserves K -indexed colimits. Using the criterion of Proposition 7.1.8.2, we see that this is equivalent to the requirement that the composite functor

$$\mathrm{Fun}(L, \mathcal{C}) \xrightarrow{s} \mathrm{Fun}'(L^\triangleleft, \mathcal{C}) \hookrightarrow \mathrm{Fun}(L^\triangleleft, \mathcal{C}) \xrightarrow{\mathrm{ev}_v} \mathcal{C}$$

preserves K -indexed colimits. Since this composition is isomorphic to the limit functor $\varprojlim : \mathrm{Fun}(L, \mathcal{C}) \rightarrow \mathcal{C}$ (Remark 7.1.6.16), this is reformulation of condition (1).

We now show that (4) $\Rightarrow$ (2). Suppose we are given a diagram $f : K \rightarrow \text{Fun}(L^\triangleleft, \mathcal{C})$ which carries each vertex $k \in K$ to an object of $\text{Fun}'(L^\triangleleft, \mathcal{C})$; we wish to show that the colimit of f has the same property. Choose an extension of f to a colimit diagram $\bar{f} : K^\triangleright \rightarrow \text{Fun}(L^\triangleleft, \mathcal{C})$, which we identify with a morphism of simplicial sets $\bar{F} : K^\triangleright \times L^\triangleleft \rightarrow \mathcal{C}$. The restriction $\bar{F}|_{K^\triangleright \times L}$ can be identified with a diagram $g : L \rightarrow \text{Fun}(K^\triangleright, \mathcal{C})$. Our assumption that $\bar{f}$ is a colimit diagram guarantees that, for each vertex $\ell \in L$, the image $g(\ell)$ is a colimit diagram in $\mathcal{C}$. Since the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{C})$ admits L -indexed limits, we can extend g to a limit diagram $\bar{g} : L^\triangleleft \rightarrow \text{Fun}(K^\triangleright, \mathcal{C})$. If condition (4) is satisfied, then $\bar{g}(v) \in \text{Fun}(K^\triangleright, \mathcal{C})$ is also a colimit diagram in $\mathcal{C}$. Let us identify $\bar{g}$ with a morphism of simplicial sets $\bar{G} : K^\triangleright \times L^\triangleleft \rightarrow \mathcal{C}$, which we further identify with a diagram $\bar{f}' : K^\triangleright \rightarrow \text{Fun}(L^\triangleleft, \mathcal{C})$. Since K -indexed colimits in $\text{Fun}(L^\triangleleft, \mathcal{C})$ are computed levelwise (Proposition 7.1.8.2), $\bar{f}'$ is a colimit diagram. Moreover, we have $\bar{f}'|_K = f$ by construction. We are therefore reduced to showing that $\bar{f}'(u) \in \text{Fun}(L^\triangleleft, \mathcal{C})$ is a limit diagram. This follows from our assumption that $\bar{g}$ is a limit diagram, since the evaluation functor $\text{ev}_u : \text{Fun}(K^\triangleright, \mathcal{C}) \rightarrow \mathcal{C}$ preserves L -indexed limits. $\square$

Definition 7.7.7.2. Let K and L be simplicial sets, and let $\mathcal{C}$ be an ∞ -category which admits K -indexed colimits and L -indexed limits. We say that *K -indexed colimits commute with L -indexed limits in $\mathcal{C}$* if the equivalent conditions of Proposition 7.7.7.1 are satisfied. 05XJ

We will be particularly interested in the special case where $\mathcal{C} = \mathcal{S}$ is the ∞ -category of spaces. In this case, we can reformulate Definition 7.7.7.2 as follows:

Proposition 7.7.7.3. Let K and L be small simplicial sets. Then *K -indexed colimits commute with L -indexed limits in the ∞ -category $\mathcal{S}$ if and only if the following condition is satisfied:* 05XK

(*) Let $\text{Fun}'(K, \mathcal{S})$ denote the full subcategory of $\text{Fun}(K, \mathcal{S})$ spanned by those diagrams $\mathcal{F} : K \rightarrow \mathcal{S}$ for which the colimit $\varinjlim(\mathcal{F}) \in \mathcal{S}$ is contractible. Then $\text{Fun}'(K, \mathcal{S})$ is closed under L -indexed limits.

Following the convention of Remark 4.7.0.5, we can regard Proposition 7.7.7.3 as a special case of the following:

Variant 7.7.7.4. Let κ , λ , and μ be infinite cardinals, let K be a κ -small simplicial set, and let L be a λ -small simplicial set. Assume that μ is uncountable of cofinality $\geq \kappa$ and exponential cofinality $\geq \lambda$, so that the ∞ -category $\mathcal{S}_{<\mu}$ admits K -indexed colimits (Example 7.6.6.10) and L -indexed limits (Example 7.6.6.11). Then *K -indexed colimits commute with L -indexed limits in the ∞ -category $\mathcal{S}_{<\mu}$ if and only if the following condition is satisfied:* 05XL

(*) Let $\text{Fun}'(K, \mathcal{S}_{<\mu})$ denote the full subcategory of $\text{Fun}(K, \mathcal{S}_{<\mu})$ spanned by those diagrams $\mathcal{F} : K \rightarrow \mathcal{S}$ for which the colimit $\varinjlim(\mathcal{F}) \in \mathcal{S}_{<\mu}$ is contractible. Then $\text{Fun}'(K, \mathcal{S}_{<\mu})$ is closed under L -indexed limits.

Proof. Let $\mathcal{C} \subseteq \mathcal{S}_{<\mu}$ denote the full subcategory spanned by the contractible Kan complexes. Then $\mathcal{C}$ is closed under the formation of L -indexed limits. By definition, $\text{Fun}'(K, \mathcal{S}_{<\mu})$ is the inverse image of $\mathcal{C}$ under the colimit functor $\varinjlim : \text{Fun}(K, \mathcal{S}_{<\mu}) \rightarrow \mathcal{S}_{<\mu}$. If K -indexed colimits commute with L -indexed limits in $\mathcal{S}_{<\mu}$, then the functor $\varinjlim$ preserves L -indexed limits, so that $\text{Fun}'(K, \mathcal{S}_{<\mu})$ is closed under the formation of L -indexed limits.

We now prove the converse. Assume that condition $(*)$ is satisfied; we wish to show that K -indexed colimits commute with L -indexed limits in the ∞ -category $\mathcal{S}_{<\mu}$. In what follows, if Z is an object of $\mathcal{S}_{<\mu}$, we let $\underline{Z}_K$ denote the constant diagram $K \rightarrow \mathcal{S}_{<\mu}$ taking the value Z , and $\underline{Z}_L$ for the constant diagram $L \rightarrow \mathcal{S}_{<\mu}$ taking the value Z . Suppose we are given diagrams

$$\mathcal{F} : L \rightarrow \text{Fun}(K, \mathcal{S}_{<\mu}) \quad X : L \rightarrow \mathcal{S}_{<\mu},$$

having limits $\varinjlim(\mathcal{F}) \in \text{Fun}(K, \mathcal{S}_{<\mu})$ and $\varinjlim(X) \in \mathcal{S}_{<\mu}$, respectively. Write $\underline{X}_K$ for the L -indexed diagram in $\text{Fun}(L, \mathcal{S}_{<\mu})$ given by the construction $\ell \mapsto \underline{X}(\ell)$. Assume we are given a natural transformation $\gamma : \mathcal{F} \rightarrow \underline{X}_K$, carrying each vertex $\ell \in L$ to a natural transformation $\gamma(\ell) : \mathcal{F}(\ell) \rightarrow \underline{X}(\ell)_K$. We wish to show that the induced map $\varinjlim(\gamma) : \varinjlim(\mathcal{F}) \rightarrow \varinjlim(X)_K$ exhibits the Kan complex $\varinjlim(X)$ as a colimit of the K -indexed diagram $\varinjlim(\mathcal{F})$. To prove this, we will show that $\varinjlim(\gamma)$ satisfies the criterion of Corollary 7.7.0.6. Let $f : Y \rightarrow \varinjlim(X)$ be a morphism of Kan complexes, where Y is contractible, and suppose we are given a (levelwise) pullback square σ :

$$\begin{array}{ccc} \mathcal{G} & \xrightarrow{\beta} & \underline{Y}_K \\ \downarrow & & \downarrow f_K \\ \varinjlim(\mathcal{F}) & \xrightarrow{\varinjlim(\gamma)} & \varinjlim(X)_K \end{array}$$

in the ∞ -category $\text{Fun}(K, \mathcal{S}_{<\mu})$; we wish to show that the diagram $\mathcal{G}$ has contractible colimit. Note that f determines a natural transformation of L -indexed diagrams $\alpha : \underline{Y}_L \rightarrow X$. Since the limit functor $\varinjlim : \text{Fun}(L, \mathcal{S}_{<\mu}) \rightarrow \mathcal{S}_{<\mu}$ preserves pullback squares, we can identify σ with the limit of an L -indexed diagram of pullback squares in $\text{Fun}(K, \mathcal{S}_{<\mu})$, carrying each $\ell \in L$ to a diagram σ_ℓ :

$$\begin{array}{ccc} \mathcal{G}_\ell & \xrightarrow{\beta_\ell} & \underline{Y}_K \\ \downarrow & & \downarrow \alpha(\ell)_K \\ \mathcal{F}(\ell) & \xrightarrow{\gamma(\ell)} & \underline{X}(\ell)_K \end{array}$$

By virtue of condition (*), it will suffice to show that each of the diagrams $\mathcal{G}_\ell : K \rightarrow \mathcal{S}_{<\mu}$ has a contractible colimit. This follows from the criterion of Corollary 7.7.0.6, since $\gamma(\ell)$ exhibits $X(\ell)$ as a colimit of $\mathcal{F}(\ell)$. $\square$

Chapter 8

The Yoneda Embedding

03JA 8.1 Twisted Arrows and Cospans

03JB Let $\mathcal{C}$ be an ∞ -category. In § 4.6.1, we associated to every pair of objects $X, Y \in \mathcal{C}$ a Kan complex $\mathrm{Hom}_{\mathcal{C}}(X, Y)$, whose vertices are morphisms from X to Y . In § 8.3.3, we will see that the construction $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y)$ can be refined to a functor of ∞ -categories

$$\mathrm{Hom}_{\mathcal{C}}(\bullet, \bullet) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathrm{Set} = \mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}).$$

It is somewhat cumbersome to give an explicit description of this functor. It will therefore be more convenient to specify it *implicitly* by realizing it as the covariant transport representation of a left fibration over $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$. We begin by discussing the counterpart of this fibration in the setting of classical category theory.

00AZ **Construction 8.1.0.1** (The Twisted Arrow Category). Let $\mathcal{C}$ be a category. We define a new category $\mathrm{Tw}(\mathcal{C})$ as follows:

- An object of $\mathrm{Tw}(\mathcal{C})$ is a morphism $f : X \rightarrow Y$ in $\mathcal{C}$.
- Let $f : X \rightarrow Y$ and $f' : X' \rightarrow Y'$ be objects of $\mathrm{Tw}(\mathcal{C})$. A morphism from f to f' in $\mathrm{Tw}(\mathcal{C})$ is a pair of morphisms $u : X' \rightarrow X$, $v : Y \rightarrow Y'$ in $\mathcal{C}$ satisfying $f' = v \circ f \circ u$, so that we have a commutative diagram

$$\begin{array}{ccc} X & \xleftarrow{u} & X' \\ \downarrow f & & \downarrow f' \\ Y & \xrightarrow{v} & Y' \end{array}$$

- Let $f : X \rightarrow Y$, $f' : X' \rightarrow Y'$, and $f'' : X'' \rightarrow Y''$ be objects of $\text{Tw}(\mathcal{C})$. If (u, v) is a morphism from f to f' in $\text{Tw}(\mathcal{C})$ and (u', v') is a morphism from f' to f'' in $\mathcal{C}$, then the composition $(u', v') \circ (u, v)$ in $\text{Tw}(\mathcal{C})$ is the pair $(u \circ u', v' \circ v)$.

We will refer to $\text{Tw}(\mathcal{C})$ as the *twisted arrow category* of $\mathcal{C}$.

Remark 8.1.0.2. Let $\mathcal{C}$ be a category. Then the construction $(f : X \rightarrow Y) \mapsto (X, Y)$ 00B1 determines a forgetful functor $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$. Moreover, λ is a left covering functor, in the sense of Definition 4.2.3.1.

Remark 8.1.0.3 ($\text{Tw}(\mathcal{C})$ as a Category of Elements). Let $\mathcal{C}$ be a category. Then the 03JC construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ determines a functor $\text{Hom}_{\mathcal{C}}(\bullet, \bullet) : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \text{Set}$. The twisted arrow category $\text{Tw}(\mathcal{C})$ of Construction 8.1.0.1 can be identified with the category of elements $\int_{\mathcal{C}^{\text{op}} \times \mathcal{C}} \text{Hom}_{\mathcal{C}}(\bullet, \bullet)$ (see Construction 5.2.6.1).

It follows that the functor $\text{Hom}_{\mathcal{C}}(\bullet, \bullet)$ is determined (up to canonical isomorphism) by the datum of the twisted arrow category $\text{Tw}(\mathcal{C})$ together with the forgetful functor $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Remark 8.1.0.2 (see Corollary 5.2.7.5).

Warning 8.1.0.4 (Untwisted Arrow Categories). Let $[1] = \{0 < 1\}$ denote a linearly ordered 03JD set with two elements. For any category $\mathcal{C}$, we can identify morphisms of $\mathcal{C}$ with functors $F : [1] \rightarrow \mathcal{C}$. The collection of such functors can be organized into a category $\text{Fun}([1], \mathcal{C})$, which we refer to as the *arrow category* of $\mathcal{C}$. The arrow category $\text{Fun}([1], \mathcal{C})$ has the same objects as the twisted arrow category $\text{Tw}(\mathcal{C})$. However, the morphisms are different: if $f : X \rightarrow Y$ and $f' : X' \rightarrow Y'$ are morphisms of $\mathcal{C}$, then morphisms from f to f' in $\text{Fun}([1], \mathcal{C})$ can be identified with commutative diagrams

$$\begin{array}{ccc} X & \longrightarrow & X' \\ \downarrow f & & \downarrow f' \\ Y & \longrightarrow & Y', \end{array}$$

where the horizontal maps are oriented in the same direction.

Example 8.1.0.5. Let Q be a partially ordered set, which we regard as a category. Then 00B2 the twisted arrow category $\text{Tw}(Q)$ can be identified (via the forgetful functor of Remark 8.1.0.2) with the partially ordered set

$$\{(p, q) \in Q^{\text{op}} \times Q : p \leq q\} \subseteq Q^{\text{op}} \times Q.$$

Remark 8.1.0.6. Let $\mathcal{C}$ be a category. For every object $X \in \mathcal{C}$, the fiber $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ 03JE can be identified with the coslice category $\mathcal{C}_{X/}$ of Variant 4.3.1.4. Similarly, the fiber $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{X\}$ can be identified with the *opposite* of the slice category $\mathcal{C}_{/X}$ of Construction 4.3.1.1.

In §8.1.1, we generalize Construction 8.1.0.1 to the setting of ∞ -categories. To every simplicial set $\mathcal{C}$, we associate another simplicial set $\mathrm{Tw}(\mathcal{C})$, whose n -simplices can be identified with $(2n + 1)$ -simplices of $\mathcal{C}$ (Construction 8.1.1.1). This construction has the following features:

- If $\mathcal{C} = \mathbf{N}_\bullet(\mathcal{C}_0)$ is (the nerve of) an ordinary category $\mathcal{C}_0$, then $\mathrm{Tw}(\mathcal{C})$ can be identified with the nerve of the twisted arrow category $\mathrm{Tw}(\mathcal{C}_0)$ (Proposition 8.1.1.10). Consequently, the twisted arrow construction of §8.1.1 can be regarded as a generalization of Construction 8.1.0.1.
- The simplicial set $\mathrm{Tw}(\mathcal{C})$ is equipped with a projection map $\lambda : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$. If $\mathcal{C}$ is an ∞ -category, then λ is a left fibration (Proposition 8.1.1.11); in particular, $\mathrm{Tw}(\mathcal{C})$ is also an ∞ -category (Corollary 8.1.1.12).

Let $\mathcal{C}$ be an ∞ -category. In §8.1.2, we study the fibers of the left fibration $\lambda : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$. Our main result asserts that if $f : X \rightarrow Y$ is an isomorphism in the ∞ -category $\mathcal{C}$, then f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (see Proposition 8.1.2.1, and Corollary 8.1.2.21 for the converse). From this, we deduce an analogue of Remark 8.1.0.6: there is a canonical equivalence of ∞ -categories $\mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ (Proposition 8.1.2.9), which induces a homotopy equivalence of Kan complexes

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \simeq \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

for each object $Y \in \mathcal{C}$ (Notation 8.1.2.14). Moreover, we show that these homotopy equivalences are compatible with covariant transport for the left fibration λ (Corollary 8.1.2.18).

The twisted arrow construction $S \mapsto \mathrm{Tw}(S)$ determines a functor from the category of simplicial sets to itself. In particular, to every simplicial set T we can associate a new simplicial set $\mathrm{Cospan}(T)$, whose n -simplices are given by maps $\mathrm{Tw}(\Delta^n) \rightarrow T$. We will refer to $\mathrm{Cospan}(T)$ as the *simplicial set of cospans in T* (Construction 8.1.3.1). This construction has the following features:

- The construction $T \mapsto \mathrm{Cospan}(T)$ determines a functor from the category of simplicial sets to itself, which is right adjoint to the twisted arrow functor $S \mapsto \mathrm{Tw}(S)$ (Corollary 8.1.3.8).
- Let $\mathcal{C}$ be an ordinary category which admits pushouts, and let $\mathrm{Cospan}(\mathcal{C})$ denote the 2-category of cospans in $\mathcal{C}$ (Example 2.2.2.1). Then there is a canonical isomorphism of simplicial sets

$$\mathrm{Cospan}(\mathbf{N}_\bullet(\mathcal{C})) \xrightarrow{\sim} \mathbf{N}_\bullet^{\mathrm{D}}(\mathrm{Cospan}(\mathcal{C})),$$

which we construct in §8.1.3 (see Corollary 8.1.3.15).

- Let $\mathcal{C}$ be a 2-category containing a pair of objects X and Y , and let $\underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)$ denote the category of 1-morphisms from X to Y . Then there is a canonical isomorphism of simplicial sets

$$\mathrm{Cospan}(\mathbf{N}_{\bullet} \underline{\mathrm{Hom}}_{\mathcal{C}}(X, Y)) \xrightarrow{\sim} \mathrm{Hom}_{\mathbf{N}_{\bullet}^{\mathrm{P}}(\mathcal{C})}(X, Y),$$

which we construct in §8.1.8 (see Corollary 8.1.8.6).

- If $\mathcal{C}$ is an ∞ -category which admits pushouts, then the simplicial set $\mathrm{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category (Proposition 8.1.4.1). We prove this in §8.1.4 using an explicit characterization of the collection of thin 2-simplices of $\mathrm{Cospan}(\mathcal{C})$ (Proposition 8.1.4.2), which we prove in §8.1.5.

8.1.1 The Twisted Arrow Construction

We now describe an ∞ -categorical generalization of Construction 8.1.0.1.

03JF

Construction 8.1.1.1 (Twisted Arrows in Simplicial Sets). Let Δ denote the simplex category (Definition 1.1.0.2) and let $\mathcal{C}$ be a simplicial set. We let $\mathrm{Tw}(\mathcal{C}) : \Delta^{\mathrm{op}} \rightarrow \mathrm{Set}$ denote the functor given by the construction

03JG

$$(J \in \Delta^{\mathrm{op}}) \mapsto \mathrm{Hom}_{\mathrm{Set}_{\Delta}}(\mathbf{N}_{\bullet}(J^{\mathrm{op}} \star J), \mathcal{C}).$$

We will refer to $\mathrm{Tw}(\mathcal{C})$ as the *simplicial set of twisted arrows of $\mathcal{C}$* .

Remark 8.1.1.2. For every integer $n \geq 0$, there is a unique isomorphism of simplicial sets $\mathbf{N}_{\bullet}([n]^{\mathrm{op}} \star [n]) \simeq \Delta^{2n+1}$. It follows that, for every simplicial set $\mathcal{C}$, we can identify n -simplices σ of $\mathrm{Tw}(\mathcal{C})$ with $(2n+1)$ -simplices $\bar{\sigma}$ of $\mathcal{C}$. In terms of these identifications, the face and degeneracy operators of $\mathrm{Tw}(\mathcal{C})$ are given explicitly by the formulae

03JH

$$\overline{d_i^n \sigma} = d_{n-i}^{2n} d_{n+1+i}^{2n+1} \bar{\sigma} \quad \overline{s_i^n \sigma} = s_{n-i}^{2n+2} s_{n+1+i}^{2n+1} \bar{\sigma}.$$

Remark 8.1.1.3. Let $\mathcal{C}$ be a simplicial set. We will generally use Remark 8.1.1.2 to identify vertices of the simplicial set $\mathrm{Tw}(\mathcal{C})$ with edges $f : X \rightarrow Y$ of $\mathcal{C}$. More generally, it will be useful to think of n -simplices of $\mathrm{Tw}(\mathcal{C})$ as encoding diagrams

03JJ

$$\begin{array}{ccccccc} X_0 & \longleftarrow & X_1 & \longleftarrow & X_2 & \longleftarrow & \cdots & \longleftarrow & X_n \\ \downarrow f_0 & & \downarrow f_1 & & \downarrow f_2 & & \downarrow & & \downarrow f_n \\ Y_0 & \longrightarrow & Y_1 & \longrightarrow & Y_2 & \longrightarrow & \cdots & \longrightarrow & Y_n \end{array}$$

Remark 8.1.1.4. The construction $\mathcal{C} \mapsto \mathrm{Tw}(\mathcal{C})$ determines a functor from the category of simplicial sets to itself, which preserves all limits and colimits (this follows from Remark 8.1.1.2, since limits and colimits in the category Set_{Δ} are computed levelwise).

00B3

03Y5 **Remark 8.1.1.5.** Let κ be an uncountable cardinal. If $\mathcal{C}$ is a κ -small simplicial set, then $\mathrm{Tw}(\mathcal{C})$ is also κ -small. To prove this, we may assume without loss of generality that κ is the smallest uncountable cardinal for which $\mathcal{C}$ is κ -small. In particular, κ is regular. It will therefore suffice to show that, for every integer n , the set of n -simplices of $\mathrm{Tw}(\mathcal{C})$ is κ -small (Proposition 4.7.4.10). This follows from the κ -smallness of the set of $(2n+1)$ -simplices of $\mathcal{C}$ (Remark 8.1.1.2).

03JK **Notation 8.1.1.6** (Projection Maps). Let $\mathcal{C}$ be a simplicial set. Then the simplicial set $\mathrm{Tw}(\mathcal{C})$ is equipped with projection maps

$$\lambda_- : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \quad \lambda_+ : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}.$$

Here λ_+ carries an n -simplex σ of $\mathrm{Tw}(\mathcal{C})$ to the n -simplex of $\mathcal{C}$ given by the composition

$$\Delta^n = N_\bullet([n]) \hookrightarrow N_\bullet([n]^{\mathrm{op}} \star [n]) \xrightarrow{\sigma} \mathcal{C},$$

while λ_- carries σ to the n -simplex of $\mathcal{C}^{\mathrm{op}}$ given by the composite map

$$(\Delta^n)^{\mathrm{op}} = N_\bullet([n]^{\mathrm{op}}) \hookrightarrow N_\bullet([n]^{\mathrm{op}} \star [n]) \xrightarrow{\sigma} \mathcal{C}.$$

Concretely, λ_- and λ_+ are given on vertices by the formulae $\lambda_-(f : X \rightarrow Y) = X$ and $\lambda_+(f : X \rightarrow Y) = Y$.

03JL **Remark 8.1.1.7** (Duality). Let $\mathcal{C}$ be a simplicial set. Then there is a canonical isomorphism of simplicial sets $\iota : \mathrm{Tw}(\mathcal{C}) \simeq \mathrm{Tw}(\mathcal{C}^{\mathrm{op}})$, given on n -simplices by precomposition with the unique isomorphism

$$N_\bullet([n]^{\mathrm{op}} \star [n])^{\mathrm{op}} \simeq N_\bullet([n]^{\mathrm{op}} \star [n]).$$

The isomorphism ι interchanges the projection maps λ_- and λ_+ of Notation 8.1.1.6.

03JM **Exercise 8.1.1.8** (Slices of Twisted Arrows). Let $\mathcal{C}$ be a simplicial set and let $f : X \rightarrow Y$ be an edge of $\mathcal{C}$, which we regard as a vertex of the simplicial set $\mathrm{Tw}(\mathcal{C})$. Show that there is a canonical isomorphism of simplicial sets

$$\mathrm{Tw}(\mathcal{C})_{/f} \simeq \mathrm{Tw}(\mathcal{C}_{X/Y}).$$

Here $\mathcal{C}_{X/Y}$ denotes the simplicial set $(\mathcal{C}_{X/})_{/Y} \simeq (\mathcal{C}_{/Y})_{X/}$, obtained either by promoting Y to a vertex of $\mathcal{C}_{X/}$ or X to a vertex of $\mathcal{C}_{/Y}$ by means of the edge f (see Remark 4.6.6.2).

03LW **Warning 8.1.1.9.** Let $\mathcal{C}$ be a simplicial set. Then there is a tautological map $T : \mathcal{C} \rightarrow \mathrm{Tw}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C})$, which carries an n -simplex $\sigma : \Delta^n \rightarrow \mathcal{C}$ to the n -simplex $T(\sigma)$ of $\mathrm{Tw}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C})$ given by the composition

$$N_\bullet([n]^{\mathrm{op}} \star [n]) \xrightarrow{\sigma^{\mathrm{op}} \star \sigma} \mathcal{C}^{\mathrm{op}} \star \mathcal{C}.$$

If $\mathcal{D}$ is another simplicial set, then precomposition with T induces a comparison map

$$\mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\mathcal{C}^{\mathrm{op}} \star \mathcal{C}), \mathrm{Tw}(\mathcal{D})) \xrightarrow{\circ T} \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{C}, \mathrm{Tw}(\mathcal{D})).$$

Beware that, in general, this map is not a bijection. However, it is a bijection whenever $\mathcal{C}$ is isomorphic to the nerve of a linearly ordered set Q . To prove this, we can write Q as a filtered colimit of its finite subsets and thereby reduce to the case where Q is finite. In this case, the linearly ordered set Q is either empty (in which case the desired result is obvious) or isomorphic to $[n]$ for some integer $n \geq 0$ (in which case the desired result follows from the definition of the $\mathrm{Tw}(\mathcal{D})$).

We now show that Construction 8.1.1.1 can be regarded as a generalization of Construction 8.1.0.1.

Proposition 8.1.1.10. *Let $\mathcal{C}$ be a category. Then there is a canonical isomorphism of simplicial sets $T : N_\bullet(\mathrm{Tw}(\mathcal{C})) \xrightarrow{\sim} \mathrm{Tw}(N_\bullet(\mathcal{C}))$, which is uniquely determined by the following requirements:*

- (1) *For every morphism $f : C \rightarrow D$ in the category $\mathcal{C}$, the map T carries f (regarded as an object of $\mathrm{Tw}(\mathcal{C})$) to itself (regarded as a vertex of $\mathrm{Tw}(N_\bullet(\mathcal{C}))$).*
- (2) *The diagram*

$$\begin{array}{ccc} N_\bullet(\mathrm{Tw}(\mathcal{C})) & \xrightarrow{T} & \mathrm{Tw}(N_\bullet(\mathcal{C})) \\ \downarrow & & \downarrow (\lambda_-, \lambda_+) \\ N_\bullet(\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) & \xrightarrow{\sim} & N_\bullet(\mathcal{C})^{\mathrm{op}} \times N_\bullet(\mathcal{C}) \end{array}$$

commutes, where the right vertical map is given by Notation 8.1.1.6 and the left vertical map is the nerve of the forgetful functor

$$\mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \quad (f : X \rightarrow Y) \mapsto (X, Y).$$

Proof. Let σ be an n -simplex of the simplicial set $N_\bullet(\mathrm{Tw}(\mathcal{C}))$, which we identify with a diagram

$$(f_0 : X_0 \rightarrow Y_0) \xrightarrow{(u_1, v_1)} (f_1 : X_1 \rightarrow Y_1) \xrightarrow{(u_2, v_2)} \cdots \xrightarrow{(u_n, v_n)} (f_n : X_n \rightarrow Y_n)$$

in the category $\mathrm{Tw}(\mathcal{C})$. Here each $f_i : X_i \rightarrow Y_i$ denotes a morphism in $\mathcal{C}$, and each (u_i, v_i) is

a pair of morphisms in $\mathcal{C}$ which determine a commutative diagram

$$\begin{array}{ccc} X_{i-1} & \xleftarrow{u_i} & X_i \\ \downarrow f_{i-1} & & \downarrow f_i \\ Y_{i-1} & \xrightarrow{v_i} & Y_i. \end{array}$$

In this case, we can regard the chain of morphisms

$$\begin{array}{ccccccc} X_0 & \xleftarrow{u_1} & X_1 & \xleftarrow{u_2} & X_2 & \xleftarrow{\dots} & X_n \\ \downarrow f_0 & & & & & & \\ Y_0 & \xrightarrow{v_1} & Y_1 & \xrightarrow{v_2} & Y_2 & \xrightarrow{\dots} & Y_n \end{array} \quad (8.1)$$

as a $(2n + 1)$ -simplex of $\mathbf{N}_\bullet(\mathcal{C})$, which we identify with an n -simplex $T(\sigma)$ of $\mathbf{Tw}(\mathbf{N}_\bullet(\mathcal{C}))$. The construction $\sigma \mapsto T(\sigma)$ then determines a morphism of simplicial sets $T : \mathbf{N}_\bullet(\mathbf{Tw}(\mathcal{C})) \rightarrow \mathbf{Tw}(\mathbf{N}_\bullet(\mathcal{C}))$, which satisfies conditions (1) and (2) by construction.

We now claim that T is an isomorphism of simplicial sets. Let τ be an n -simplex of $\mathbf{Tw}(\mathbf{N}_\bullet(\mathcal{C}))$; we wish to show that there is a unique n -simplex σ of $\mathbf{N}_\bullet(\mathbf{Tw}(\mathcal{C}))$ satisfying $T(\sigma) = \tau$. Let us identify τ with a diagram of the form (8.1) in the category $\mathcal{C}$. We wish to show that there is a unique collection of morphisms $\{f_i : X_i \rightarrow Y_i\}_{1 \leq i \leq n}$ satisfying the identities $f_i = v_i \circ f_{i-1} \circ u_i$, which follows immediately by induction on i .

We now complete the proof by establishing the uniqueness of T . Suppose that $T' : \mathbf{N}_\bullet(\mathbf{Tw}(\mathcal{C})) \xrightarrow{\sim} \mathbf{Tw}(\mathbf{N}_\bullet(\mathcal{C}))$ is another morphism of simplicial sets satisfying conditions (1) and (2). Then $T^{-1} \circ T'$ determines a functor F from the twisted arrow category $\mathbf{Tw}(\mathcal{C})$ to itself. Because T and T' both satisfy condition (1), the functor F carries each object of $\mathbf{Tw}(\mathcal{C})$ to itself. Since the forgetful functor $\mathbf{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ is faithful, condition (2) guarantees that F also carries each morphism of $\mathbf{Tw}(\mathcal{C})$ to itself. It follows that F is the identity functor, so that $T' = T$. $\square$

Let $\mathcal{C}$ be a simplicial set. It follows from Proposition 8.1.1.10 that if $\mathcal{C}$ is isomorphic to the nerve of a category, then the simplicial set $\mathbf{Tw}(\mathcal{C})$ is also isomorphic to the nerve of a category. Moreover, the projection maps of Notation 8.1.1.6 determine a left covering map $\mathbf{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ (see Remark 8.1.0.2). This observation has an ∞ -categorical counterpart:

03JQ Proposition 8.1.1.11. *Let $\mathcal{C}$ be an ∞ -category. Then the projection maps of Notation 8.1.1.6 determine a left fibration of simplicial sets*

$$(\lambda_-, \lambda_+) : \mathbf{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}.$$

Corollary 8.1.1.12. *Let $\mathcal{C}$ be an ∞ -category. Then the simplicial set $\mathrm{Tw}(\mathcal{C})$ is also an ∞ -category.* 03JR

Proof. Combine Proposition 8.1.1.11 with Remark 4.1.1.9. $\square$

Corollary 8.1.1.13. *Let $\mathcal{C}$ be a Kan complex. Then the projection map $(\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ is a Kan fibration. In particular, $\mathrm{Tw}(\mathcal{C})$ is a Kan complex.* 048H

Proof. Combine Proposition 8.1.1.11 with Corollary 4.4.3.8. $\square$

In the situation of Corollary 8.1.1.12, we will refer to $\mathrm{Tw}(\mathcal{C})$ as the *twisted arrow ∞ -category of $\mathcal{C}$* .

Corollary 8.1.1.14. *Let $\mathcal{C}$ be an ∞ -category. Then the projection maps $\lambda_- : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}}$ and $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ are cocartesian fibrations of ∞ -categories. Moreover, a morphism f of $\mathrm{Tw}(\mathcal{C})$ is λ_- -cocartesian if and only if $\lambda_+(f)$ is an isomorphism, and λ_+ -cocartesian if and only if $\lambda_-(f)$ is an isomorphism.* 03JS

Proof. Let $\pi_- : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{C}^{\mathrm{op}}$ and $\pi_+ : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{C}$ denote the projection maps. Then π_- and π_+ are cocartesian fibrations of simplicial sets. Moreover, a morphism (e_-, e_+) of $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ is π_- -cocartesian if and only if e_+ is an isomorphism in $\mathcal{C}$, and π_+ -cocartesian if and only if e_- is an isomorphism in $\mathcal{C}^{\mathrm{op}}$ (this follows immediately from Remark 5.1.4.6 and Example 5.1.1.4). Corollary 8.1.1.14 now follows by applying Proposition 8.1.1.11 to left and right sides of the diagram

$$\begin{array}{ccccc} & & \mathrm{Tw}(\mathcal{C}) & & \\ & \swarrow \lambda_- & \downarrow (\lambda_-, \lambda_+) & \searrow \lambda_+ & \\ \mathcal{C}^{\mathrm{op}} & \xleftarrow{\pi_-} & \mathcal{C}^{\mathrm{op}} \times \mathcal{C} & \xrightarrow{\pi_+} & \mathcal{C}, \end{array}$$

since the vertical map in the center is a left fibration (Proposition 8.1.1.11). $\square$

Proposition 8.1.1.11 is a special case of the following more general assertion:

Proposition 8.1.1.15. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of simplicial sets. Then the projection maps of Notation 8.1.1.6 determine a left fibration of simplicial sets* 03JT

$$\mathrm{Tw}(\mathcal{C}) \rightarrow (\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) \times_{(\mathcal{D}^{\mathrm{op}} \times \mathcal{D})} \mathrm{Tw}(\mathcal{D}).$$

Proof. Fix a pair of integers $0 < i \leq n$; we wish to show that every lifting problem

03JU

$$\begin{array}{ccc}
 \Lambda_{n-i}^n & \xrightarrow{\quad} & \mathrm{Tw}(\mathcal{C}) \\
 \downarrow & \nearrow \text{dashed} & \downarrow \\
 \Delta^n & \xrightarrow{\quad} & (\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) \times_{(\mathcal{D}^{\mathrm{op}} \times \mathcal{D})} \mathrm{Tw}(\mathcal{D})
 \end{array} \tag{8.2}$$

admits a solution.

For each nonempty subset $S \subseteq [2n+1] = \{0 < 1 < \cdots < 2n+1\}$, let σ_S denote the corresponding nondegenerate simplex of Δ^{2n+1} . Let us say that S is *basic* if it satisfies one of the following conditions:

- (a) The set S is contained in $\{0 < 1 < \cdots < n\}$.
- (b) The set S is contained in $\{n+1 < n+2 < \cdots < 2n+1\}$.
- (c) There exists an integer $j \neq i$ such that $0 \leq j \leq n$ and $S \cap \{j, 2n+1-j\} = \emptyset$.

Let $K_0 \subseteq \Delta^{2n+1}$ be the simplicial subset whose nondegenerate simplices have the form σ_S , where S is basic. Unwinding the definitions, we can rewrite (8.2) as a lifting problem

$$\begin{array}{ccc}
 K_0 & \xrightarrow{\quad} & \mathcal{C} \\
 \downarrow & \nearrow \text{dashed} & \downarrow U \\
 \Delta^{2n+1} & \xrightarrow{\quad} & \mathcal{D}
 \end{array}$$

Since U is an inner fibration, it will suffice to show that the inclusion $K_0 \hookrightarrow \Delta^{2n+1}$ is an inner anodyne map of simplicial sets.

We now introduce two more collections of subsets of $[2n+1]$.

- We say that a subset $S \subseteq [2n+1]$ is *primary* if it is not basic, the intersection $S \cap \{0, 1, \dots, i-1\}$ is empty, and $2n+1-i \in S$.
- We say that a subset $S \subseteq [2n+1]$ is *secondary* if it is not basic, the intersection $S \cap \{0, 1, \dots, i-1\}$ is nonempty, and $i \in S$.

Let $\{S_1, S_2, \dots, S_m\}$ be an ordering of the collection of all subsets of $[2n+1]$ which are either primary or secondary, satisfying the following conditions:

- The sequence of cardinalities $|S_1|, |S_2|, \dots, |S_m|$ is nondecreasing. That is, for $1 \leq p \leq q \leq m$, we have $|S_p| \leq |S_q|$.

- If $|S_p| = |S_q|$ for $p \leq q$ and S_q is primary, then S_p is also primary.

For $1 \leq q \leq m$, let $\sigma_q \subseteq \Delta^{2n+1}$ denote the simplex spanned by the vertices of S_q , and let K_q denote the union of K_0 with the simplices $\{\sigma_1, \sigma_2, \dots, \sigma_q\}$. We have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \dots \hookrightarrow K_m.$$

Note that we have $\sigma_m = K_m = \Delta^{2n+1}$ (since the set $[2n+1]$ is secondary). It will therefore suffice to show that for $1 \leq q \leq m$, the inclusion map $K_{q-1} \hookrightarrow K_q$ is inner anodyne.

In what follows, we regard q as fixed. Let d be the dimension of the simplex σ_q . Let us abuse notation by identifying σ_q with a morphism of simplicial sets $\Delta^d \rightarrow K_q \subseteq \Delta^{2n+1}$, and set $L = \sigma_q^{-1}K_{q-1} \subseteq \Delta^d$. To complete the proof, it will suffice to show that L is an inner horn of Δ^d , so that the diagram of simplicial sets

$$\begin{array}{ccc} L & \xrightarrow{\quad} & K_{q-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\sigma_q} & K_q. \end{array}$$

is a pushout square by virtue of Lemma 3.1.2.11.

We first consider the case where the set $S_q = \{j_0 < j_1 < \dots < j_d\}$ is primary, so that we have $j_0 \geq i$ and $j_k = 2n+1-i$ for some $0 \leq k \leq d$. Note that we must have $k > 0$ (otherwise S_q satisfies condition (b)) and $k < d$ (otherwise, S_q satisfies condition (c), since it is disjoint from $\{0, 2n+1\}$). In this case, we will show that L coincides with the inner horn $\Lambda_k^d \subset \Delta^d$. This can be restated as follows:

- (*) Let j be an element of S_q , and set $S' = S_q \setminus \{j\}$. Then $\sigma_{S'}$ is contained in K_{q-1} if and only if $j \neq 2n+1-i$.

Assume first that $j \neq 2n+1-i$. Then the set S' contains $2n+1-i$ and satisfies $S' \cap \{0, 1, \dots, i-1\} = \emptyset$. Consequently, the set S' is either primary (and therefore coincides with $S_{q'}$ for some $q' < q$) or basic. In either case, the simplex $\sigma_{S'}$ belongs to the simplicial subset $K_{q-1} \subseteq \Delta^{2n+1}$.

We now prove (*) in the case $j = 2n+1-i$. Since S_q does not satisfy conditions (b) or (c), the set S' also does not satisfy conditions (b) or (c). It also cannot satisfy condition (a): if S' were contained in the set $\{0, 1, \dots, n\}$, then S_q would be contained in the set $\{i, i+1, \dots, n, 2n+1-i\}$, and would therefore satisfy condition (c). It follows that S' is not basic. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1} . We then have $\sigma_{S'} \subseteq \sigma_{q'}$ for some $q' < q$. Since S' is neither primary nor secondary, this must be a proper inclusion: that is, we must have

$$\dim(\sigma_q) - 1 = \dim(\sigma_{S'}) < \dim(\sigma_{q'}) \leq \dim(\sigma_q).$$

It follows that the second inequality must be an equality: that is, we have $|S_{q'}| = |S_q|$ and therefore $S_{q'}$ is also primary. In particular, the set $S_{q'}$ contains $2n + 1 - i$, and therefore contains the union $S' \cup \{2n + 1 - i\} = S_q$. Since S_q and $S_{q'}$ have the same cardinality, it follows that $S_q = S_{q'}$ and therefore $q = q'$, contradicting our assumption that $q' < q$.

We now consider the case where $S_q = \{j_0 < j_1 < \cdots < j_d\}$ is secondary, so that we have $j_0 < i$ and $j_k = i$ for some $0 < k \leq d$. Note that we must have $k < d$ (otherwise, S_q satisfies condition (a)). In this case, we will show that L coincides with the inner horn $\Lambda_k^d \subset \Delta^d$. This can be restated as follows:

(*) Let $j \in S_q$ and set $S' = S_q \setminus \{j\}$. Then the simplex $\sigma_{S'}$ is contained in K_{q-1} if and only if $j = i$.

We first treat the case where $j \neq i$, so that $i \in S'$. If S' is basic, then $\sigma_{S'} \subseteq K \subseteq K_{q-1}$. We may therefore assume that S' is not basic. If the intersection $S' \cap \{0, 1, \dots, i-1\}$ is nonempty, then S' is secondary and has smaller cardinality than S_q . It follows that $S' = S_{q'}$ for some $q' < q$, so that $\sigma_{S'} \subseteq K_{q'} \subseteq K_{q-1}$. We may therefore assume that the intersection $S' \cap \{0, 1, \dots, i-1\}$ is empty. In this case, the union $S' \cup \{2n + 1 - i\}$ is a primary set of cardinality $\leq |S_q|$, and therefore has the form $S_{q'}$ for some $q' < q$. From this, we again conclude that $\sigma_{S'} \subseteq K_{q'} \subseteq K_{q-1}$.

We now prove (*) in the case $j = i$. Since S_q does not satisfy conditions (a) or (c), it follows that S' also does not satisfy conditions (a) or (c). The set S' also does not satisfy condition (b), since the intersection $S' \cap \{0, \dots, i-1\}$ is nonempty. It follows that S' is not basic. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1} . We then have $\sigma_{S'} \subseteq \sigma_{q'}$ for some $q' < q$. Since the intersection $S_{q'} \cap \{1, \dots, i-1\}$ is nonempty, the set $S_{q'}$ cannot be primary and is therefore secondary. In particular, the set $S_{q'}$ contains the element i and therefore contains the union $S' \cup \{i\} = S_q$. Combining this observation with the inequality $|S_{q'}| \leq |S_q|$, we deduce that $S_{q'} = S_q$ and therefore $q' = q$, contradicting our assumption that $q' < q$. $\square$

06BW **Corollary 8.1.1.16.** *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of simplicial sets. Then the induced map $\mathrm{Tw}(U) : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathrm{Tw}(\mathcal{D})$ is an inner fibration. If U is an isofibration, then $\mathrm{Tw}(U)$ is also an isofibration.*

8.1.2 Homotopy Transport for Twisted Arrows

03JV Let $\mathcal{C}$ be an ∞ -category and let $\mathrm{Tw}(\mathcal{C})$ denote its twisted arrow ∞ -category. For every pair of objects $X, Y \in \mathcal{C}$, Proposition 8.1.1.11 guarantees that the fiber product

$$\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

is a Kan complex, whose vertices can be identified with morphisms $f : X \rightarrow Y$. Our goal in this section is to show that this identification can be promoted to a homotopy equivalence

of Kan complexes

$$\mathrm{Hom}_{\mathcal{C}}^{\mathrm{L}}(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\},$$

where $\mathrm{Hom}_{\mathcal{C}}^{\mathrm{L}}(X, Y) = \mathcal{C}_{X/} \times_{\mathcal{C}} \{Y\}$ denotes the left-pinched morphism space of Construction 4.6.5.1 (see Corollary 8.1.2.10). Our starting point is the following result:

Proposition 8.1.2.1. *Let $\mathcal{C}$ be an ∞ -category and let $f : X \rightarrow Y$ be an isomorphism in $\mathcal{C}$. 03JW Then f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$.*

Remark 8.1.2.2. The converse of Proposition 8.1.2.1 is also true: see Corollary 8.1.2.21. 03JX

We will prove Proposition 8.1.2.1 at the end of this section. First, let us record some consequences.

Corollary 8.1.2.3. *Let $\mathcal{C}$ be a Kan complex. Then the projection maps*

048J

$$\mathcal{C}^{\mathrm{op}} \xleftarrow{\lambda_-} \mathrm{Tw}(\mathcal{C}) \xrightarrow{\lambda_+} \mathcal{C}$$

are trivial Kan fibrations of simplicial sets.

Proof. It follows from Corollary 8.1.1.13 that λ_- and λ_+ are Kan fibrations. By virtue of Proposition 3.3.7.6, it will suffice to show that the fibers of λ_- and λ_+ are contractible Kan complexes, which is an immediate consequence of Proposition 8.1.2.1 (see Corollary 4.6.7.12). $\square$

Corollary 8.1.2.4. *Let $\mathcal{C}$ be a simplicial set. Then the projection map $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ is 048K universally localizing (see Definition 6.3.5.1).*

Proof. Writing $\mathcal{C}$ as the filtered colimit of its skeleta $\mathrm{sk}_n(\mathcal{C})$ and using Proposition 6.3.5.13, we can reduce to the case where $\mathcal{C}$ has dimension $\leq n$ for some integer $n \geq 0$. We proceed by induction on n . If $n = 0$, the morphism λ_+ is an isomorphism. Let us therefore assume that n is positive. Let S denote the collection of nondegenerate n -simplices of $\mathcal{C}$, so that Proposition 1.1.4.12 supplies a pushout square

$$\begin{array}{ccc} S \times \partial\Delta^n & \longrightarrow & S \times \Delta^n \\ \downarrow & & \downarrow \\ \mathrm{sk}_{n-1}(\mathcal{C}) & \longrightarrow & \mathcal{C}, \end{array}$$

where the horizontal maps are monomorphisms. Combining our inductive hypothesis with Proposition 6.3.5.14, we can replace $\mathcal{C}$ by $S \times \Delta^n$ and thereby reduce to the case where $\mathcal{C}$ is an ∞ -category. In this case, λ_+ is a cocartesian fibration (Corollary 8.1.1.14) having weakly contractible fibers (Proposition 8.1.2.1 and Corollary 4.6.7.26), and is therefore universally localizing by virtue of Example 6.3.5.2. $\square$

048L **Corollary 8.1.2.5.** *Let $\mathcal{C}$ be a simplicial set. Then the projection map $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ is a weak homotopy equivalence.*

Proof. Combine Corollary 8.1.2.4 with Remark 6.3.5.6. $\square$

048M **Corollary 8.1.2.6.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Then F is a weak homotopy equivalence if and only if the induced map $\mathrm{Tw}(F) : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathrm{Tw}(\mathcal{D})$ is a weak homotopy equivalence.*

Proof. We have a commutative diagram of simplicial sets

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}) & \xrightarrow{\mathrm{Tw}(F)} & \mathrm{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C} & \longrightarrow & \mathcal{D}, \end{array}$$

where the vertical maps are weak homotopy equivalences by virtue of Corollary 8.1.2.4. $\square$

03JY **Construction 8.1.2.7.** Let $\mathcal{C}$ be a simplicial set and let X be a vertex of $\mathcal{C}$. Let σ be an n -simplex of the coslice simplicial set $\mathcal{C}_{X/}$, which we identify with a morphism of simplicial sets $\{x\} \star \Delta^n \rightarrow \mathcal{C}$ satisfying $\sigma(x) = X$. Then the composite map

$$(\Delta^n)^{\mathrm{op}} \star \Delta^n \twoheadrightarrow \{x\} \star \Delta^n \xrightarrow{\sigma} \mathcal{C}$$

can be identified with an n -simplex of the twisted arrow simplicial set $\mathrm{Tw}(\mathcal{C})$, which we will denote by $\iota_X(\sigma)$. The construction $\sigma \mapsto \iota_X(\sigma)$ is compatible with the formation of face and degeneracy operators, and therefore determines a morphism of simplicial sets $\iota_X : \mathcal{C}_{X/} \rightarrow \mathrm{Tw}(\mathcal{C})$. Moreover, the diagram

$$\begin{array}{ccc} \mathcal{C}_{X/} & \xrightarrow{\iota_X} & \mathrm{Tw}(\mathcal{C}) \\ \downarrow & & \downarrow \lambda_- \\ \{X\} & \longrightarrow & \mathcal{C}^{\mathrm{op}} \end{array}$$

commutes, where λ_- is the projection map of Notation 8.1.1.6. It follows that ι_X can be regarded as a morphism of simplicial sets from $\mathcal{C}_{X/}$ to the fiber $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. We will refer to this morphism as the *coslice inclusion*.

Remark 8.1.2.8. Let $\mathcal{C}$ be a simplicial set and let $X \in \mathcal{C}$ be a vertex. Then an n -simplex σ of $\mathcal{C}_{X/}$ can be identified with an $(n+1)$ -simplex of $\mathcal{C}$, which we represent informally as a diagram

$$X \xrightarrow{f} Y_0 \xrightarrow{v_1} Y_1 \xrightarrow{v_2} Y_2 \rightarrow \cdots \xrightarrow{v_n} Y_n.$$

The morphism ι_X of Construction 8.1.2.7 carries σ to a $(2n+1)$ -simplex τ of $\mathcal{C}$, which can be represented informally by the diagram

$$\begin{array}{ccccccc} X & \xleftarrow{\text{id}} & X & \xleftarrow{\text{id}} & X & \xleftarrow{\text{id}} & \cdots \xleftarrow{\text{id}} X \\ \downarrow f & & & & & & \\ Y_0 & \xrightarrow{v_1} & Y_1 & \xrightarrow{v_2} & Y_2 & \longrightarrow & \cdots \xrightarrow{v_n} Y_n. \end{array}$$

Note that σ can be recovered from τ (by composing with the inclusion map $\Delta^{n+1} \hookrightarrow \Delta^{2n+1}$, given on vertices by $i \mapsto i+n$). It follows that ι_X is a monomorphism of simplicial sets $\mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ (as suggested by our terminology).

Proposition 8.1.2.9. *Let $\mathcal{C}$ be an ∞ -category. For every object $X \in \mathcal{C}$, the coslice inclusion* 03K0

$$\iota_X : \mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$$

is an equivalence of ∞ -categories.

Proof. By construction, we have a commutative diagram

$$\begin{array}{ccc} \mathcal{C}_{X/} & \xrightarrow{\iota_X} & \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \\ & \searrow & \swarrow \lambda_+ \\ & \mathcal{C}, & \end{array}$$

where the vertical maps are left fibrations of ∞ -categories (Propositions 4.3.6.1 and 8.1.1.11). Moreover, the ∞ -category $\mathcal{C}_{X/}$ has an initial object $\tilde{X}$, given by the identity morphism $\text{id}_X : X \rightarrow X$ (Proposition 4.6.7.23). Proposition 8.1.2.1 guarantees that $\iota_X(\tilde{X})$ is an initial object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$, so that ι_X is an equivalence of ∞ -categories by virtue of Corollary 5.6.6.20. $\square$

Corollary 8.1.2.10. *Let $\mathcal{C}$ be an ∞ -category. For every pair of objects $X, Y \in \mathcal{C}$, the coslice inclusion ι_X restricts to a homotopy equivalence of Kan complexes* 03K1

$$\text{Hom}_{\mathcal{C}}^{\text{L}}(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}.$$

Proof. Combine Proposition 8.1.2.9 with Corollary 5.1.6.4. $\square$

03K2 **Corollary 8.1.2.11.** *Let $\mathcal{C}$ be an ∞ -category and let $f, f' : X \rightarrow Y$ be morphisms of $\mathcal{C}$. Then f and f' are homotopic (in the sense of Definition 1.4.3.1) if and only if they belong to the same connected component of the Kan complex $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$. Consequently, we have a canonical isomorphism of sets*

$$\text{Hom}_{\text{h}\mathcal{C}}(X, Y) \simeq \pi_0(\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}).$$

03K3 **Exercise 8.1.2.12.** Prove Corollary 8.1.2.11 directly from the definitions.

03K4 **Exercise 8.1.2.13.** Let $\mathcal{C}$ be an ∞ -category containing morphisms $u : X' \rightarrow X$ and $v : Y \rightarrow Y'$, so that covariant transport for the left fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ determines a morphism of Kan complexes

$$T : \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \{X'\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y'\}.$$

Show that, under the identifications supplied by Corollary 8.1.2.11, the induced map of connected components $\pi_0(T) : \text{Hom}_{\text{h}\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\text{h}\mathcal{C}}(X', Y')$ is given by the construction $[f] \mapsto [v] \circ [f] \circ [u]$.

We now apply Proposition 8.1.2.9 to describe the left fibration $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Proposition 8.1.1.15.

03K5 **Notation 8.1.2.14.** Let $\mathcal{C}$ be an ∞ -category. For every pair of objects $X, Y \in \mathcal{C}$, Proposition 4.6.5.10 and Corollary 8.1.2.10 supply homotopy equivalences of Kan complexes

$$\text{Hom}_{\mathcal{C}}(X, Y) \hookrightarrow \text{Hom}_{\mathcal{C}}^{\text{I}}(X, Y) \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}.$$

Passing to homotopy, we obtain an isomorphism

$$\alpha_{X,Y} : \text{Hom}_{\mathcal{C}}(X, Y) \xrightarrow{\sim} \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$$

in the homotopy category hKan .

03LX **Corollary 8.1.2.15.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then F is fully faithful if and only if the diagram*

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}) & \xrightarrow{\text{Tw}(F)} & \text{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{F^{\text{op}} \times F} & \mathcal{D}^{\text{op}} \times \mathcal{D} \end{array} \quad (8.3)$$

is a categorical pullback square.

Proof. Since the vertical maps in the diagram (8.3) are left fibrations (Proposition 8.1.1.11), it is a categorical pullback square if and only if, for every pair of objects $X, Y \in \mathcal{C}$, the induced map

$$\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \{F(X)\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{F(Y)\}$$

is a homotopy equivalence of Kan complexes (Corollary 5.1.7.16). Using Notation 8.1.2.14, we see that this is equivalent to the requirement that F induces a homotopy equivalence $\text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \text{Hom}_{\mathcal{D}}(F(X), F(Y))$. $\square$

Corollary 8.1.2.16. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be an equivalence of ∞ -categories. Then the induced map $\text{Tw}(F) : \text{Tw}(\mathcal{C}) \rightarrow \text{Tw}(\mathcal{D})$ is also an equivalence of ∞ -categories.* 03K9

Proof. Combine Corollary 8.1.2.15 with Proposition 4.5.2.22. $\square$

Corollary 8.1.2.17. *Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category. If $\mathcal{C}$ is essentially κ -small, then $\text{Tw}(\mathcal{C})$ is essentially κ -small.* 03Y6

Proof. Choose an equivalence of ∞ -categories $\mathcal{C}' \rightarrow \mathcal{C}$, where $\mathcal{C}'$ is a κ -small simplicial set. It follows from Corollary 8.1.2.16 that the induced map $\text{Tw}(\mathcal{C}') \rightarrow \text{Tw}(\mathcal{C})$ is also an equivalence of ∞ -categories. We conclude by observing that $\text{Tw}(\mathcal{C}')$ is also a κ -small simplicial set (Remark 8.1.1.5). $\square$

Corollary 8.1.2.18. *Let $\mathcal{C}$ be an ∞ -category, let $\text{h}\mathcal{C}$ be its homotopy category, and let* 03K6

$$\underline{\text{Hom}}_{\text{h}\mathcal{C}} : \text{h}\mathcal{C}^{\text{op}} \times \text{h}\mathcal{C} \rightarrow \text{hKan} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$$

denote the functor determined by the hKan -enrichment of Construction 4.6.9.13. Then the assignment $(X, Y) \mapsto \alpha_{X, Y}$ of Notation 8.1.2.14 determines an isomorphism from $\underline{\text{Hom}}_{\text{h}\mathcal{C}}$ to the homotopy transport representation of the left fibration $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$.

Proof. Let $H : \text{h}(\mathcal{C}^{\text{op}}) \times \text{h}\mathcal{C} \rightarrow \text{hKan}$ denote the homotopy transport representation for the left fibration (λ_-, λ_+) , given on objects by the formula $H(X, Y) = \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$. For every pair of objects $X, Y \in \mathcal{C}$, Notation 8.1.2.14 determines an isomorphism

$$\alpha_{X, Y} : \underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y) \xrightarrow{\sim} H(X, Y)$$

in the homotopy category hKan . We wish to show that $\alpha_{X, Y}$ depends functorially on X and Y .

We first establish a strong form of functoriality in Y . Fix an object $X \in \mathcal{C}$, and let $h^X : \text{h}\mathcal{C} \rightarrow \text{hKan}$ denote the hKan -enriched functor corepresented by X , given concretely by the formula $h^X(Y) = \underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y) = \text{Hom}_{\mathcal{C}}(X, Y)$. Let $H^X : \text{h}\mathcal{C} \rightarrow \text{hKan}$ denote the restriction $H|_{\{X\} \times \text{h}\mathcal{C}}$, which we also regard as an hKan -enriched functor (using Variant 5.2.8.11). Note

that h^X can be identified with the (enriched) homotopy transport representation of the left fibration $\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C} \rightarrow \mathcal{C}$ (see Example 5.2.8.13). Corollary 4.6.4.20 and Proposition 8.1.2.9 supply equivalences

$$\{X\} \tilde{\times}_{\mathcal{C}} \mathcal{C} \hookleftarrow \mathcal{C}_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$$

of left fibrations over $\mathcal{C}$, which induce an isomorphism of hKan-enriched functors $\alpha_{X,-} : h^X \xrightarrow{\sim} H^X$. By construction, this isomorphism carries each object $Y \in \text{h}\mathcal{C}$ to the isomorphism $\alpha_{X,Y} : \underline{\text{Hom}}(X, Y) \xrightarrow{\sim} H(X, Y)$ of Notation 8.1.2.14, which proves that $\alpha_{X,Y}$ depends functorially on Y .

We now show that $\alpha_{X,Y}$ depends functorially on X . Fix a morphism $f : W \rightarrow X$ in the ∞ -category $\mathcal{C}$. We then have a diagram of hKan-enriched functors

$$\begin{array}{ccc} h^X & \xrightarrow{\alpha_{X,-}} & H^X \\ \downarrow & & \downarrow \\ h^W & \xrightarrow{\alpha_{X,-}} & H^W, \end{array} \quad (8.4)$$

where the vertical maps are induced by the homotopy class $[f] \in \text{Hom}_{\text{h}\mathcal{C}^{\text{op}}}(X, W)$. To complete the proof, it will suffice to show that this diagram commutes. Using the corepresentability of the hKan-enriched functor h^X , we are reduced to showing that clockwise and counter-clockwise composition around the diagram (8.4) carry $[\text{id}_X] \in \pi_0(h^X(X)) = \text{Hom}_{\text{h}\mathcal{C}}(X, X)$ to the same element of $\pi_0(H^W(X))$. We conclude by observing that under the identification $\pi_0(H^W(X)) \simeq \text{Hom}_{\text{h}\mathcal{C}}(W, X)$ supplied by Corollary 8.1.2.11, both constructions carry $[\text{id}_X]$ to $[f]$ (Exercise 8.1.2.13). $\square$

03K8 Warning 8.1.2.19. Let $\mathcal{C}$ be an ∞ -category. Our proof of Corollary 8.1.2.18 shows that the isomorphism $\alpha_{X,Y} : \underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y) \rightarrow H(X, Y)$ is compatible with the hKan-enrichment in the second variable. Beware that things are a bit more subtle if we wish to view $\underline{\text{Hom}}_{\text{h}\mathcal{C}}(X, Y)$ and $H(X, Y)$ as hKan-enriched functors of the *first* variable. The functor $\underline{\text{Hom}}_{\text{h}\mathcal{C}}$ is defined using the enrichment of the category $\text{h}\mathcal{C}$, and can therefore be viewed an hKan-enriched functor

$$(\text{h}\mathcal{C})^{\text{op}} \times \text{h}\mathcal{C} \rightarrow \text{hKan}.$$

On the other hand, the functor H is defined as the enriched homotopy transport representation of the left fibration $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$, which is an hKan-enriched functor

$$\text{h}(\mathcal{C}^{\text{op}}) \times \text{h}\mathcal{C} \rightarrow \text{hKan}.$$

The hKan-enriched categories $(\text{h}\mathcal{C})^{\text{op}}$ and $\text{h}(\mathcal{C}^{\text{op}})$ are *a priori* different objects: to a pair of objects $X, Y \in \mathcal{C}$, they assign morphism spaces $\text{Hom}_{\mathcal{C}}(X, Y)$ and $\text{Hom}_{\mathcal{C}}(X, Y)^{\text{op}}$, respectively.

It is possible to address this point (since $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ and $\mathrm{Hom}_{\mathcal{C}}(X, Y)^{\mathrm{op}}$ are canonically isomorphic as objects of the homotopy category hKan), but we will not pursue the matter here.

We can use Proposition 8.1.2.9 to deduce a stronger form of Proposition 8.1.2.1.

Corollary 8.1.2.20. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of ∞ -categories and let $f : X \rightarrow Y$ be a morphism of $\mathcal{C}$, which we regard as an object of the twisted arrow ∞ -category $\mathrm{Tw}(\mathcal{C})$. Then:* 03KA

- *The morphism f is U -cocartesian if and only if it is V -initial, where V denotes the induced map*

$$\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \{U(X)\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D}).$$

- *The morphism f is U -cartesian if and only if it is V' -initial, where V' denotes the induced map*

$$\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \mathrm{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{U(Y)\}.$$

Proof. We will prove the first assertion; the proof of the second is similar. Construction 8.1.2.7 supplies a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C}_{X/} & \xrightarrow{\iota_X} & \{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \\ \downarrow U_{X/} & & \downarrow V \\ \mathcal{D}_{U(X)/} & \xrightarrow{\iota_{U(X)}} & \{U(X)\} \times_{\mathcal{D}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{D}), \end{array}$$

where the horizontal maps are equivalences of ∞ -categories (Proposition 8.1.2.9). By virtue of Remark 7.1.5.9, it will suffice to show that f is U -cocartesian if and only if it is a $U_{X/}$ -initial object of the ∞ -category $\mathcal{C}_{X/}$, which is a special case of Example 7.1.7.2. $\square$

Corollary 8.1.2.21. *Let $\mathcal{C}$ be an ∞ -category and let $f : X \rightarrow Y$ be a morphism of $\mathcal{C}$. The following conditions are equivalent:* 03KB

- (1) *The morphism f is an isomorphism in the ∞ -category $\mathcal{C}$.*
- (2) *The morphism f is initial when regarded as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$.*
- (3) *The morphism f is initial when regarded as an object of the ∞ -category $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$.*

Proof. Apply Corollary 8.1.2.20 in the special case $\mathcal{D} = \Delta^0$ (together with Examples 7.1.5.2 and 5.1.1.4). $\square$

Proof of Proposition 8.1.2.1. Let $\mathcal{C}$ be an ∞ -category and let $f : X \rightarrow Y$ be an isomorphism in $\mathcal{C}$; we wish to show that f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. Fix an integer $n > 0$ and a morphism $\rho_0 : \partial\Delta^n \rightarrow \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ satisfying $\rho_0(0) = f$; we wish to show that ρ_0 can be extended to an n -simplex of $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$.

We now use a variation on the proof of Proposition 8.1.1.15. For every nonempty subset $S \subseteq [2n+1]$, let σ_S denote the corresponding nondegenerate simplex of Δ^{2n+1} . Let us say that S is *basic* if it satisfies one of the following conditions:

- (a) The set S is contained in $\{0 < 1 < \cdots < n\}$.
- (b) There exists an integer $0 \leq i \leq n$ such that $S \cap \{i, 2n+1-i\} = \emptyset$.

Let $K_0 \subseteq \Delta^{2n+1}$ be the simplicial subset whose nondegenerate simplices have the form σ_S , where S is basic. Unwinding the definitions, we can identify ρ_0 with a morphism of simplicial sets $\theta_0 : K \rightarrow \mathcal{C}$, where the composition $\Delta^n \hookrightarrow K \xrightarrow{\theta_0} \mathcal{C}$ is the constant map taking the value X and the composition

$$\Delta^1 \simeq N_\bullet(\{n < n+1\}) \hookrightarrow K \xrightarrow{\theta_0} \mathcal{C}$$

is the morphism f . To complete the proof, we must show that θ_0 admits an extension $\theta : \Delta^{2n+1} \rightarrow \mathcal{C}$.

Let S be a nonempty subset of $[2n+1]$ which is not basic. Then there exists an integer $0 \leq i \leq n$ such that $2n+1-i$ belongs to S . We denote the largest such integer by $\text{pr}(S)$ and refer to it as the *priority* of S . We say that S is *prioritized* if it also contained the integer $\text{pr}(S)$. Let $\{S_1, S_2, \dots, S_m\}$ be an ordering of the collection of all prioritized (non-basic) subsets of $[2n+1]$ which satisfies the following conditions:

- The sequence of priorities $\text{pr}(S_1), \text{pr}(S_2), \dots, \text{pr}(S_m)$ is nondecreasing. That is, if $1 \leq p \leq q \leq m$, then we have $\text{pr}(S_p) \leq \text{pr}(S_q)$.
- If $\text{pr}(S_p) = \text{pr}(S_q)$ for $p \leq q$, then $|S_p| \leq |S_q|$.

For $1 \leq q \leq m$, let $\sigma_q \subseteq \Delta^{2n+1}$ denote the simplex spanned by the vertices of S_q , and let $K_q \subseteq \Delta^{2n+1}$ denote the union of K_0 with the simplices $\{\sigma_1, \sigma_2, \dots, \sigma_q\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \cdots \hookrightarrow K_m.$$

Note that the set $S = [2n+1]$ is prioritized (with priority n), and is therefore equal to S_m . It follows that $K_m = \Delta^{2n+1}$. We will complete the proof by showing that θ_0 admits a compatible sequence of extensions $\{\theta_q : K_q \rightarrow \mathcal{C}\}_{0 \leq q \leq m}$, so that $\theta = \theta_m$ is an extension of θ_0 to Δ^{2n+1} .

For the remainder of the proof, we fix an integer $1 \leq q \leq m$, and suppose that the morphism $\theta_{q-1} : K_{q-1} \rightarrow \mathcal{C}$ has already been constructed. Let d denote the dimension of

the simplex σ_q , let us abuse notation by identifying σ_q with a morphism of simplicial sets $\Delta^d \rightarrow K_q \subseteq \Delta^{2n+1}$, and set $L = \sigma_q^{-1}K_{q-1} \subseteq \Delta^d$. Let $i = \text{pr}(S_q)$ denote the priority of S_q , so that S_q contains both i and $2n+1-i$. Write $S_q = \{j_0 < j_1 < \cdots < j_d\}$, so that $i = j_k$ for some integer $0 \leq k \leq d$. We will prove below that L is equal to the horn $\Lambda_k^d \subseteq \Delta^d$, so that the diagram of simplicial sets

$$\begin{array}{ccc} L & \xrightarrow{\quad} & K_{q-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\sigma_q} & K_q \end{array}$$

is a pushout square (Lemma 3.1.2.11). Let τ_0 denote the composite map $L \xrightarrow{\sigma_q} K_{q-1} \xrightarrow{\theta_{q-1}} \mathcal{C}$. We will complete the proof by showing that τ_0 admits an extension $\tau : \Delta^d \rightarrow \mathcal{C}$ (which then determines a morphism $\theta_q : K_q \rightarrow \mathcal{C}$ extending θ_{q-1}). The proof splits into four cases:

- Suppose that $0 < k < d$. Then $\Lambda_k^d \subseteq \Delta^d$ is an inner horn, so that τ_0 admits an extension $\tau : \Delta^d \rightarrow \mathcal{C}$ by virtue of our assumption that $\mathcal{C}$ is an ∞ -category.
- Suppose that $k = d$. Then S_q is contained in $\{0, 1, \dots, n\}$, contradicting our assumption that S_q is not basic.
- Suppose $k = 0$ and $i < n$, so that i is the least element of S_q . Our assumption $\text{pr}(S_q) = i$ guarantees that $2n-i \notin S$. Since S_q does not satisfy (b), we must also have $i+1 \in S_q$. It follows that $d \geq 2$ (otherwise, S_q would satisfy (a)), and that $\tau_0 : \Lambda_0^d \rightarrow \mathcal{C}$ carries the initial edge $N_\bullet(\{0 < 1\})$ to the identity morphism id_X . In this case, the existence of the extension τ follows from Theorem 4.4.2.6.
- Suppose $k = 0$ and $i = n$, so that $i = n$ is the least element of S_q . Since S_q has priority n , the element $n+1$ also belongs to S_q . We must then have $d \geq 2$ (otherwise, S_q would satisfy condition (b)). It follows that $\tau_0 : \Lambda_0^d \rightarrow \mathcal{C}$ carries the initial edge $N_\bullet(\{0 < 1\})$ to the morphism f , which is an isomorphism in $\mathcal{C}$. In this case, the existence of the extension τ again follows from Theorem 4.4.2.6.

It remains to prove that $L = \Lambda_k^d$, which we can formulate more concretely as follows:

- (*) Let j be an element of S_q , and set $S' = S_q \setminus \{j\}$. Then $\sigma_{S'}$ is contained in K_{q-1} if and only if $j \neq i$.

We first treat the case $j = i$; in this case, we wish to show that $\sigma_{S'}$ is not contained in K_{q-1} . Note that S' cannot be basic: it cannot be contained in $\{0, 1, \dots, n\}$ (otherwise

$S_q = S' \cup \{i\}$ would have the same property) and cannot have empty intersection with a set of the form $\{i', 2n+1-i'\}$ (otherwise S_q would have the same property; here we use the fact that $2n+1-i$ is contained in S_q). Moreover, we have $\text{pr}(S') = i \notin S'$, so that S' is not prioritized. Assume, for a contradiction, that $\sigma_{S'}$ is contained in K_{q-1} . Then we must have $S' \subseteq S_{q'}$, for some $1 \leq q' < q$. Note that $2n+1-i \in S' \subseteq S_{q'}$, so that $S_{q'}$ has priority $\geq i$. Since $q' < q$, it follows that $S_{q'}$ has priority i and that $|S_{q'}| \leq |S_q|$. Since $S_{q'}$ is prioritized, it contains the element i , and therefore contains $S_q = S' \cup \{i\}$. It follows that $S_{q'} = S_q$, contradicting our assumption that $q' < q$.

We now treat the case $j \neq i$; in this case, we wish to show that $\sigma_{S'}$ is contained in K_{q-1} . We may assume without loss of generality that S' is not basic (otherwise, the simplex $\sigma_{S'}$ is already contained in K_0). Let $i' = \text{pr}(S')$ denote the priority of S' ; note that the inclusion $S' \subseteq S_q$ guarantees that $i' \leq i$. If $i' < i$, then $S' \cup \{i'\}$ is a prioritized set of priority $< i$, and therefore of the form $S_{q'}$ for some $q' < q$. If $i' = i$, then S' is a prioritized set of priority i and cardinality $|S_q| - 1$, and therefore of the form $S_{q'}$ for some $q' < q$. In either case, we obtain $\sigma_{S'} \subseteq \sigma_{q'} \subseteq K_{q-1}$. $\square$

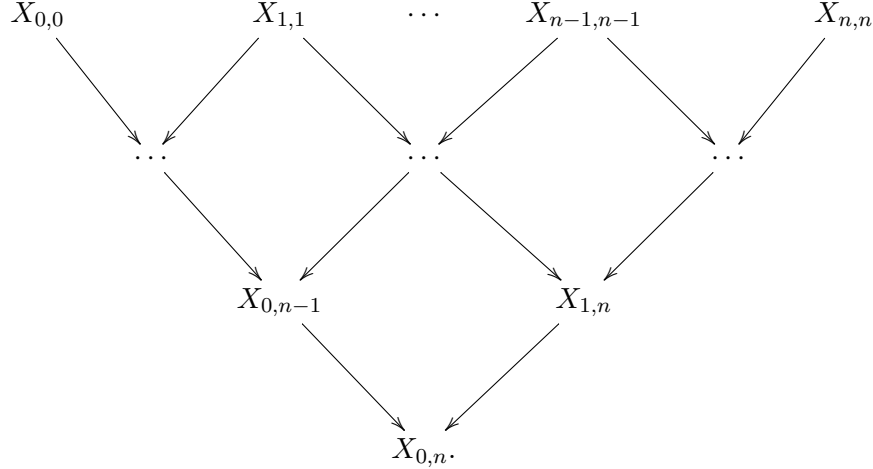

8.1.3 The Cospan Construction

00AY Let $\mathcal{C}_0$ be a category which admits pushouts. In §2.2.1, we introduced a 2-category $\text{Cospan}(\mathcal{C}_0)$ having the same objects, where 1-morphisms from X to Y in $\text{Cospan}(\mathcal{C}_0)$ are *cospans* from X to Y : that is, diagrams $X \xrightarrow{f} B \xleftarrow{g} Y$ in the category $\mathcal{C}_0$ (see Example 2.2.2.1). In this section, we introduce a generalization of this construction, which will allow us to replace the ordinary category $\mathcal{C}_0$ by an ∞ -category. More precisely, we will associate to every simplicial set $\mathcal{C}$ a simplicial set $\text{Cospan}(\mathcal{C})$ of *cospans in $\mathcal{C}$* (Construction 8.1.3.1). In the special case where $\mathcal{C} = \mathbf{N}_\bullet(\mathcal{C}_0)$ is the nerve of a category $\mathcal{C}_0$ which admits pushouts, we show that $\text{Cospan}(\mathcal{C})$ can be identified with the Duskin nerve of the 2-category $\text{Cospan}(\mathcal{C}_0)$ (Corollary 8.1.3.15).

03KN **Construction 8.1.3.1.** Let $\mathcal{C}$ be a simplicial set. For every integer $n \geq 0$, we let $\text{Cospan}_n(\mathcal{C})$ denote the collection of morphisms $\text{Tw}(\Delta^n) \rightarrow \mathcal{C}$ in the category of simplicial sets. The construction $[n] \mapsto \text{Cospan}_n(\mathcal{C})$ depends functorially on the set $[n] = \{0 < 1 < \cdots < n\}$ as an object of the category $\mathbf{\Delta}^{\text{op}}$, and can therefore be viewed as a simplicial set. We will denote this simplicial set by $\text{Cospan}(\mathcal{C})$ and refer to it as the *simplicial set of cospans in $\mathcal{C}$* .

03KP **Remark 8.1.3.2.** Let $n \geq 0$ be an integer. Then the simplicial set $\text{Tw}(\Delta^n)$ can be identified with the nerve of the partially ordered set $Q = \{(i, j) \in [n]^{\text{op}} \times [n] : i \leq j\}$ (see Example 8.1.0.5). Consequently, if $\mathcal{C}$ is an arbitrary simplicial set, then n -simplices of $\text{Cospan}(\mathcal{C})$ can

be identified with morphisms $N_\bullet(Q) \rightarrow \mathcal{C}$, which we depict informally as diagrams

Example 8.1.3.3. Let $\mathcal{C}$ be a simplicial set. Then:

03KQ

- Vertices of the simplicial set $\text{Cospan}(\mathcal{C})$ can be identified with vertices of $\mathcal{C}$.
- Let X and Y be vertices of $\mathcal{C}$. Then edges of $\text{Cospan}(\mathcal{C})$ joining X to Y can be identified with pairs (f, g) , where $f : X \rightarrow B$ and $g : Y \rightarrow B$ are edges of $\mathcal{C}$ having the same target.

Remark 8.1.3.4 (Symmetry). Let $\mathcal{C}$ be a simplicial set and let σ be an n -simplex of $\text{Cospan}(\mathcal{C})$, which we identify with a morphism of simplicial sets $\text{Tw}(\Delta^n) \rightarrow \mathcal{C}$. Composing with the automorphism

$$\text{Tw}(\Delta^n) \xrightarrow{\sim} \text{Tw}(\Delta^n) \quad (i, j) \mapsto (n - j, n - i),$$

we obtain a new n -simplex $\bar{\sigma}$ of $\text{Cospan}(\mathcal{C})$. The construction $\sigma \mapsto \bar{\sigma}$ determines an isomorphism of simplicial sets $\tau : \text{Cospan}(\mathcal{C}) \simeq \text{Cospan}(\mathcal{C})^{\text{op}}$, which can be described concretely as follows:

- For every vertex $X \in \mathcal{C}$, the morphism τ carries X (regarded as a vertex of $\text{Cospan}(\mathcal{C})$) to itself.
- Let X and Y be vertices of $\mathcal{C}$, and let $e : X \rightarrow Y$ be an edge of $\text{Cospan}(\mathcal{C})$, given by a pair of edges $(f : X \rightarrow B, g : Y \rightarrow B)$ of $\mathcal{C}$. Then $\tau(e) : Y \rightarrow X$ is the edge of $\text{Cospan}(\mathcal{C})$ given by the pair (g, f) .

Note that τ is involutive: that is, the composition

$$\text{Cospan}(\mathcal{C}) \xrightarrow{\tau} \text{Cospan}(\mathcal{C})^{\text{op}} \xrightarrow{\tau^{\text{op}}} \text{Cospan}(\mathcal{C})$$

is the identity automorphism of $\text{Cospan}(\mathcal{C})$.

03KT **Construction 8.1.3.5.** Let $\mathcal{D}$ be a simplicial set and let $\sigma : \Delta^n \rightarrow \mathcal{D}$ be an n -simplex of $\mathcal{D}$. Invoking the functoriality of the twisted arrow construction, we obtain a map $\mathrm{Tw}(\Delta^n) \xrightarrow{\mathrm{Tw}(\sigma)} \mathrm{Tw}(\mathcal{D})$, which we can identify with an n -simplex $u(\sigma)$ of the simplicial set $\mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$. The construction $\sigma \mapsto u(\sigma)$ is compatible with face and degeneracy operators, and therefore determines a morphism of simplicial sets $u : \mathcal{D} \rightarrow \mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$ which we will refer to as the *unit map*.

048N **Example 8.1.3.6** (Tautological Cospans). Let $\mathcal{D}$ be a simplicial set and let $e : X \rightarrow Y$ be an edge of $\mathcal{D}$, which we also view as a vertex of the simplicial set $\mathrm{Tw}(\mathcal{D})$. Then the morphism $\mathcal{D} \rightarrow \mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$ carries e to an edge of the simplicial set $\mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$, which we can identify with a pair of edges

$$\mathrm{id}_X \xrightarrow{e_L} e \xleftarrow{e_R} \mathrm{id}_Y$$

in the simplicial set $\mathrm{Tw}(\mathcal{D})$. Here e_L and e_R can be identified with degenerate 3-simplices of $\mathcal{D}$, which we depict informally in the diagrams

$$\begin{array}{ccc} X & \xleftarrow{\mathrm{id}_X} & X \\ \mathrm{id}_X \downarrow & & \\ X & \xrightarrow{f} & Y \end{array} \qquad \begin{array}{ccc} Y & \xleftarrow{f} & X \\ \mathrm{id}_Y \downarrow & & \\ Y & \xrightarrow{\mathrm{id}_Y} & Y. \end{array}$$

03KU **Proposition 8.1.3.7.** Let $\mathcal{D}$ be a simplicial set and let $u : \mathcal{D} \rightarrow \mathrm{Cospan}(\mathrm{Tw}(\mathcal{D}))$ be the unit map of Construction 8.1.3.5. For every simplicial set $\mathcal{C}$, the composite map

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\mathcal{D}), \mathcal{C}) &\rightarrow \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Cospan}(\mathrm{Tw}(\mathcal{D})), \mathrm{Cospan}(\mathcal{C})) \\ &\xrightarrow{\circ u} \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{D}, \mathrm{Cospan}(\mathcal{C})) \end{aligned}$$

is a bijection.

Proof. Let us regard the simplicial set $\mathcal{C}$ as fixed. For every simplicial set $\mathcal{D}$, the unit map u of Construction 8.1.3.5 determines a function

$$\theta_{\mathcal{D}} : \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\mathcal{D}), \mathcal{C}) \rightarrow \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathcal{D}, \mathrm{Cospan}(\mathcal{C})).$$

Using Remark 8.1.1.4, we see that the construction $\mathcal{D} \mapsto \theta_{\mathcal{D}}$ carries colimits (in the category of simplicial sets) to limits (in the arrow category $\mathrm{Fun}([1], \mathrm{Set})$). Consequently, to show that $\theta_{\mathcal{D}}$ is a bijection, we may assume without loss of generality that $\mathcal{D} = \Delta^n$ is a standard simplex (see Remark 1.1.3.13). In this case, the desired result follows immediately from the definition of the simplicial set $\mathrm{Cospan}(\mathcal{C})$. $\square$

Corollary 8.1.3.8. *The twisted arrow functor*

03KV

$$\mathrm{Tw} : \mathrm{Set}_\Delta \rightarrow \mathrm{Set}_\Delta \quad \mathcal{D} \mapsto \mathrm{Tw}(\mathcal{D})$$

has a right adjoint, given on objects by the construction $\mathcal{C} \mapsto \mathrm{Cospan}(\mathcal{C})$.

Remark 8.1.3.9. Let $\mathcal{C}$ and $\mathcal{D}$ be simplicial sets. Using Proposition 8.1.3.7, we obtain 048P
bijections

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Set}_\Delta}(\Delta^n, \mathrm{Fun}(\mathcal{C}, \mathrm{Cospan}(\mathcal{D}))) &\simeq \mathrm{Hom}_{\mathrm{Set}_\Delta}(\Delta^n \times \mathcal{C}, \mathrm{Cospan}(\mathcal{D})) \\ &\simeq \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\Delta^n \times \mathcal{C}), \mathcal{D}) \\ &\simeq \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\Delta^n) \times \mathrm{Tw}(\mathcal{C}), \mathcal{D}) \\ &\simeq \mathrm{Hom}_{\mathrm{Set}_\Delta}(\mathrm{Tw}(\Delta^n), \mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D})) \\ &\simeq \mathrm{Hom}_{\mathrm{Set}_\Delta}(\Delta^n, \mathrm{Cospan}(\mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D}))). \end{aligned}$$

These bijections depend functorially on $[n] \in \Delta$, and therefore determine an isomorphism of simplicial sets $\mathrm{Fun}(\mathcal{C}, \mathrm{Cospan}(\mathcal{D})) \simeq \mathrm{Cospan}(\mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathcal{D}))$.

Corollary 8.1.3.10. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be a Kan fibration of simplicial sets. Then the induced 048Q
map $\mathrm{Cospan}(U) : \mathrm{Cospan}(\mathcal{C}) \rightarrow \mathrm{Cospan}(\mathcal{D})$ is also a Kan fibration.*

Proof. Let $i : A \hookrightarrow B$ be a monomorphism of simplicial sets which is a weak homotopy equivalence. We wish to show that every lifting problem

$$\begin{array}{ccc} A & \longrightarrow & \mathrm{Cospan}(\mathcal{C}) \\ \downarrow i & \nearrow & \downarrow \mathrm{Cospan}(U) \\ B & \longrightarrow & \mathrm{Cospan}(\mathcal{D}) \end{array} \quad (8.5) \quad 048R$$

admits a solution. Using Proposition 8.1.3.7, we can rewrite (8.5) as a lifting problem of the form

$$\begin{array}{ccc} \mathrm{Tw}(A) & \longrightarrow & \mathcal{C} \\ \downarrow \mathrm{Tw}(i) & \nearrow & \downarrow U \\ \mathrm{Tw}(B) & \longrightarrow & \mathcal{D}. \end{array}$$

Our assumption that U is a Kan fibration guarantees that this lifting problem has a solution, since the monomorphism $\mathrm{Tw}(i) : \mathrm{Tw}(A) \hookrightarrow \mathrm{Tw}(B)$ is also a weak homotopy equivalence (Corollary 8.1.2.6). $\square$

048S **Corollary 8.1.3.11.** *Let $\mathcal{C}$ be a Kan complex. Then the simplicial set $\text{Cospan}(\mathcal{C})$ is also a Kan complex.*

Proof. Apply Corollary 8.1.3.10 in the special case $\mathcal{D} = \Delta^0$. $\square$

We now study the relationship between Construction 8.1.3.1 with the classical cospan construction (Example 2.2.2.1).

00B4 **Construction 8.1.3.12.** Let $\mathcal{C}$ be a category which admits pushouts, and let $\text{Cospan}(\mathcal{C})$ denote the 2-category of Example 2.2.2.1. Suppose we are given another category $\mathcal{D}$ and a functor $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$. We define a strictly unitary lax functor $F^+ : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$ as follows:

- For each $X \in \mathcal{D}$, we define $F^+(X) = F(\text{id}_X)$; here we regard the identity morphism $\text{id}_X : X \rightarrow X$ as an object of the twisted arrow category $\text{Tw}(\mathcal{C})$.
- For each morphism $f : X \rightarrow Y$ in $\mathcal{D}$, we define $F^+(f)$ to be the 1-morphism of $\text{Cospan}(\mathcal{C})$ given by the cospan

$$F(\text{id}_X) \xrightarrow{F(\text{id}_X, f)} F(f) \xleftarrow{F(f, \text{id}_Y)} F(\text{id}_Y).$$

Note that this determines the values of F^+ on 2-morphisms, since every 2-morphism in $\mathcal{D}$ is an identity 2-morphism.

- For every pair of composable morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$ in $\mathcal{D}$, the composition constraint $\mu_{g,f} : F^+(g) \circ F^+(f) \Rightarrow F^+(g \circ f)$ is the 2-morphism of $\text{Cospan}(\mathcal{C})$ corresponding to the map $F(f) \amalg_{F(\text{id}_Y)} F(g) \rightarrow F(g \circ f)$ classifying the commutative diagram

$$\begin{array}{ccc} F(\text{id}_Y) & \xrightarrow{F(f, \text{id}_Y)} & F(f) \\ \downarrow F(\text{id}_Y, g) & & \downarrow F(\text{id}_X, g) \\ F(g) & \xrightarrow{F(f, \text{id}_Z)} & F(g \circ f) \end{array}$$

in the category $\mathcal{C}$.

03KW **Example 8.1.3.13.** Let $\mathcal{C}$ be a category which admits pushouts and let n be a nonnegative integer. Applying Construction 8.1.3.12 in the special case where $\mathcal{D} = [n]$, we obtain a function

$$\{\text{Functors } \text{Tw}([n]) \rightarrow \mathcal{C}\} \xrightarrow{\sim} \{\text{Strictly unitary lax functors } [n] \rightarrow \text{Cospan}(\mathcal{C})\}.$$

Using Propositions 1.3.3.1 and 8.1.1.10, we can identify the left hand side with the collection of n -simplices of the simplicial set $\text{Cospan}(\mathbf{N}_\bullet(\mathcal{C}))$. This construction depends functorially on n , and therefore determines a morphism of simplicial sets from $\text{Cospan}(\mathbf{N}_\bullet(\mathcal{C}))$ to the Duskin nerve $\mathbf{N}_\bullet^{\mathbf{D}}(\text{Cospan}(\mathcal{C}))$.

We can now formulate our main result.

Theorem 8.1.3.14. *Let $\mathcal{C}$ and $\mathcal{D}$ be categories, where $\mathcal{C}$ admits pushouts. Then Construction 00B5 8.1.3.12 induces a bijection of sets*

$$\{\text{Functors } F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}\} \xrightarrow{\sim} \{\text{Strictly unitary lax functors } F^+ : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})\}.$$

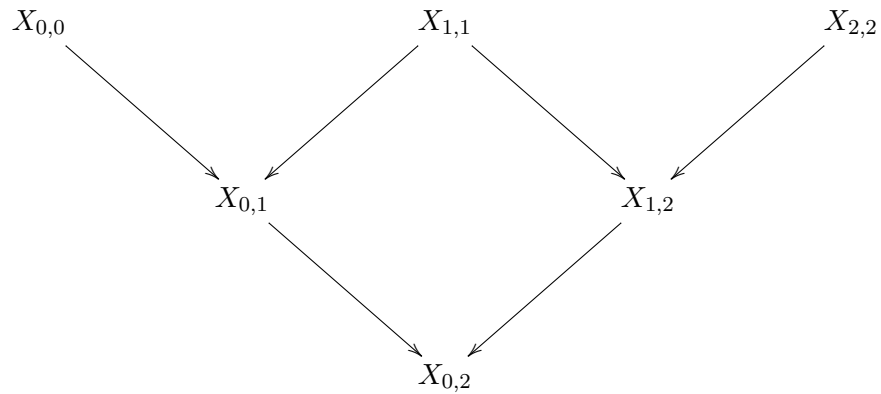

Corollary 8.1.3.15. *Let $\mathcal{C}$ be a category which admits pushouts. Then the comparison map 00B6 of Example 8.1.3.13 determines an isomorphism of simplicial sets*

$$\text{Cospan}(\mathbf{N}_\bullet(\mathcal{C})) \rightarrow \mathbf{N}_\bullet^{\mathbf{D}}(\text{Cospan}(\mathcal{C})).$$

Exercise 8.1.3.16. Show that Corollary 8.1.3.15 implies Theorem 8.1.3.14. That is, to 03KX prove Theorem 8.1.3.14 in general, it suffices to treat the special case where $\mathcal{D}$ is a category of the form $[n] = \{0 < 1 < \cdots < n\}$ for $n \geq 0$.

Remark 8.1.3.17. Let $\mathcal{C}$ be a category which admits pushouts. The construction of the 03KY 2-category $\text{Cospan}(\mathcal{C})$ of Example 2.2.2.1 involves some auxiliary choices: if $X \rightarrow B \leftarrow Y$ and $Y \rightarrow C \leftarrow Z$ are cospans in $\mathcal{C}$, then their composition (as 1-morphisms of $\text{Cospan}(\mathcal{C})$) is given by $X \rightarrow (B \amalg_Y C) \leftarrow Z$, where the pushout $B \amalg_Y C$ is only well-defined up to (canonical) isomorphism. Corollary 8.1.3.15 supplies a description of the Duskin nerve $\mathbf{N}_\bullet^{\mathbf{D}}(\text{Cospan}(\mathcal{C}))$ which does not depend on these choices. This shows, in particular, that the 2-category $\text{Cospan}(\mathcal{C})$ is well-defined up to (non-strict) isomorphism; see Example 2.2.6.13.

Example 8.1.3.18. Let $\mathcal{C}$ be a category which admits pushouts. Then 2-simplices σ of the 00B8 Duskin nerve $\mathbf{N}_\bullet^{\mathbf{D}}(\text{Cospan}(\mathcal{C}))$ can be identified with commutative diagrams

in the category $\mathcal{C}$. It follows from Theorem 2.3.2.5 that the 2-simplex σ is thin (in the sense of Definition 2.3.2.3) if and only if the square appearing in the diagram is a pushout: that is, it induces an isomorphism $X_{0,1} \amalg_{X_{1,1}} X_{1,2} \rightarrow X_{0,2}$ in the category $\mathcal{C}$.

Proof of Theorem 8.1.3.14. Let $\mathcal{C}$ and $\mathcal{D}$ be categories, where $\mathcal{C}$ admits pushouts, and let $G : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$ be a strictly unitary lax functor of 2-categories. For every morphism $f : X \rightarrow Y$ in the category $\mathcal{D}$, we can identify $G(f)$ with a cospan from $G(X)$ to $G(Y)$ in the category $\mathcal{C}$, given by a diagram we will denote by $G(X) \xrightarrow{b_-(f)} B(f) \leftarrow b_+(f) G(Y)$. Our assumption that G is strictly unitary guarantees the following:

- (*) For each object $X \in \mathcal{D}$, the object $B(\text{id}_X)$ is equal to $G(X)$, and the maps $b_-(\text{id}_X) : G(X) \rightarrow B(\text{id}_X)$ and $b_+(\text{id}_X) : G(X) \rightarrow B(\text{id}_X)$ are the identity morphisms from $G(X)$ to itself in the category $\mathcal{C}$.

For every pair of composable 1-morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$, the composition constraint $\mu_{g,f}$ for the lax functor G can be identified with a morphism from the pushout $B(f) \amalg_{G(Y)} B(g)$ to $B(g \circ f)$, or equivalently with a pair of morphisms

$$p(g, f) : B(f) \rightarrow B(g \circ f) \quad q(g, f) : B(g) \rightarrow B(g \circ f)$$

satisfying $p(g, f) \circ b_+(f) = q(g, f) \circ b_-(g)$. The axioms for a lax functor (Definition 2.2.4.5) then translate to the following additional conditions:

- (a) For every morphism $f : X \rightarrow Y$ in the category $\mathcal{D}$, $p(\text{id}_Y, f)$ is the identity morphism from $B(f)$ to itself.
- (b) For every morphism $f : X \rightarrow Y$ in the category $\mathcal{D}$, $q(f, \text{id}_X)$ is the identity morphism from $B(f)$ to itself.
- (c) For every composable triple of 1-morphisms $W \xrightarrow{f} X \xrightarrow{g} Y \xrightarrow{h} Z$ in the category $\mathcal{D}$, we have

$$p(h \circ g, f) = p(h, g \circ f) \circ p(g, f) \quad q(h, g \circ f) = q(h \circ g, f) \circ q(h, g)$$

$$p(h, g \circ f) \circ q(g, f) = q(h \circ g, f) \circ p(h, g).$$

We wish to show that there exists a unique functor of ordinary categories $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ such that $G = F^+$, where F^+ is the lax functor associated to F by Construction 8.1.3.12. For this condition to be satisfied, the functor F must satisfy the following conditions:

- (0) For each object $X \in \mathcal{D}$, we have $F(\text{id}_X) = G(X)$ (this guarantees that G and F^+ coincide on objects).

- (1) For each morphism $f : X \rightarrow Y$ in $\mathcal{D}$ (regarded as an object of $\text{Tw}(\mathcal{D})$), we have $F(f) = B(f)$, and the morphisms $b_-(f)$ and $b_+(f)$ are given by $F(\text{id}_X, f)$ and $F(f, \text{id}_Y)$, respectively (this guarantees that G and F^+ coincide on 1-morphisms, and therefore also on 2-morphisms).
- (2) For every pair of composable 1-morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$, the morphisms $p(g, f) : B(f) \rightarrow B(g \circ f)$ and $q(g, f) : B(g) \rightarrow B(g \circ f)$ are given by $F(\text{id}_X, g) : F(f) \rightarrow F(g \circ f)$ and $F(f, \text{id}_Z) : F(g) \rightarrow F(g \circ f)$, respectively (this guarantees that the composition constraints on G and F^+ coincide).

Note that the value of F on each object of $\text{Tw}(\mathcal{D})$ is determined by condition (1). Moreover, if (u, v) is a morphism from $f : X \rightarrow Y$ to $f' : X' \rightarrow Y'$ in the category $\text{Tw}(\mathcal{D})$, then condition (2) guarantees that $F(u, v)$ must be equal to the composition

$$F(f) = B(f) \xrightarrow{q(f, u)} B(f \circ u) \xrightarrow{p(v, f \circ u)} B(v \circ f \circ u) = B(f') = F(f').$$

This proves the uniqueness of the functor F .

To prove existence, we define F on objects f of $\text{Tw}(\mathcal{D})^{\text{op}}$ by the formula $F(f) = B(f)$, and on morphisms $(u, v) : f \rightarrow f'$ by the formula $F(u, v) = p(v, f \circ u) \circ q(f, u)$. For any morphism $f : X \rightarrow Y$ in $\mathcal{C}$, we can use (a) and (b) to compute

$$F(\text{id}_X, \text{id}_Y) = p(\text{id}_X, f) \circ q(f, \text{id}_Y) = \text{id}_{B(f)} \circ \text{id}_{B(f)} = \text{id}_{B(f)},$$

so that F carries identity morphisms in $\text{Tw}(\mathcal{D})$ to identity morphisms in $\mathcal{C}$. To complete the proof that F is a functor, we note that for every pair of composable morphisms

$$(f : X \rightarrow Y) \xrightarrow{(u, v)} (f' : X' \rightarrow Y') \xrightarrow{(u', v')} (f'' : X'' \rightarrow Y'')$$

in the twisted arrow category $\text{Tw}(\mathcal{D})$, the identities given in (c) allow us to compute

$$\begin{aligned} F(u', v') \circ F(u, v) &= p(v', f' \circ u') \circ q(f', u') \circ p(v, f \circ u) \circ q(f, u) \\ &= p(v', v \circ f \circ u \circ u') \circ q(v \circ f \circ u, u') \circ p(v, f \circ u) \circ q(f, u) \\ &= p(v', v \circ f \circ u \circ u') \circ p(v, f \circ u \circ u') \circ q(f \circ u, u') \circ q(f, u) \\ &= p(v' \circ v, f \circ u \circ u') \circ q(f, u \circ u') \\ &= F(u \circ u', v' \circ v). \end{aligned}$$

We now complete the proof by showing that the functor F satisfies conditions (0), (1), and (2). Condition (0) is an immediate consequence of (*). To prove (2), we note that for any pair of composable morphisms $X \xrightarrow{f} Y \xrightarrow{g} Z$ in $\mathcal{D}$, identities (a) and (b) yield equalities

$$F(\text{id}_X, g) = p(g, f) \circ q(f, \text{id}_X) = p(g, f) \quad F(f, \text{id}_Z) = p(\text{id}_Z, g \circ f) \circ q(g, f) = q(g, f).$$

To prove (1), we note that if $f : X \rightarrow Y$ is a morphism in $\mathcal{D}$, then we have

$$\begin{aligned}
 F(\mathrm{id}_X, f) &= p(f, \mathrm{id}_X \circ \mathrm{id}_X) \circ q(\mathrm{id}_X, \mathrm{id}_X) \\
 &= p(f, \mathrm{id}_X) \circ \mathrm{id}_{G(X)} \\
 &= p(f, \mathrm{id}_X) \circ b_+(\mathrm{id}_X) \\
 &= q(f, \mathrm{id}_X) \circ b_-(f) \\
 &= \mathrm{id}_{B(f)} \circ b_-(f) \\
 &= b_-(f),
 \end{aligned}$$

and a similar calculation yields $F(f, \mathrm{id}_Y) = b_+(f)$. $\square$

8.1.4 Cospans in ∞ -Categories

03L4 Let $\mathcal{C}$ be an ∞ -category, and let $\mathrm{Cospan}(\mathcal{C})$ denote the simplicial set of cospans in $\mathcal{C}$ (Construction 8.1.3.1). In the special case where $\mathcal{C} = N_\bullet(\mathcal{C}_0)$ is the nerve of an ordinary category $\mathcal{C}_0$ which admits pushouts, Corollary 8.1.3.15 supplies an isomorphism of $\mathrm{Cospan}(\mathcal{C})$ with the Duskin nerve of the 2-category $\mathrm{Cospan}(\mathcal{C}_0)$ of Example 2.2.2.1. In particular, $\mathrm{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category (see Proposition 5.4.1.5). Our goal in this section is to prove an ∞ -categorical generalization of this result.

03L5 **Proposition 8.1.4.1.** *Let $\mathcal{C}$ be an ∞ -category. Then the simplicial set $\mathrm{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category if and only if $\mathcal{C}$ admits pushouts.*

Our proof of Proposition 8.1.4.1 will require several steps. The main ingredient is the following characterization of thin 2-simplices of $\mathrm{Cospan}(\mathcal{C})$, which we will establish in §8.1.5:

03L6 **Proposition 8.1.4.2.** *Let $\mathcal{C}$ be an ∞ -category and let σ be a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$, which we identify with a diagram*

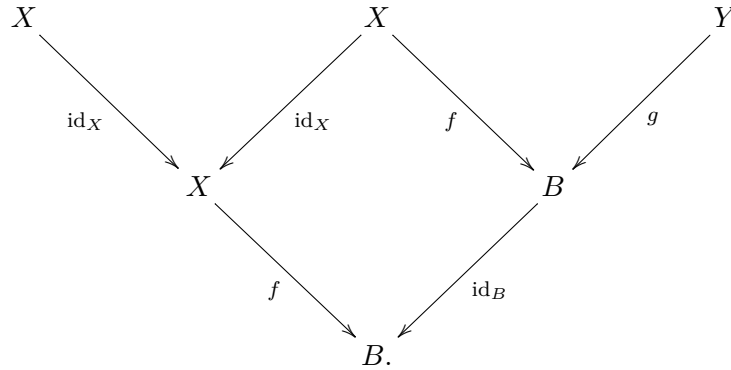

03L7

$$\begin{array}{ccccc}
 & X_{0,0} & & X_{1,1} & & X_{2,2} \\
 & \searrow & & \swarrow & \searrow & \swarrow \\
 & & X_{0,1} & & X_{1,2} & \\
 & & \searrow & & \swarrow & \\
 & & & X_{0,2} & &
 \end{array} \tag{8.6}$$

in the ∞ -category $\mathcal{C}$. Then σ is thin (in the sense of Definition 2.3.2.3) if and only if the inner region is a pushout square in the ∞ -category $\mathcal{C}$.

Corollary 8.1.4.3. *Let $\mathcal{C}$ be an ∞ -category. Then every degenerate 2-simplex of $\text{Cospan}(\mathcal{C})$ is thin.* 03L8

Proof. Let σ be a 1-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$, corresponding to a diagram $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category $\mathcal{C}$ where f belongs to L and g belongs to R . We will show that the left-degenerate 2-simplex $s_0^1(\sigma)$ is thin; a similar argument will show that the right-degenerate 2-simplex $s_1^1(\sigma)$ is thin (see Remark 8.1.3.4). Unwinding the definitions, we see that $s_0^1(\sigma)$ corresponds to a diagram in $\mathcal{C}$ of the form

By virtue of Proposition 8.1.4.2, it will suffice to show that the inner region of the diagram is a pushout square in $\mathcal{C}$. This follows from Corollary 7.6.2.27, since id_B and id_X are isomorphisms in $\mathcal{C}$. $\square$

Lemma 8.1.4.4. *Let $\mathcal{C}$ be an ∞ -category and let $\sigma_0 : \Lambda_1^2 \rightarrow \text{Cospan}(\mathcal{C})$ be a morphism of simplicial sets, corresponding to a diagram* 048T

$$\begin{array}{ccccc}
 X_{0,0} & & X_{1,1} & & X_{2,2} \\
 & \searrow & \swarrow u & \searrow v & \swarrow \\
 & & X_{0,1} & & X_{1,2}
 \end{array} \tag{8.7}$$

in the ∞ -category $\mathcal{C}$. Then any commutative diagram

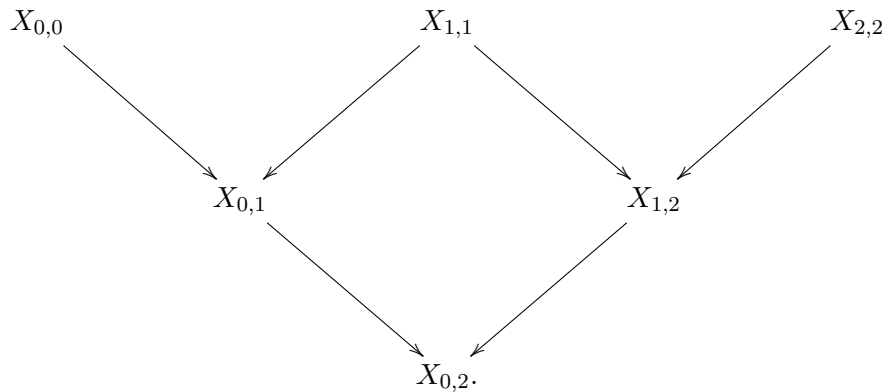

$$\begin{array}{ccc}
 X_{1,1} & \xrightarrow{u} & X_{1,2} \\
 \downarrow v & & \downarrow \\
 X_{0,1} & \longrightarrow & X_{0,2}
 \end{array} \tag{8.8}$$

can be obtained from an extension of σ_0 to a 2-simplex of $\text{Cospan}(\mathcal{C})$. In particular, if $X_{1,2}$ and $X_{0,1}$ admit a pushout along $X_{1,1}$, then σ_0 can be extended to a thin 2-simplex of $\mathcal{C}$. 048U

Proof. Let us identify $\mathrm{Tw}(\Delta^2)$ with the simplicial set $N_\bullet(\overline{Q})$, where $\overline{Q}$ denotes the partially ordered set $\{(i, j) \in [2]^{\mathrm{op}} \times [2] : i \leq j\}$. Under this identification, $\mathrm{Tw}(\Lambda_1^2)$ corresponds to the simplicial subset $N_\bullet(Q) \subseteq N_\bullet(\overline{Q})$, where $Q = \overline{Q} \setminus \{(0, 2)\}$, so σ_0 determines a diagram $\tau : N_\bullet(Q) \rightarrow \mathcal{C}$.

Set $Q_0 = Q \setminus \{(0, 0), (2, 2)\}$ and $\tau_0 = \tau|_{N_\bullet(Q_0)}$. Lemma 8.1.4.4 is equivalent to the assertion that the restriction map $\mathcal{C}_{\tau/} \rightarrow \mathcal{C}_{\tau_0/}$ is surjective on vertices. To prove this, it will suffice to show that the inclusion map $N_\bullet(Q_0) \hookrightarrow N_\bullet(Q)$ is right anodyne (Corollary 4.3.6.14), or equivalently that it is right cofinal (Proposition 7.2.1.3). This is a special case of Corollary 7.2.3.7, since the inclusion map $Q_0 \hookrightarrow Q$ has a left adjoint (given by $(0, 0) \mapsto (0, 1)$ and $(2, 2) \mapsto (1, 2)$). $\square$

03LB Remark 8.1.4.5. Let $\mathcal{C}$ be an ∞ -category and suppose we are given a morphism of simplicial sets $\varphi : \mathrm{Tw}(\Delta^2) \rightarrow \mathcal{C}$, which we display as a diagram

The proof of Lemma 8.1.4.4 shows that φ is a colimit diagram if and only if the inner region is a pushout square.

We now study the problem of filling outer horns in simplicial sets of the form $\mathrm{Cospans}(\mathcal{C})$.

048V Lemma 8.1.4.6. *Let $U : \mathcal{C} \rightarrow \mathcal{D}$ be an inner fibration of simplicial sets. Suppose we are given an integer $n \geq 3$ and a lifting problem*

$$\begin{array}{ccc}
 \Lambda_0^n & \xrightarrow{\sigma_0} & \mathrm{Cospans}(\mathcal{C}) \\
 \downarrow & \nearrow & \downarrow \mathrm{Cospans}(U) \\
 \Delta^n & \xrightarrow{\bar{\sigma}} & \mathrm{Cospans}(\mathcal{D}),
 \end{array} \tag{8.9}$$

where σ_0 corresponds to a morphism of simplicial sets $F_0 : \mathrm{Tw}(\Lambda_0^n) \rightarrow \mathcal{C}$ with the following properties:

(a) The morphism F_0 carries the edge $(0, 0) \rightarrow (0, 1)$ of $\text{Tw}(\Lambda_0^n)$ to a U -cocartesian edge of $\mathcal{C}$.

(b) The morphism F_0 carries the edge $(1, n) \rightarrow (0, n)$ to a U -cartesian edge of $\mathcal{C}$.

Then the lifting problem (8.9) admits a solution.

Proof. Using Proposition 8.1.3.7, we can rewrite (8.9) as a lifting problem

$$\begin{array}{ccc}
 \text{Tw}(\Lambda_0^n) & \xrightarrow{F_0} & \mathcal{C} \\
 \downarrow & \nearrow & \downarrow U \\
 \text{Tw}(\Delta^n) & \xrightarrow{\bar{F}} & \mathcal{D}.
 \end{array} \tag{8.10}$$

Let P denote the set of all ordered pairs (i, j) , where i and j are integers satisfying $0 \leq i \leq j \leq n$. We regard P as a partially ordered set by identifying it with its image in the product $[n]^{\text{op}} \times [n]$ (so that $(i, j) \leq (i', j')$ if and only if $i' \leq i$ and $j \leq j'$). In what follows, we will identify $\text{Tw}(\Delta^n)$ with the nerve $N_\bullet(P)$; under this identification, $\text{Tw}(\Lambda_0^n)$ corresponds to a simplicial subset $K_0 \subseteq N_\bullet(P)$.

Let $S = \{(i_0, j_0) < (i_1, j_1) < \cdots < (i_d, j_d)\}$ be a nonempty linearly ordered subset of P , so that we have inequalities $0 \leq i_d \leq i_{d-1} \leq \cdots \leq i_0 \leq j_0 \leq j_1 \leq \cdots \leq j_d \leq n$. In this case, we write τ_S for the corresponding nondegenerate d -simplex of $N_\bullet(P)$. We will say that S is *basic* if τ_S is contained in K_0 . Equivalently, S is basic if the set $\{i_0, i_1, \dots, i_d, j_0, j_1, \dots, j_d\}$ does not contain $\{1 < 2 < \cdots < n\}$. If S is not basic, we let $\text{pr}(S)$ denote the largest integer j such that S contains the pair (i, j) for some $i \neq 0$. If no such integer exists, we define $\text{pr}(S) = 0$. We will refer to $\text{pr}(S)$ as the *priority* of S . We say that S is *prioritized* if it is not basic and contains the pair $(0, \text{pr}(S))$.

Let $\{S_1, S_2, \dots, S_m\}$ be an enumeration of the collection of all prioritized linearly ordered subsets of P which satisfies the following conditions:

- The sequence of priorities $\text{pr}(S_1), \text{pr}(S_2), \dots, \text{pr}(S_m)$ is nondecreasing. That is, if $1 \leq k \leq \ell \leq m$, then we have $\text{pr}(S_k) \leq \text{pr}(S_\ell)$.
- If $\text{pr}(S_k) = \text{pr}(S_\ell)$ for $k \leq \ell$, then $|S_k| \leq |S_\ell|$.

For $1 \leq \ell \leq m$, let $\tau_\ell \subseteq N_\bullet(P)$ denote the simplex τ_{S_ℓ} and let $K_\ell \subseteq N_\bullet(P)$ denote the union of K_0 with the simplices $\{\tau_1, \tau_2, \dots, \tau_\ell\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \cdots \hookrightarrow K_m.$$

We claim that $K_m = N_\bullet(P)$: that is, K_m contains τ_S for every nonempty linearly ordered subset $S \subseteq P$. If S is basic, there is nothing to prove. We may therefore assume that S

has priority p for some integer $p \geq 0$. The union $S \cup \{(0, p)\}$ is then a prioritized linearly ordered subset of P , and therefore coincides with S_ℓ for some $1 \leq \ell \leq m$. In this case, we have $\tau_S \subseteq \tau_\ell \subseteq K_\ell \subseteq K_m$.

We will complete the proof by constructing a compatible sequence of maps $F_\ell : K_\ell \rightarrow \mathcal{C}$ extending F_0 and satisfying $U \circ F_\ell = \overline{F}|_{K_\ell}$. Fix an integer $1 \leq \ell \leq m$, and suppose that $F_{\ell-1}$ has already been constructed. Write $S_\ell = \{(i_0, j_0) < (i_1, j_1) < \cdots < (i_d, j_d)\}$, so that the simplex τ_ℓ has dimension d . Let p be the priority of S_ℓ . Since S_ℓ is prioritized, it contains $(0, p)$; we can therefore write $(0, p) = (i_{d'}, j_{d'})$ for some integer $0 \leq d' \leq d$. Let $L \subseteq \Delta^d$ denote the inverse image of $K_{\ell-1}$ under the map $\tau_\ell : \Delta^d \rightarrow N_\bullet(P)$. We will show that L coincides with the horn $\Lambda_{d'}^d$, so that the pullback diagram of simplicial sets

$$\begin{array}{ccc} L & \xrightarrow{\quad} & K_{\ell-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\tau_\ell} & K_\ell. \end{array}$$

is also a pushout square (Lemma 3.1.2.11). This can be stated more concretely as follows:

- (*) Let (i, j) be an element of S_ℓ , and set $S' = S_\ell \setminus \{(i, j)\}$. Then the simplex $\tau_{S'}$ is contained in $K_{\ell-1}$ if and only if $(i, j) \neq (0, p)$.

We first prove (*) in the case where $(i, j) \neq (0, p)$; in this case, we wish to show that $\tau_{S'}$ is contained in $K_{\ell-1}$. If S' is basic, then $\tau_{S'}$ is contained in K_0 and there is nothing to prove. Let us therefore assume that S' is not basic. Let $p' = \text{pr}(S')$ denote the priority of S' . Then the union $S' \cup \{(0, p')\}$ is a prioritized subset of P , and therefore has the form S_k for some $1 \leq k \leq m$. By construction, we have $\text{pr}(S_k) = p' \leq p = \text{pr}(S_\ell)$. Moreover, if $p' = p$, then our assumption $(i, j) \neq (0, p)$ guarantees that $S_k = S'$, so that $|S_k| < |S_\ell|$. It follows that $k < \ell$, so that we have $\tau_{S'} \subseteq \tau_k \subseteq K_k \subseteq K_{\ell-1}$.

We now prove (*) in the case $(i, j) = (0, p)$; in this case, we wish to show that $\tau_{S'}$ is not contained in $K_{\ell-1}$. Assume otherwise. Then, since S' is not basic, it is contained in S_k for some $k < \ell$. The inequalities

$$p = \text{pr}(S') \leq \text{pr}(S_k) \leq \text{pr}(S_\ell) = p.$$

ensure that S_k has priority p . Since S_k is prioritized, it contains $(0, p)$, and therefore contains the union $S_\ell = S' \cup \{(0, p)\}$. The inequality $|S_k| \leq |S_\ell|$ then forces $k = \ell$, contradicting our assumption that $k < \ell$. This completes the proof of (*).

Let ρ_0 denote the composite map $\Lambda_{d'}^d = L \xrightarrow{\tau_\ell} K_{\ell-1} \xrightarrow{F_{\ell-1}} \mathcal{C}$. To complete the proof, it

will suffice to show that the lifting problem

$$\begin{array}{ccc}
 \Lambda_{d'}^d & \xrightarrow{\rho_0} & \mathcal{C} \\
 \downarrow & \nearrow \text{dashed} & \downarrow U \\
 \Delta^d & \xrightarrow{\bar{F} \circ \tau_\ell} & \mathcal{D}
 \end{array}
 \tag{8.11}$$

admits a solution. We consider three cases:

- If $0 < d' < d$, then the lifting problem (8.11) admits a solution by virtue of our assumption that U is an inner fibration of simplicial sets.
- Suppose that $d' = 0$: that is, the pair $(0, p)$ is the smallest element of S_ℓ . Then S_ℓ does not contain any pairs (i, j) with $i \neq 0$, so we have $p = 0$. Since the set S_ℓ is not basic, we must have $S_\ell = \{(0, 0) < (0, 1) < \cdots < (0, n-1) < (0, n)\}$. In this case, the lifting problem (8.11) admits a solution by virtue of assumption (a).
- Suppose that $d' = d$: that is, the pair $(0, p)$ is the largest element of S_ℓ . Our assumption that S_ℓ is not basic then guarantees that $p = n$ and $(1, n) \in S_\ell$: that is, we have $S_\ell = \{(i_0, j_0) < (i_1, j_1) < \cdots < (1, n) < (0, n)\}$. In this case, the lifting problem (8.11) admits a solution by virtue of assumption (b).

□

Specializing Lemma 8.1.4.6 to the case $\mathcal{D} = \Delta^0$, we obtain the following:

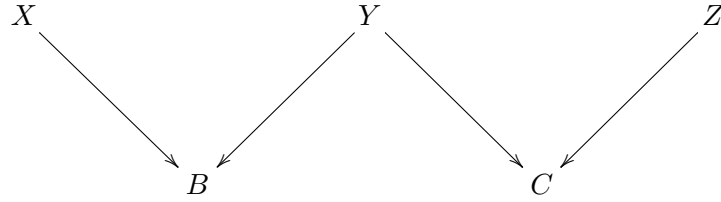

Lemma 8.1.4.7. *Let $\mathcal{C}$ be an ∞ -category and let $\sigma_0 : \Lambda_0^n \rightarrow \text{Cospan}(\mathcal{C})$ be a morphism of simplicial sets, which we identify with a diagram $X : \text{Tw}(\Lambda_0^n) \rightarrow \text{Cospan}(\mathcal{C})$. Assume that $n \geq 3$ and that the morphisms $X(0, 0) \rightarrow X(0, 1)$ and $X(1, n) \rightarrow X(0, n)$ are isomorphisms in $\mathcal{C}$. Then σ_0 can be extended to an n -simplex of $\text{Cospan}(\mathcal{C})$.* 03LC

Proof of Proposition 8.1.4.1. Let $\mathcal{C}$ be an ∞ -category. By virtue of Lemma 8.1.4.7 and Corollary 8.1.4.3, the simplicial set $\text{Cospan}(\mathcal{C})$ satisfies conditions (2) and (3) of Definition 5.4.1.1. Since $\text{Cospan}(\mathcal{C})$ is isomorphic to $\text{Cospan}(\mathcal{C})^{\text{op}}$ (Remark 8.1.3.4), it also satisfies condition (4) of Definition 5.4.1.1. It follows that $\text{Cospan}(\mathcal{C})$ is an $(\infty, 2)$ -category if and only if it satisfies the following condition:

- (*) Every morphism of simplicial sets $\Lambda_1^2 \rightarrow \text{Cospan}(\mathcal{C})$ can be extended to a thin 2-simplex of $\text{Cospan}(\mathcal{C})$.

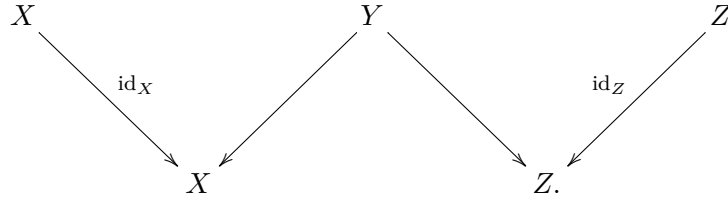

Using Lemma 8.1.4.4, we can rewrite condition (*) as follows:

(*) For every diagram

in the ∞ -category $\mathcal{C}$, there exists a pushout of B and C along Y .

It is clear that if the ∞ -category $\mathcal{C}$ admits pushouts, then it satisfies condition (*). The converse follows by applying condition (*) to diagrams of the form

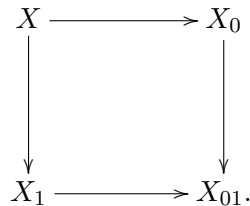

□

03LD Corollary 8.1.4.8. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{C}$ and $\mathcal{D}$ admit pushouts. The following conditions are equivalent:*

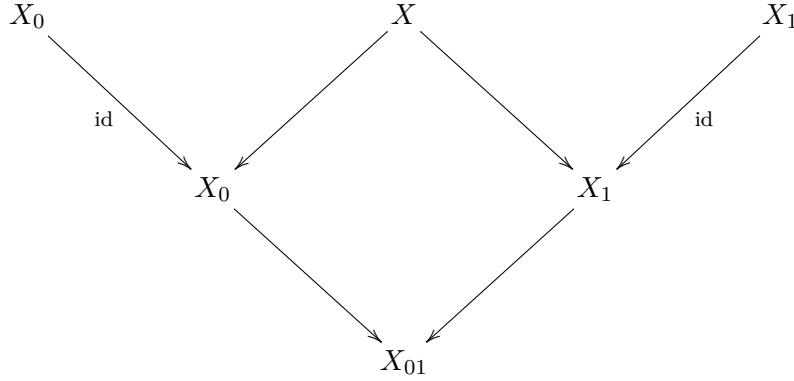

- (1) *The functor F carries pushout squares in $\mathcal{C}$ to pushout squares in $\mathcal{D}$.*
- (2) *The induced map $\text{Cospan}(F) : \text{Cospan}(\mathcal{C}) \rightarrow \text{Cospan}(\mathcal{D})$ is a functor of $(\infty, 2)$ -categories, in the sense of Definition 5.4.7.1.*

Proof. The implication (1) $\Rightarrow$ (2) follows immediately from the criterion of Proposition 8.1.4.2. For the converse implication, suppose that $\text{Cospan}(F) : \text{Cospan}(\mathcal{C}) \rightarrow \text{Cospan}(\mathcal{D})$ is a functor of 2-categories, and let $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C}$ be a pushout square, which we display as a diagram

Let $\rho : \text{Tw}(\Delta^2) \rightarrow \Delta^1 \times \Delta^1$ denote the morphism of simplicial sets given on vertices by the formula $\rho(i, j) = (\max(0, 1 - i), \max(0, j - 1))$. Then $\sigma \circ \rho$ can be identified with a 2-simplex

τ of $\text{Cospan}(\mathcal{C})$, corresponding to a diagram

in the ∞ -category $\mathcal{C}$. It follows from the criterion of Proposition 8.1.4.2 that τ is a thin 2-simplex of $\text{Cospan}(\mathcal{C})$. If $\text{Cospan}(F)$ is a functor of $(\infty, 2)$ -categories, then it carries τ to a thin 2-simplex of $\text{Cospan}(\mathcal{D})$. Applying the criterion of Proposition 8.1.4.2 again, we conclude that $F(\sigma)$ is a pushout square in $\mathcal{D}$. $\square$

8.1.5 Thin 2-Simplices of $\text{Cospan}(\mathcal{C})$

Let $\mathcal{C}$ be an ∞ -category. Our goal in this section is to prove Proposition 8.1.4.2, which 03LE provides necessary and sufficient conditions for a 2-simplex of the simplicial set $\text{Cospan}(\mathcal{C})$ to be thin. By virtue of Remark 8.1.4.5, it will suffice to prove the following pair of assertions:

Lemma 8.1.5.1. *Let $\mathcal{C}$ be an ∞ -category and let σ be a 2-simplex of $\text{Cospan}(\mathcal{C})$, which we 03LF identify with a diagram $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$. If σ is thin, then φ is a colimit diagram.*

Lemma 8.1.5.2. *Let $\mathcal{C}$ be an ∞ -category and let σ be a 2-simplex of $\text{Cospan}(\mathcal{C})$, which we 03LG identify with a diagram $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$. If φ is a colimit diagram, then σ is thin.*

Proof of Lemma 8.1.5.1. Let Q denote the partially ordered set appearing in the proof of Lemma 8.1.4.4, so that we can identify $\text{Tw}(\Lambda_1^2)$ with the nerve of Q . Set $\varphi_0 = \varphi|_{N_\bullet(Q)}$. Assume that σ is thin. We wish to show that the restriction map $\mathcal{C}_{\varphi/} \rightarrow \mathcal{C}_{\varphi_0/}$ is a trivial Kan fibration: that is, every lifting problem

$$\begin{array}{ccc} \partial\Delta^n & \xrightarrow{\quad} & \mathcal{C}_{\varphi/} \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ \Delta^n & \xrightarrow{\quad} & \mathcal{C}_{\varphi_0/} \end{array}$$

03LH

(8.12)

admits a solution.

Let K denote the coproduct $(\mathrm{Tw}(\Delta^2) \star \partial\Delta^n) \amalg_{(\mathrm{N}_\bullet(Q) \star \partial\Delta^n)} (\mathrm{N}_\bullet(Q) \star \Delta^n)$, which we regard as a simplicial subset of $\mathrm{Tw}(\Delta^2) \star \Delta^n$. Unwinding the definitions, we can identify the lifting problem (8.12) with a morphism of simplicial sets $\tau_0 : K \rightarrow \mathcal{C}$ satisfying $\tau_0|_{\mathrm{Tw}(\Delta^2)} = \varphi$. We wish to show that τ_0 can be extended to a morphism $\tau : \mathrm{Tw}(\Delta^2) \star \Delta^n \rightarrow \mathcal{C}$.

Let $\iota : \mathrm{Tw}(\Delta^2) \star \Delta^n \rightarrow \mathrm{Tw}(\Delta^{n+3})$ be the morphism of simplicial sets given on vertices by the formula

$$\iota(x) = \begin{cases} (i, j) & \text{if } x = (i, j) \in \mathrm{Tw}(\Delta^2) \\ (0, x+3) & \text{if } x \in \Delta^n. \end{cases}$$

The morphism ι has a left inverse $\rho : \mathrm{Tw}(\Delta^{n+3}) \rightarrow \mathrm{Tw}(\Delta^2) \star \Delta^n$, given on vertices by the formula

$$\rho(i, j) = \begin{cases} (i, j) \in \mathrm{Tw}(\Delta^2) & \text{if } j \leq 2 \\ j-3 \in \Delta^n & \text{otherwise.} \end{cases}$$

We observe that ι and ρ restrict to morphisms of simplicial subsets

$$\iota_0 : K \rightarrow \mathrm{Tw}(\Lambda_1^{n+3}) \quad \rho_0 : \mathrm{Tw}(\Lambda_1^{n+3}) \rightarrow K,$$

so that we have a commutative diagram of simplicial sets

$$\begin{array}{ccccc} K & \xrightarrow{\iota_0} & \mathrm{Tw}(\Lambda_1^{n+3}) & \xrightarrow{\rho_0} & K \\ \downarrow & & \downarrow & & \downarrow \\ \mathrm{Tw}(\Delta^2) \star \Delta^n & \xrightarrow{\iota} & \mathrm{Tw}(\Delta^{n+3}) & \xrightarrow{\rho} & \mathrm{Tw}(\Delta^2) \star \Delta^n \end{array}$$

where the horizontal compositions are equal to the identity.

The composition $\tau_0 \circ \rho_0$ can be identified with a morphism of simplicial sets $\psi_0 : \Lambda_1^{n+3} \rightarrow \mathrm{Cospan}(\mathcal{C})$ having the property that the composition

$$\Delta^2 \simeq \mathrm{N}_\bullet(\{0 < 1 < 2\}) \xrightarrow{\psi_0} \mathrm{Cospan}(\mathcal{C})$$

coincides with σ . Since σ is thin, we can extend ψ_0 to an $(n+3)$ -simplex ψ of $\mathrm{Cospan}(\mathcal{C})$, which we identify with a map $\tau' : \mathrm{Tw}(\Delta^{n+3}) \rightarrow \mathcal{C}$. It follows that the composition $\tau = \tau' \circ \iota$ is a morphism $\mathrm{Tw}(\Delta^2) \star \Delta^n \rightarrow \mathcal{C}$ satisfying $\tau|_K = \tau_0$. $\square$

Proof of Lemma 8.1.5.2. Let $\mathcal{C}$ be an ∞ -category and let σ be a 2-simplex of $\mathrm{Cospan}(\mathcal{C})$, which we identify with a diagram $\varphi : \mathrm{Tw}(\Delta^2) \rightarrow \mathcal{C}$. Assume that φ is a colimit diagram. We wish to show that σ is thin. We proceed by a (somewhat more complicated) variation on the proof of Lemma 8.1.4.7.

Fix integers $0 < q < n$ with $n \geq 3$, and suppose that we are given a morphism $f_0 : \Lambda_q^n \rightarrow \text{Cospan}(\mathcal{C})$ for which the composition

$$\Delta^2 \simeq N_\bullet(\{q-1 < q < q+1\}) \hookrightarrow \Lambda_q^n \xrightarrow{f_0} \text{Cospan}(\mathcal{C})$$

is equal to σ ; we wish to show that f_0 can be extended to an n -simplex of $\text{Cospan}(\mathcal{C})$. Using Proposition 8.1.3.7, we can identify f_0 with a morphism of simplicial sets $F_0 : \text{Tw}(\Lambda_q^n) \rightarrow \mathcal{C}$; we wish to show that F_0 admits an extension $\text{Tw}(\Delta^n) \rightarrow \mathcal{C}$.

Let P denote the set of all ordered pairs (i, j) , where i and j are integers satisfying $0 \leq i \leq j \leq n$. We regard P as a partially ordered set by identifying it with its image in the product $[n]^{\text{op}} \times [n]$ (so that $(i, j) \leq (i', j')$ if and only if $i' \leq i$ and $j \leq j'$). In what follows, we will identify $\text{Tw}(\Delta^n)$ with the nerve $N_\bullet(P)$; under this identification, $\text{Tw}(\Lambda_q^n)$ corresponds to a simplicial subset $K_0 \subseteq N_\bullet(P)$.

Let $S = \{(i_0, j_0) < (i_1, j_1) < \cdots < (i_d, j_d)\}$ be a nonempty linearly ordered subset of P , so that we have inequalities $0 \leq i_d \leq i_{d-1} \leq \cdots \leq i_0 \leq j_0 \leq j_1 \leq \cdots \leq j_d \leq n$. In this case, we write τ_S for the corresponding nondegenerate d -simplex of $N_\bullet(P)$. Let $C(S)$ denote the set of integers $\{i_0, i_1, \dots, i_d, j_0, j_1, \dots, j_d\}$, which we regard as a subset of $[n] = \{0 < 1 < \cdots < n\}$; we will refer to $C(S)$ as the *content* of S .

- We will say that S is *basic* if $C(S) \cup \{q\} \neq [n]$. Equivalently, S is basic if the simplex τ_S is contained in K_0 .
- Suppose that S is not basic and that it contains an ordered pair of the form $(p, q+1)$. We will say that S is *low* if the largest such integer p satisfies $p \leq q-2$. In this case, we will denote p by $\text{pr}(S)$ and refer to it as the *priority* of S .
- Suppose that S is not basic and that it contains an ordered pair of the form $(q-1, r)$. We will say that S is *high* if the smallest such integer r satisfies $r \geq q+2$.

Note that the set S cannot be both low and high, since the elements $(p, q+1)$ and $(q-1, r)$ are incomparable in P when $p < q < r$. Moreover, if S is low, then any nonempty subset $S' \subseteq S$ is either low (and satisfies $\text{pr}(S') \leq \text{pr}(S)$) or satisfies $q+1 \notin C(S')$, so that S' is basic (the set S' cannot contain any elements of the form $(q+1, r)$, since these are incomparable with $(p, q+1)$). Consequently, the collection of simplices of the form τ_S where S is either basic or low determine a simplicial subset $K_{\text{low}} \subseteq N_\bullet(P)$. Similarly, the collection of simplices of the form τ_S where S is either basic or high determine a simplicial subset $K_{\text{high}} \subseteq N_\bullet(P)$, and the intersection $K_{\text{low}} \cap K_{\text{high}}$ is equal to K_0 .

We will prove the following:

- (*) The inclusion maps $K_0 \hookrightarrow K_{\text{low}}$ and $K_0 \hookrightarrow K_{\text{high}}$ are inner anodyne.

We will prove that the inclusion map $K_0 \hookrightarrow K_{\text{low}}$ is inner anodyne; the analogous assertion for the inclusion $K_0 \hookrightarrow K_{\text{high}}$ follows by a similar argument. Let us say that a linearly ordered subset $S \subseteq P$ is *prioritized* if it is low and contains the ordered pair (p, q) , where $p = \text{pr}(S)$ denotes the priority of S .

Let $\{S_1, S_2, \dots, S_m\}$ be an enumeration of the collection of all prioritized low subsets of P which satisfies the following conditions:

- The sequence of priorities $\text{pr}(S_1), \text{pr}(S_2), \dots, \text{pr}(S_m)$ is nondecreasing. That is, if $1 \leq k \leq \ell \leq m$, then we have $\text{pr}(S_k) \leq \text{pr}(S_\ell)$.
- If $\text{pr}(S_k) = \text{pr}(S_\ell)$ for $k \leq \ell$, then $|S_k| \leq |S_\ell|$.

For $1 \leq \ell \leq m$, let $\tau_\ell \subseteq N_\bullet(P)$ denote the simplex τ_{S_ℓ} and let K_ℓ denote the union of K_0 with the simplices $\{\tau_1, \tau_2, \dots, \tau_\ell\}$, so that we have inclusion maps

$$K_0 \hookrightarrow K_1 \hookrightarrow K_2 \hookrightarrow \dots \hookrightarrow K_m.$$

We claim that $K_m = K_{\text{low}}$: that is, every low subset $S \subseteq P$ is contained in S_ℓ for some $1 \leq \ell \leq m$. This is clear: if $p = \text{pr}(S)$ is the priority of S , then the union $S \cup \{(p, q)\}$ is a prioritized low subset of P (having the same priority p).

We will prove (*) by showing that, for $1 \leq \ell \leq m$, the inclusion map $K_{\ell-1} \hookrightarrow K_\ell$ is inner anodyne. Set $S_q = \{(i_0, j_0) < (i_1, j_1) < \dots < (i_d, j_d)\}$. Let p denote the priority of S_ℓ . Since S_ℓ is prioritized, it contains the ordered pair (p, q) . We therefore have $(p, q) = (i_c, j_c)$ for some $0 \leq c \leq d$. Note that since $p \leq q - 2$, we must have $c > 0$: otherwise, we have $q - 1 \notin C(S_\ell)$, contradicting our assumption that S_ℓ is not basic. Since S_ℓ also contains $(p, q + 1)$, we must also have $c < d$. Let $L \subseteq \Delta^d$ denote the inverse image of $K_{\ell-1}$ under the map $\tau_\ell : \Delta^d \rightarrow N_\bullet(P)$. We will complete the proof of (*) by showing that L coincides with the inner horn Λ_c^d , so that the pullback diagram of simplicial sets

$$\begin{array}{ccc} L & \xrightarrow{\quad} & K_{\ell-1} \\ \downarrow & & \downarrow \\ \Delta^d & \xrightarrow{\tau_\ell} & K_\ell \end{array}$$

is also a pushout square (Lemma 3.1.2.11). This can be stated more concretely as follows:

- (*)' Let (i, j) be an element of S_ℓ , and set $S' = S_\ell \setminus \{(i, j)\}$. Then the simplex $\tau_{S'}$ is contained in $K_{\ell-1}$ if and only if $(i, j) \neq (p, q)$.

We first prove (*)' in the case where $(i, j) \neq (p, q)$; in this case, we wish to show that $\tau_{S'}$ is contained in $K_{\ell-1}$. If S' is basic, then $\tau_{S'}$ is contained in K_0 and there is nothing to prove.

We may therefore assume that S' is not basic, and is therefore low. If $(i, j) \neq (p, q + 1)$, then S' is a prioritized low subset of P satisfying $\text{pr}(S') = p = \text{pr}(S_\ell)$ and $|S'| < |S_\ell|$. It follows that $S' = S_k$ for some $k < \ell$, so that $\tau_{S'}$ is contained in $K_k \subseteq K_{\ell-1}$. In the case $(i, j) = (p, q + 1)$, the set S' has priority $p' = \text{pr}(S') < p$. It follows that $S' \cup \{(p', q)\}$ is a prioritized low subset of P having priority $p' < \text{pr}(S_q)$, and is therefore of the form S_k for some $k < \ell$. In this case, we again conclude that $\tau_{S'}$ is contained in $K_k \subseteq K_{\ell-1}$.

We now prove $(*)'$ in the case where $(i, j) = (p, q)$; in this case, we wish to show that $\tau_{S'}$ is not contained in $K_{\ell-1}$. Note that, since S' contains $(p, q + 1)$, we have $C(S') \cup \{q\} = C(S_\ell) \cup \{q\}$. Since S_ℓ is not basic, it follows that S' is not basic. Assume, for a contradiction, that $\tau_{S'}$ is contained in $K_{\ell-1}$; it follows that we have $S' \subseteq S_k$ for some $1 \leq k \leq \ell$. We then have $\text{pr}(S_k) \leq \text{pr}(S_\ell) = p$. Since S_k contains $(p, q + 1)$, we must have $\text{pr}(S_k) = p$. Since S_k is prioritized, it contains (p, q) , and therefore contains $S' \cup \{(p, q)\} = S_\ell$. The inequality $k < \ell$ guarantees that $|S_k| \leq |S_\ell|$. It follows that $S_k = S_\ell$, contradicting our assumption that $k < \ell$. This completes the proof of $(*)$.

Since $\mathcal{C}$ is an ∞ -category, assertion $(*)$ guarantees that the morphism $F_0 : K_0 \rightarrow \mathcal{C}$ admits an extension $F_{\text{low}} : K_{\text{low}} \rightarrow \mathcal{C}$ (Proposition 1.5.6.7). Similarly, the morphism F_0 admits an extension $F_{\text{high}} : K_{\text{high}} \rightarrow \mathcal{C}$. Let K denote the union of K_{low} with K_{high} (as simplicial subsets of $N_\bullet(P)$). Since the intersection $K_{\text{low}} \cap K_{\text{high}}$ coincides with K_0 , we can amalgamate F_{low} with F_{high} to obtain a morphism of simplicial sets $F : K \rightarrow \mathcal{C}$. We will complete the proof of Proposition 8.1.4.2 by showing that F can be extended to a morphism $N_\bullet(P) \rightarrow \mathcal{C}$.

Set $P_- = \{(i, j) \in P : (i, j) < (q - 1, q + 1)\}$ and $P_+ = \{(i, j) \in P : (i, j) > (q - 1, q + 1)\}$. Let us say that a nonempty linearly ordered subset $S \subseteq P$ is *decomposable* if the union $S \cup \{(q - 1, q + 1)\}$ is also linearly ordered. In this case, we can write S (uniquely) as a union $S_- \cup S_0 \cup S_+$, where $S_- \subseteq P_-$, $S_0 \subseteq \{(q - 1, q + 1)\}$, and $S_+ \subseteq P_+$. The collection of simplices τ_S , where S is decomposable, span a simplicial subset of $N_\bullet(P)$ which will identify with the join $N_\bullet(P_-) \star \{(q - 1, q + 1)\} \star N_\bullet(P_+)$.

We next claim that $N_\bullet(P)$ is the union of K with the join $N_\bullet(P_-) \star \{(q - 1, q + 1)\} \star N_\bullet(P_+)$. In other words, if a nonempty linearly ordered subset $S \subseteq P$ is not decomposable, then τ_S is contained in K . Choose an element $(i, j) \in S$ which is incomparable with $(q - 1, q + 1)$ in the partially ordered set P . Without loss of generality, we may assume that $i < q - 1$ and $j < q + 1$. If S is basic, there is nothing to prove. We may therefore assume that $q + 1$ belongs to the content $C(S)$. Note that ordered pairs of the form $(q + 1, r)$ are incomparable with (i, j) , and therefore cannot be contained in S . It follows that S contains an element of the form $(p, q + 1)$. Since $(p, q + 1)$ is comparable with (i, j) in P , we must have $p \leq i \leq q - 2$. It follows that S is low, so that τ_S is contained in $K_{\text{low}} \subseteq K$.

Let $K' \subseteq K$ denote the intersection of K with the join $N_\bullet(P_-) \star \{(q - 1, q + 1)\} \star N_\bullet(P_+)$,

so that we have a pushout diagram of simplicial sets

$$\begin{array}{ccc} K' & \xrightarrow{\quad} & K \\ \downarrow & & \downarrow \\ N_{\bullet}(P_-) \star \{(q-1, q+1)\} \star N_{\bullet}(P_+) & \xrightarrow{\quad} & N_{\bullet}(P). \end{array}$$

Set $F' = F|_{K'}$. To complete the proof, it will suffice to show that F' can be extended to a morphism of simplicial sets $N_{\bullet}(P_-) \star \{(q-1, q+1)\} \star N_{\bullet}(P_+) \rightarrow \mathcal{C}$.

We now give a more explicit description of K' . Let us say that a linearly ordered subset $S_+ \subseteq P_+$ is *old* if the simplex $\tau_{S_+ \cup \{(q-1, q+1)\}}$ is contained in K . Let $S \subseteq P$ be an arbitrary decomposable subset, and write $S = S_- \cup S_0 \cup S_+$ as above. We then make the following observations:

- (a) Suppose that $S_0 = \{(q-1, q+1)\}$. Then replacing S by the subset $S_0 \cup S_+$ does not change the set $C(S) \cup \{q\}$. In particular, S is basic if and only if $S_0 \cup S_+$ is basic. Moreover, since S_- does not contain any pairs of the form $(p, q+1)$ for $p \leq q-1$, it follows that S is low if and only if $S_0 \cup S_+$ is low. Similarly, S is high if and only if $S_0 \cup S_+$ is high. It follows that τ_S is contained in K if and only if $\tau_{S_0 \cup S_+}$ is contained in K : that is, if and only if S_+ is old.
- (b) Suppose that $S_0 = \emptyset$. In this case, we claim that τ_S is automatically contained in K . Assume otherwise. Then S is not basic, so the set $C(S)$ contains the element $q+1$. Since ordered pairs of the form $(q+1, q')$ are incomparable with $(q-1, q+1)$ for $q' > q+1$, it follows that S contains an ordered pair of the form $(p, q+1)$ for some $p \leq q+1$. Since S is not low, we must have $p \geq q-1$. By assumption, S does not contain $(q-1, q+1)$, so we must have $p \in \{q, q+1\}$. By the same reasoning (using the fact that $C(S)$ contains $q-1$ and S is not high), we conclude that S contains an element of the form $(q-1, r)$ for $r \in \{q-1, q\}$. This is a contradiction, since S is linearly ordered and the ordered pairs $(p, q+1)$ and $(q-1, r)$ are incomparable in P .

Let $A \subseteq N_{\bullet}(P_+)$ denote the simplicial subset spanned by the simplices τ_{S_+} , where S_+ is old. Combining (a) and (b), we deduce that K' can be identified with the pushout

$$(N_{\bullet}(P_-) \star \{(q-1, q+1)\} \star A) \coprod_{N_{\bullet}(P_-) \star A} (N_{\bullet}(P_-) \star N_{\bullet}(P_+)).$$

Note that, since the restriction of f_0 to the simplex $N_{\bullet}(\{q-1 < q < q+1\})$ coincides with σ , the restriction of F' to the simplicial subset $N_{\bullet}(P_-) \star \{(q-1, q+1)\} \subseteq K$ can be identified with the diagram $\varphi : \text{Tw}(\Delta^2) \rightarrow \mathcal{C}$. Let φ_0 denote the restriction of φ to

$N_\bullet(P_-)$. Unwinding the definitions, we see that the problem of extension of F' to a morphism $N_\bullet(P_-) \star \{(q-1, q+1)\} \star N_\bullet(P_+) \rightarrow \mathcal{C}$ can be rewritten as a lifting problem

$$\begin{array}{ccc} A & \xrightarrow{\quad} & \mathcal{C}_{\varphi/} \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ N_\bullet(P_+) & \xrightarrow{\quad} & \mathcal{C}_{\varphi_0/} \end{array}$$

This lifting problem admits a solution by virtue of our assumption that φ is a colimit diagram in $\mathcal{C}$. □

8.1.6 Restricted Cospans

Let $\mathcal{C}$ be an ∞ -category, and let $\text{Cospan}(\mathcal{C})$ be the simplicial set introduced in Construction 8.1.3.1. By definition, the edges of $\text{Cospan}(\mathcal{C})$ correspond to cospans in the ∞ -category $\mathcal{C}$: that is, pairs of morphisms $X \xrightarrow{f} B \xleftarrow{g} Y$ having a common target. In practice, it will sometimes be useful to consider a variant of this construction, where we place additional restrictions on the morphisms f and g .

Definition 8.1.6.1 (Restricted Cospans). Let $\mathcal{C}$ be a simplicial set and let L and R be collections of edges of $\mathcal{C}$. We let $\text{Cospan}^{L,R}(\mathcal{C})$ denote the simplicial subset of $\text{Cospan}(\mathcal{C})$ whose n -simplices are given by diagrams $X : \text{Tw}(\Delta^n) \rightarrow \mathcal{C}$ which satisfy the following condition:

- For every pair of integers $0 \leq i \leq j \leq n$, the edge $X_{i,i} \rightarrow X_{i,j}$ belongs to L and the edge $X_{j,j} \rightarrow X_{i,j}$ belongs to R .

Remark 8.1.6.2 (Symmetry). Let $\mathcal{C}$ be a simplicial set and let L and R be collections of edges of $\mathcal{C}$. Then the isomorphism $\text{Cospan}(\mathcal{C}) \xrightarrow{\sim} \text{Cospan}(\mathcal{C})^{\text{op}}$ of Remark 8.1.3.4 restricts to an isomorphism of simplicial subsets $\text{Cospan}^{L,R}(\mathcal{C}) \xrightarrow{\sim} \text{Cospan}^{R,L}(\mathcal{C})^{\text{op}}$.

Remark 8.1.6.3. Let $\mathcal{C}$ be a simplicial set and let L and R be collections of edges of $\mathcal{C}$. Suppose we are given a morphism of simplicial sets $f : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$, corresponding to a morphism $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ (see Proposition 8.1.3.7). For every edge $e : X \rightarrow Y$ of $\mathcal{D}$, let $e_L : \text{id}_X \rightarrow e$ and $e_R : \text{id}_Y \rightarrow e$ be the edges of $\text{Tw}(\mathcal{D})$ described in Example 8.1.3.6. Then f factors through the simplicial subset $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if the edge $F(e_L)$ belongs to L and the edge $F(e_R)$ belongs to R , for every edge e of $\mathcal{D}$.

Remark 8.1.6.4. Let $\mathcal{C}$ be a simplicial set, let L and R be collections of edges of $\mathcal{C}$, and let $\text{Cospan}^{L,R}(\mathcal{C})$ denote the restricted cospan construction of Definition 8.1.6.1. Note that a

morphism of simplicial sets $K \rightarrow \text{Cospan}(\mathcal{C})$ factors through $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if its restriction to the 1-skeleton $\text{sk}_1(K)$ factors through $\text{Cospan}^{L,R}(\mathcal{C})$. In particular, if σ is a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ which is thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$, then it is also thin when viewed as a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$. For a partial converse, see Corollary 8.1.6.8.

We now formulate a criterion which guarantees that the simplicial set $\text{Cospan}^{L,R}(\mathcal{C})$ is an $(\infty, 2)$ -category.

0494 **Definition 8.1.6.5.** Let $\mathcal{C}$ be an ∞ -category and let L and R be collections of morphisms of $\mathcal{C}$. We will say that L and R are *pushout-compatible* if, for every morphism $f_0 : X \rightarrow X_0$ of $\mathcal{C}$ which belongs to L and every morphism $f_1 : X \rightarrow X_1$ of $\mathcal{C}$ which belongs to R , there exists a pushout diagram

$$\begin{array}{ccc} X & \xrightarrow{f_0} & X_0 \\ \downarrow f_1 & & \downarrow f'_1 \\ X_1 & \xrightarrow{f'_0} & X_{01} \end{array}$$

where f'_0 belongs to L and f'_1 belongs to R .

0495 **Example 8.1.6.6.** Let $\mathcal{C}$ be an ∞ -category, let L be a collection of morphisms of $\mathcal{C}$, and let R be the collection of all isomorphisms in $\mathcal{C}$. Assume that L is stable under isomorphism (that is, if f is a morphism of $\mathcal{C}$ which is isomorphic to an element of L in the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$, then f also belongs to L). Then L and R are pushout-compatible.

0496 **Proposition 8.1.6.7.** Let $\mathcal{C}$ be an ∞ -category and let L and R denote collections of morphisms of $\mathcal{C}$ which are closed under composition. If L and R are pushout-compatible (in the sense of Definition 8.1.6.5), then the simplicial set $\text{Cospan}^{L,R}(\mathcal{C})$ is an $(\infty, 2)$ -category.

Proof. We will show that $\text{Cospan}^{L,R}(\mathcal{C})$ satisfies each condition of Definition 5.4.1.1:

(1) Let $\sigma_0 : \Lambda_1^2 \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets; we wish to show that σ_0 can be extended to a thin 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$. Let us identify σ_0 with a diagram

$$\begin{array}{ccccc} & X_{0,0} & & X_{1,1} & & X_{2,2} \\ & \searrow u & & \swarrow u' & \searrow v & \swarrow v' \\ & & X_{0,1} & & X_{1,2} & \end{array} \quad (8.13)$$

in the ∞ -category $\mathcal{C}$, where the morphisms u and v belong to L and the morphisms u' and v' belong to R . Combining our assumption that L and R are pushout-compatible with Lemma 8.1.4.4, we can enlarge (8.13) to a commutative diagram

$$\begin{array}{ccccc}
 X_{0,0} & & X_{1,1} & & X_{2,2} \\
 & \searrow u & & \swarrow u' & \\
 & & X_{0,1} & & X_{1,2} \\
 & & \searrow w & & \swarrow w' \\
 & & & & X_{0,2}
 \end{array}$$

where w belongs to L , w' belongs to R , and the lower square is a pushout. By virtue of Proposition 8.1.4.2, this extension can be viewed as a thin 2-simplex of the simplicial set $\text{Cospan}(\mathcal{C})$. Using our assumption that L and R are closed under composition, we see that σ belongs to the simplicial subset $\text{Cospan}^{L,R}(\mathcal{C})$, and is therefore also thin when regarded as a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ (Remark 8.1.6.4).

- (2) Every degenerate 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ is thin; this follows from Corollary 8.1.4.3 and Remark 8.1.6.4.
- (3) Let $n \geq 3$ and let $\sigma_0 : \Lambda_0^n \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets with the property that the 2-simplex $\sigma_0|_{N_\bullet(\{0 < 1 < n\})}$ is left-degenerate. Using Lemma 8.1.4.7, we can extend σ_0 to an n -simplex σ of $\text{Cospan}(\mathcal{C})$. Since every edge of Δ^n is contained in Λ_0^n , the extension σ is automatically contained in $\text{Cospan}^{L,R}(\mathcal{C})$ (Remark 8.1.6.4).
- (4) Let $n \geq 3$ and let $\sigma_0 : \Lambda_n^n \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ be a morphism of simplicial sets with the property that the 2-simplex $\sigma_0|_{N_\bullet(\{0 < n-1 < n\})}$ is right-degenerate. Then σ_0 can be extended to an n -simplex of $\text{Cospan}^{L,R}(\mathcal{C})$; this follows by applying (3) to the opposite simplicial set $\text{Cospan}^{L,R}(\mathcal{C})^{\text{op}} \simeq \text{Cospan}^{R,L}(\mathcal{C})$ (see Remark 8.1.6.2).

□

Corollary 8.1.6.8. *Let $\mathcal{C}$ be an ∞ -category and let L and R denote collections of morphisms of $\mathcal{C}$ which are closed under composition. If L and R are pushout-compatible, then a 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$ is thin if and only if it is thin when viewed as a 2-simplex of the simplicial set $\text{Cospan}(\mathcal{C})$.*

Proof. Let σ be a thin 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$; we will show that σ is also thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$ (the reverse implication follows from Remark 8.1.6.4). Choose a fully faithful functor $f : \mathcal{C} \rightarrow \mathcal{D}$, where $\mathcal{D}$ is an ∞ -category which admits pushouts and the functor f preserves all pushout squares which exist in $\mathcal{C}$ (see Corollary 8.3.3.17). Then f induces a morphism of simplicial sets $F : \text{Cospan}^{L,R}(\mathcal{C}) \rightarrow \text{Cospan}(\mathcal{D})$. The proof of Proposition 8.1.6.7 shows that every morphism $\tau_0 : \Lambda_1^2 \rightarrow \text{Cospan}^{L,R}(\mathcal{C})$ can be extended to a 2-simplex τ of $\text{Cospan}^{L,R}(\mathcal{C})$ which is thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$. Since f preserves pushout squares, the criterion of Proposition 8.1.4.2 guarantees that $F(\tau)$ is a thin 2-simplex of $\text{Cospan}(\mathcal{D})$. Allowing τ_0 to vary and invoking Proposition 5.4.7.9, we deduce that F is a functor of $(\infty, 2)$ -categories. In particular, $F(\sigma)$ is a thin 2-simplex of $\text{Cospan}(\mathcal{D})$. Using the criterion of Proposition 8.1.4.2 and the assumption that f is fully faithful, we deduce that σ is also thin when viewed as a 2-simplex of $\text{Cospan}(\mathcal{C})$. $\square$

0499 **Remark 8.1.6.9.** In the situation of Proposition 8.1.6.7, let σ be an n -simplex of the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$, corresponding to a diagram

049A

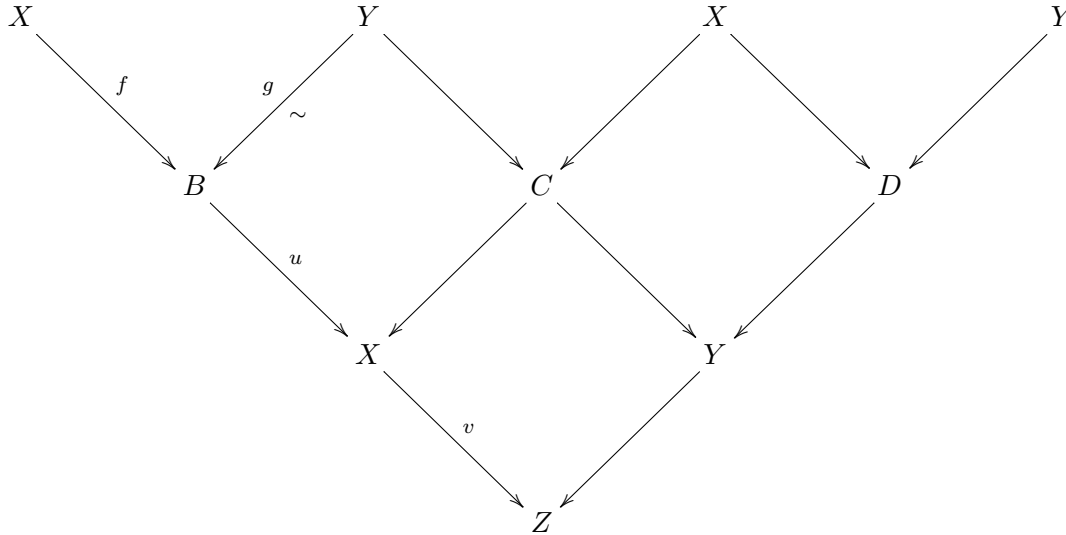

$$\begin{array}{ccccccc}
 X_{0,0} & & X_{1,1} & & \cdots & & X_{n-1,n-1} & & X_{n,n} \\
 & \searrow & & \searrow & & \searrow & & \searrow & \\
 & & \cdots & & \cdots & & \cdots & & \\
 & & & \searrow & & \searrow & & \searrow & \\
 & & & & X_{0,n-1} & & X_{1,n} & & \\
 & & & & & \searrow & & \searrow & \\
 & & & & & & X_{0,n} & &
 \end{array}
 \tag{8.14}$$

in the ∞ -category $\mathcal{C}$. Then σ is contained in the pith $\text{Pith}(\text{Cospan}^{L,R}(\mathcal{C}))$ if and only if each of the rectangular regions in the diagram (8.14) is a pushout square in the ∞ -category $\mathcal{C}$. This follows from the thinness criterion of Corollary 8.1.6.8 (together with Proposition 7.6.2.28).

049B **Corollary 8.1.6.10** (Invertible Cospans). *Let $\mathcal{C}$ be an ∞ -category. Let L and R be collections of morphisms of $\mathcal{C}$ which contain all isomorphisms and are closed under composition. Assume that L and R are pushout-compatible and let $e : X \rightarrow Y$ be a morphism in the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$, which we identify with a diagram $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category $\mathcal{C}$. Then e is an isomorphism in $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if f and g are isomorphisms in $\mathcal{C}$.*

Proof. Let $\mathcal{C}^\simeq$ denote the core of $\mathcal{C}$ (Construction 1.3.5.4). If f and g are isomorphisms, then e can be regarded as an edge of the simplicial set $\text{Cospan}(\mathcal{C}^\simeq)$. Since $\mathcal{C}^\simeq$ is a Kan complex (Corollary 4.4.3.11), the simplicial set $\text{Cospan}(\mathcal{C}^\simeq)$ is also a Kan complex (Corollary 8.1.3.11), so e is automatically an isomorphism when viewed as a morphism of $\text{Cospan}(\mathcal{C}^\simeq)$ (Proposition 1.4.6.10). Since the inclusion map $\text{Cospan}(\mathcal{C}^\simeq) \hookrightarrow \text{Cospan}^{L,R}(\mathcal{C})$ is a functor of $(\infty, 2)$ -categories (Corollary 8.1.6.8), it follows that e is also an isomorphism when regarded as a morphism of $\text{Cospan}^{L,R}(\mathcal{C})$ (Remark 5.4.7.5).

Now suppose that e is an isomorphism in the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$. Arguing as in the proof of Proposition 5.4.6.6, we can produce a 3-simplex $\sigma : \Delta^3 \rightarrow \text{Pith}(\text{Cospan}^{L,R}(\mathcal{C}))$, where $\sigma|_{N_\bullet(\{0<1\})}$ is the morphism e , $\sigma|_{N_\bullet(\{0<2\})}$ is the identity morphism id_X , and $\sigma|_{N_\bullet(\{1<3\})}$ is the identity morphism id_Y . Let us identify σ with a diagram

in the ∞ -category $\mathcal{C}$. This diagram exhibits the identity morphism id_X as a composition of u with f . Since $\sigma|_{N_\bullet(\{0<1<3\})}$ is a thin 2-simplex of $\text{Cospan}^{L,R}(\mathcal{C})$, the outer rectangular region on the left is a pushout square in $\mathcal{C}$ (Corollary 8.1.6.8). It follows that the composition of v with u is an isomorphism in $\mathcal{C}$ (since it is a pushout of the identity morphism id_X ; see Corollary 7.6.2.27). Applying the two-out-of-six property to the 3-simplex of $\mathcal{C}$ given by the left edge of the diagram, we conclude that f is an isomorphism in $\mathcal{C}$ (see Proposition 5.4.6.5). A similar argument shows that g is an isomorphism in $\mathcal{C}$. $\square$

Exercise 8.1.6.11. Show that, if the conditions of Corollary 8.1.6.10 are satisfied, then the diagram $Y \xrightarrow{g} B \xleftarrow{f} X$ is a homotopy inverse of e , when regarded as a morphism from Y to X in the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$. 049C

Corollary 8.1.6.12. Let $\mathcal{C}$ be an ∞ -category containing objects X and Y . Let L and R be collections of morphisms of $\mathcal{C}$ which are pushout-compatible, contain all isomorphisms of $\mathcal{C}$, 049D

and are closed under composition. Then X and Y are isomorphic as objects of the ∞ -category $\mathcal{C}$ if and only if they are isomorphic as objects of the $(\infty, 2)$ -category $\text{Cospan}^{L,R}(\mathcal{C})$.

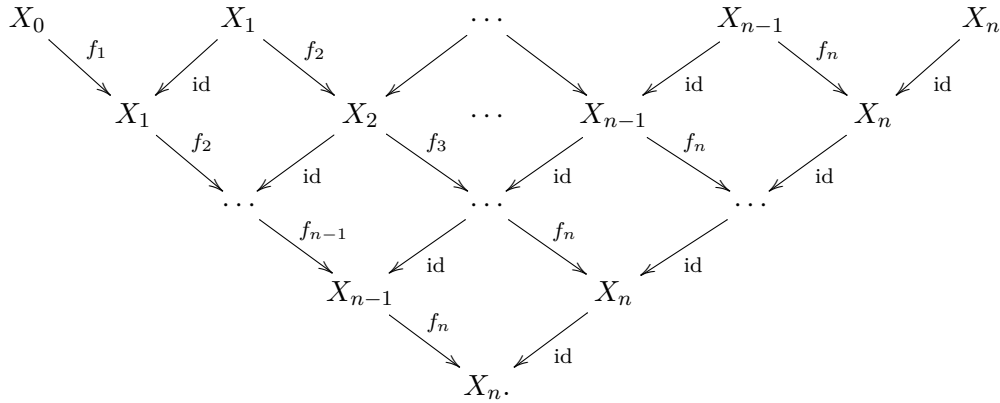

8.1.7 Comparing $\mathcal{C}$ with $\text{Cospan}(\mathcal{C})$

049E Let $\mathcal{C}$ be a category which admits pushouts. Then there is a functor from $\mathcal{C}$ to the 2-category $\text{Cospan}(\mathcal{C})$ of Example 2.2.2.1, which carries each object of $\mathcal{C}$ to itself and each morphism $f : X \rightarrow Y$ to the cospan $X \xrightarrow{f} Y \xleftarrow{\text{id}_Y} Y$. This observation has an ∞ -categorical counterpart:

049F **Construction 8.1.7.1.** Let $\mathcal{C}$ be a simplicial set and let $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ be the projection map of Notation 8.1.1.6, carrying each vertex $(f : X \rightarrow Y)$ of $\text{Tw}(\mathcal{C})$ to the vertex $Y \in \mathcal{C}$. Under the bijection supplied by Proposition 8.1.3.7, we can identify λ_+ with a morphism of simplicial sets $\rho_+ : \mathcal{C} \rightarrow \text{Cospan}(\mathcal{C})$. If σ is an n -simplex of $\mathcal{C}$, which we display informally as a diagram

$$X_0 \xrightarrow{f_1} X_1 \xrightarrow{f_2} X_2 \rightarrow \cdots \xrightarrow{f_n} X_n,$$

then $\rho_+(\sigma)$ is an n -simplex of $\text{Cospan}(\mathcal{C})$ which can be depicted informally as a diagram

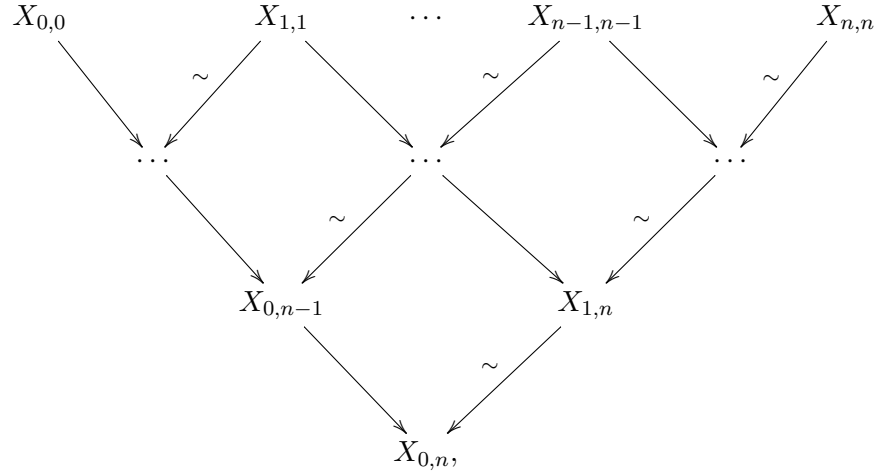

Note that ρ_+ is a monomorphism of simplicial sets.

Our goal in this section is to study the behavior of Construction 8.1.7.1 in the case where the simplicial set $\mathcal{C}$ is an ∞ -category. In this case, we will show that ρ_+ induces an equivalence of $\mathcal{C}$ with a certain restricted cospan construction (Proposition 8.1.7.6).

049G **Construction 8.1.7.2.** Let $\mathcal{C}$ be an ∞ -category. We let $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$ denote the simplicial

subset of $\text{Cospan}(\mathcal{C})$ whose n -simplices are diagrams

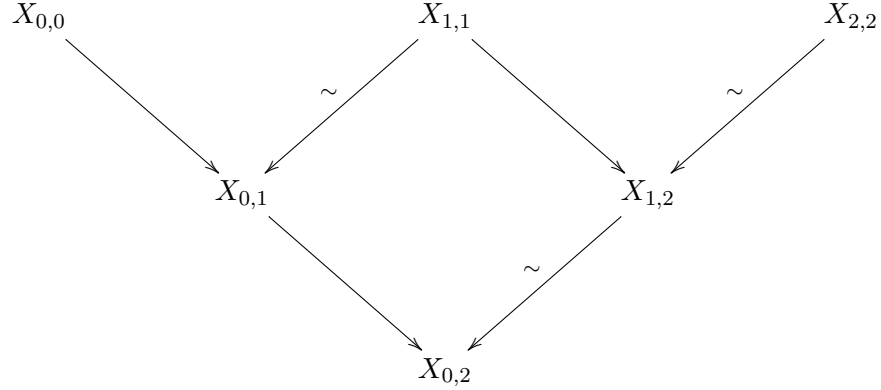

where each of the leftward-directed arrows is an isomorphism in $\mathcal{C}$.

Remark 8.1.7.3. Let $\mathcal{C}$ be an ∞ -category. Then the simplicial set $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ of 049H Construction 8.1.7.2 coincides with the restricted cospan construction $\text{Cospan}^{L,R}(\mathcal{C})$ of Definition 8.1.6.1, where we take L to be the collection of all morphisms of $\mathcal{C}$ and R to be the collection of all isomorphisms in $\mathcal{C}$ (see Example 8.1.7.10 for a more general statement).

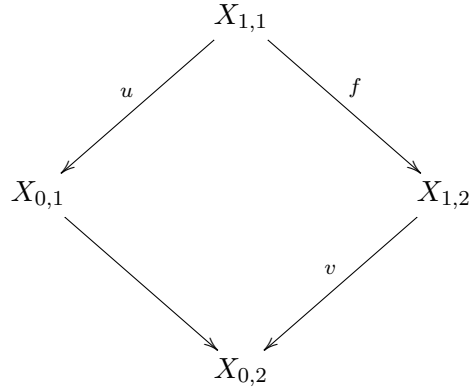

Variant 8.1.7.4. Let $\mathcal{C}$ be a simplicial set and let R be a collection of edges of $\mathcal{C}$. We 049J let $\text{Cospan}^{\text{all},R}(\mathcal{C})$ denote the simplicial subset $\text{Cospan}^{A,R}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$, where A is the collection of all edges of $\mathcal{C}$. Similarly, if L is a collection of edges of $\mathcal{C}$, we let $\text{Cospan}^{L,\text{all}}(\mathcal{C})$ denote the simplicial subset $\text{Cospan}^{L,A}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$. Note that the simplicial set $\text{Cospan}^{L,R}(\mathcal{C})$ of Definition 8.1.6.1 can be recovered as the intersection $\text{Cospan}^{L,\text{all}}(\mathcal{C}) \cap \text{Cospan}^{\text{all},R}(\mathcal{C})$.

Proposition 8.1.7.5. Let $\mathcal{C}$ be an ∞ -category. Then the simplicial set $\text{Cospan}^{\text{all},\text{iso}}(\mathcal{C})$ is 049K an ∞ -category.

Proof. Let σ be a 2-simplex of $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$, which we identify with a diagram

in the ∞ -category $\mathcal{C}$ where the leftward-directed morphisms are isomorphisms. Using Corollary 7.6.2.27, we deduce that the inner region is a pushout square in $\mathcal{C}$. It follows that σ is automatically thin when regarded as a 2-simplex of $\text{Cospan}(\mathcal{C})$ (Proposition 8.1.4.2), and therefore also when regarded as a 2-simplex of $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$ (Remark 8.1.6.4). To complete the proof, it will suffice to show that every diagram $\Lambda_1^2 \rightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{C})$ can be extended to a 2-simplex of $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$ (see Example 2.3.2.4). Using Lemma 8.1.4.4, we can restate this as follows: for every pair of morphisms $f : X_{1,1} \rightarrow X_{1,2}$ and $u : X_{1,1} \rightarrow X_{0,1}$ of $\mathcal{C}$ where u is an isomorphism, there exists a commutative diagram

where v is also an isomorphism. This follows immediately from the definitions (or from Corollary 4.4.5.9). $\square$

Let $\mathcal{C}$ be an ∞ -category and let $\rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}(\mathcal{C})$ the morphism described in Construction 8.1.7.1. Note that ρ_+ carries each object of $\mathcal{C}$ to itself, and each morphism $f : X \rightarrow Y$ of $\mathcal{C}$ to the edge of $\text{Cospan}(\mathcal{C})$ given by the diagram $X \xrightarrow{f} Y \xleftarrow{\text{id}_Y}$. Since every identity morphism in $\mathcal{C}$ is an isomorphism, ρ_+ factors through the ∞ -category $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$. The remainder of this section is devoted to the proof of the following:

Proposition 8.1.7.6. *Let $\mathcal{C}$ be an ∞ -category. Then the functor $\rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{C})$ is an equivalence of ∞ -categories.* 049L

Example 8.1.7.7. Let X be a Kan complex. Applying Proposition 8.1.7.6 (and noting that every edge of X is an isomorphism), we see that $\rho_+ : X \rightarrow \text{Cospan}(X)$ is a homotopy equivalence of Kan complexes (see Corollary 8.1.3.11). 049M

Our proof of Proposition 8.1.7.6 will require some preliminaries.

Definition 8.1.7.8. Let $\mathcal{C}$ be a simplicial set and let W be a collection of morphisms of $\mathcal{C}$. We say that W has the *left two-out-of-three property* if, for every 2-simplex of $\mathcal{C}$ with boundary indicated in by the diagram 049N

$$\begin{array}{ccc} X & \xrightarrow{h} & Z \\ & \searrow f & \nearrow g \\ & Y, & \end{array}$$

where f belongs to W , g belongs to W if and only if h belongs to W .

Lemma 8.1.7.9. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories and let $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ be a functor, corresponding to a morphism of simplicial sets $f : \mathcal{D} \rightarrow \text{Cospan}(\mathcal{C})$. Let L and R be collections of morphisms of $\mathcal{C}$ which satisfy the left two-out-of-three property. Then f factors through $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if F satisfies the following pair of conditions:* 049P

- (1) *For each object X in $\mathcal{D}$, the morphism F carries every morphism of $\{X\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D})$ to a morphism of $\mathcal{C}$ which belongs to L .*
- (2) *For each vertex Y in $\mathcal{D}$, the morphism F carries every morphism of $\text{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{Y\}$ to a morphism of $\mathcal{C}$ which belongs to R .*

Proof. For every morphism $e : X \rightarrow Y$ of $\mathcal{D}$, let $\text{id}_X \xrightarrow{e_L} e \xleftarrow{e_R} \text{id}_Y$ be the tautological cospan in $\text{Tw}(\mathcal{D})$ described in Example 8.1.3.6. By virtue of Remark 8.1.6.3, the morphism f factors through $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if it satisfies the following pair of conditions:

- (1') For every morphism $e : X \rightarrow Y$ of $\mathcal{D}$, the functor F carries e_L to a morphism of $\mathcal{C}$ which belongs to L .
- (2') For every morphism $e : X \rightarrow Y$ of $\mathcal{D}$, the functor F carries e_R to a morphism of $\mathcal{C}$ which belongs to R .

The implications $(1) \Rightarrow (1')$ and $(2) \Rightarrow (2')$ are immediate (if $e : X \rightarrow Y$ is any morphism of $\mathcal{D}$, then e_L is contained to the fiber $\{X\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D})$, and e_R is contained in $\text{Tw}(\mathcal{D}) \times_{\mathcal{D}} \{Y\}$). We will complete the proof by showing that $(1')$ implies (1) ; a similar argument shows that $(2')$ implies (2) .

Assume that condition $(1')$ is satisfied, let X be an object of $\mathcal{D}$, and let $u : X \rightarrow Y$ and $v : X \rightarrow Z$ be morphisms of $\mathcal{D}$. Suppose we are given a morphism $g : u \rightarrow v$ in the ∞ -category $\mathcal{E} = \{X\} \times_{\mathcal{D}^{\text{op}}} \text{Tw}(\mathcal{D})$; we wish to show that $F(g)$ belongs to L . Since id_X is initial when viewed as an object of $\mathcal{E}$ (Proposition 8.1.2.1), there is a 2-simplex of $\mathcal{E}$ whose boundary is indicated in the diagram

$$\begin{array}{ccc} & \text{id}_X & \\ & \swarrow \quad \searrow & \\ u & \xrightarrow{g} & v. \end{array}$$

(Note: The arrows from id_X to u and v are labeled u_L and v_L respectively in the original image.)

Assumption $(1')$ guarantees that $F(u_L)$ and $F(v_L)$ belong to L . Since L satisfies the left two-out-of-three property, it follows that $F(g)$ also belongs to L . $\square$

049Q **Example 8.1.7.10.** Let $\mathcal{C}$ be an ∞ -category and let σ be an n -simplex of the simplicial set $\text{Cospan}(\mathcal{C})$, corresponding to a diagram

049R

$$\begin{array}{ccccccc} X_{0,0} & & X_{1,1} & & \cdots & & X_{n-1,n-1} & & X_{n,n} \\ & \searrow & \swarrow & \searrow & \swarrow & \searrow & \swarrow & \searrow & \\ & \cdots & & \cdots & & \cdots & & \cdots & \\ & \searrow & \swarrow & \searrow & \swarrow & \searrow & \swarrow & \searrow & \\ & X_{0,n-1} & & X_{1,n} & & & & & \\ & \searrow & \swarrow & & \searrow & \swarrow & & & \\ & X_{0,n} & & & & & & & \end{array} \quad (8.15)$$

Let L and R be collections of morphisms of $\mathcal{C}$ which contain all identity morphisms and have the left two-out-of-three property. Then σ belongs to $\text{Cospan}^{L,R}(\mathcal{C})$ if and only if each of the rightward-pointing morphisms displayed in (8.15) belong to L , and each of the leftward-pointing morphisms displayed in (8.15) belong to R .

049S **Remark 8.1.7.11.** Let $\mathcal{C}$ be an ∞ -category, let R be a collection of morphisms of $\mathcal{C}$ which has the left two-out-of-three property, and let $\mathcal{D}$ be a simplicial set. Suppose we are given

a pair of morphisms $f, g : \mathcal{D} \rightarrow \text{Fun}^{\text{all}, R}(\mathcal{C})$, corresponding to diagrams $F, G : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$. If $\alpha : F \rightarrow G$ is a natural transformation of diagrams, then the following conditions are equivalent:

- (a) For every edge $u : D' \rightarrow D$ of $\mathcal{D}$, the morphism $\alpha_u : F(u) \rightarrow G(u)$ belongs to R .
- (b) For every degenerate edge $u : D \rightarrow D$ of $\mathcal{D}$, the morphism $\alpha_u : F(u) \rightarrow G(u)$ belongs to R .

The implication (a) $\Rightarrow$ (b) is immediate. To prove the reverse implication, let $u : D' \rightarrow D$ be an edge of $\mathcal{D}$ and let $u_R : \text{id}_D \rightarrow u$ be the edge of $\text{Tw}(\mathcal{D})$ described in Example 8.1.3.6. Evaluating α on the morphism u_R , we obtain a commutative diagram

$$\begin{array}{ccc} F(\text{id}_D) & \xrightarrow{\alpha_{\text{id}_D}} & G(\text{id}_D) \\ \downarrow & & \downarrow \\ F(u) & \xrightarrow{\alpha_u} & G(u) \end{array}$$

in the ∞ -category $\mathcal{C}$, where the vertical maps belong to R by virtue of our assumption that f and g factor through $\text{Cospan}^{\text{all}, R}(\mathcal{C})$. Applying the left two-out-of-three property, we conclude that if the upper horizontal map belongs to R , then the lower horizontal map also belongs to R .

Lemma 8.1.7.12. *Let $\mathcal{C}$ be an ∞ -category, let L and R be collections of morphisms of $\mathcal{C}$ which have the left two-out-of-three property, and let $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ denote the full subcategory of $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those objects which correspond to diagrams $\mathcal{D} \rightarrow \text{Cospan}^{L, R}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$. Let R' be the collection of morphisms in $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ which satisfy the equivalent conditions of Remark 8.1.7.11, and define L' similarly. Then the isomorphism $\text{Fun}(\mathcal{D}, \text{Cospan}(\mathcal{C})) \simeq \text{Cospan}(\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C}))$ of Remark 8.1.3.9 restricts to an isomorphism of simplicial subsets $\text{Fun}(\mathcal{D}, \text{Cospan}^{L, R}(\mathcal{C})) \simeq \text{Cospan}^{L', R'}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$.*

Proof. Writing $\text{Cospan}^{L, R}(\mathcal{C})$ as the intersection $\text{Cospan}^{L, \text{all}}(\mathcal{C}) \cap \text{Cospan}^{\text{all}, R}(\mathcal{C})$ (see Variant 8.1.7.4), we can reduce to the case where either L or R is the collection of all morphisms of $\mathcal{C}$. Let us assume that L is the collection of all morphisms of $\mathcal{C}$, so that L' is the collection of all morphisms of $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$. Suppose we are given another simplicial set $\mathcal{E}$ and a diagram $F : \text{Tw}(\mathcal{D}) \times \text{Tw}(\mathcal{E}) \rightarrow \mathcal{C}$. We can identify F with a morphism of simplicial sets $\mathcal{E} \rightarrow \text{Fun}(\mathcal{D}, \text{Cospan}(\mathcal{C}))$. By virtue of Remark 8.1.6.3, this morphism factors through the simplicial subset $\text{Fun}(\mathcal{D}, \text{Cospan}^{L, R}(\mathcal{C}))$ if and only if, for every edge $u : D' \rightarrow D$ of $\mathcal{D}$ and every edge $v : E' \rightarrow E$ of $\mathcal{E}$, the morphism F satisfies the following condition:

(1_{u,v}) Let $u_R : \text{id}_D \rightarrow u$ and $v_R : \text{id}_E \rightarrow v$ be the edges of $\text{Tw}(\mathcal{D})$ and $\text{Tw}(\mathcal{E})$ described in Example 8.1.3.6. Then the morphism $F(u_R, v_R)$ belongs to R .

Identifying F with a morphism $f : \mathcal{E} \rightarrow \text{Cospan}(\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C}))$, we see that f factors through $\text{Cospan}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$ if and only if it satisfies condition (1_{u,v}) whenever v is a degenerate edge of $\mathcal{E}$. Under this assumption, f factors through $\text{Cospan}^{L', R'}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$ if and only if, for every edge $u : D' \rightarrow D$ of $\mathcal{D}$ and every edge $v : E' \rightarrow E$ of $\mathcal{E}$, the diagram F satisfies the following condition:

(2_{u,v}) The morphism $F(\text{id}_u, v)$ belongs to R .

To complete the proof, it suffices to observe that if condition (1_{u, id_E}) is satisfied, then condition (1_{u,v}) is equivalent to condition (2_{u,v}). This follows by applying the left two-out-of-three property to the upper triangle appearing in the diagram

$$\begin{array}{ccc}
 F(\text{id}_D, \text{id}_E) & \xrightarrow{F(u_R, \text{id})} & F(u, \text{id}_E) \\
 \downarrow F(\text{id}, v_R) & \searrow F(u_R, v_R) & \downarrow F(\text{id}_u, v_R) \\
 F(\text{id}_D, v) & \xrightarrow{F(u_R, \text{id}_v)} & F(u, v).
 \end{array}$$

□

049U **Lemma 8.1.7.13.** *Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{D}$ be a simplicial set, and suppose we are given a pair of diagrams $f, g : \mathcal{D} \rightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})$, corresponding to diagrams $F, G : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$. The following conditions are equivalent:*

- (1) *The diagrams f and g are isomorphic when viewed as objects of the ∞ -category $\text{Fun}(\mathcal{D}, \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}))$.*
- (2) *The diagrams F and G are isomorphic when viewed as objects of the ∞ -category $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$.*

Proof. Let $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ denote the full subcategory of $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those functors $\text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ which correspond to diagrams $\mathcal{D} \rightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})$. Lemma 8.1.7.12, identifies $\text{Fun}(\mathcal{D}, \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}))$ with the ∞ -category $\text{Cospan}^{\text{all}, \text{iso}}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$. We are therefore reduced to proving that F and G are isomorphic when viewed as objects of the ∞ -category $\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C})$ if and only if they are isomorphic when viewed as objects of the ∞ -category $\text{Cospan}^{\text{all}, \text{iso}}(\text{Fun}'(\text{Tw}(\mathcal{D}), \mathcal{C}))$. This is a special case of Corollary 8.1.6.12. □

Proof of Proposition 8.1.7.6. Let $\mathcal{C}$ be an ∞ -category. We wish to show that the comparison map $\rho_+ : \mathcal{C} \hookrightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C})$ of Construction 8.1.7.1. Let $\mathcal{D}$ be a simplicial

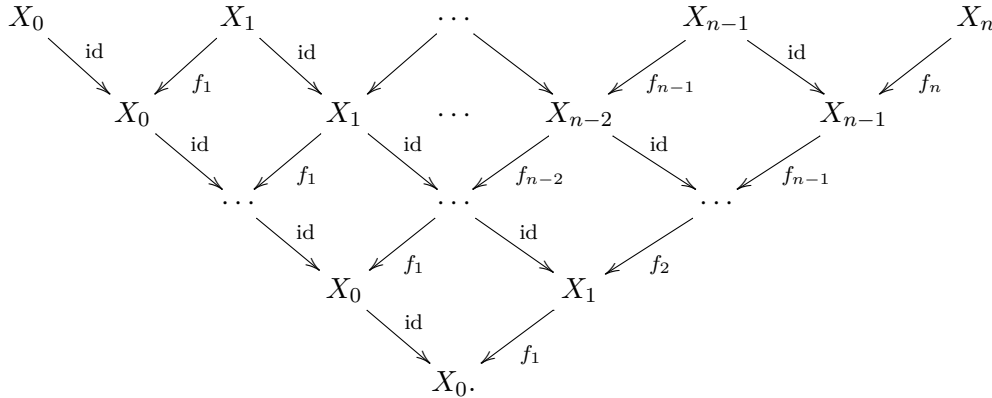

set; we will show that composition with ρ_+ induces a bijection $\theta : \pi_0(\text{Fun}(\mathcal{D}, \mathcal{C})^\simeq) \rightarrow \pi_0(\text{Fun}(\mathcal{D}, \text{Cospan}^{\text{all, iso}}(\mathcal{C}))^\simeq)$.

Let $\lambda_+ : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}$ denote the projection map, and let W be the collection of all edges e of $\text{Tw}(\mathcal{D})$ such that $\lambda_+(e)$ is a degenerate edge of $\mathcal{D}$. Let $\text{Fun}(\text{Tw}(\mathcal{D})[W^{-1}], \mathcal{C})$ denote the full subcategory of $\text{Fun}(\text{Tw}(\mathcal{D}), \mathcal{C})$ spanned by those diagrams $F : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{C}$ which carry each edge of W to an isomorphism in $\mathcal{C}$ (Notation 6.3.1.1). Using Lemmas 8.1.7.9 and 8.1.7.13, we can identify θ with the map $\pi_0(\text{Fun}(\mathcal{D}, \mathcal{C})^\simeq) \rightarrow \pi_0(\text{Fun}(\text{Tw}(\mathcal{D})[W^{-1}], \mathcal{C})^\simeq)$ given by composition λ_+ . To complete the proof, it will suffice to show that λ_+ exhibits $\mathcal{D}$ as a localization of $\text{Tw}(\mathcal{D})$ with respect to W , in the sense of Definition 6.3.1.9. This follows from Corollary 6.3.5.5, since the morphism λ_+ is universally localizing (Corollary 8.1.2.4). $\square$

Variant 8.1.7.14. Let $\mathcal{C}$ be a simplicial set. Then the projection map $\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ 049V determines a morphism of simplicial sets $\rho_- : \mathcal{C}^{\text{op}} \rightarrow \text{Cospan}(\mathcal{C})$. If σ is an n -simplex of $\mathcal{C}^{\text{op}}$, which we display informally as a diagram

$$X_0 \xleftarrow{f_1} X_1 \xleftarrow{f_2} X_2 \leftarrow \cdots \xleftarrow{f_n} X_n,$$

then $\rho_-(\sigma)$ is an n -simplex of $\text{Cospan}(\mathcal{C})$ which is depicted informally by the diagram

If $\mathcal{C}$ is an ∞ -category, then ρ_- restricts an equivalence $\mathcal{C}^{\text{op}} \hookrightarrow \text{Cospan}^{\text{iso, all}}(\mathcal{C})$, where $\text{Cospan}^{\text{iso, all}}(\mathcal{C})$ is the simplicial subset $\text{Cospan}^{L, R}(\mathcal{C}) \subseteq \text{Cospan}(\mathcal{C})$ where L is the collection of isomorphisms in $\mathcal{C}$, and R is the collection of all morphisms of $\mathcal{C}$.

8.1.8 Morphisms in the Duskin Nerve

Let S be a simplicial set. Recall that, for every pair of vertices $X, Y \in S$, the morphism 03KZ space $\text{Hom}_S(X, Y)$ is defined by the formula

$$\text{Hom}_S(X, Y) = \{X\} \tilde{\times}_S \{Y\} = \{X\} \times_{\text{Fun}(\{0\}, S)} \text{Fun}(\Delta^1, S) \times_{\text{Fun}(\{1\}, S)} \{Y\}.$$

In this section, we specialize to the case where $S = N_{\bullet}^D(\mathcal{C})$ is the Duskin nerve of a 2-category $\mathcal{C}$. In this case, we will see that there is close relationship between the simplicial set $\text{Hom}_S(X, Y)$ and the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ of 1-morphisms from X to Y . More precisely, we will construct a comparison map

$$\text{Cospan}(N_{\bullet} \underline{\text{Hom}}_{\mathcal{C}}(X, Y)) \rightarrow \text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y),$$

and show that it is an isomorphism of simplicial sets (Corollary 8.1.8.6).

03L0 Warning 8.1.8.1. Let $\mathcal{C}$ be a 2-category. If every 2-morphism in $\mathcal{C}$ is invertible, then the Duskin nerve $N_{\bullet}^D(\mathcal{C})$ is an ∞ -category (Theorem 2.3.2.1). It follows that, for every pair of objects $X, Y \in \mathcal{C}$, the simplicial set $\text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y)$ is a Kan complex. Beware that, in the case where $\mathcal{C}$ contains non-invertible 2-morphisms, the simplicial set $\text{Hom}_{N_{\bullet}^D(\mathcal{C})}(X, Y)$ is generally not an ∞ -category (in fact, it is not even an $(\infty, 2)$ -category unless the category $\text{Hom}_{\mathcal{C}}(X, Y)$ admits pushouts: see Proposition 8.1.4.1). In such cases, it may be more useful to consider the *pinched* morphism spaces of $N_{\bullet}^D(\mathcal{C})$: see Example 4.6.5.13 and Remark 8.1.8.8.

01G9 Construction 8.1.8.2. Let $\mathcal{A}$ be a category, let $\mathcal{C}$ be a 2-category containing objects X and Y , and let $F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ be a functor. We define a strictly unitary lax functor $U_F : [1] \times \mathcal{A} \rightarrow \mathcal{C}$ as follows:

- (1) The lax functor U_F is given on objects by $U_F(0, A) = X$ and $U_F(1, A) = Y$ for each object $A \in \mathcal{A}$.
- (2) Let $f : A \rightarrow B$ be a morphism in the category $\mathcal{A}$, which we also regard as an object of the twisted arrow category $\text{Tw}(\mathcal{A})$. For $0 \leq i \leq j \leq 1$, we let f_{ji} denote the corresponding morphism from (i, A) to (j, B) in the product category $[1] \times \mathcal{A}$. Then the lax functor U_F is given on 1-morphisms by the formula

$$U_F(f_{ji}) = \begin{cases} \text{id}_X & \text{if } i = j = 0 \\ \text{id}_Y & \text{if } i = j = 1 \\ F(f) & \text{if } 0 = i < j = 1. \end{cases}$$

- (3) Let $f : A \rightarrow B$ and $v : B \rightarrow C$ be composable morphisms in the category $\mathcal{A}$, and let $0 \leq i \leq j \leq k \leq 1$. Then the composition constraint $\mu_{g_{kj}, f_{ji}}$ for the lax functor U_F is given as follows:

- If $i = j = k = 0$, then $\mu_{g_{kj}, f_{ji}}$ is the unit constraint $v_X : \text{id}_X \circ \text{id}_X \xrightarrow{\sim} \text{id}_X$ of the 2-category $\mathcal{C}$.
- If $i = 0$ and $j = k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is given by the composition

$$\text{id}_Y \circ F(f) \xrightarrow{\lambda_{F(f)}} F(f) \xrightarrow{F(\text{id}_A, g)} F(g \circ f),$$

where $\lambda_{F(f)}$ is the left unit constraint of Construction 2.2.1.11 and we regard the pair (id_A, g) as an element of $\text{Hom}_{\text{Tw}(\mathcal{A})}(f, g \circ f)$.

- If $i = j = 0$ and $k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is given by the composition

$$F(g) \circ \text{id}_X \xrightarrow{\rho_{F(g)}} F(g) \xrightarrow{F(f, \text{id}_C)} F(g \circ f),$$

where $\rho_{F(g)}$ is the right unit constraint of Construction 2.2.1.11 and we regard the pair (f, id_C) as an element of $\text{Hom}_{\text{Tw}(\mathcal{A})}(g, g \circ f)$.

- If $i = j = k = 1$, then $\mu_{g_{kj}, f_{ji}}$ is equal to the unit constraint $v_Y : \text{id}_Y \circ \text{id}_Y \xrightarrow{\sim} \text{id}_Y$ of the 2-category $\mathcal{C}$.

Exercise 8.1.8.3. Show that Construction 8.1.8.2 is well-defined. That is, given a functor $F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ as in Construction 8.1.8.2, show that there is a unique strictly unitary lax functor U_F satisfying properties (1), (2), and (3) of Construction 8.1.8.2.

We can now formulate the main result of this section.

Theorem 8.1.8.4. Let $\mathcal{A}$ be a category and let $\mathcal{C}$ be a 2-category containing objects X and Y . Then the assignment $F \mapsto U_F$ of Construction 8.1.8.2 induces a monomorphism of sets

$$\begin{array}{c} \{\text{Functors } F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)\} \\ \downarrow \\ \{\text{Strictly unitary lax functors } U : [1] \times \mathcal{A} \rightarrow \mathcal{C}\}. \end{array}$$

The image of this monomorphism consists of those strictly unitary lax functors $U : [1] \times \mathcal{A} \rightarrow \mathcal{C}$ having the property that $U|_{\{0\} \times \mathcal{A}}$ and $U|_{\{1\} \times \mathcal{A}}$ are the constant functors taking the values X and Y , respectively.

Remark 8.1.8.5. Let $\mathcal{C}$ be a 2-category containing objects X and Y . For every category $\mathcal{A}$, we can use Theorem 2.3.4.1 to identify strictly unitary lax functors $U : [1] \times \mathcal{A} \rightarrow \mathcal{C}$ with morphisms of simplicial sets $G : \Delta^1 \times N_{\bullet}(\mathcal{A}) \rightarrow N_{\bullet}^{\mathcal{D}}(\mathcal{C})$. Consequently, Theorem 8.1.8.4 supplies a bijection

$$\begin{array}{c} \{\text{Functors } F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)\} \\ \downarrow \sim \\ \{\text{Morphisms of simplicial sets } N_{\bullet}(\mathcal{A}) \rightarrow \text{Hom}_{N_{\bullet}^{\mathcal{D}}(\mathcal{C})}(X, Y)\}. \end{array}$$

Note that the bijection of Remark 8.1.8.5 depends functorially on the simplicial set $\mathcal{A}$. Specializing to categories of the form $\mathcal{A} = [n]$, we obtain the following:

01GC **Corollary 8.1.8.6.** *Let $\mathcal{C}$ be a 2-category containing objects X and Y . Then Construction 8.1.8.2 induces an isomorphism of simplicial sets*

$$\text{Cospan}(\mathbf{N}_\bullet \underline{\text{Hom}}_{\mathcal{C}}(X, Y)) \xrightarrow{\sim} \text{Hom}_{\mathbf{N}_{\bullet}^{\mathcal{D}}(\mathcal{C})}(X, Y).$$

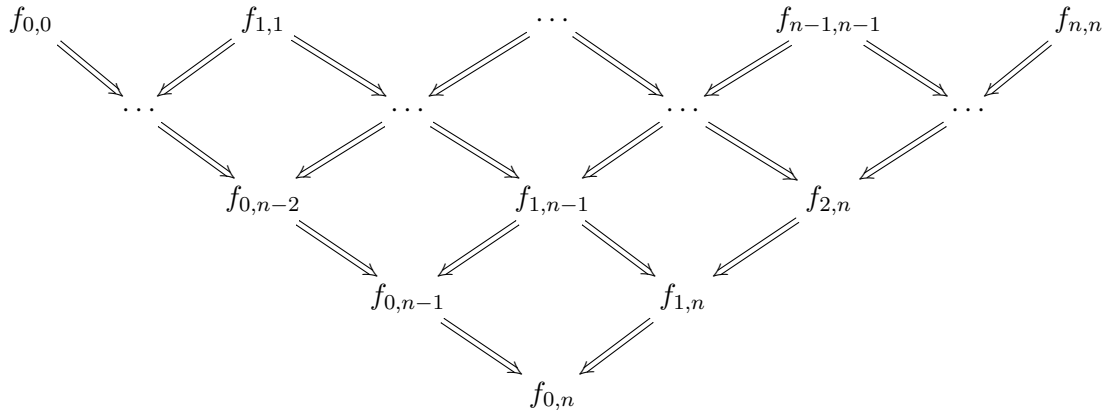

03L2 **Exercise 8.1.8.7.** Show that Theorem 8.1.8.4 follows from Corollary 8.1.8.6. In other words, to prove Theorem 8.1.8.4, there is no loss of generality in assuming that $\mathcal{A}$ has the form $\{0 < 1 < \dots < n\}$ for some integer $n \geq 0$.

03L3 **Remark 8.1.8.8.** Let $\mathcal{C}$ be a 2-category containing a pair of objects X and Y . Then we have a commutative diagram of simplicial sets

$$\begin{array}{ccccc} \mathbf{N}_\bullet \underline{\text{Hom}}_{\mathcal{C}}(X, Y) & \xrightarrow{\rho_+} & \text{Cospan}(\mathbf{N}_\bullet \underline{\text{Hom}}_{\mathcal{C}}(X, Y)) & \xleftarrow{\rho_-} & \mathbf{N}_\bullet \underline{\text{Hom}}_{\mathcal{C}}(X, Y)^{\text{op}} \\ \downarrow \sim & & \downarrow \sim & & \downarrow \sim \\ \text{Hom}_{\mathbf{N}_{\bullet}^{\mathcal{D}}(\mathcal{C})}^{\text{L}}(X, Y) & \xrightarrow{\iota^{\text{L}}} & \text{Hom}_{\mathbf{N}_{\bullet}^{\mathcal{D}}(\mathcal{C})}(X, Y) & \xleftarrow{\iota^{\text{R}}} & \text{Hom}_{\mathbf{N}_{\bullet}^{\mathcal{D}}(\mathcal{C})}^{\text{R}}(X, Y) \end{array}$$

where the upper horizontal maps are the inclusions of Construction 8.1.7.1 and Variant 8.1.7.14, the lower horizontal maps are the pinch inclusion maps of Construction 4.6.5.7, the outer vertical maps are the isomorphisms of Example 4.6.5.13, and the inner vertical map is the isomorphism of Corollary 8.1.8.6.

Stated more concretely, Corollary 8.1.8.6 asserts that we can identify n -simplices of the simplicial set $\text{Hom}_{\mathbf{N}_{\bullet}^{\mathcal{D}}(\mathcal{C})}(X, Y)$ with commutative diagrams

in the category of 1-morphisms $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. The image of the left-pinch inclusion morphism

$$\iota^{\text{L}} : \text{Hom}_{\mathbf{N}_{\bullet}^{\mathcal{D}}(\mathcal{C})}^{\text{L}}(X, Y) \hookrightarrow \text{Hom}_{\mathbf{N}_{\bullet}^{\mathcal{D}}(\mathcal{C})}(X, Y)$$

consists of those simplices which correspond (under this identification) to commutative diagrams in which each of the leftward pointing 2-morphisms $f_{i,j} \Rightarrow f_{i-1,j}$ is an identity map. In this case, the entire diagram is determined by the sequence of composable morphisms $f_{0,0} \Rightarrow f_{0,1} \Rightarrow f_{0,2} \Rightarrow \cdots \Rightarrow f_{0,n}$ in the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. Similarly, the image of the right-pinch inclusion morphism

$$\iota^R : \text{Hom}_{\mathbf{N}_{\bullet}^D(\mathcal{C})}^R(X, Y) \hookrightarrow \text{Hom}_{\mathbf{N}_{\bullet}^D(\mathcal{C})}(X, Y)$$

consists of those simplices which correspond to commutative diagrams in which the rightward pointing 2-morphisms $f_{i,j} \Rightarrow f_{i,j+1}$ are identity maps, which ensures that the entire diagram is determined by the sequence of composable morphisms $f_{n,n} \Rightarrow f_{n-1,n} \Rightarrow f_{n-2,n} \Rightarrow \cdots \Rightarrow f_{0,n}$ in $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$.

Proof of Theorem 8.1.8.4. Let $\mathcal{A}$ be an ordinary category, let $\mathcal{C}$ be a 2-category containing objects X and Y , and let $U : [1] \times \mathcal{A} \rightarrow \mathcal{C}$ be a strictly unitary lax functor having the property that $U|_{\{0\} \times \mathcal{A}}$ and $U|_{\{1\} \times \mathcal{A}}$ are the constant functors taking the values X and Y , respectively. We wish to show that there exists a unique functor of ordinary categories $F : \text{Tw}(\mathcal{A}) \rightarrow \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$ such that U is equal to the strictly unitary lax functor U_F given by Construction 8.1.8.2. To prove this, we may assume without loss of generality that the 2-category $\mathcal{C}$ is strictly unitary (Proposition 2.2.7.7). Given a morphism $f : A \rightarrow B$ in the category $\mathcal{A}$ and a pair of integers $0 \leq i \leq j \leq 1$, we write $f_{ji} : (i, A) \rightarrow (j, B)$ for the corresponding morphism in the product category $[1] \times \mathcal{A}$. Unwinding the definitions, we see that the identity $U = U_F$ imposes the following requirements on the functor F :

- (1) Let $f : A \rightarrow B$ be a morphism in the category $\mathcal{C}$, which we identify with an object of the twisted arrow category $\text{Tw}(\mathcal{A})$. Then $F(f)$ is equal to $U(f_{10}) \in \underline{\text{Hom}}_{\mathcal{C}}(X, Y)$.
- (2) Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be composable morphisms in the category $\mathcal{A}$, and regard the pairs (id_A, g) and (f, id_C) as elements of $\text{Hom}_{\text{Tw}(\mathcal{A})}(f, g \circ f)$ and $\text{Hom}_{\text{Tw}(\mathcal{A})}(g, g \circ f)$, respectively. Then $F(\text{id}_A, g)$ and $F(f, \text{id}_C)$ are equal to the composition constraints $\mu_{g_{11}, f_{10}}$ and $\mu_{g_{10}, f_{00}}$ for the lax functor U , respectively.

We now establish the uniqueness of the functor F . The value of F on objects is determined by condition (1). If $f : A \rightarrow B$ and $f' : A' \rightarrow B'$ are objects of the twisted arrow category $\text{Tw}(\mathcal{A})$, then an element of $\text{Hom}_{\text{Tw}(\mathcal{A})}(f, f')$ can be identified with a pair (u, v) where $u \in \text{Hom}_{\mathcal{A}}(A', A)$ and $v \in \text{Hom}_{\mathcal{A}}(B, B')$ satisfy $f' = v \circ f \circ u$. In this case, the morphism (u, v) factors as a composition $(u, \text{id}_{B'}) \circ (\text{id}_A, v)$, so condition (2) guarantees the identity

$$F(u, v) = F(u, \text{id}_{B'}) \circ F(\text{id}_A, v) = \mu_{(vf)_{10}, u_{00}} \circ \mu_{v_{11}, f_{10}}.$$

This proves the uniqueness of F on morphisms.

To prove existence, we define the functor F on objects $f \in \text{Tw}(\mathcal{A})$ by setting $F(f) = U(f_{10})$, and on morphisms $(u, v) \in \text{Hom}_{\text{Tw}(\mathcal{A})}(f, f')$ by the formula

$$F(u, v) = \mu_{(vf)_{10}, u_{00}} \circ \mu_{v_{11}, f_{10}}.$$

Note that this prescription automatically satisfies condition (1). Since U is a strictly unitary functor between strictly unitary 2-categories, its composition constraints $\mu_{g,h}$ are the identity whenever either g or h is an identity morphism (Remark 2.2.7.5), which shows that F satisfies condition (2) and that it carries identity morphisms to identity morphisms. We will complete the proof by showing that F is compatible with composition. Let $f : A \rightarrow B$, $f' : A' \rightarrow B'$, and $f'' : A'' \rightarrow B''$ be objects of the twisted arrow category $\text{Tw}(\mathcal{A})$, and suppose we are given morphisms $(u, v) \in \text{Hom}_{\text{Tw}(\mathcal{A})}(f, f')$ and $(u', v') \in \text{Hom}_{\text{Tw}(\mathcal{A})}(f', f'')$. We wish to prove an equality $F(u \circ u', v' \circ v) = F(u', v') \circ F(u, v)$ of morphisms from $F(f)$ to $F(f'')$ in the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. Unwinding the definitions, this is equivalent to the commutativity of the outer cycle of the diagram

$$\begin{array}{ccccc}
 & & F(vfu) & & \\
 & \nearrow^{\mu_{(vf)_{10}, u_{00}}} & & \searrow_{\mu_{v'_{11}, (vf'u)_{10}}} & \\
 & F(vf) & & F(v'vf'u) & \\
 \nearrow_{\mu_{v_{11}, f_{10}}} & & \searrow_{\mu_{v'_{11}, (vf)_{10}}} & \nearrow_{\mu_{(v'vf)_{10}, u_{00}}} & \searrow_{\mu_{(v'vf'u)_{10}, u'_{00}}} \\
 F(f) & \xrightarrow{\mu_{(v'v)_{11}, f_{10}}} & F(v'vf) & \xrightarrow{\mu_{(v'vf)_{10}, (uu')_{00}}} & F(v'vf'uu')
 \end{array}$$

in the category $\underline{\text{Hom}}_{\mathcal{C}}(X, Y)$. In fact, the entire diagram commutes. The commutativity of the upper square follows by applying property (c) of Definition 2.2.4.5 to the composable triple of morphisms

$$(0, A') \xrightarrow{u_{00}} (0, A) \xrightarrow{(vf)_{10}} (1, B') \xrightarrow{v'_{11}} (1, B'')$$

in the product category $[1] \times \mathcal{A}$. The commutativity of the lower left triangle follows by applying property (c) to the composable triple of morphisms

$$(0, A) \xrightarrow{f_{10}} (1, B) \xrightarrow{v_{11}} (1, B') \xrightarrow{v'_{11}} (1, B'')$$

and noting that the composition constraint $\mu_{v'_{11}, v_{11}}$ is equal to the identity (by virtue of our assumption that the lax functor $U|_{\{1\} \times \mathcal{A}}$ is constant). Similarly, the commutativity of the lower right triangle follows by applying (c) to the composable triple of morphisms

$$(0, A'') \xrightarrow{u'_{00}} (0, A') \xrightarrow{u_{00}} (0, A) \xrightarrow{(v'vf)_{10}} (1, B'')$$

and noting that the composition constraint $\mu_{u_{00}, u'_{00}}$ is equal to the identity (by virtue of our assumption that the lax functor $U|_{\{0\} \times \mathcal{A}}$ is constant). $\square$

8.1.9 Cospan Fibrations

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. Beware that the induced map $\text{Cospans}(U) : \text{Cospans}(\mathcal{E}) \rightarrow \text{Cospans}(\mathcal{C})$ is usually not an inner fibration. For example, in the special case $\mathcal{C} = \Delta^0$, the morphism U is an inner fibration if and only if $\mathcal{E}$ is an ∞ -category. In this case, the simplicial set $\text{Cospans}(\mathcal{E})$ is usually not an ∞ -category (unless $\mathcal{E}$ is a Kan complex). However, it contains an ∞ -category $\text{Cospans}^{\text{all, iso}}(\mathcal{E}) \subseteq \text{Cospans}(\mathcal{E})$ (Construction 8.1.7.2), which is canonically equivalent to the ∞ -category $\mathcal{E}$ (Proposition 8.1.7.6). In this section, we describe a generalization which applies to any simplicial set $\mathcal{C}$. Our main result can be stated as follows:

Proposition 8.1.9.1. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets and let W denote the collection of all U -cocartesian edges of $\mathcal{E}$. Then the induced map $\text{Cospans}^{\text{all, } W}(\mathcal{E}) \rightarrow \text{Cospans}(\mathcal{C})$ is an inner fibration of simplicial sets.*

We will give the proof of Proposition 8.1.9.1 at the end of this section.

Remark 8.1.9.2. In the situation of Proposition 8.1.9.1, let C be a vertex of $\mathcal{C}$ and let $\mathcal{E}_C$ denote the fiber $\{C\} \times_{\mathcal{C}} \mathcal{E}$. Note that a morphism u in the ∞ -category $\mathcal{E}_C$ is an isomorphism if and only if it is U -cocartesian when viewed as a morphism in $\mathcal{E}$ (Proposition 5.1.4.12). It follows that the fiber $\{C\} \times_{\text{Cospans}(\mathcal{C})} \text{Cospans}^{\text{all, } W}(\mathcal{E})$ can be identified with the ∞ -category $\text{Cospans}^{\text{all, iso}}(\mathcal{E}_C)$. In particular, Proposition 8.1.7.6 supplies an equivalence of ∞ -categories

$$\rho_+ : \{C\} \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \{C\} \times_{\text{Cospans}(\mathcal{C})} \text{Cospans}^{\text{all, } W}(\mathcal{E}).$$

Remark 8.1.9.3. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let W be the collection of all U -cocartesian morphisms of $\mathcal{E}$. Then we have a commutative diagram

$$\begin{array}{ccccc} \mathcal{E} & \longrightarrow & \text{Cospans}^{\text{all, iso}}(\mathcal{E}) & \longrightarrow & \text{Cospans}^{\text{all, } W}(\mathcal{E}) \\ \downarrow U & & \downarrow & & \downarrow \\ \mathcal{C} & \longrightarrow & \text{Cospans}^{\text{all, iso}}(\mathcal{C}) & \longrightarrow & \text{Cospans}(\mathcal{C}), \end{array}$$

where the horizontal maps on the left are equivalences of ∞ -categories (Proposition 8.1.7.6), and the right half of the diagram is a pullback square (Proposition 5.1.1.9). It follows that from Proposition 8.1.9.1 that map $\text{Cospans}^{\text{all, iso}}(\mathcal{E}) \rightarrow \text{Cospans}^{\text{all, iso}}(\mathcal{C})$ is an inner fibration of ∞ -categories. In fact, it is even an isofibration: this follows easily from the

description of isomorphisms in the ∞ -categories $\text{Cospan}^{\text{all,iso}}(\mathcal{C})$ and $\text{Cospan}^{\text{all,iso}}(\mathcal{E})$ supplied by Corollary 8.1.6.10 (together with the fact that U is an isofibration; see Proposition 5.1.4.9). Applying Theorem 5.1.6.1 to the right side of the diagram, we conclude that the map $\text{Cospan}^{\text{all,iso}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{C})$ is also a cocartesian fibration of simplicial sets. Moreover, Corollary 4.5.2.30 guarantees that the induced map

$$\mathcal{E} \hookrightarrow \mathcal{C} \times_{\text{Cospan}^{\text{all,iso}}(\mathcal{C})} \text{Cospan}^{\text{all,iso}}(\mathcal{E}) \simeq \mathcal{C} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{\text{all},W}(\mathcal{E})$$

is an equivalence of ∞ -categories.

04FN Remark 8.1.9.4. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let W be the collection of all U -cocartesian morphisms of $\mathcal{E}$. It follows from Proposition 8.1.9.1 that U also induces an inner fibration $\text{Cospan}^{W,\text{all}}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$, whose fiber over an object $C \in \mathcal{C}$ is equivalent to the *opposite* of the ∞ -category $\mathcal{E}_C$ (see Variant 8.1.7.14). This construction will play an important role in §8.6.

For later use, it will be convenient to have a generalization of Proposition 8.1.9.1, where we impose some additional constraints on the cospans that we consider.

04A0 Definition 8.1.9.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets and let $\bar{f} : \bar{X} \rightarrow \bar{Y}$ be an edge of $\mathcal{C}$. We say that $\bar{f}$ *admits U -cartesian lifts* if, for every vertex $Y \in \mathcal{E}$ satisfying $U(Y) = \bar{Y}$, there is a U -cartesian edge $f : X \rightarrow Y$ of $\mathcal{E}$ satisfying $U(f) = \bar{f}$. We say that $\bar{f}$ *admits U -cocartesian lifts* if, for every vertex $X \in \mathcal{E}$ satisfying $U(X) = \bar{X}$, there is a U -cocartesian edge $f : X \rightarrow Y$ of $\mathcal{E}$ satisfying $U(f) = \bar{f}$.

04A1 Remark 8.1.9.6. In the situation of Definition 8.1.9.5, the edge $\bar{f}$ admits U -cocartesian lifts if and only if it admits U^{op} -cartesian lifts, when regarded as an edge of the opposite simplicial set $\mathcal{E}^{\text{op}}$.

04A2 Example 8.1.9.7. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. Then U is a cocartesian fibration if and only if every edge of $\mathcal{C}$ admits U -cocartesian lifts. Similarly, U is a cartesian fibration if and only if every edge of $\mathcal{C}$ admits U -cartesian lifts.

04A3 Example 8.1.9.8. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. The following conditions are equivalent:

- The morphism U is an isofibration of ∞ -categories.
- Every isomorphism of $\mathcal{C}$ admits U -cocartesian lifts.
- Every isomorphism of $\mathcal{C}$ admits U -cartesian lifts.

04A4 Proposition 8.1.9.9. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets, let R be a collection of edges of $\mathcal{C}$ which admits U -cocartesian lifts, and let $\tilde{R}$ denote the collection of all U -cocartesian edges f of $\mathcal{E}$ such that $U(f)$ belongs to $\tilde{R}$. Then the induced map $\text{Cospan}^{\text{all},\tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all},R}(\mathcal{C})$ is an inner fibration of simplicial sets.

Proof. Replacing $\mathcal{C}$ by a full simplicial subset if necessary, we may assume that R contains every degenerate edge of $\mathcal{C}$. Choose integers $0 < i < n$; we wish to show that every lifting problem

$$\begin{array}{ccc} \Lambda_i^n & \xrightarrow{f_0} & \text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E}) \\ \downarrow & \nearrow & \downarrow \\ \Delta^n & \xrightarrow{\bar{f}} & \text{Cospan}^{\text{all}, R}(\mathcal{C}) \end{array} \quad \begin{array}{l} \text{04A5} \\ (8.16) \end{array}$$

admits a solution. Using Proposition 8.1.3.7, we can rewrite (8.16) as a lifting problem

$$\begin{array}{ccc} \text{Tw}(\Lambda_i^n) & \xrightarrow{F_0} & \mathcal{E} \\ \downarrow & \nearrow F & \downarrow U \\ \text{Tw}(\Delta^n) & \xrightarrow{\bar{F}} & \mathcal{C}, \end{array}$$

where the morphism F is required to satisfy the following additional condition:

- (*) For every pair of integers $0 \leq i \leq j \leq n$, the morphism F carries $(j, j) \rightarrow (i, j)$ to a U -cocartesian edge of $\mathcal{E}$.

Replacing $\mathcal{E}$ by the fiber product $\text{Tw}(\Delta^n) \times_{\mathcal{C}} \mathcal{E}$, we can reduce to the case where $\mathcal{C} = \text{Tw}(\Delta^n)$, and $\bar{F}$ is the identity morphism. Since U is an inner fibration, it follows that $\mathcal{E}$ is an ∞ -category.

Suppose first that $n \geq 3$. In this case, F_0 determines a commutative diagram

$$\begin{array}{ccc} F_0(i, i) & \longrightarrow & F_0(i-1, i) \\ \downarrow & & \downarrow \\ F_0(i, i+1) & \longrightarrow & F_0(i-1, i+1) \end{array} \quad \begin{array}{l} \text{04A6} \\ (8.17) \end{array}$$

in the ∞ -category $\mathcal{E}$. Using our assumption that f_0 factors through $\text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E}) \subseteq \text{Cospan}(\mathcal{E})$ (together with Corollary 5.1.2.4), we deduce that the horizontal maps the diagram (8.17) are U -cocartesian. In particular, (8.17) is a U -colimit diagram (Proposition 7.6.2.26). Since the image of (8.17) in $\text{Tw}(\Delta^n)$ is a pushout square, it is a pushout diagram in $\mathcal{E}$ (Corollary 7.1.6.11). Applying Proposition 8.1.4.2, we deduce that $f_0|_{N_\bullet(\{i-1 < i < i+1\})}$ is a thin 2-simplex of $\text{Cospan}(\mathcal{E})$, and therefore also of $\text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E})$ (Remark 8.1.6.4). It

follows that f_0 can be extended to an n -simplex σ of $\text{Cosp}^{\text{all}, \widetilde{R}}(\mathcal{E})$, which we can identify with a functor $F : \text{Tw}(\Delta^n) \rightarrow \mathcal{E}$ satisfying condition $(*)$ and the identity $F|_{\text{Tw}(\Lambda_i^n)} = F_0$. The equality $U \circ F = \overline{F}$ is automatic, since $\text{Tw}(\Delta^n)$ is the nerve of a partially ordered set and $\text{Tw}(\Lambda_i^n)$ contains every vertex of $\text{Tw}(\Delta^n)$.

We now treat the case $n = 2$ (so that $i = 1$). In this case, we can identify F_0 with a diagram

$$X_{0,0} \xrightarrow{r} X_{0,1} \xleftarrow{u} X_{1,1} \xrightarrow{s} X_{1,2} \xleftarrow{v} X_{2,2}$$

in the ∞ -category $\mathcal{E}$, where the morphisms u and v are U -cocartesian. Our assumption that $\overline{f}$ factors through $\text{Cosp}^{\text{all}, R}(\mathcal{C})$ guarantees that the morphism $(2, 2) \rightarrow (0, 2)$ belongs to R . Since morphisms of R admit U -cocartesian lifts, we can choose a U -cocartesian morphism $w' : X_{2,2} \rightarrow X_{0,2}$ in $\mathcal{E}$, where $X_{0,2}$ belongs to the fiber over the object $(0, 2) \in \mathcal{C}$. Since v is also U -cocartesian, we can choose a 2-simplex σ_0 of $\mathcal{E}$ with boundary indicated in the diagram

$$\begin{array}{ccc} X_{2,2} & \xrightarrow{w'} & X_{0,2} \\ & \searrow v \quad \nearrow w & \\ & X_{1,2} & \end{array}$$

Since $\mathcal{E}$ is an ∞ -category, we can choose another 2-simplex σ_1 of $\mathcal{E}$ with boundary indicated in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{q} & X_{0,2} \\ & \searrow s \quad \nearrow w' & \\ & X_{1,2} & \end{array}$$

Invoking our assumption that u is U -cocartesian, we can choose another 2-simplex σ_2 of $\mathcal{E}$ with boundary indicated in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{q} & X_{0,2} \\ & \searrow u \quad \nearrow t & \\ & X_{0,1} & \end{array}$$

Using the fact that $\mathcal{E}$ is an ∞ -category, we obtain another 2-simplex σ_3 of $\mathcal{E}$ with boundary

indicated in the diagram

$$\begin{array}{ccc}
 X_{0,0} & \xrightarrow{\quad} & X_{0,2} \\
 & \searrow r \quad \nearrow t & \\
 & X_{0,1} &
 \end{array}$$

The 2-simplices σ_0 , σ_1 , σ_2 , and σ_3 determine a functor $F : \mathrm{Tw}(\Delta^2) \rightarrow \mathcal{C}$ extending F_0 , which we display informally as a diagram

$$\begin{array}{ccccc}
 X_{0,0} & & X_{1,1} & & X_{2,2} \\
 & \searrow r & \swarrow u & \searrow s & \swarrow v \\
 & X_{0,1} & & X_{1,2} & \\
 & \searrow t & & \swarrow w & \\
 & X_{0,2} & & &
 \end{array}$$

Since the morphism w' is U -cocartesian, the functor F satisfies condition $(*)$ and can therefore be viewed as a solution to the lifting problem (8.16). $\square$

Proof of Proposition 8.1.9.1. Combine Proposition 8.1.9.9 with Example 8.1.9.7. $\square$

Proposition 8.1.9.10. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories, let L and R be collections of morphisms of $\mathcal{C}$ which are pushout-compatible, and assume that morphisms of R admit U -cocartesian lifts. Let $\tilde{L}$ denote the collection of all morphisms f of $\mathcal{E}$ such that $U(f) \in L$, and let $\tilde{R}$ denote the collection of all U -cocartesian morphisms f of $\mathcal{E}$ such that $U(f) \in R$. Then the collections $\tilde{L}$ and $\tilde{R}$ are also pushout-compatible.* 04A7

Proof. Let $f : X \rightarrow X_1$ be a morphism of $\mathcal{E}$ which belongs to $\tilde{L}$, and let $g' : X \rightarrow X_0$ be a morphism of $\mathcal{E}$ which belongs to $\tilde{R}$. We wish to show that there exists a pushout diagram

$$\begin{array}{ccc}
 X & \xrightarrow{g'} & X_0 \\
 \downarrow f & & \downarrow f' \\
 X_1 & \xrightarrow{g} & X_{01}
 \end{array}
 \tag{8.18}$$
04A8

in the ∞ -category $\mathcal{E}$, where f' belongs to $\tilde{L}$ and g belongs to $\tilde{R}$. Since L and R are pushout compatible, there exists a pushout diagram

04A9

$$\begin{array}{ccc}
 U(X) & \xrightarrow{U(g')} & U(X_0) \\
 \downarrow U(f) & & \downarrow \bar{f}' \\
 U(X_1) & \xrightarrow{\bar{g}} & \bar{X}_{01}
 \end{array} \tag{8.19}$$

in the ∞ -category $\mathcal{C}$, where $\bar{f}'$ belongs to L and $\bar{g}$ belongs to R . Our assumption on U guarantees that $\bar{g}$ can be lifted to a U -cocartesian morphism $g : X_0 \rightarrow X_{01}$ of $\mathcal{E}$. Since U is an inner fibration, the lower left half of (8.19) can be lifted to a 2-simplex σ of $\mathcal{E}$ which we display as a diagram

$$\begin{array}{ccc}
 X & & \\
 \downarrow f & \searrow h & \\
 X_1 & \xrightarrow{g} & X_{01}.
 \end{array}$$

Since g' is U -cocartesian, we can then lift the upper right half of (8.19) to a 2-simplex τ of $\mathcal{E}$ which we display as a diagram

$$\begin{array}{ccc}
 X & \xrightarrow{g'} & X_0 \\
 & \searrow h & \downarrow f' \\
 & & X_{01}.
 \end{array}$$

Amalgamating σ and τ , we obtain a diagram of the form (8.18), where $f' \in \tilde{L}$ and $g \in \tilde{R}$. We will complete the proof by showing that this diagram is a pushout square in the ∞ -category $\mathcal{E}$. Since (8.19) is a pushout square in $\mathcal{C}$, it will suffice to show that 8.18 is a U -pushout square (Corollary 7.1.6.12). This is a special case of Proposition 7.6.2.26, since the horizontal morphisms appearing in the diagram are U -cocartesian. $\square$

04AA Remark 8.1.9.11. In the situation of Proposition 8.1.9.10, suppose that the collections L and R are closed under composition. Then $\tilde{L}$ and $\tilde{R}$ are also closed under composition (see Corollary 5.1.2.4). Applying Proposition 8.1.6.7, we deduce that the simplicial sets $\text{Cospan}^{L,R}(\mathcal{C})$ and $\text{Cospan}^{\tilde{L},\tilde{R}}(\mathcal{E})$ are $(\infty, 2)$ -categories. Moreover, it follows from the proof

of Proposition 8.1.9.10 that for every pushout diagram σ :

$$\begin{array}{ccc} X & \xrightarrow{g'} & X_0 \\ \downarrow f & & \downarrow f' \\ X_1 & \xrightarrow{g} & X_{01} \end{array}$$

in $\mathcal{E}$ where f belongs to $\tilde{L}$ and g belongs to $\tilde{R}$, the image $U(\sigma)$ is a pushout diagram in $\mathcal{C}$. Combining this observation with Corollary 8.1.6.8 and Proposition 8.1.4.2, we see that a 2-simplex of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is thin if and only if its image in $\text{Cospan}^{L, R}(\mathcal{C})$ is thin. In particular:

- The induced map $\bar{V} : \text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$ is a functor of $(\infty, 2)$ -categories.
- The functor $\bar{V}$ is an inner fibration (since it is a pullback of the inner fibration $\text{Cospan}^{\text{all}, \tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all}, R}(\mathcal{C})$ of Proposition 8.1.9.9).
- The underlying functor $V : \text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$ is also an inner fibration (since it is a pullback of $\bar{V}$).

8.1.10 Beck-Chevalley Fibrations

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. For each object $C \in \mathcal{C}$, we let $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ denote the corresponding fiber of U . If U is a cartesian fibration, then every morphism $f : C \rightarrow B$ in $\mathcal{C}$ determines a functor $f^* : \mathcal{E}_B \rightarrow \mathcal{E}_C$, given by contravariant transport along f (Definition 5.2.2.15). If U is a cocartesian fibration, then every morphism $f' : C' \rightarrow B$ determines a functor $f'_! : \mathcal{E}_{C'} \rightarrow \mathcal{E}_B$, given by covariant transport along f' (Definition 5.2.2.4). If both of these conditions are satisfied, then every cospan $C \xrightarrow{f} B \xleftarrow{f'} C'$ in $\mathcal{C}$ determines a functor from $\mathcal{E}_{C'}$ to $\mathcal{E}_C$, given by the composition $f^* \circ f'_!$. Our goal in this section is to show that, under some mild assumptions, the construction $(f, f') \mapsto f^* \circ f'_!$ is compatible with the composition law on cospans, up to coherent homotopy. More precisely, we will show that this construction is given by contravariant transport for a certain cartesian fibration between cospan constructions (Theorem 8.1.10.3 and Remark 8.1.10.4). First, we need some terminology.

Definition 8.1.10.1. Let $\mathcal{C}$ be an ∞ -category which admits pushouts. We will say that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is a *dual Beck-Chevalley fibration* if the following conditions are satisfied:

- (1) The morphism U is a cartesian fibration.

- (2) The morphism U is a cocartesian fibration.
- (3) Suppose we are given a morphism $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{E}$, which we display informally as a diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & X_0 \\ \downarrow g & & \downarrow g' \\ X_1 & \xrightarrow{f'} & X_{01}. \end{array}$$

Assume that f is U -cartesian, that g' is U -cocartesian, and that $U(\sigma)$ is a pushout square in $\mathcal{C}$. Then f' is U -cartesian if and only if g is U -cocartesian.

04AD Example 8.1.10.2. Let $\mathcal{E} = \text{Mod}(\text{Ab})$ denote the category of pairs (A, M) , where A is a commutative ring and M is an A -module (see Example 5.0.0.2). Let $\mathcal{C}$ denote the category of commutative rings and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be the forgetful functor $(A, M) \mapsto A$. Then (the nerve of) U is a dual Beck-Chevalley fibration, in the sense of Definition 8.1.10.1. To see this, suppose we are given a commutative diagram σ :

$$\begin{array}{ccc} (A, M) & \xrightarrow{f} & (A_0, M_0) \\ \downarrow g & & \downarrow g' \\ (A_1, M_1) & \xrightarrow{f'} & (A_{01}, M_{01}) \end{array}$$

in the category $\mathcal{E}$. Then:

- The morphism f is U -cartesian if and only if the underlying map $M \rightarrow M_1$ is an isomorphism of A -modules.
- The morphism g' is U -cocartesian if and only if it exhibits M_{01} as obtained from M_1 by extending scalars along the ring homomorphism $A_1 \rightarrow A_{01}$: that is, if and only if it induces an isomorphism $A_{01} \otimes_{A_1} M_1 \rightarrow M_{01}$.
- The image of σ is a pushout diagram in $\mathcal{C}$ if and only if the induced map $A_0 \otimes_A A_1 \rightarrow A_{01}$ is an isomorphism.

If all three of these conditions are satisfied, then the composite map $A_0 \otimes_A M \rightarrow M_0 \rightarrow M_{01}$ is an isomorphism. Using the two-out-of-three property, we conclude that f' is U -cartesian if and only if g is U -cocartesian.

We can now formulate our main result, which we prove at the end of this section.

Theorem 8.1.10.3. *Let $\mathcal{C}$ be an ∞ -category which admits pushouts, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a dual Beck-Chevalley fibration and let R denote the collection of all U -cocartesian morphisms of $\mathcal{E}$. Then the map $\text{Cospan}(U) : \text{Cospan}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$ restricts to a cartesian fibration of ∞ -categories*

$$V : \text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}(\mathcal{C})).$$

Moreover, a morphism of $\text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E}))$ is V -cartesian if and only if it corresponds to a cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category $\mathcal{E}$, where f is U -cartesian and g is U -cocartesian.

Remark 8.1.10.4 (Contravariant Transport for Cospan Fibrations). In the situation of Theorem 8.1.10.3, let C and C' be objects of $\mathcal{C}$, so that Proposition 8.1.7.6 supplies equivalences of ∞ -categories

$$\rho_+^C : \mathcal{E}_C \hookrightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E}_C) = V^{-1}\{C\} \quad \rho_+^{C'} : \mathcal{E}_{C'} \hookrightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E}_{C'}) = V^{-1}\{C'\}.$$

Let e be a morphism from C to C' in the $(\infty, 2)$ -category $\text{Cospan}(\mathcal{C})$, which we identify with a pair of morphisms $C \xrightarrow{f} B \xleftarrow{f'} C'$ in the ∞ -category $\mathcal{C}$. Choose functors $f^* : \mathcal{E}_B \rightarrow \mathcal{E}_C$, $f'_! : \mathcal{E}_{C'} \rightarrow \mathcal{E}_B$ and diagrams

$$\begin{array}{ccccc} \Delta^1 \times \mathcal{E}_B & \xrightarrow{H} & \mathcal{E} & \xleftarrow{H'} & \Delta^1 \times \mathcal{E}_{C'} \\ \downarrow & & \downarrow U & & \downarrow \\ \Delta^1 & \xrightarrow{f} & \mathcal{C} & \xleftarrow{f'} & \Delta^1 \end{array}$$

which exhibit f^* and $f'_!$ as given by contravariant and covariant transport along f and f' , respectively (see Definitions 5.2.2.4 and 5.2.2.15). Then the composition

$$\begin{aligned} \text{Tw}(\Delta^1 \times \mathcal{E}_{C'}) &\simeq \text{Tw}(\Delta^1) \times \text{Tw}(\mathcal{E}_{C'}) \\ &\rightarrow \text{Tw}(\Delta^1) \times \mathcal{E}_{C'} \\ &\simeq (\text{N}_\bullet(\{(0, 0) < (0, 1)\}) \amalg_{\text{N}_\bullet(\{(0, 1)\})} \text{N}_\bullet(\{(1, 1) < (0, 1)\})) \times \mathcal{E}_{C'} \\ &\rightarrow \mathcal{E} \end{aligned}$$

can be identified with a functor $T : \Delta^1 \times \mathcal{E}_{C'} \rightarrow \text{Cospan}(\mathcal{E})$ which fits into a commutative diagram

$$\begin{array}{ccc} \Delta^1 \times \mathcal{E}_{C'} & \xrightarrow{T} & \text{Pith}(\text{Cospan}^{\text{all}, W}(\mathcal{E})) \\ \downarrow & & \downarrow V \\ \Delta^1 & \xrightarrow{e} & \text{Pith}(\text{Cospan}(\mathcal{C})). \end{array}$$

For each object $X \in \mathcal{E}_{C'}$, the characterization of V -cartesian morphisms given in Theorem 8.1.10.3 shows that $T|_{\Delta^1 \times \{X\}}$ is a V -cartesian morphism of $\text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E}))$. It follows that the diagram

$$\begin{array}{ccccc} \mathcal{E}_{C'} & \xrightarrow{f'_!} & \mathcal{E}_B & \xrightarrow{f^*} & \mathcal{E}_C \\ \downarrow \rho_+^{C'} & & & & \downarrow \rho_+^C \\ V^{-1}\{C'\} & \xrightarrow{e^*} & & & V^{-1}\{C\} \end{array}$$

commutes up to homotopy, where the functor e^* is given by contravariant transport along e (for the cartesian fibration V).

04AG Corollary 8.1.10.5. *Let $\mathcal{C}$ be an ∞ -category which admits pushouts, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a dual Beck-Chevalley fibration, let L be the collection of all U -cartesian morphisms of $\mathcal{C}$, and let R be the collection of all U -cocartesian morphisms of $\mathcal{C}$. Then $\text{Cospan}^{L,R}(\mathcal{E})$ is an $(\infty, 2)$ -category, and U induces a right fibration of ∞ -categories $\text{Pith}(\text{Cospan}^{L,R}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}(\mathcal{C}))$.*

Proof. The collections L and R are closed under composition (Corollary 5.1.2.4) and pushout-compatible by virtue of our assumption that U is a Beck-Chevalley fibration. Using Proposition 8.1.6.7, we see that $\text{Cospan}^{L,R}(\mathcal{E})$ is an $(\infty, 2)$ -category. Moreover, the pith of $\text{Cospan}^{L,R}(\mathcal{E})$ can be identified with the subcategory of $\text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E}))$ spanned by those morphisms which are cartesian with respect to the fibration $V : \text{Pith}(\text{Cospan}^{\text{all}, R}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}(\mathcal{C}))$ of Theorem 8.1.10.3. The desired result now follows from Corollary 5.1.4.16. $\square$

For later use, we will prove a more general form of Theorem 8.1.10.3, where we place some restrictions on the cospans under consideration. This will allow us to loosen the requirements of Definition 8.1.10.1.

04AH Definition 8.1.10.6. Let $\mathcal{C}$ be an ∞ -category and let L and R be collections of morphisms of $\mathcal{C}$ which are pushout-compatible (Definition 8.1.6.5). We will say that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is a *dual Beck-Chevalley fibration relative to (L, R)* if the following conditions are satisfied:

- (1) Every morphism of $\mathcal{C}$ which belongs to L admits U -cartesian lifts (Definition 8.1.9.5).
- (2) Every morphism of $\mathcal{C}$ which belongs to R admits U -cocartesian lifts.
- (3) Suppose we are given a morphism $\sigma : \Delta^1 \times \Delta^1 \rightarrow \mathcal{E}$, which we display informally as a

diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & X_0 \\ \downarrow g & & \downarrow g' \\ X_1 & \xrightarrow{f'} & X_{01}. \end{array}$$

Assume that f is U -cartesian, that g is U -cocartesian, that $U(f)$ belongs to L , that $U(g)$ belongs to R , and that $U(\sigma)$ is a pushout square in $\mathcal{C}$. Then f' is U -cartesian if and only if g is U -cocartesian.

Example 8.1.10.7. Let $\mathcal{C}$ be an ∞ -category which admits pushouts and let A denote the 04AJ collection of all morphisms of $\mathcal{C}$. Then an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is a dual Beck-Chevalley fibration (in the sense of Definition 8.1.10.6) if and only if it is a dual Beck-Chevalley fibration relative to (A, A) (in the sense of Definition 8.1.10.6).

Example 8.1.10.8. In the situation of Definition 8.1.10.6, suppose that L is the collection 04AK of all isomorphisms in $\mathcal{C}$. Then condition (1) is equivalent to the requirement that U is an isofibration (Example 8.1.9.8), and condition (3) is automatic. Similarly, if R is the collection of all isomorphisms in $\mathcal{C}$, then condition (2) is the requirement that U is an isofibration, and condition (3) is automatic.

Theorem 8.1.10.9. Let $\mathcal{C}$ be an ∞ -category, let L and R be collections of morphisms of 04AL $\mathcal{C}$ which are closed under composition and pushout-compatible. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a dual Beck-Chevalley fibration with respect to (L, R) and define $\tilde{L}$ and $\tilde{R}$ as in Proposition 8.1.9.10. Then the functor $V : \text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$ of Remark 8.1.9.11 is a cartesian fibration of ∞ -categories. Moreover, a morphism e of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is V -cartesian if and only if it satisfies the following condition:

- (*) The morphism e corresponds to a cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category $\mathcal{E}$, where f is U -cartesian and g is U -cocartesian.

Proof. Let us say that a morphism e of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is *special* if it satisfies condition (*). We first show that every special morphism e of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is V -cartesian. Suppose we are given an integer $n \geq 2$ and a lifting problem

$$\begin{array}{ccc} \Lambda_n^n & \xrightarrow{h_0} & \text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) \\ \downarrow & \nearrow h & \downarrow U' \\ \Delta^n & \xrightarrow{\bar{h}} & \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C})), \end{array} \quad (8.20) \quad 04AM$$

where the composition

$$\Delta^1 \simeq N_\bullet(\{n-1 < n\}) \subseteq \Lambda_n^n \xrightarrow{h_0} \text{Cospans}^{\tilde{L}, \tilde{R}}(\mathcal{E})$$

coincides with the edge e ; we wish to show that (8.20) admits a solution. Let us identify $\bar{h}$ with a diagram $\bar{F} : \text{Tw}(\Delta^n) \rightarrow \mathcal{E}$ and h_0 with a diagram $H_0 : \text{Tw}(\Lambda_n^n) \rightarrow \mathcal{C}$ satisfying $U \circ H_0 = \bar{H}|_{\text{Tw}(\Lambda_n^n)}$. We first treat the case $n = 2$. In this case, we can identify F_0 with a pair of cospans

$$X_{0,0} \xrightarrow{f'} X_{0,2} \xleftarrow{g'} X_{2,2} \quad X_{1,1} \xrightarrow{f} X_{1,2} \xleftarrow{g} X_{2,2}$$

in the ∞ -category $\mathcal{E}$, where $f, f' \in \tilde{L}$ and $g, g' \in \tilde{R}$. Since g is U -cocartesian, we can lift $\bar{H}((2, 2) \rightarrow (1, 2) \rightarrow (0, 2))$ to a 2-simplex σ_0 of $\mathcal{E}$ whose boundary we display in the diagram

$$\begin{array}{ccc} X_{2,2} & \xrightarrow{g'} & X_{0,2} \\ & \searrow g \quad \nearrow g'' & \\ & X_{1,2} & \end{array}$$

Since g and g' are U -cocartesian by assumption, Corollary 5.1.2.4 guarantees that g'' is also U -cocartesian. Since U is an inner fibration, we can lift $\bar{H}((1, 1) \rightarrow (1, 2) \rightarrow (0, 2))$ to a 2-simplex σ_1 of $\mathcal{E}$, whose boundary we display in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{s} & X_{0,2} \\ & \searrow f \quad \nearrow g'' & \\ & X_{1,2} & \end{array}$$

Since morphisms of R admit U -cocartesian lifts, we can lift $\bar{H}((1, 1) \rightarrow (0, 1) \rightarrow (0, 2))$ to a 2-simplex σ_2 of $\mathcal{E}$ displayed in the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{s} & X_{0,2} \\ & \searrow g''' \quad \nearrow f'' & \\ & X_{0,1} & \end{array}$$

where g''' is U -cocartesian. Applying condition (3) of Definition 8.1.10.6 to the diagram

$$\begin{array}{ccc} X_{1,1} & \xrightarrow{f} & X_{1,2} \\ \downarrow g''' & & \downarrow g'' \\ X_{0,1} & \xrightarrow{f''} & X_{0,2}, \end{array}$$

we deduce that the morphism f'' is U -cartesian. We can therefore lift $\overline{H}((0,0) \rightarrow (0,1) \rightarrow (0,2))$ to a 2-simplex σ_3 of $\mathcal{E}$ which we display as a diagram

$$\begin{array}{ccc} X_{0,0} & \xrightarrow{f'} & X_{0,2} \\ & \searrow f''' & \nearrow f'' \\ & X_{0,1} & \end{array}$$

The 2-simplices σ_0 , σ_1 , σ_2 , and σ_3 can then be amalgamated into a functor $H : \mathrm{Tw}(\Delta^2) \rightarrow \mathcal{E}$ which we display informally as a diagram

$$\begin{array}{ccccc} X_{0,0} & & X_{1,1} & & X_{2,2} \\ & \searrow f''' & \swarrow g''' & \searrow f & \swarrow g \\ & X_{0,1} & & X_{1,2} & \\ & \searrow f'' & & \swarrow g'' & \\ & X_{0,2} & & & \end{array}$$

which is a solution to the lifting problem (8.20).

We now treat the case $n \geq 3$. By virtue of Lemma 8.1.4.6, it will suffice to show that the following conditions are satisfied:

- (a) The functor F_0 carries the edge $(n, n) \rightarrow (n-1, n)$ of $\mathrm{Tw}(\Lambda_n^n)$ to a U -cocartesian edge of $\mathcal{E}$.
- (b) The functor F_0 carries the edge $(0, n-1) \rightarrow (0, n)$ of $\mathrm{Tw}(\Lambda_n^n)$ to a U -cartesian edge of $\mathcal{E}$.

Assertion (a) follows immediately from our requirement that f_0 factors through $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$. To prove (b), we observe that F_0 determines a commutative diagram τ :

$$\begin{array}{ccc} F_0(n-1, n-1) & \xrightarrow{f} & F_0(n-1, n) \\ \downarrow g & & \downarrow g' \\ F_0(0, n-1) & \xrightarrow{f'} & F_0(0, n) \end{array}$$

in the ∞ -category $\mathcal{E}$, where $f \in \tilde{L}$ and $g \in \tilde{R}$. Our assumption that e is special guarantees that f is U -cartesian, and our assumption that $\bar{h}$ factors through the pith of $\text{Cospan}^{L, R}(\mathcal{C})$ guarantees that $U(\tau)$ is a pushout diagram in $\mathcal{C}$. Applying Corollary 5.1.2.4 to the diagram

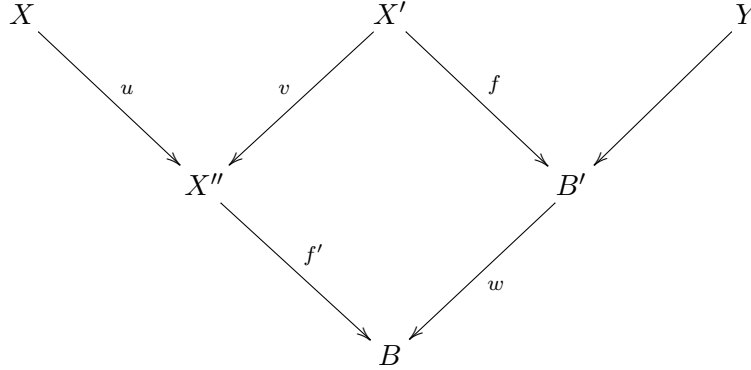

$$\begin{array}{ccc} F_0(n, n) & \xrightarrow{\quad} & F_0(0, n) \\ & \searrow & \nearrow g' \\ & F_0(n-1, n), & \end{array}$$

we see that g' is U -cocartesian. Condition (3) of Definition 8.1.10.6 then guarantees that f' is U -cartesian, as desired. This completes the proof that every special morphism of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is V -cartesian.

It follows from Remark 8.1.9.11 that V is an inner fibration of ∞ -categories. To show that V is a cartesian fibration, it will suffice to show that for every object $Y \in \mathcal{E}$ and every morphism $\bar{e} : \bar{X} \rightarrow U(Y)$ in the ∞ -category $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$, there exists a special morphism $e : X \rightarrow Y$ in $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$ satisfying $V(e) = \bar{e}$. Let us identify $\bar{e}$ with a cospan $\bar{X} \xrightarrow{\bar{f}} \bar{B} \xleftarrow{\bar{g}} U(Y)$ in the ∞ -category $\mathcal{C}$. Then $\bar{g}$ belongs to R , and can therefore be lifted to a U -cocartesian morphism $g : Y \rightarrow B$ in the ∞ -category $\mathcal{E}$. Since $\bar{f}$ belongs to L , it can be lifted to a U -cartesian morphism $f : X \rightarrow B$ in the ∞ -category $\mathcal{E}$. The cospan $X \xrightarrow{f} B \xleftarrow{g} Y$ then determines a special morphism $e : X \rightarrow Y$ of $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$ satisfying $V(e) = \bar{e}$.

We now complete the proof of Theorem 8.1.10.3 by showing that every V -cartesian morphism $e : X \rightarrow Y$ of $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$ is special. Let $\bar{e}$ denote the image of e in $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$. Arguing as above, we can lift $\bar{e}$ to a special morphism $e' : X' \rightarrow Y$ of $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$. Then e' is also V -cartesian. Applying Remark 5.1.3.8, we can choose a 2-simplex σ of $\text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$ which exhibits e as the composition of e' with

an isomorphism in the ∞ -category $\mathrm{Pith}(\mathrm{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}))$. Let us identify σ with a diagram

in the ∞ -category $\mathcal{E}$. Corollary 8.1.6.10 implies that u and v are isomorphisms in $\mathcal{E}$. Since the inner region is a pushout diagram in $\mathcal{E}$, it follows that w is also an isomorphism (Corollary 7.6.2.27). Our assumption that e' is special guarantees that f is U -cartesian. Applying Corollary 5.1.2.5, we deduce that f' is U -cartesian. It follows that any composition of f' with u is U -cartesian (Corollary 5.1.2.4), so that the morphism e is also special. $\square$

Proof of Theorem 8.1.10.3. Apply Theorem 8.1.10.9 in the special case $L = A = R$, where A is the collection of all morphisms in the ∞ -category $\mathcal{C}$ (Example 8.1.10.7). $\square$

Remark 8.1.10.10. In the situation of Theorem 8.1.10.9, the morphism

04AN

$$\bar{V} : \mathrm{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \rightarrow \mathrm{Cospan}^{L, R}(\mathcal{C})$$

is a locally cartesian fibration. To prove this, we observe that Remark 8.1.9.11 guarantees that $\bar{V}$ is an inner fibration of $(\infty, 2)$ -categories and that the diagram

$$\begin{array}{ccc} \mathrm{Pith}(\mathrm{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) & \longrightarrow & \mathrm{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \\ \downarrow V & & \downarrow \bar{V} \\ \mathrm{Pith}(\mathrm{Cospan}^{L, R}(\mathcal{C})) & \longrightarrow & \mathrm{Cospan}^{L, R}(\mathcal{C}) \end{array}$$

is a pullback square. Since every morphism of $\mathrm{Cospan}^{L, R}(\mathcal{C})$ is contained in the pith $\mathrm{Pith}(\mathrm{Cospan}^{L, R}(\mathcal{C}))$, the desired result follows from Theorem 8.1.10.9 (see Remark 5.1.5.6).

Remark 8.1.10.11. In the situation of Theorem 8.1.10.9, suppose that $\mathrm{Cospan}^{L, R}(\mathcal{C})$ is an ∞ -category (this condition is satisfied, for example, if either L or R consists of isomorphisms; see Proposition 8.1.7.5). Then every 2-simplex of $\mathrm{Cospan}^{L, R}(\mathcal{C})$ is thin. Applying Remark

04AP

8.1.9.11, we deduce that every 2-simplex of $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is thin, so that $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is also an ∞ -category (Example 2.3.2.4). In this case, Theorem 8.1.10.9 asserts that the projection map $V : \text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{L, R}(\mathcal{E})$ is a cartesian fibration.

We also have the following variant of Corollary 8.1.10.5:

04AQ Corollary 8.1.10.12. *Let $\mathcal{C}$ be an ∞ -category, let L and R be collections of morphisms of $\mathcal{C}$ which are closed under composition and pushout-compatible. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a dual Beck-Chevalley fibration with respect to (L, R) , let $\tilde{L}$ denote the collection of all U -cartesian morphisms f of $\mathcal{E}$ such that $U(f) \in L$, and let $\tilde{R}$ denote the collection of all U -cocartesian morphisms f of $\mathcal{E}$ such that $U(f) \in R$. Then:*

- (1) *The simplicial set $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is an $(\infty, 2)$ -category.*
- (2) *The morphism U induces a right fibration $\text{Pith}(\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})) \rightarrow \text{Pith}(\text{Cospan}^{L, R}(\mathcal{C}))$.*
- (3) *If $\text{Cospan}^{L, R}(\mathcal{C})$ is an ∞ -category, then $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E})$ is an ∞ -category, and U induces a right fibration $\text{Cospan}^{\tilde{L}, \tilde{R}}(\mathcal{E}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$.*

04AR Example 8.1.10.13. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories and let L and R be collections of morphisms of $\mathcal{C}$ which are closed under composition and pushout-compatible. Assume that the following conditions are satisfied:

- (0) Let $f : X \rightarrow Y$ be a morphism of $\mathcal{E}$. If $U(f)$ belongs to L , then f is U -cartesian. If $U(f)$ belongs to R , then f is U -cocartesian.
- (1) For every object $Y \in \mathcal{E}$ and every morphism $\bar{f} : \bar{X} \rightarrow U(Y)$ of $\mathcal{C}$ which belongs to L , there exists a morphism $f : X \rightarrow Y$ of $\mathcal{E}$ satisfying $U(f) = \bar{f}$.
- (2) For every object $X \in \mathcal{E}$ and every morphism $\bar{f} : U(X) \rightarrow \bar{Y}$ of $\mathcal{C}$ which belongs to R , there exists a morphism $f : X \rightarrow Y$ of $\mathcal{E}$ satisfying $U(f) = \bar{f}$.

Then U is a dual Beck-Chevalley fibration relative to (L, R) . Applying Remark 8.1.10.10, we deduce that the projection map

$$V : \text{Cospan}(\mathcal{E}) \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{L, R}(\mathcal{C}) \rightarrow \text{Cospan}^{L, R}(\mathcal{C})$$

is a locally cartesian fibration. Corollary 8.1.10.12 guarantees that each fiber of V is a Kan complex, so that V is a right fibration (Corollary 5.1.5.12).

8.2 Couplings of ∞ -Categories

We now axiomatize an essential feature of the twisted arrow construction introduced in §8.1. 043P

Definition 8.2.0.1. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. A *coupling of $\mathcal{C}_+$ with $\mathcal{C}_-$* is an ∞ -category $\mathcal{C}$ equipped with a left fibration $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$. 043Q

In the situation of Definition 8.2.0.1, we will often refer to the functor $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ as a *coupling of ∞ -categories*. This terminology signifies both that λ is a left fibration and that its target is equipped with a *specified* factorization as a product of ∞ -categories $\mathcal{C}_-^{\text{op}}$ and $\mathcal{C}_+$.

Example 8.2.0.2 (The Twisted Arrow Coupling). Let $\mathcal{C}$ be an ∞ -category. Then the map $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Notation 8.1.1.6 is a coupling of $\mathcal{C}$ with itself (Proposition 8.1.1.11). We will refer to λ as the *twisted arrow coupling* of the ∞ -category $\mathcal{C}$. 043R

Construction 8.2.0.3. Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories. Pulling back the left fibration $\text{Tw}(\mathcal{C}_-) \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-$ of Proposition 8.1.1.11, we obtain a left fibration of ∞ -categories 043S

$$\lambda_G : \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+ \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+,$$

which we regard as a coupling of $\mathcal{C}_+$ with $\mathcal{C}_-$. We will refer to λ_G as the *coupling associated to the functor G* .

We say that a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is *representable* if, for every object $C_+ \in \mathcal{C}_+$, the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$ has an initial object (Definition 8.2.1.3). It is not difficult to show that, for every functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, the coupling λ_G of Construction 8.2.0.3 is representable (Variant 8.2.1.6). Our primary goal in this section is to prove the converse:

Theorem 8.2.0.4. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. Then the assignment $G \mapsto \lambda_G$ of Construction 8.2.0.3 induces a bijection 043T

$$\begin{array}{c} \{\text{Functors } G : \mathcal{C}_+ \rightarrow \mathcal{C}_-\} / \text{Isomorphism} \\ \downarrow \\ \{\text{Representable couplings } \lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+\} / \text{Equivalence.} \end{array}$$

Remark 8.2.0.5. Let $\mathcal{C}_-$ be a (locally small) ∞ -category. For every ∞ -category $\mathcal{C}_+$, Corollary 5.6.0.6 supplies an identification of equivalence classes of couplings $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ (having essentially small fibers) with isomorphism classes of functors $T : \mathcal{C}_+ \rightarrow$ 043U

$\mathrm{Fun}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})$. Moreover, λ is representable if and only if T factors through the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})$ spanned by the representable functors (see Proposition 5.6.6.21). Consequently, Theorem 8.2.0.4 supplies a bijection

$$\mathrm{Hom}_{\mathrm{hQC}\mathrm{at}}(\mathcal{C}_+, \mathcal{C}_-) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{hQC}\mathrm{at}}(\mathcal{C}_+, \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})).$$

It is not hard to see that this bijection depends functorially on $\mathcal{C}_+$, and is therefore induced by an isomorphism $\mathcal{C}_- \simeq \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{S})$ in the homotopy category $\mathrm{hQC}\mathrm{at}$. We can therefore regard Theorem 8.2.0.4 as an “implicit” version of Yoneda’s lemma. We will give a more precise formulation in §8.3 (see Theorem 8.3.3.13).

Let us outline our approach to Theorem 8.2.0.4. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. For a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, we say that λ is *representable by G* if it is equivalent to the coupling λ_G of Construction 8.2.0.3 (Definition 8.2.3.1). Theorem 8.2.0.4 asserts that every representable coupling is representable by some functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, which is uniquely determined up to isomorphism. To prove this, we need to construct a commutative diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \mathrm{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{\mathrm{id} \times G} & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- \end{array} \quad (8.21)$$

which is a categorical pullback square; in this case, we say that (8.21) *exhibits λ as represented by G* (Definition 8.2.3.5).

It will be useful to place this problem in a somewhat larger context. Suppose that $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ is another coupling of ∞ -categories. We will refer to a commutative diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\mathrm{op}} \times F_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ \end{array} \quad (8.22)$$

as a *morphism of couplings* from λ to μ (Definition 8.2.2.1). The collection of such diagrams can be organized into an ∞ -category $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$, which is equipped with a forgetful functor

$$\Phi : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+).$$

It is not difficult to see that Φ is also a left fibration: that is, it can be regarded as a coupling of the ∞ -category $\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$ with the ∞ -category $\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)$ (Proposition

8.2.2.2). Suppose now that the coupling λ is representable, and that the coupling μ is corepresentable (that is, for every object $D_- \in \mathcal{D}_-$, the ∞ -category $\{D_-\} \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$ has an initial object). In §8.2.2, we show these assumptions imply that the coupling Φ is also corepresentable (Theorem 8.2.2.11). In particular, every functor $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ has a canonical promotion to a commutative diagram of the form (8.22), which is characterized (up to isomorphism) by the requirement that it represents an initial object of the ∞ -category $\{F_-\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$. In §8.2.3, we specialize this assertion to the situation where μ is the twisted arrow coupling $\text{Tw}(\mathcal{C}_-) \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and F_- is the identity functor from $\mathcal{C}_-$ to itself. In this case, we obtain a diagram of the form (8.21) and use it to deduce Theorem 8.2.0.4.

Every assertion in the preceding discussion has a dual counterpart, where the assumption of representability is replaced by corepresentability (and vice versa). If $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is a corepresentable coupling of ∞ -categories, then Theorem 8.2.0.4 guarantees the existence of a categorical pullback square

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \text{Tw}(\mathcal{C}_+) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F^{\text{op}} \times \text{id}} & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ . \end{array}$$

for some functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$, which is uniquely determined up to isomorphism; in this case, we say that the coupling λ is *corepresentable by F* (Variant 8.2.3.8). In §8.2.5, we study couplings which are simultaneously representable and corepresentable. Our main result asserts that if a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$, then it is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ if and only if F is left adjoint to G (Theorem 8.2.5.1). Our proof is based on an alternative characterization of the corepresenting functor F , which we explain in §8.2.4.

Let $\mathcal{C}$ be an ∞ -category. Then the twisted arrow coupling $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ has the following features:

- (a) The coupling λ is corepresentable. That is, for every object $X \in \mathcal{C}$, the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ has an initial object.
- (b) The coupling λ is representable. That is, for every object $Y \in \mathcal{C}$, the ∞ -category $\text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$ has an initial object.
- (c) Let f be an object of the ∞ -category $\text{Tw}(\mathcal{C})$, which we regard as a morphism $X \rightarrow Y$ in the ∞ -category $\mathcal{C}$. Then f is initial when viewed as an object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ if and only if it is initial when viewed as an object of the ∞ -category

$\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\}$ (by virtue of Corollary 8.1.2.21, both conditions are equivalent to the requirement that f corresponds to an isomorphism in the ∞ -category $\mathcal{C}$).

In §8.2.6, we show that twisted arrow couplings are characterized (up to equivalence) by these properties. More precisely, we show that a coupling $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ satisfies conditions (a), (b) and (c) if and only if it is representable (or corepresentable) by an equivalence of ∞ -categories (Theorem 8.2.6.6), and therefore equivalent to the twisted arrow ∞ -category associated to the ∞ -category $\mathcal{D}_-$ (or $\mathcal{D}_+$). In this case, we say that the coupling λ is *balanced* (Definition 8.2.6.1).

8.2.1 Representable Couplings

043X We now axiomatize an essential feature of the couplings that can be obtained from Construction 8.2.0.3.

043Y **Definition 8.2.1.1.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let C be an object of $\mathcal{C}$, having image $\lambda(C) = (C_-, C_+) \in \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$. We say that X is *universal* if it is an initial object of the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$, and *couniversal* if it is an initial object of the ∞ -category $\{C_-\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$.

043Z **Remark 8.2.1.2** (Uniqueness). Let $\lambda = (\lambda_+, \lambda_-) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories, let C be a universal object of $\mathcal{C}$, and let D be another object of $\mathcal{C}$. The following conditions are equivalent:

- The object C is isomorphic to D (as an object of the ∞ -category $\mathcal{C}$).
- The object D is universal, and $\lambda_+(D)$ is isomorphic to $\lambda_+(C)$ (as an object of the ∞ -category $\mathcal{C}_+$).

0440 **Definition 8.2.1.3.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories.

- We say that λ is *representable* if, for every object $C_+ \in \mathcal{C}_+$, there exists a universal object $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$.
- We say that λ is *corepresentable* if, for every object $C_- \in \mathcal{C}_-$, there exists a couniversal object $C \in \mathcal{C}$ satisfying $\lambda_-(C) = C_-$.

0441 **Remark 8.2.1.4** (Symmetry). Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories, and let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of $\mathcal{C}_+$ with $\mathcal{C}_-$. Then the transposition $\lambda' = (\lambda_+, \lambda_-)$ can be regarded as a coupling of $\mathcal{C}_-^{\mathrm{op}}$ with $\mathcal{C}_+^{\mathrm{op}}$. In this situation:

- An object $C \in \mathcal{C}$ is universal for the coupling λ if and only if it is couniversal for the coupling λ' .

- The coupling λ is representable if and only if the coupling λ' is corepresentable.

Example 8.2.1.5. Let $\mathcal{C}$ be an ∞ -category and let $\lambda : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ be the twisted 0442
arrow coupling of Example 8.2.0.2. For every morphism $f : X \rightarrow Y$ in the ∞ -category $\mathcal{C}$, Corollary 8.1.2.21 asserts that the following conditions are equivalent:

- (1) The morphism f is an isomorphism in $\mathcal{C}$.
- (2) As an object of $\mathrm{Tw}(\mathcal{C})$, f is couniversal with respect to the coupling λ .
- (3) As an object of $\mathrm{Tw}(\mathcal{C})$, f is universal with respect to the coupling λ .

In particular, the coupling λ is both representable and corepresentable.

Variant 8.2.1.6. Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories, set $\mathcal{C} = \mathrm{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+$, 0443
and let $\lambda_G : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ denote the coupling of Construction 8.2.0.3. Unwinding the definitions, we see that objects of $\mathcal{C}$ can be identified with pairs (e, C_+) , where C_+ is an object of the ∞ -category $\mathcal{C}_+$ and $e : C_- \rightarrow G(C_+)$ is a morphism in the ∞ -category $\mathcal{C}_-$. It follows from Example 8.2.1.5 that an object $(e, C_+) \in \mathcal{C}$ is universal if and only if e is an isomorphism in the ∞ -category $\mathcal{C}_-$. Note that every object $C_+ \in \mathcal{C}_+$ can be lifted to a universal object of $\mathcal{C}$ (for example, we can choose e to be the identity morphism from $G(C_+)$ to itself), so that the coupling λ_G is representable. In §8.2.3, we will prove the converse: every representable coupling of ∞ -categories can be obtained (up to equivalence) from Construction 8.2.0.3 (Theorem 8.2.0.4).

Our goal in this section is to establish a universal mapping property of (co)representable couplings (Proposition 8.2.1.8). First, we give a reformulation of Definition 8.2.0.1 (compare with Corollary 8.1.1.14).

Proposition 8.2.1.7. *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. Then a morphism of simplicial 0444
sets $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is a left fibration if and only if it satisfies the following conditions:*

- (1) *The morphism λ is an isofibration; in particular, $\mathcal{C}$ is an ∞ -category.*
- (2) *The functor $\lambda_- : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}}$ is a cocartesian fibration. Moreover, a morphism u of $\mathcal{C}$ is λ_- -cocartesian if and only if $\lambda_+(u)$ is an isomorphism in $\mathcal{C}_+$.*
- (3) *The functor $\lambda_+ : \mathcal{C} \rightarrow \mathcal{C}_+$ is a cocartesian fibration. Moreover, a morphism u of $\mathcal{C}$ is λ_+ -cocartesian if and only if $\lambda_-(u)$ is an isomorphism in $\mathcal{C}_-^{\mathrm{op}}$.*

Proof. Suppose first that λ is a left fibration. Then λ is a cocartesian fibration, and every morphism of $\mathcal{C}$ is λ -cocartesian (Proposition 5.1.4.15). In particular, λ is an isofibration. Let $\pi_- : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{C}_-^{\mathrm{op}}$ and $\pi_+ : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{C}_+$ denote the projection maps. Note that

π_- is a cocartesian fibration, and that a morphism (u_-, u_+) of $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is π_- -cocartesian if and only if $u_+ = \pi_+(u_-, u_+)$ is an isomorphism in the ∞ -category $\mathcal{C}_+$ (see Remark 5.1.4.6). Applying Proposition 5.1.4.14, we see that $\lambda_- = \pi_- \circ \lambda$ is also a cocartesian fibration, and that a morphism u of $\mathcal{C}$ is λ_- -cocartesian if and only if $\pi_+(\lambda(u)) = \lambda_+(u)$ is an isomorphism in $\mathcal{C}_+$. This proves assertion (2), and assertion (3) follows by a similar argument.

We now prove the converse. Suppose that λ satisfies conditions (1), (2), and (3); we wish to show that λ is a left fibration. We first show that λ is a cocartesian fibration. Fix an object $X \in \mathcal{C}$ having image $\bar{X} = \lambda(X)$, together with a morphism $\bar{w} : \bar{X} \rightarrow \bar{Z}$ in the product $\mathcal{C}_- \times \mathcal{C}_+$. We wish to show that we can write $\bar{u} = \lambda(w)$ for some λ -cocartesian morphism $w : X \rightarrow Z$ in $\mathcal{C}$. Invoking assumption (2), we can choose a λ_- -cocartesian morphism $u : X \rightarrow Y$ of $\mathcal{C}$ satisfying $\lambda_-(u) = \pi_-(\bar{w})$. Set $\bar{Y} = \lambda(Y)$ and $\bar{u} = \lambda(u)$. Note that the morphism $\lambda_+(u) = \pi_+(\bar{u})$ is an isomorphism in the ∞ -category $\mathcal{C}_+$. We can therefore choose a 2-simplex $\bar{\sigma}$ of $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ as indicated in the diagram

$$\begin{array}{ccc} & \bar{Y} & \\ \bar{u} \nearrow & & \searrow \bar{v} \\ \bar{X} & \xrightarrow{\bar{w}} & \bar{Z}, \end{array}$$

for which the image $\pi_-(\bar{\sigma})$ is a right-degenerate 2-simplex of $\mathcal{C}_-^{\text{op}}$. Note that, if v can be lifted to a λ -cocartesian morphism $v : Y \rightarrow Z$ of $\mathcal{C}$, then assumption (1) guarantees that we can lift $\bar{\sigma}$ to a diagram

$$\begin{array}{ccc} & Y & \\ u \nearrow & & \searrow v \\ X & \xrightarrow{w} & Z \end{array}$$

in the ∞ -category $\mathcal{C}$, where w is λ -cocartesian by virtue of Proposition 5.1.4.13. Consequently, to prove the existence of w , we can replace $\bar{w}$ by $\bar{v}$ and thereby reduce to the case where $\lambda_-(\bar{w})$ is an isomorphism in the ∞ -category $\mathcal{C}_-^{\text{op}}$. Repeating this argument with the roles of $\mathcal{C}_-^{\text{op}}$ and $\mathcal{C}_+$ interchanged, we may also assume that $\lambda_+(\bar{w})$ is an isomorphism in the ∞ -category $\mathcal{C}_+$. In this case, assumption (1) guarantees that we can lift $\bar{w}$ to an isomorphism $w : X \rightarrow Z$ in the ∞ -category $\mathcal{C}$, which is λ -cocartesian by virtue of Proposition 5.1.1.9. This completes the proof that λ is a cocartesian fibration.

To complete the proof that λ is a left fibration, it will suffice to show that every morphism $w : X \rightarrow Z$ in $\mathcal{C}$ is λ -cocartesian (see Proposition 5.1.4.15). Arguing as in Remark 5.1.3.8,

we can choose a diagram

$$\begin{array}{ccc} & Y & \\ u \nearrow & & \searrow v \\ X & \xrightarrow{w} & Z \end{array}$$

in $\mathcal{C}$, where u is λ -cocartesian and $\lambda(v)$ is an isomorphism in $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$. It follows from (2) that v is λ_- -cocartesian. Since $\lambda_-(v)$ is an isomorphism in $\mathcal{C}_-^{\text{op}}$, it follows that v is an isomorphism in $\mathcal{C}$ (Proposition 5.1.1.9). In particular, v is λ -cocartesian (Proposition 5.1.1.9), so that $w = v \circ u$ is also λ -cocartesian (Proposition 5.1.4.13). $\square$

Proposition 8.2.1.8. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a corepresentable coupling and 0445*
let $U : \mathcal{E} \rightarrow \mathcal{C}_+$ be a cocartesian fibration of ∞ -categories. Suppose that, for every object
 $Y \in \mathcal{C}_+$, the fiber $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$ has an initial object. Then the ∞ -category $\text{Fun}/_{\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ has
an initial object. Moreover, an object $F \in \text{Fun}/_{\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ is initial if and only if it satisfies
the following pair of conditions:

- (1) *For every couniversal object $C \in \mathcal{C}$, the image $F(C)$ is initial when viewed as an object of the ∞ -category $\{\lambda_+(C)\} \times_{\mathcal{C}_+} \mathcal{E}$.*
- (2) *The functor F carries λ_+ -cocartesian morphisms of $\mathcal{C}$ to U -cocartesian morphisms of $\mathcal{E}$.*

Remark 8.2.1.9. By virtue of Proposition 8.2.1.7, we can restate condition (2) of Proposition 0446
 8.2.1.8 as follows:

- (2') Let e be a morphism of $\mathcal{C}$ having the property that $\lambda_-(e)$ is an isomorphism in the ∞ -category $\mathcal{C}_-^{\text{op}}$. Then $F(e)$ is a U -cocartesian morphism of $\mathcal{E}$.

Proof of Proposition 8.2.1.8. The functor $\lambda_- : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}}$ is a cocartesian fibration (Proposition 8.2.1.7) and is therefore exponentiable (Proposition 5.3.6.1). Let $\text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{E})$ and $\text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+)$ be the relative exponentials introduced in Construction 4.5.9.1. Composition with U induces a functor $V : \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{E}) \rightarrow \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+)$, which is an isofibration by virtue of Proposition 4.5.9.18. Let us identify the functor $\lambda_+ : \mathcal{C} \rightarrow \mathcal{C}_+$ with a section s of the projection map $\text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+) \rightarrow \mathcal{C}_-^{\text{op}}$, and form a pullback diagram

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{\quad} & \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{E}) \\ \downarrow V' & & \downarrow V \\ \mathcal{C}_-^{\text{op}} & \xrightarrow{s} & \text{Fun}(\mathcal{C} / \mathcal{C}_-^{\text{op}}, \mathcal{C}_+). \end{array}$$

Since V' is a pullback of V , it is also an isofibration (Remark 4.5.5.11). Moreover, the ∞ -category $\mathrm{Fun}/_{\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ can be identified with the ∞ -category $\mathrm{Fun}/_{\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{D})$ of sections of V' .

For each object $X \in \mathcal{C}_-$, let $\mathcal{C}_X$ denote the fiber $\{X\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$. Unwinding the definitions, we can identify objects of $\mathcal{D}$ with pairs (X, F_X) , where X is an object of $\mathcal{C}_-$ and $F_X : \mathcal{C}_X \rightarrow \mathcal{E}$ is a functor satisfying $U \circ f = \lambda_+|_{\mathcal{C}_X}$. For fixed $X \in \mathcal{C}_-$, our assumption that λ is corepresentable guarantees that the ∞ -category $\mathcal{C}_X$ has an initial object C . Set $Y = \lambda_+(C)$. By assumption, the ∞ -category $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$ also has an initial object. Invoking the criterion of Corollary 7.3.6.11, we see that the ∞ -category $\{X\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{D} \simeq \mathrm{Fun}/_{\mathcal{C}_+}(\mathcal{C}_X, \mathcal{E})$ also has an initial object. Moreover, an object $F_X \in \mathrm{Fun}/_{\mathcal{C}_+}(\mathcal{C}_X, \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:

- (1_X) For every initial object $C \in \mathcal{C}_X$, the image $F_X(C)$ is an initial object of the ∞ -category $\{Y\} \times_{\mathcal{C}_+} \mathcal{E}$.
- (2_X) The functor F_X carries each morphism in $\mathcal{C}_X$ to a U -cocartesian morphism of $\mathcal{E}$.

We will prove below that the functor V' is a cartesian fibration. Assuming this Corollary 7.3.5.7, we guarantee that the ∞ -category

$$\mathrm{Fun}/_{\mathcal{C}_+}(\mathcal{C}, \mathcal{E}) \simeq \mathrm{Fun}/_{\mathcal{C}_-^{\mathrm{op}}}(\mathcal{C}_-^{\mathrm{op}}, \mathcal{D})$$

has an initial object. Moreover, an object $F \in \mathrm{Fun}/_{\mathcal{C}_+}(\mathcal{C}, \mathcal{E})$ is initial if and only if, for every object $X \in \mathcal{C}_-$, the restriction $F_X = F|_{\mathcal{C}_X}$ satisfies conditions (1_X) and (2_X) above. Unwinding the definitions, this is equivalent to the requirement that F satisfies condition (1) and the following variant of condition (2') of Remark 8.2.1.9:

- (2'') If e is a morphism of $\mathcal{C}$ such that $\lambda_-(e)$ is an identity morphism of $\mathcal{C}_-^{\mathrm{op}}$, then $F(e)$ is a U -cocartesian morphism of $\mathcal{E}$.

The implication (2') $\Rightarrow$ (2'') is immediate. The reverse implication follows from the observation that if $\lambda_-(e)$ is an isomorphism in $\mathcal{C}_-^{\mathrm{op}}$, then e is isomorphic (as an object of $\mathrm{Fun}(\Delta^1, \mathcal{C})$) to a morphism e' such that $\lambda_-(e')$ is an identity morphism of $\mathcal{C}_-^{\mathrm{op}}$.

We now complete the proof by showing that V' is a cartesian fibration. Fix an object $(X, F_X) \in \mathcal{D}$, and a morphism $u : X' \rightarrow X$ in the ∞ -category $\mathcal{C}_-^{\mathrm{op}}$. We wish to show that u can be lifted to a V' -cartesian morphism $\tilde{u} : (X', F_{X'}) \rightarrow (X, F_X)$ in the ∞ -category $\mathcal{D}$. We will prove a slightly stronger assertion: we can arrange that the image of $\tilde{u}$ in the ∞ -category $\mathrm{Fun}(\mathcal{C}/\mathcal{C}_-^{\mathrm{op}}, \mathcal{E})$ is V -cartesian. Let us identify u with a morphism $\Delta^1 \rightarrow \mathcal{C}_-^{\mathrm{op}}$ and set $\mathcal{C}_u = \Delta^1 \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$, so that $\mathcal{C}_X$ can be identified with the fiber $\{1\} \times_{\Delta^1} \mathcal{C}_u$. By virtue

of Corollary 7.3.7.6, it will suffice to show that the lifting problem

$$\begin{array}{ccc}
 \mathcal{C}_X & \xrightarrow{F_X} & \mathcal{E} \\
 \downarrow & \nearrow F_u & \downarrow U \\
 \mathcal{C}_u & \xrightarrow{\quad} & \mathcal{C}_+
 \end{array}$$

admits a solution having the property that F_u is U -right Kan extended from $\mathcal{C}_X$.

Let $\pi : \mathcal{C}_u \rightarrow \Delta^1$ denote the projection map. Since π is a pullback of λ_- , it is a cocartesian fibration of ∞ -categories (Proposition 8.2.1.7). In particular, $\mathcal{C}_X$ is a reflective subcategory of $\mathcal{C}_u$. Moreover, if C is an object of $\mathcal{C}_X$, then a morphism $v : C' \rightarrow C$ in $\mathcal{C}_u$ is π -cocartesian if and only if it exhibits C as a $\mathcal{C}_X$ -reflection of C' (see Proposition 6.2.4.1). By virtue of Corollary 7.3.5.9, it will suffice to show that if this condition is satisfied, then $\lambda_+(v)$ can be lifted to a U -cartesian morphism $E \rightarrow F_X(C)$ in $\mathcal{E}$. This is clear: our assumption that v is π -cocartesian guarantees that $\lambda_+(v)$ is an isomorphism in the ∞ -category $\mathcal{C}_+$ (Proposition 8.2.1.7), and can therefore be lifted to an isomorphism in $\mathcal{E}$ by virtue of the fact that U is an isofibration (Proposition 5.1.4.9). $\square$

Corollary 8.2.1.10. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Suppose that, for every object $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \mathcal{E} \times_{\mathcal{C}} \{C\}$ has an initial object. Then the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}), \mathcal{E})$ has an initial object. Moreover, an object $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}), \mathcal{E})$ is initial if and only if it satisfies the following pair of conditions:*

- (1) *For every object $C \in \mathcal{C}$, the image $F(\mathrm{id}_C)$ is an initial object of the ∞ -category $\mathcal{E}_C$.*
- (2) *Let e be a morphism of $\mathrm{Tw}(\mathcal{C})$ whose image in $\mathcal{C}^{\mathrm{op}}$ is an isomorphism. Then $F(e)$ is a U -cocartesian morphism of $\mathcal{E}$.*

Stated more informally, Corollary 8.2.1.10 asserts that the twisted arrow ∞ -category $\mathrm{Tw}(\mathcal{C})$ is *universal* among ∞ -categories $\mathcal{E}$ equipped with a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ having the property that each fiber of U has an initial object.

8.2.2 Morphisms of Couplings

We begin by introducing a companion of Definition 8.2.0.1.

Definition 8.2.2.1. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. A *morphism of couplings* from λ to μ is a triple of functors

$$F_- : \mathcal{C}_- \rightarrow \mathcal{D}_- \quad F : \mathcal{C} \rightarrow \mathcal{D} \quad F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$$

for which the diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array}$$

is commutative. Note that such diagrams can be identified with the vertices of a simplicial set $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$, defined by the formula

$$\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) = \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})} \text{Fun}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+).$$

044A Proposition 8.2.2.2. *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Then the projection maps*

$$\Phi_- : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \quad \Phi_+ : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

induce a left fibration

$$(\Phi_-, \Phi_+) : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+).$$

Proof. By construction, there is a pullback diagram of simplicial sets

$$\begin{array}{ccc} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) & \xrightarrow{\quad} & \text{Fun}(\mathcal{C}, \mathcal{D}) \\ \downarrow (\Phi_-, \Phi_+) & & \downarrow \mu \circ \\ \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \xrightarrow{\circ \lambda} & \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+). \end{array}$$

It will therefore suffice to show that the right vertical map is a left fibration (Remark 4.2.1.8), which follows from our assumption that μ is a left fibration (Corollary 4.2.5.2). $\square$

044B Remark 8.2.2.3 (Functor Couplings). Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Proposition 8.2.2.2 asserts that the induced map

$$\Phi = (\Phi_-, \Phi_+) : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

is also a coupling of ∞ -categories. Moreover, it is characterized by a universal property: for every coupling of ∞ -categories $\kappa : \mathcal{B} \rightarrow \mathcal{B}_-^{\text{op}} \times \mathcal{B}_+$, there is a canonical isomorphism of simplicial sets

$$\text{Fun}_{\pm}(\mathcal{B}, \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})) \simeq \text{Fun}_{\pm}(\mathcal{B} \times \mathcal{C}, \mathcal{D}),$$

where the right hand side is defined using the product coupling

$$\mathcal{B} \times \mathcal{C} \xrightarrow{\kappa \times \lambda} (\mathcal{B}_- \times \mathcal{C}_-)^{\text{op}} \times (\mathcal{B}_+ \times \mathcal{C}_+).$$

Remark 8.2.2.4. Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be 044C
couplings of ∞ -categories, and suppose we are given a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ . \end{array}$$

It follows from Proposition 8.2.1.7 that the functor F carries λ_- -cocartesian morphisms of $\mathcal{C}$ to μ_- -cocartesian morphisms of $\mathcal{D}$, and λ_+ -cocartesian morphisms of $\mathcal{C}$ to μ_+ -cocartesian morphisms of $\mathcal{D}$.

Corollary 8.2.2.5. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ - 044D
categories. Then the simplicial set $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is an ∞ -category.

Proof. Combine Proposition 8.2.2.2 with Remark 4.2.1.4. □

Example 8.2.2.6. The canonical isomorphism $\lambda : \Delta^0 \xrightarrow{\sim} (\Delta^0)^{\text{op}} \times \Delta^0$ can be regarded 044E
as a coupling of the 0-simplex Δ^0 with itself. For every coupling of ∞ -categories $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$, the ∞ -category $\text{Fun}_{\pm}(\Delta^0, \mathcal{D})$ can be identified with the ∞ -category $\mathcal{D}$.

Exercise 8.2.2.7. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories, 04AS
and suppose we are given a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array} \tag{8.23} \quad \text{04AT}$$

Show that the following conditions are equivalent:

- The functors F_- , F , and F_+ are equivalences of ∞ -categories.
- There exists a morphism of couplings $(G_-, G, G_+) \in \text{Fun}_{\pm}(\mathcal{D}, \mathcal{C})$ which is a homotopy inverse to (F_-, F, F_+) , in the sense that the compositions $(G_- \circ F_-, G \circ F, G_+ \circ F_+)$ and $(F_- \circ G_-, F \circ G, F_+ \circ G_+)$ are isomorphic to $(\text{id}_{\mathcal{C}_-}, \text{id}_{\mathcal{C}}, \text{id}_{\mathcal{C}_+})$ and $(\text{id}_{\mathcal{D}_-}, \text{id}_{\mathcal{D}}, \text{id}_{\mathcal{D}_+})$ as objects of the ∞ -categories $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$ and $\text{Fun}_{\pm}(\mathcal{D}, \mathcal{D})$, respectively.

If these conditions are satisfied, we will say that the diagram (8.23) is an *equivalence of couplings*.

04AU **Remark 8.2.2.8.** Suppose we are given a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array}$$

which is an equivalence (in the sense of Exercise 8.2.2.7). Then:

- The coupling λ is representable if and only if the coupling μ is representable.
- The coupling λ is corepresentable if and only if the coupling μ is corepresentable.
- An object $C \in \mathcal{C}$ is universal (with respect to the coupling λ) if and only if $F(C)$ is universal $\mathcal{D}$ (with respect to the coupling μ).
- An object $C \in \mathcal{C}$ is universal (with respect to the coupling λ) if and only if $F(C)$ is universal $\mathcal{D}$ (with respect to the coupling μ).

See Corollaries 4.6.7.22 and 4.6.7.21.

Beware that, in the situation of Definition 8.2.2.1, the ∞ -category $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ depends not only on $\mathcal{C}$ and $\mathcal{D}$, but also on the left fibrations $\lambda : \mathcal{C} \rightarrow \mathcal{C}_- \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_- \times \mathcal{D}_+$. Our goal in this section is to show that, nevertheless, it can often be identified with a full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{D})$ (Proposition 8.2.2.9).

044F **Proposition 8.2.2.9.** *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Let $\mathcal{E}_- \subseteq \text{Fun}(\mathcal{C}, \mathcal{D})$ be the full subcategory spanned by those functors $F : \mathcal{C} \rightarrow \mathcal{D}$ which carry λ_+ -cocartesian morphisms of $\mathcal{C}$ to μ_+ -cocartesian morphisms of $\mathcal{D}$, define $\mathcal{E}_+ \subseteq \text{Fun}(\mathcal{C}, \mathcal{D})$ similarly, and set $\mathcal{E}_{\pm} = \mathcal{E}_- \cap \mathcal{E}_+$. Then:*

- (1) *Suppose that, for every object $C_- \in \mathcal{C}_-$, the ∞ -category $\{C_-\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C}$ is weakly contractible. Then the forgetful functor*

$$\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{E}_- \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

is an equivalence of ∞ -categories.

- (2) *Suppose that, for every object $C_+ \in \mathcal{C}_+$, the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C_+\}$ is weakly contractible. Then the forgetful functor*

$$\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})} \mathcal{E}_+$$

is an equivalence of ∞ -categories.

- (3) *If the hypotheses of both (1) and (2) are satisfied, then the forgetful functor $\text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{E}_\pm$ is an equivalence of ∞ -categories.*

Proof. We first prove (1). Let W be the collection of all λ_+ -cocartesian morphisms of $\mathcal{C}$. Note that a morphism u of $\mathcal{C}$ belongs to W if and only if $\lambda_-(u)$ is an isomorphism in the ∞ -category $\mathcal{C}_-^{\text{op}}$ (Proposition 8.2.1.7). Suppose that, for every object $C_- \in \mathcal{C}_-$, the ∞ -category $\{C_-\} \times_{\mathcal{C}_-} \mathcal{C}$ is weakly contractible. Applying Corollary 6.3.4.3, we deduce that the functor λ_- exhibits $\mathcal{C}_-^{\text{op}}$ as a localization of $\mathcal{C}$ with respect to W . It follows that precomposition with λ_- induces an equivalence of ∞ -categories $\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\text{op}})$, where $\text{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\text{op}})$ denotes the full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})$ spanned by those functors which carry each element of W to an isomorphism in $\mathcal{D}_-^{\text{op}}$ (Notation 6.3.1.1). We have a commutative diagram of ∞ -categories

$$\begin{array}{ccc}
 \text{Fun}_\pm(\mathcal{C}, \mathcal{D}) & \xrightarrow{\quad} & \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \\
 \downarrow & & \downarrow \circ \lambda_- \\
 \mathcal{E}_- \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \xrightarrow{\quad} & \text{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\text{op}}) \\
 \downarrow & & \downarrow \\
 \text{Fun}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \xrightarrow{\quad \theta \quad} & \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})
 \end{array} \tag{8.24}$$

in which both squares are pullbacks. To prove (1), it will suffice to show that the upper square is a categorical pullback diagram (Proposition 4.5.2.22). In fact, we will show that θ is an isofibration, so that both squares are categorical pullback diagrams (Corollary 4.5.2.28). This follows by observing that θ factors as a composition

$$\text{Fun}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_+)} \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \xrightarrow{\theta'} \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \xrightarrow{\theta''} \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}),$$

where θ' is a pullback of the composition map $\text{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\mu_{\circ}} \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+)$ (hence a left fibration by virtue of Corollary 4.2.5.2) and θ'' is a pullback of the projection map $\text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \rightarrow \Delta^0$. This completes the proof of assertion (1).

Assertion (2) follows by a similar argument. We now prove (3). Suppose that λ satisfies the hypotheses of both (1) and (2); we wish to prove that the forgetful functor $T : \text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{E}_\pm$ is an equivalence of ∞ -categories. Note that T factors as a composition

$$\text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \xrightarrow{T'} \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times_{\text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}})} \mathcal{E}_+ \xrightarrow{T''} \mathcal{E}_\pm,$$

where T' is an equivalence of ∞ -categories by virtue of (2). It will therefore suffice to show that T'' is an equivalence of ∞ -categories. We have a commutative diagram

$$\begin{array}{ccc}
 \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}})} \mathcal{E}_+ & \longrightarrow & \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \\
 \downarrow T'' & & \downarrow \circ \lambda_- \\
 \mathcal{E}_\pm & \xrightarrow{\mu_- \circ} & \mathrm{Fun}(\mathcal{C}[W^{-1}], \mathcal{D}_-^{\mathrm{op}}) \\
 \downarrow & & \downarrow \\
 \mathcal{E}_+ & \xrightarrow{\rho} & \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}}),
 \end{array}$$

where both squares are pullbacks and the upper right vertical map is an equivalence of ∞ -categories. It will therefore suffice to show that the upper square is a categorical pullback diagram (Proposition 4.5.2.22). In fact, we claim that ρ is an isofibration, so that both squares are categorical pullback diagrams (Corollary 4.5.2.28). This follows by observing that ρ is the restriction of the map $\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\mu_- \circ} \mathrm{Fun}(\mathcal{C}, \mathcal{D}_-^{\mathrm{op}})$ (which is a cocartesian fibration by virtue of Proposition 8.2.1.7 and Theorem 5.2.1.1) to a replete subcategory $\mathcal{E}_+ \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$. $\square$

044H Corollary 8.2.2.10. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Fix a functor $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$. If λ is corepresentable, then the forgetful functor*

$$\mathrm{Fun}_\pm(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \rightarrow \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{C}, \mathcal{D})$$

is fully faithful, and its essential image is the full subcategory $\mathrm{Fun}_{/\mathcal{D}_+}^0(\mathcal{C}, \mathcal{D}) \subseteq \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{C}, \mathcal{D})$ spanned by those functors which carry λ_+ -cocartesian morphisms of $\mathcal{C}$ to μ_+ -cocartesian morphisms of $\mathcal{D}$.

Proof. Let $\mathcal{E}_- \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ be the full subcategory defined in Proposition 8.2.2.9. We then

have a commutative diagram of ∞ -categories

$$\begin{array}{ccc}
 \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} & \xrightarrow{\quad\quad\quad} & \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \\
 \downarrow & & \downarrow \\
 \mathrm{Fun}_{/\mathcal{D}_+}^0(\mathcal{C}, \mathcal{D}) & \xrightarrow{\quad\quad\quad} & \mathcal{E}_- \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D}_+)} \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+) \\
 \downarrow & & \downarrow \\
 \{F_+\} & \xrightarrow{\quad\quad\quad} & \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+),
 \end{array} \tag{8.25}$$

where both squares are pullback diagrams. Note that the vertical map on the lower right is a pullback of the functor $\mathcal{E}_- \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D}_+)$ obtained by restricting the cocartesian fibration $\mathrm{Fun}(\mathcal{C}, \mathcal{D}) \xrightarrow{\mu_+ \circ} \mathrm{Fun}(\mathcal{C}, \mathcal{D}_+)$ (see Proposition 8.2.1.7 and Theorem 5.2.1.1) to the replete subcategory $\mathcal{E}_- \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{D})$, and is therefore an isofibration. Moreover, the right vertical composition $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$ is a cocartesian fibration (see Proposition 8.2.1.7 and Remark 8.2.2.3), and therefore an isofibration. It follows that the bottom square and outer rectangle of (8.25) are categorical pullback diagrams (Corollary 4.5.2.28), so that the upper square is also a categorical pullback diagram (Proposition 4.5.2.19). Our assumption that λ is corepresentable guarantees that for each object $X_- \in \mathcal{C}_-$, the fiber $\{X_-\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C}$ has an initial object, and is therefore weakly contractible. Applying Proposition 8.2.2.9, we deduce that the vertical map on the upper right is an equivalence of ∞ -categories. Invoking Proposition 4.5.2.22, we conclude that the forgetful functor $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \rightarrow \mathrm{Fun}_{/\mathcal{D}_+}^0(\mathcal{C}, \mathcal{D})$ is also an equivalence of ∞ -categories. $\square$

We can now formulate the main result of this section.

Theorem 8.2.2.11. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a representable coupling of ∞ -categories and let $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be a corepresentable coupling of ∞ -categories. Then the functor coupling*

$$\Phi = (\Phi_-, \Phi_+) : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

is corepresentable. Moreover, an object $(F_-, F, F_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is couniversal if and only if the functor $F : \mathcal{C} \rightarrow \mathcal{D}$ carries universal objects of $\mathcal{C}$ to couniversal objects of $\mathcal{D}$.

Proof. Fix a functor $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$; we wish to show that it can be extended to a couniversal object $(F_-, F, F_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$. Set $\mathcal{E} = \mathcal{C}_-^{\mathrm{op}} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$. Then projection onto the first factor determines a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}_-^{\mathrm{op}}$ (Proposition 8.2.1.7). Let $\mathrm{Fun}_{/\mathcal{C}_-^{\mathrm{op}}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$

denote the full subcategory of $\mathrm{Fun}/_{\mathcal{C}^{\mathrm{op}}}(\mathcal{C}, \mathcal{E})$ spanned by those functors which carry λ_- -cocartesian morphisms of $\mathcal{C}$ to U -cocartesian of $\mathcal{E}$ (Notation 5.3.1.10). Corollary 8.2.2.10 guarantees that the forgetful functor

$$\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}/_{\mathcal{C}^{\mathrm{op}}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞ -categories. Theorem 8.2.2.11 can therefore be restated as follows:

- (1) The ∞ -category $\mathrm{Fun}/_{\mathcal{C}^{\mathrm{op}}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ has an initial object.
- (2) An object $F \in \mathrm{Fun}/_{\mathcal{C}^{\mathrm{op}}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ is initial if and only if, for universal object $C \in \mathcal{C}$, the image $F(C)$ is an initial object of the ∞ -category

$$\mathcal{E}_{\lambda_-(C)} \simeq \{F_-(\lambda_-(C))\} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}.$$

Our assumption that μ is corepresentable guarantees that, for each object $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_{\lambda_-(C)}$ has an initial object. Consequently, assertions (1) and (2) follow from (the dual of) Proposition 8.2.1.8. $\square$

044L **Example 8.2.2.12.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then the commutative diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}) & \xrightarrow{\mathrm{Tw}(F)} & \mathrm{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\mathrm{op}} \times \mathcal{C} & \xrightarrow{F^{\mathrm{op}} \times F} & \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \end{array} \quad (8.26)$$

is a morphism of couplings. It follows from Theorem 8.2.2.11 that this morphism is initial when viewed as an object of the ∞ -category $\{F\} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$.

044N **Corollary 8.2.2.13.** Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories, and suppose we are given a pair of functors $F_-, F_+ : \mathcal{C} \rightarrow \mathcal{D}$. Then F_- and F_+ are isomorphic (as objects of the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$) if and only if there exists a morphism of couplings

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}) & \xrightarrow{\tilde{F}} & \mathrm{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\mathrm{op}} \times \mathcal{C} & \xrightarrow{F_-^{\mathrm{op}} \times F_+} & \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \end{array} \quad (8.27)$$

having the property that the functor $\tilde{F}$ carries isomorphisms of $\mathcal{C}$ (regarded as objects of $\mathrm{Tw}(\mathcal{C})$) to isomorphisms of $\mathcal{D}$ (regarded as objects of $\mathrm{Tw}(\mathcal{D})$).

Proof. Suppose first that there exists an isomorphism of functors $\alpha : F_- \rightarrow F_+$. Since the projection map $\mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ is an isofibration, we can use Corollary 4.4.5.6 to lift the natural transformation

$$(\mathrm{id} \times \alpha) : F_-^{\mathrm{op}} \times F_+ \rightarrow F_-^{\mathrm{op}} \times F_-$$

to an isomorphism $\tilde{F} \rightarrow \mathrm{Tw}(F_-)$ in the ∞ -category $\mathrm{Fun}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$, so that we have a commutative diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}) & \xrightarrow{\tilde{F}} & \mathrm{Tw}(\mathcal{D}) \\ \downarrow & & \downarrow \\ \mathcal{C}^{\mathrm{op}} \times \mathcal{C} & \xrightarrow{F_-^{\mathrm{op}} \times F_+} & \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \end{array}$$

where $\tilde{F}$ carries isomorphisms of $\mathcal{C}$ to isomorphisms of $\mathcal{D}$.

We now prove the converse. Suppose we are given a commutative diagram (8.27), where $\tilde{F}$ carries isomorphisms of $\mathcal{C}$ to isomorphisms of $\mathcal{D}$. Applying Theorem 8.2.2.11, we deduce that the triple $(F_-, \tilde{F}, F_+)$ is initial when viewed as an object of the ∞ -category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$. Applying Example 8.2.2.12 (and Corollary 4.6.7.16), we deduce that $(F_-, \tilde{F}, F_+)$ is isomorphic to $(F_-, \mathrm{Tw}(F_-), F_-)$ as an object of the ∞ -category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}), \mathrm{Tw}(\mathcal{D}))$. In particular, F_+ is isomorphic to F_- as an object of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. $\square$

8.2.3 Representations of Couplings

We now apply Theorem 8.2.2.11 to give a classification of representable couplings. 044Q

Definition 8.2.3.1. Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories. We will say that a 044R
coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is *representable by G* if it is equivalent (as a left fibration over $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$) to the coupling λ_G of Construction 8.2.0.3.

Remark 8.2.3.2. Let $G, G' : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be functors which are isomorphic (as objects of the 044S
 ∞ -category $\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)$). Then a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ is representable by G if and only if it is representable by G' . See Proposition 5.1.7.5.

Example 8.2.3.3. Let $\mathcal{C}$ be an ∞ -category. Then the twisted arrow coupling $\lambda : \mathrm{Tw}(\mathcal{C}) \rightarrow$ 044T
 $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ of Example 8.2.0.2 is representable by the identity functor $\mathrm{id} : \mathcal{C} \rightarrow \mathcal{C}$.

Our goal is to prove the following restatement of Theorem 8.2.0.4:

Theorem 8.2.3.4. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. Then λ is 044U
representable (in the sense of Definition 8.2.1.3) if and only if there exists a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ such that λ is representable by G (in the sense of Definition 8.2.3.1). If this condition is satisfied, then the functor G is uniquely determined up to isomorphism.

Before giving the proof of Theorem 8.2.3.4, it will be useful to formulate a more precise version of Definition 8.2.3.1.

044V Definition 8.2.3.5. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor. We say that a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad (8.28)$$

exhibits the coupling λ as represented by G if it is a categorical pullback square. Note that λ is representable by G if and only if there exists a morphism of couplings which exhibits λ as represented by G .

We now describe an alternative formulation of Definition 8.2.3.5.

044X Lemma 8.2.3.6. *Suppose we are given a morphism of couplings*

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+, \end{array} \quad (8.29)$$

where λ is representable and F_- is an equivalence of ∞ -categories. The following conditions are equivalent:

- (1) *The diagram (8.29) is a categorical pullback square.*
- (2) *For every object $Y \in \mathcal{C}_+$, the functor F induces an equivalence of ∞ -categories*

$$F_Y : \mathcal{C} \times_{\mathcal{C}_+} \{Y\} \rightarrow \mathcal{D} \times_{\mathcal{D}_+} \{F_+(Y)\}.$$

- (3) *For every universal object $C \in \mathcal{C}$, the image $F(C) \in \mathcal{D}$ is universal.*

Proof. The equivalence (1) $\Leftrightarrow$ (2) follows from Theorem 5.1.6.1 and Remark 8.2.2.4. To complete the proof, it will suffice to show that for each object $Y \in \mathcal{C}_+$, the following conditions are equivalent:

- (2_Y) *The functor F_Y is an equivalence of ∞ -categories.*

(3_Y) The functor F_Y carries initial objects of $\mathcal{C} \times_{\mathcal{C}_+} \{Y\}$ to initial objects of $\mathcal{D} \times_{\mathcal{D}_+} \{F_+(Y)\}$.

Replacing $\mathcal{D}$ by the ∞ -category $\mathcal{C}_-^{\text{op}} \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D}$, we can assume that F_- is an isomorphism. In this case, the equivalence of (2_Y) and (3_Y) is a special case of Corollary 4.6.7.22. $\square$

Proposition 8.2.3.7. *Suppose we are given a morphism of couplings*

044Z

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad (8.30)$$

The following conditions are equivalent:

(1) The diagram (8.30) exhibits the coupling λ as represented by the functor G (in the sense of Definition 8.2.3.1).

(2) For every object $C \in \mathcal{C}_+$, the functor $\tilde{G}$ induces an equivalence of ∞ -categories

$$\tilde{G}_C : \mathcal{C} \times_{\mathcal{C}_+} \{C\} \rightarrow \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \{G(C)\}.$$

(3) The coupling λ is representable and, for every universal object $C \in \mathcal{C}$, the image $\tilde{G}(C) \in \text{Tw}(\mathcal{C}_-)$ is an isomorphism (when viewed as a morphism of the ∞ -category $\mathcal{C}_-$).

(4) The coupling λ is representable and the triple $(\text{id}, \tilde{G}, G)$ is initial when viewed as an object of the ∞ -category $\{\text{id}\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{C}_-))$.

Proof. The implication (1) $\Rightarrow$ (2) is immediate. Note that, if condition (2) is satisfied, then the coupling λ is representable; the implications (2) $\Rightarrow$ (3) $\Rightarrow$ (1) then follow from Lemma 8.2.3.6 (using the characterization of universal objects of $\text{Tw}(\mathcal{C}_-)$ given by Example 8.2.1.5). The equivalence (3) $\Leftrightarrow$ (4) follows from Theorem 8.2.2.11. $\square$

Proof of Theorem 8.2.3.4. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. It follows from Proposition 8.2.3.7 that λ is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ if and only if it is representable and G can be lifted to an initial object of the ∞ -category $\mathcal{E} = \{\text{id}\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{C}_-))$. This immediately shows that G is uniquely determined up to isomorphism. To prove existence, it suffices to show that if λ is representable then $\mathcal{E}$ has an initial object. This follows from Theorem 8.2.2.11. $\square$

0451 **Variant 8.2.3.8.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ be a functor. We say that λ is *corepresentable by F* if there exists a categorical pullback square

$$\begin{array}{ccc}
 \mathcal{C} & \xrightarrow{\tilde{F}} & \text{Tw}(\mathcal{C}_+) \\
 \downarrow \lambda & & \downarrow \\
 \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F^{\text{op}} \times \text{id}} & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ .
 \end{array} \tag{8.31}$$

In this case, we will say that the diagram (8.31) *exhibits the coupling λ as corepresented by F* . It follows from Theorem 8.2.3.4 that λ is corepresentable (in the sense of Definition 8.2.1.3) if and only if it is corepresentable by F , for some functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$. Moreover, if this condition is satisfied, then the functor F is uniquely determined up to isomorphism.

Couplings representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ can be characterized by a universal mapping property.

0453 **Proposition 8.2.3.9.** Let $\mu = (\mu_-, \mu_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be a coupling of ∞ -categories, let $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$ be a functor, and suppose we are given a morphism of couplings

$$\begin{array}{ccc}
 \mathcal{D} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{D}_-) \\
 \downarrow & & \downarrow \\
 \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ & \xrightarrow{\text{id} \times G} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_- .
 \end{array} \tag{8.32}$$

The following conditions are equivalent:

- (1) The diagram (8.32) exhibits μ as represented by G (in the sense of Definition 8.2.3.5).
- (2) For every coupling of ∞ -categories $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and every pair of functors $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$, composition with $\tilde{G}$ induces a homotopy equivalence of Kan complexes

$$\begin{array}{c}
 \{F_-\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \\
 \downarrow \\
 \{F_-\} \times_{\text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}} \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\}
 \end{array}$$

(3) For every coupling of ∞ -categories $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and every functor $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$, composition $\tilde{G}$ induces an equivalence of ∞ -categories

$$\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} \rightarrow \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\}.$$

Proof. We first show that (1) $\Rightarrow$ (2). Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$ be functors. If condition (1) is satisfied, then Remark 4.5.2.9 guarantees that the diagram

$$\begin{array}{ccc} \text{Fun}(\mathcal{C}, \mathcal{D}) & \xrightarrow{\tilde{G} \circ} & \text{Fun}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \\ \downarrow \mu \circ & & \downarrow \\ \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}, \mathcal{D}_+) & \longrightarrow & \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}, \mathcal{D}_-) \end{array}$$

is a categorical pullback square, where the vertical maps are left fibrations (Corollary 4.2.5.2). Assertion (2) now follows by applying Corollary 4.5.2.32 to the object $(F_-^{\text{op}} \circ \lambda_-, F_+ \circ \lambda_+) \in \text{Fun}(\mathcal{C}, \mathcal{D}_-^{\text{op}}) \times \text{Fun}(\mathcal{C}, \mathcal{D}_+)$. The implication (2) $\Rightarrow$ (3) follows by applying Corollary 5.1.6.4 to the commutative diagram of ∞ -categories

$$\begin{array}{ccc} \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)} \{F_+\} & \longrightarrow & \text{Fun}_{\pm}(\mathcal{C}, \text{Tw}(\mathcal{D}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{D}_-)} \{G \circ F_+\} \\ & \searrow & \swarrow \\ & \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}}, & \end{array}$$

since the vertical maps are left fibrations (Proposition 8.2.2.2). We complete the proof by showing that (3) implies (1). Specializing assertion (3) to the coupling $\lambda : \Delta^0 \xrightarrow{\sim} (\Delta^0)^{\text{op}} \times \Delta^0$, we deduce that $\tilde{G}$ induces an equivalence of ∞ -categories $\mathcal{D} \times_{\mathcal{D}_+} \{D\} \rightarrow \text{Tw}(\mathcal{D}_-) \times_{\mathcal{D}_-} \{G(D)\}$ for each object $D \in \mathcal{D}_+$, so that (8.32) is a categorical pullback square by virtue of Proposition 8.2.3.7. $\square$

8.2.4 Presentations of Representable Couplings

For some applications, it is convenient to work with a variant of Definition 8.2.3.5.

0455

0456 **Definition 8.2.4.1.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor. We will say that a morphism of couplings

$$\begin{array}{ccc}
 \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} & \mathcal{C} \\
 \downarrow & & \downarrow \lambda \\
 \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+
 \end{array} \tag{8.33}$$

exhibits λ as represented by G if, for every object $C \in \mathcal{C}_+$, the image $\tilde{G}(\text{id}_C)$ is a universal object of $\mathcal{C}$.

0458 **Remark 8.2.4.2.** In the situation of Definition 8.2.4.1, if the diagram (8.33) exhibits λ as represented by G if and only if the functor $\tilde{G}$ carries each isomorphism in $\mathcal{C}_+$ (regarded as an object of the ∞ -category $\text{Tw}(\mathcal{C}_+)$) to a universal object of $\mathcal{C}$. This follows from Remark 8.2.1.2, since every isomorphism in $\mathcal{C}_+$ is isomorphic to an identity morphism (when viewed as an object of $\text{Tw}(\mathcal{C}_+)$).

0459 **Proposition 8.2.4.3.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor. The following conditions are equivalent:

- (1) The coupling λ is representable by G (in the sense of Definition 8.2.3.1).
- (2) There exists a morphism of couplings

$$\begin{array}{ccc}
 \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} & \mathcal{C} \\
 \downarrow & & \downarrow \lambda \\
 \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+
 \end{array}$$

which exhibits λ as represented by G (in the sense of Definition 8.2.4.1).

Proof. We first show that (2) implies (1). Suppose that there exists a morphism of couplings

$$\begin{array}{ccc}
 \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} & \mathcal{C} \\
 \downarrow & & \downarrow \lambda \\
 \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+
 \end{array} \tag{8.34}$$

which exhibits λ as represented by G (in the sense of Definition 8.2.4.1). For each object $C_+ \in \mathcal{C}_+$, the functor $\tilde{G}$ carries id_C to a universal object of $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$. It follows that the coupling λ is representable. Theorem 8.2.3.4, guarantees that there exists a functor $G' : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ such that λ is representable by G' . Choose morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}'} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G'} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad \begin{array}{l} \text{045B} \\ (8.35) \end{array}$$

which exhibits λ as represented by G' (in the sense of Definition 8.2.3.5). Composing (8.35) with (8.34), we obtain a morphism of twisted arrow couplings

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}' \circ \tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times G'} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array}$$

where the functor $\tilde{G}' \circ \tilde{G}$ carries isomorphisms of $\mathcal{C}_+$ to isomorphisms of $\mathcal{C}_-$. Invoking Corollary 8.2.2.13, we deduce that the functors G and G' are isomorphic, so that λ is also representable by G (Remark 8.2.3.2).

We now show that (1) implies (2). Assume that λ is representable by G . Setting $G' = G$, we can choose a diagram (8.35) which exhibits λ as represented by G . Applying Proposition 8.2.3.9, we deduce that composition with $\tilde{G}'$ induces a homotopy equivalence of Kan complexes

$$\begin{array}{c} \{G\} \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \mathcal{C}) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_+)} \{\text{id}\} \\ \downarrow \theta \\ \{G\} \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)^{\text{op}}} \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)} \{G\}. \end{array}$$

In particular, there exists an object $(G, \tilde{G}, \text{id}) \in \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \mathcal{C})$ such that $(\text{id}, \tilde{G}', G) \circ (G, \tilde{G}, \text{id})$ is isomorphic to $(G, \text{Tw}(G), G)$ in the ∞ -category $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-))$. In particular, the functor $\tilde{G}' \circ \tilde{G} : \text{Tw}(\mathcal{C}_+) \rightarrow \text{Tw}(\mathcal{C}_-)$ is isomorphic to the functor $\text{Tw}(G)$, and therefore carries isomorphisms of $\mathcal{C}_+$ to isomorphisms of $\mathcal{C}_-$. It follows that the functor

$\tilde{G} : \mathrm{Tw}(\mathcal{C}_+) \rightarrow \mathcal{C}$ carries isomorphisms in $\mathcal{C}_+$ to universal objects of $\mathcal{C}$, so that the diagram (8.34) exhibits λ as represented by G . $\square$

045C Corollary 8.2.4.4. *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories which are representable by functors $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ and $H : \mathcal{D}_+ \rightarrow \mathcal{D}_-$, respectively. Let $F_- : \mathcal{C}_- \rightarrow \mathcal{D}_-$ and $F_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$ be functors. The following conditions are equivalent:*

- (1) *The functors $H \circ F_+$ and $F_- \circ G$ are isomorphic (as objects of the ∞ -category $\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_-)$). That is, the diagram of ∞ -categories*

$$\begin{array}{ccc} \mathcal{C}_+ & \xrightarrow{F_+} & \mathcal{D}_+ \\ \downarrow G & & \downarrow H \\ \mathcal{C}_- & \xrightarrow{F_-} & \mathcal{D}_- \end{array}$$

commutes up to isomorphism.

- (2) *There is a morphism of couplings*

045D

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\mathrm{op}} \times F_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+, \end{array} \quad (8.36)$$

where the functor $\tilde{F}$ carries universal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$.

Proof. Choose morphisms of couplings

045E

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} & \mathcal{C} \\ \downarrow & & \downarrow \lambda \\ \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\mathrm{op}} \times \mathrm{id}} & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \end{array} \quad \begin{array}{ccc} \mathcal{D} & \xrightarrow{\tilde{H}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow \mu & & \downarrow \\ \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ & \xrightarrow{\mathrm{id} \times H} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-, \end{array} \quad (8.37)$$

which exhibit λ and μ as represented by G and H , respectively. We first prove that (2) implies (1). Suppose there exists a diagram (8.36), where $\tilde{F}$ carries universal objects of $\mathcal{C}$ to

universal objects of $\mathcal{D}$. Composing with the morphisms (8.37), we obtain a morphism of twisted arrow couplings

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{H} \circ \tilde{F} \circ \tilde{G}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{(F_- \circ G)^{\mathrm{op}} \times (H \circ F_+)} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-, \end{array}$$

where the functor $\tilde{H} \circ \tilde{F} \circ \tilde{G}$ carries isomorphisms in $\mathcal{C}_+$ to isomorphisms in $\mathcal{D}_-$. Applying Corollary 8.2.2.13, we deduce that the functors $F_- \circ G$ and $H \circ F_+$ are isomorphic.

We now show that (1) implies (2). Since λ is representable and the twisted arrow pairing $\mathrm{Tw}(\mathcal{D}_-) \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-$ is corepresentable, Theorem 8.2.2.11 guarantees that there exists a morphism of pairings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{T}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\mathrm{op}} \times T_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-, \end{array} \quad \begin{array}{l} \text{045F} \\ (8.38) \end{array}$$

where $\tilde{T}$ carries universal objects of $\mathcal{C}$ to isomorphisms in the ∞ -category $\mathcal{D}_-$. Composing with the pairing on the left half of (8.37), we obtain a morphism of twisted arrow pairings

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{T} \circ \tilde{G}} & \mathrm{Tw}(\mathcal{D}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{(F_- \circ G)^{\mathrm{op}} \times T_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-. \end{array}$$

Applying Corollary 8.2.2.13, we conclude that T_+ is isomorphic to the functor $F_- \circ G$. If condition (1) is satisfied, then T_+ is also isomorphic to the functor $H \circ F_+$. Replacing (8.38) by an isomorphic objects of ∞ -category $\{F_-\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}}} \times_{\mathrm{Fun}_\pm(\mathcal{C}, \mathrm{Tw}(\mathcal{D}_-))}$, we may assume without loss of generality that T_+ is equal to $H \circ F_+$. Invoking the universal property

of Proposition 8.2.3.9, we can further assume that (8.38) factors as a composition

$$\begin{array}{ccccc}
 \mathcal{C} & \xrightarrow{\tilde{F}} & \mathcal{D} & \xrightarrow{\tilde{H}} & \mathrm{Tw}(\mathcal{D}_-) \\
 \downarrow \lambda & & \downarrow \mu & & \downarrow \\
 \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\mathrm{op}} \times F_+} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+ & \xrightarrow{\mathrm{id} \times H} & \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_-.
 \end{array}$$

Since $\tilde{T} = \tilde{H} \circ \tilde{F}$ carries universal objects of $\mathcal{D}$ to isomorphisms in $\mathcal{D}_-$, the functor $\tilde{F}$ carries universal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$. $\square$

045G **Variant 8.2.4.5.** Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ be a functor. We will say that a morphism of couplings

$$\begin{array}{ccc}
 \mathrm{Tw}(\mathcal{C}_-) & \xrightarrow{\tilde{F}} & \mathcal{C} \\
 \downarrow & & \downarrow \lambda \\
 \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- & \xrightarrow{\mathrm{id} \times F} & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+
 \end{array} \tag{8.39}$$

exhibits λ as corepresented by F if, for every object $X_- \in \mathcal{C}_-$, the image $\tilde{F}(\mathrm{id}_{X_-})$ is a couniversal object of $\mathcal{C}$. Equivalently, the diagram (8.39) exhibits λ as corepresented by F if it exhibits the coupling $\lambda' : \mathcal{C} \rightarrow \mathcal{C}_+ \times \mathcal{C}_-^{\mathrm{op}}$ of Remark 8.2.1.4 as represented by the functor $F^{\mathrm{op}} : \mathcal{C}_-^{\mathrm{op}} \rightarrow \mathcal{C}_+^{\mathrm{op}}$.

We now apply these ideas to prove a more precise version of Theorem 8.2.2.11. To (slightly) simplify the notation, we state the result in a dual form.

045J **Theorem 8.2.4.6.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories. Assume that λ is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ and that μ is representable by a functor $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$. Then:*

(1) *The coupling*

$$\Phi : \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

of Remark 8.2.2.3 is representable by the functor

$$\mathrm{Fun}(\mathcal{C}_+, \mathcal{D}_+) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{D}_-) \quad T_+ \mapsto G \circ T_+ \circ F.$$

(2) *An object $(T_-, T, T_+) \in \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ is universal if and only if the functor T carries couniversal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$.*

Remark 8.2.4.7. Stated more informally, Theorem 8.2.4.6 states that if a coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is corepresented by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ and a coupling $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ is represented by a functor $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$, then the objects of $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{D})$ can be identified with triples (T_-, T_+, α) where T_+ is a functor from $\mathcal{C}_+$ to $\mathcal{D}_+$, and $\alpha : T_- \rightarrow G \circ T_+ \circ F$ is a natural transformation of functors from $\mathcal{C}_-$ to $\mathcal{D}_-$. Moreover, the natural transformation α is an isomorphism if and only if the corresponding functor $\mathcal{C} \rightarrow \mathcal{D}$ carries couniversal objects to universal objects.

Example 8.2.4.8. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories, let $(\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ and $(\mu_-, \mu_+) : \text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\text{op}} \times \mathcal{D}$ be the twisted arrow couplings of Example 8.2.0.2, and let

$$\text{ev} : \text{Fun}(\mathcal{C}, \mathcal{D}) \times \mathcal{C} \rightarrow \mathcal{D} \quad (F, C) \mapsto F(C)$$

be the evaluation functor. Passing to twisted arrow ∞ -categories, we obtain a map

$$\text{Tw}(\text{ev}) : \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) \times \text{Tw}(\mathcal{C}) \rightarrow \text{Tw}(\mathcal{D}),$$

which we can identify with a functor $\tilde{E} : \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) \rightarrow \text{Fun}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$. By construction, the functor $\tilde{E}$ fits into a commutative diagram

$$\begin{array}{ccccc} \text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}} & \xleftarrow{\quad} & \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) & \xrightarrow{\quad} & \text{Fun}(\mathcal{C}, \mathcal{D}) \\ \downarrow \circ \lambda_- & & \downarrow \tilde{T} & & \downarrow \circ \lambda_+ \\ \text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{D}^{\text{op}}) & \xleftarrow{\mu_- \circ} & \text{Fun}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D})) & \xrightarrow{\mu_+ \circ} & \text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{D}), \end{array}$$

and therefore determines a functor $E : \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) \rightarrow \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D}))$. The commutative diagram

$$\begin{array}{ccc} \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})) & \xrightarrow{E} & \text{Fun}_{\pm}(\text{Tw}(\mathcal{C}), \text{Tw}(\mathcal{D})) \\ \downarrow & & \downarrow \Phi \\ \text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}} \times \text{Fun}(\mathcal{C}, \mathcal{D}) & \xrightarrow{\text{id} \times \text{id}} & \text{Fun}(\mathcal{C}, \mathcal{D})^{\text{op}} \times \text{Fun}(\mathcal{C}, \mathcal{D}) \end{array}$$

exhibits the coupling Φ as represented by the identity functor $\text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$. In particular, E is an equivalence of ∞ -categories.

Proof of Theorem 8.2.4.6. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling which is corepresented by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$, and let $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be a coupling which is represented by a functor $G : \mathcal{D}_+ \rightarrow \mathcal{D}_-$. It follows from Theorem 8.2.2.11 that the coupling

$$\Phi : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

of Remark 8.2.2.3 is representable, and that an object $(T_-, T, T_+) \in \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$ is universal if and only if the functor T carries couniversal objects of $\mathcal{C}$ to universal objects of $\mathcal{D}$. We will complete the proof by showing that the coupling Φ is representable by the functor

$$H : \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-) \quad T_+ \mapsto G \circ T_+ \circ F.$$

Choose a morphism of couplings

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F}} & \text{Tw}(\mathcal{C}_+) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F^{\text{op}} \times \text{id}} & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ \end{array} \quad (8.40)$$

which exhibits λ as corepresented by F , and a morphism of couplings

$$\begin{array}{ccc} \text{Tw}(\mathcal{D}_+) & \xrightarrow{\tilde{G}} & \mathcal{D} \\ \downarrow & & \downarrow \mu \\ \mathcal{D}_+^{\text{op}} \times \mathcal{D}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array} \quad (8.41)$$

which exhibits μ as represented by G .

Let $E : \text{Tw}(\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)) \rightarrow \text{Fun}_\pm(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{D}_+))$ be the comparison map of Example 8.2.4.8. Precomposition with (8.40) and postcomposition with (8.41) determines a functor $E' : \text{Fun}_\pm(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{D}_+)) \rightarrow \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$ for which the diagram

$$\begin{array}{ccc} \text{Tw}(\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)) & \xrightarrow{E' \circ E} & \text{Fun}_\pm(\mathcal{C}, \mathcal{D}) \\ \downarrow & & \downarrow \\ \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) & \xrightarrow{H^{\text{op}} \times \text{id}} & \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+) \end{array}$$

is commutative. We will complete the proof by showing that this diagram exhibits the coupling Φ as represented by H .

Fix a functor $T_+ : \mathcal{C}_+ \rightarrow \mathcal{D}_+$; we wish to show that the composite functor

$$\text{Tw}(\text{Fun}(\mathcal{C}_+, \mathcal{D}_+)) \xrightarrow{E} \text{Fun}_\pm(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{D}_+)) \xrightarrow{E'} \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$$

carries id_{T_+} to a universal object of $\text{Fun}_\pm(\mathcal{C}, \mathcal{D})$. Unwinding the definitions, we see that the image of id_{T_+} is given by the triple $(G \circ T_+ \circ F, \tilde{G} \circ \text{Tw}(T_+) \circ \tilde{F}, T_+) \in \text{Fun}_\pm(\mathcal{C}, \mathcal{D})$. Using the criterion of Theorem 8.2.2.11, we are reduced to showing that the composite functor

$$\mathcal{C} \xrightarrow{\tilde{F}} \text{Tw}(\mathcal{C}_+) \xrightarrow{\text{Tw}(T_+)} \text{Tw}(\mathcal{D}_+) \xrightarrow{\tilde{G}} \mathcal{D}$$

carries every couniversal object $X \in \mathcal{C}$ to a universal object of $\mathcal{D}$. Proposition 8.2.3.7 guarantees that $\tilde{F}(X) \in \text{Tw}(\mathcal{C}_+)$ corresponds to an isomorphism in $\mathcal{C}_+$, so its image under $\text{Tw}(T_+)$ corresponds to an isomorphism in $\mathcal{D}_+$; the desired result now follows from our hypothesis that the functor $\tilde{G}$ carries isomorphisms in $\mathcal{D}_+$ to universal objects of $\mathcal{D}$. $\square$

We close this section by recording an alternative formulation of Definition 8.2.4.1:

Proposition 8.2.4.9. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories, let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-^{\text{op}}$ be a functor, and suppose we are given a morphism of couplings* 045P

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}} & \mathcal{C} \\ \downarrow \mu & & \downarrow \lambda \\ \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array} \quad (8.42) \quad 045Q$$

where $\mu = (\mu_-, \mu_+)$ is the twisted arrow coupling of Example 8.2.0.2. The following conditions are equivalent:

- (1) The diagram (8.42) exhibits λ as represented by G , in the sense of Definition 8.2.4.1. That is, the functor $\tilde{G}$ carries isomorphisms of $\mathcal{C}_+$ to universal objects of $\mathcal{C}$.
- (2) The functor $\tilde{G}$ is left cofinal.

Proof. By virtue of Proposition 8.2.1.7, the functors λ_+ and μ_+ are cocartesian fibrations, and the functor $\tilde{G}$ carries μ_+ -cocartesian morphisms of $\text{Tw}(\mathcal{C}_+)$ to λ_+ -cocartesian morphisms of $\mathcal{C}$. By virtue of Corollary 7.2.3.16, the functor $\tilde{G}$ is left cofinal if and only if, for every object $C \in \mathcal{C}_+$, the induced map $\tilde{G}_C : \text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{C\} \rightarrow \mathcal{C} \times_{\mathcal{C}_+} \{C\}$ is left cofinal. It will therefore suffice to show that the following conditions are equivalent, for each object $C \in \mathcal{C}_+$.

- (1_C) The image $\tilde{G}(\text{id}_C)$ is a universal object of $\mathcal{C}$: that is, it is initial when viewed as an object of the ∞ -category $\mathcal{C} \times_{\mathcal{C}_+} \{C\}$.
- (2_C) The functor $\tilde{G}_C$ is left cofinal.

The equivalence (1_C) $\Leftrightarrow$ (2_C) is a special case of Corollary 7.2.1.9, since id_C is initial when viewed as an object of the ∞ -category $\text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{C\}$ (see Proposition 8.1.2.1). $\square$

8.2.5 Adjunctions as Couplings

045R Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is both representable and corepresentable. Using Theorem 8.2.3.4 (and its dual), we can choose a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ which represents λ and a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which corepresents λ . Either of these functors determines the pairing λ up to equivalence, and therefore determines the other up to isomorphism. Our goal in this section is to establish the following more precise result:

045S **Theorem 8.2.5.1.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. Then a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ corepresents the coupling λ if and only if it is left adjoint to G .*

We first establish a weaker version of Theorem 8.2.5.1.

045T **Proposition 8.2.5.2.** *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. The following conditions are equivalent:*

- (1) *The coupling λ is corepresentable.*
- (2) *The functor G admits a left adjoint.*

Proof. By virtue of the criterion of Corollary 6.2.6.2, it will suffice to show that for each object $X \in \mathcal{C}_-$, the following conditions are equivalent:

- (1_X) There exists a couniversal object $\tilde{X} \in \mathcal{C}$ satisfying $\lambda_-(\tilde{X}) = X$.
- (2_X) The ∞ -category $(\mathcal{C}_-)_{X/} \times_{\mathcal{C}_-} \mathcal{C}_+$ has an initial object.

Note that Proposition 8.1.2.9 supplies an equivalence $(\mathcal{C}_-)_{X/} \hookrightarrow \{X\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-)$ of ∞ -categories which are left-fibered over $\mathcal{C}_-$. Restricting along the functor G , we obtain an equivalence of ∞ -categories

$$(\mathcal{C}_-)_{X/} \times_{\mathcal{C}_-} \mathcal{C}_+ \hookrightarrow \{X\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+.$$

Since λ is representable by G , there exists a categorical pullback square

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_- \end{array}$$

which induces an equivalence of ∞ -categories

$$\{X\} \times_{\mathcal{C}_-^{\text{op}}} \mathcal{C} \rightarrow \{X\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \mathcal{C}_+.$$

The equivalence of (1_X) and (2_X) now follows from Corollary 4.6.7.22. □

Proof of Theorem 8.2.5.1. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{C}_+$. By virtue of Proposition 8.2.5.2, the functor G admits a left adjoint if and only if the coupling λ is corepresentable. If this condition is satisfied, then there exists a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which corepresents the coupling λ ; moreover, F is uniquely determined up to isomorphism (Theorem 8.2.0.4). We will complete the proof by showing that F is a left adjoint of G .

Choose a diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-, \end{array} \quad \begin{array}{l} \text{045U} \\ (8.43) \end{array}$$

which exhibits λ as represented by G (see Definition 8.2.3.5). Then, for each universal object $C \in \mathcal{C}$, the image $\tilde{G}(C) \in \text{Tw}(\mathcal{C}_-)$ corresponds to an isomorphism in the ∞ -category $\mathcal{C}_-$ (Proposition 8.2.3.7). Using Proposition 8.2.4.3, we can choose a commutative diagram

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_-) & \xrightarrow{\tilde{F}} & \mathcal{C} \\ \downarrow & & \downarrow \lambda \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_- & \xrightarrow{\text{id} \times F} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array} \quad \begin{array}{l} \text{045V} \\ (8.44) \end{array}$$

which exhibits λ as corepresented by F (see Variant 8.2.4.5). It follows that the composite functor $\tilde{F} \circ \tilde{G} : \mathcal{C} \rightarrow \mathcal{C}$ carries universal objects of $\mathcal{C}$ to couniversal objects of $\mathcal{C}$. Applying Theorem 8.2.4.6, we deduce that the diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{F} \circ \tilde{G}} & \mathcal{C} \\ \downarrow \lambda & & \downarrow \lambda \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times (F \circ G)} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \end{array}$$

is couniversal when viewed as an object of the ∞ -category $\text{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$.

In particular, there exists an (essentially unique) morphism

$$\tilde{\epsilon} : (\text{id}_{\mathcal{C}_-}, \tilde{F} \circ \tilde{G}, F \circ G) \rightarrow (\text{id}_{\mathcal{C}_-}, \text{id}_{\mathcal{C}}, \text{id}_{\mathcal{C}_+})$$

in the ∞ -category $\{\mathrm{id}_{\mathcal{C}_-}\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{C})$. Let $\epsilon : F \circ G \rightarrow \mathrm{id}_{\mathcal{C}_+}$ denote the image of $\tilde{\epsilon}$ under the forgetful functor $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathcal{C}) \rightarrow \mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_+)$. We will show that ϵ is the counit of an adjunction between F and G .

Using Example 8.2.2.12, we see that the diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_-) & \xrightarrow{\mathrm{id}} & \mathrm{Tw}(\mathcal{C}_-) \\ \downarrow & & \downarrow \\ \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- & \xrightarrow{\mathrm{id} \times \mathrm{id}} & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- \end{array}$$

is couniversal when viewed as an object of the ∞ -category $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_-), \mathrm{Tw}(\mathcal{C}_-))$. In particular, there exists an (essentially unique) morphism

$$\tilde{\eta} : (\mathrm{id}_{\mathcal{C}_-^{\mathrm{op}}}, \mathrm{id}_{\mathrm{Tw}(\mathcal{C}_-)}, \mathrm{id}_{\mathcal{C}_-}) \rightarrow (\mathrm{id}_{\mathcal{C}_-^{\mathrm{op}}}, \tilde{G} \circ \tilde{F}, G \circ F)$$

in the ∞ -category $\{\mathrm{id}_{\mathcal{C}_-}\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_-), \mathrm{Tw}(\mathcal{C}_-))$. Let $\eta : \mathrm{id}_{\mathcal{C}_+} \rightarrow G \circ F$ denote the image of $\tilde{\eta}$ under the forgetful functor $\mathrm{Fun}_{\pm}(\mathrm{Tw}(\mathcal{C}_-), \mathrm{Tw}(\mathcal{C}_-)) \rightarrow \mathrm{Fun}(\mathcal{C}_-, \mathcal{C}_-)$. We will complete the proof by showing that η is compatible with ϵ up to homotopy, in the sense of Definition 6.2.1.1. For this, we must verify the following:

(Z1) The identity isomorphism id_F is a composition of the natural transformations

$$F = F \circ \mathrm{id}_{\mathcal{C}_-} \xrightarrow{\mathrm{id} \circ \eta} F \circ G \circ F \xrightarrow{\epsilon \circ \mathrm{id}} \mathrm{id}_{\mathcal{C}_+} \times F = F$$

in the ∞ -category $\mathrm{Fun}(\mathcal{C}_-, \mathcal{C}_+)$.

(Z2) The identity isomorphism id_G is a composition of the natural transformations

$$G = \mathrm{id}_{\mathcal{C}_-} \circ G \xrightarrow{\eta \circ \mathrm{id}} G \circ F \circ G \xrightarrow{\mathrm{id} \circ \epsilon} G \times \mathrm{id}_{\mathcal{C}_+} = G$$

in the ∞ -category $\mathrm{Fun}(\mathcal{C}_+, \mathcal{C}_-)$.

Using Theorem 8.2.4.6, we deduce that the diagram (8.43) is a couniversal object of $\mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{C}_-))$: that is, it is initial when viewed as an object of the ∞ -category $\mathcal{E} = \{\mathrm{id}_{\mathcal{C}_-}\} \times_{\mathrm{Fun}(\mathcal{C}_-, \mathcal{C}_-)^{\mathrm{op}}} \mathrm{Fun}_{\pm}(\mathcal{C}, \mathrm{Tw}(\mathcal{C}_-))$. It follows that the diagram

$$\begin{array}{ccc} & (\mathrm{id}_{\mathcal{C}_-}, \tilde{G} \circ \tilde{F} \circ \tilde{G}, G \circ F \circ G) & \\ \tilde{\eta} \circ \mathrm{id} \nearrow & & \searrow \mathrm{id} \circ \tilde{\epsilon} \\ (\mathrm{id}_{\mathcal{C}_-}, \tilde{G}, G) & \xrightarrow{\mathrm{id}} & (\mathrm{id}_{\mathcal{C}_-}, \tilde{G}, G) \end{array}$$

commutes up to homotopy in $\mathcal{E}$. Assertion (Z2) follows by applying the forgetful functor $\text{Fun}_\pm(\mathcal{C}, \text{Tw}(\mathcal{C}_-)) \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$. Assertion (Z1) follows by a similar argument, using the observation that the diagram (8.44) is a couniversal object of $\text{Fun}_\pm(\text{Tw}(\mathcal{C}_-), \mathcal{C})$ (Theorem 8.2.2.11). $\square$

8.2.6 Balanced Couplings

Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. In this section, we formulate a concrete criterion to determine if λ is representable (or corepresentable) by an equivalence of ∞ -categories. 045W

Definition 8.2.6.1. Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. We say that λ is *balanced* if it satisfies the following conditions: 045X

- (1) The coupling λ is representable. That is, for each object $C_+ \in \mathcal{C}_+$, there exists a universal object $C \in \mathcal{C}$ satisfying $\lambda_+(C) = C_+$.
- (2) The coupling λ is corepresentable. That is, for each object $C_- \in \mathcal{C}_-$, there exists a couniversal object $C \in \mathcal{C}$ satisfying $\lambda_-(C) = C_-$.
- (3) An object $C \in \mathcal{C}$ is universal if and only if it is couniversal.

Example 8.2.6.2. For every ∞ -category $\mathcal{C}$, the twisted arrow coupling $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Example 8.2.0.2 is balanced. See Example 8.2.1.5. 045Y

Example 8.2.6.3. Let X be a Kan complex, let $\lambda_- : \text{Fun}(\Delta^1, X) \rightarrow X$ be the morphism given by evaluation at the vertex $0 \in \Delta^1$, and let $\lambda_+ : \text{Fun}(\Delta^1, X) \rightarrow X$ be the morphism given by evaluation at the vertex $1 \in \Delta^1$. It follows from Corollary 3.1.3.3 that the map 04AV

$$\lambda = (\lambda_-, \lambda_+) : \text{Fun}(\Delta^1, X) \rightarrow X \times X$$

is a Kan fibration; in particular, we can view it as a coupling of X with itself. For each vertex $x \in X$, the path spaces $\lambda_-^{-1}\{x\} = \{x\} \tilde{\times}_X X$ and $\lambda_+^{-1}\{x\} = X \tilde{\times}_X \{x\}$ are contractible Kan complexes (Example 3.4.1.14), so that every object of $\text{Fun}(\Delta^1, X)$ is both universal and couniversal for the coupling λ . In particular, λ is a balanced coupling.

Remark 8.2.6.4. Suppose we are given a morphism of couplings 04AW

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow \lambda & & \downarrow \mu \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array}$$

which is an equivalence (in the sense of Exercise 8.2.2.7). Then λ is balanced if and only if μ is balanced. See Remark 8.2.2.8.

06BX **Example 8.2.6.5.** Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ and $\mu : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$ be couplings of ∞ -categories, and let

$$\Phi : \text{Fun}_{\pm}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}_-, \mathcal{D}_-)^{\text{op}} \times \text{Fun}(\mathcal{C}_+, \mathcal{D}_+)$$

be the functor coupling of Proposition 8.2.2.2. If λ and μ are balanced couplings, then Φ is also a balanced coupling. This follows from Theorem 8.2.2.11.

We can now formulate the main result of this section.

045Z **Theorem 8.2.6.6.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. The following conditions are equivalent:*

- (1) *The coupling λ is balanced.*
- (2) *The coupling λ is representable by an equivalence of ∞ -categories $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$.*
- (3) *The coupling λ is corepresentable by an equivalence of ∞ -categories $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$.*

04AX **Corollary 8.2.6.7.** *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. Then $\mathcal{C}_-$ and $\mathcal{C}_+$ are equivalent if and only if there exists a balanced coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$.*

0460 **Corollary 8.2.6.8.** *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories. Then λ is balanced if and only if there exists an equivalence of couplings*

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \text{Tw}(\mathcal{D}) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times F_+} & \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+ \end{array}$$

Proof. Suppose that λ is balanced. By virtue of Theorem 8.2.6.6, the coupling λ is corepresentable by a functor $F_- : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which is an equivalence of ∞ -categories. We can therefore choose a categorical pullback square

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \text{Tw}(\mathcal{C}_+) \\ \downarrow \lambda & & \downarrow \\ \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{F_-^{\text{op}} \times \text{id}} & \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ \end{array}$$

which exhibits λ as corepresented by F_- . Since F_- is an equivalence of ∞ -categories, it follows that F is also an equivalence of ∞ -categories (Proposition 4.5.2.22). The reverse implication is an immediate consequence of Example 8.2.6.2 (and Remark 8.2.6.4). $\square$

We will deduce Theorem 8.2.6.6 from the following more general result.

Proposition 8.2.6.9. *Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is repre-* 0461
sentable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. The following conditions are equivalent:

- (1) *Every universal object of $\mathcal{C}$ is couniversal.*
- (2) *The functor G is fully faithful.*

Proof. Using Proposition 8.2.4.3, we can choose a commutative diagram

$$\begin{array}{ccccc}
 \text{Tw}(\mathcal{C}_+) & \xrightarrow{\tilde{G}'} & \mathcal{C} & \xrightarrow{\tilde{G}} & \text{Tw}(\mathcal{C}_-) \\
 \downarrow & & \downarrow \lambda & & \downarrow \\
 \mathcal{C}_+^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{G^{\text{op}} \times \text{id}} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ & \xrightarrow{\text{id} \times G} & \mathcal{C}_-^{\text{op}} \times \mathcal{C}_-,
 \end{array} \tag{8.45}$$

where the left square exhibits λ as represented by G in the sense of Definition 8.2.4.1, and the right square exhibits λ as represented by G in the sense of Definition 8.2.3.5. Invoking (the dual of) Lemma 8.2.3.6, we see that (1) is equivalent to the following:

- (1') The left square of (8.45) is a categorical pullback diagram.

For each object $C \in \mathcal{C}_+$, Proposition 8.2.3.7 guarantees that the composite functor $\tilde{G} \circ \tilde{G}'$ carries id_C to an isomorphism of $\mathcal{C}_-$ (regarded as an object of $\text{Tw}(\mathcal{C}_-)$). It follows from Theorem 8.2.2.11 that $(G, \tilde{G}' \circ \tilde{G}, G)$ and $(G, \text{Tw}(G), G)$ are isomorphic when viewed as objects of $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-))$ (since both are initial objects of the ∞ -category $\text{Fun}_{\pm}(\text{Tw}(\mathcal{C}_+), \text{Tw}(\mathcal{C}_-)) \times_{\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)} \{G\}$). In particular, for every pair of objects $X, Y \in \mathcal{C}_+$, the diagram of Kan complexes

$$\begin{array}{ccc}
 \text{Hom}_{\mathcal{C}_+}(X, Y) & \longrightarrow & \{X\} \times_{\mathcal{C}_+^{\text{op}}} \text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}_+} \{Y\} \\
 \downarrow G & & \downarrow \tilde{G}' \circ \tilde{G} \\
 \text{Hom}_{\mathcal{C}_-}(G(X), G(Y)) & \longrightarrow & \{G(X)\} \times_{\mathcal{C}_-^{\text{op}}} \text{Tw}(\mathcal{C}_-) \times_{\mathcal{C}_-} \{G(Y)\}
 \end{array}$$

commutes up to homotopy, where the horizontal maps are the homotopy equivalences of Notation 8.1.2.14. Using Corollary 5.1.7.16, we see that (2) is equivalent to the following:

(2') The outer rectangle of (8.45) is a categorical pullback diagram.

The equivalence of (1') and (2') is a special case of Proposition 4.5.2.19, since the right square of (8.45) is a categorical pullback square by assumption. $\square$

Proof of Theorem 8.2.6.6. We will prove the equivalence $(1) \Leftrightarrow (2)$; the equivalence $(1) \Leftrightarrow (3)$ follows by a similar argument. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ is a coupling of ∞ -categories which is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. Combining Theorem 8.2.5.1 with Proposition 8.2.6.9, we see that λ is balanced if and only if the following conditions are satisfied:

- The functor G is fully faithful.
- The functor G admits a left adjoint $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$.
- The functor F is fully faithful.

It follows from Corollary 6.2.2.27 that these conditions are satisfied if and only if G is an equivalence of ∞ -categories. $\square$

8.3 The Yoneda Embedding

03LZ Let $\mathcal{C}$ be a category. For every object $X \in \mathcal{C}$, we let $h^X : \mathcal{C} \rightarrow \text{Set}$ denote the functor corepresented by X , given on objects by the formula $h^X(Y) = \text{Hom}_{\mathcal{C}}(X, Y)$. The construction $X \mapsto h^X$ determines a functor from $\mathcal{C}^{\text{op}}$ to the functor category $\text{Fun}(\mathcal{C}, \text{Set})$, which we refer to as the (*contravariant*) *Yoneda embedding*. This terminology is justified by the following:

03M0 **Proposition 8.3.0.1** (Yoneda's Lemma, Weak Form). *For any (locally small) category $\mathcal{C}$, the Yoneda embedding*

$$\mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \text{Set}) \quad X \mapsto h^X$$

is fully faithful.

The goal of this section is to extend Proposition 8.3.0.1 to the setting of ∞ -categories. Our first step is to construct an analogue of the functor $X \mapsto h^X$. For every pair of objects $X, Y \in \mathcal{C}$, the morphism space $\text{Hom}_{\mathcal{C}}(X, Y)$ is a Kan complex (Proposition 4.6.1.10), which we can regard as an object of the ∞ -category $\mathcal{S}$. In §8.3.3, we show that the construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ can be upgraded to a functor from the product $\mathcal{C}^{\text{op}} \times \mathcal{C}$ to the ∞ -category $\mathcal{S}$. More precisely, every locally small ∞ -category $\mathcal{C}$ admits a *Hom-functor* $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$, which is characterized (up to isomorphism) by the requirement that it is a covariant transport representation for the twisted arrow fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ of Proposition 8.3.3.2. This condition guarantees that for every object $X \in \mathcal{C}$, the functor $\mathcal{H}(X, -) : \mathcal{C} \rightarrow \mathcal{S}$ is corepresentable by X . We can therefore identify $\mathcal{H}$ with a functor

$$h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S}) \quad X \mapsto \mathcal{H}(X, -)$$

carrying each object of $\mathcal{C}$ to a functor that it corepresents; we will refer to $h^\bullet$ as a *contravariant Yoneda embedding* for $\mathcal{C}$ (Definition 8.3.3.9).

To show that the Yoneda embedding is fully faithful, we will need an additional ingredient. Let us return to the situation where $\mathcal{C}$ is an ordinary category. Proposition 8.3.0.1 asserts that for every pair of objects $X, Y \in \mathcal{C}$, the natural map $\mathrm{Hom}_{\mathcal{C}}(Y, X) \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set})}(h^X, h^Y)$ is a bijection. It is easy to see that this map is injective: in fact, it has a left inverse $T : \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set})}(h^X, h^Y) \rightarrow \mathrm{Hom}_{\mathcal{C}}(Y, X)$, which carries a natural transformation $\alpha : h^X \rightarrow h^Y$ to the element $\alpha_X(\mathrm{id}_X) \in h^Y(X) = \mathrm{Hom}_{\mathcal{C}}(Y, X)$. It will therefore suffice to show that T is bijective. This is a consequence of the following *strong* version of Yoneda's lemma: for every functor $\mathcal{F} : \mathcal{C} \rightarrow \mathrm{Set}$, the evaluation map

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathrm{Set})}(h^X, \mathcal{F}) \rightarrow \mathcal{F}(X) \quad \alpha \mapsto \alpha_X(\mathrm{id}_X)$$

is a bijection (Proposition 8.3.1.1). This assertion also has a counterpart in the setting of ∞ -categories (Proposition 8.3.1.3), which we formulate and prove in §8.3.1.

To exploit the universal mapping property of (co)representable functors, it will be convenient to introduce some terminology. Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories. We define a *profunctor from $\mathcal{D}$ to $\mathcal{C}$* to be a functor $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ (Definition 8.3.2.1). We say that a profunctor $\mathcal{K}$ is *corepresentable* if, for every object $X \in \mathcal{C}$, the functor $\mathcal{K}(X, -) : \mathcal{D} \rightarrow \mathcal{S}$ is corepresentable. In this case, the construction $X \mapsto \mathcal{K}(X, -)$ determines a functor from $\mathcal{C}^{\mathrm{op}}$ to the full subcategory $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{D}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{D}, \mathcal{S})$ spanned by the corepresentable functors. In §8.3.2, we establish a criterion for this functor to be an equivalence of ∞ -categories (Corollary 8.3.2.20). Our ∞ -categorical version of Yoneda's lemma then follows by specializing this criterion to the situation where $\mathcal{C} = \mathcal{D}$ and $\mathcal{K}$ is a Hom-functor (Theorem 8.3.3.13).

Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories. Assume that $\mathcal{C}$ is locally small, so that it admits a Hom-functor $\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$. For every functor $G : \mathcal{D} \rightarrow \mathcal{C}$, the composition

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{\mathrm{id} \times G} \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \xrightarrow{\mathcal{H}} \mathcal{S},$$

can be regarded as a profunctor $\mathcal{K}_G$ from $\mathcal{D}$ to $\mathcal{C}$, given informally by the construction $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{D}}(X, G(Y))$. In §8.3.4, we show that this construction determines a fully faithful functor $\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\mathrm{op}} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S})$, whose essential image is spanned by the *representable* profunctors (Proposition 8.3.4.1). Using the results of §8.2, we give an alternative characterization of representable profunctors (Proposition 8.3.4.15) and show that they satisfy a universal mapping property (Corollary 8.3.4.21). As an application, we show that morphism spaces in the ∞ -category $\mathrm{Fun}(\mathcal{D}, \mathcal{C})$ can be computed as limits indexed by the twisted arrow ∞ -category $\mathrm{Tw}(\mathcal{D})$ (Example 8.3.4.22).

Warning 8.3.0.2. If $\mathcal{C}$ is an ordinary category, the Yoneda embedding

03M1

$$h^\bullet : \mathcal{C}^{\mathrm{op}} \hookrightarrow \mathrm{Fun}(\mathcal{C}, \mathrm{Set}) \quad X \mapsto h^X$$

is given by a completely explicit construction. Beware that in the ∞ -categorical setting, the Yoneda embedding depends on a choice of covariant transport representation for the twisted arrow fibration $\mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$, which is well-defined only up to isomorphism. However, it is sometimes possible to eliminate this ambiguity. Suppose that $\mathcal{C} = \mathbf{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C}_0)$ is the homotopy coherent nerve of a locally Kan simplicial category $\mathcal{C}_0$. In this case, the simplicial enrichment of $\mathcal{C}_0$ determines a functor of simplicial categories

$$\mathcal{C}_0^{\mathrm{op}} \times \mathcal{C}_0 \rightarrow \mathbf{Kan} \quad (X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}_0}(X, Y)_{\bullet}.$$

Passing to the homotopy coherent nerve, we obtain a functor of ∞ -categories $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ (Construction 8.3.6.1). In §8.3.6, we show that $\mathcal{H}$ is a Hom-functor for the ∞ -category $\mathcal{C}$ (Proposition 8.3.6.2). Our proof uses a recognition principle for Hom-functors, which we formulate and prove in §8.3.5.

8.3.1 Yoneda's Lemma

03M2 Let $\mathcal{C}$ be a category. Every object $X \in \mathcal{C}$ determines a corepresentable functor $h^X : \mathcal{C} \rightarrow \mathbf{Set}$, given on objects by the formula $h^X(Y) = \mathrm{Hom}_{\mathcal{C}}(X, Y)$. This functor can be characterized by a universal mapping property:

03M3 **Proposition 8.3.1.1** (Yoneda's Lemma, Strong Form). *Let $\mathcal{C}$ be a category containing an object X . For every functor $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Set}$, evaluation on the identity morphism $\mathrm{id}_X \in h^X(X)$ induces a bijection*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathbf{Set})}(h^X, \mathcal{F}) \rightarrow \mathcal{F}(X).$$

Proof. Fix an element $x \in \mathcal{F}(X)$. We wish to show that there is a unique natural transformation $\alpha : h^X \rightarrow \mathcal{F}$ which carries $\mathrm{id}_X \in h^X(X)$ to the element $x \in \mathcal{F}(X)$.

For any object $Y \in \mathcal{C}$, every element $f \in h^X(Y) \in \mathrm{Hom}_{\mathcal{C}}(X, Y)$ can be obtained by evaluating the function $h^X(f) : h^X(X) \rightarrow h^X(Y)$ on the object id_X . It follows that, if $\alpha : h^X \rightarrow \mathcal{F}$ is a natural transformation satisfying $\alpha_X(\mathrm{id}_X) = x$, then it must satisfy the identity

$$\alpha_Y(f) = \alpha_Y(h^X(f)(\mathrm{id}_X)) = \mathcal{F}(f)(h_X(\mathrm{id}_X)) = \mathcal{F}(f)(x).$$

This proves uniqueness. To establish existence, it will suffice to show that the collection of functions

$$\alpha_Y : \mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathcal{F}(Y) \quad f \mapsto \mathcal{F}(f)(x)$$

determine a natural transformation from h^X to $\mathcal{F}$. In other words, we must show that for

each morphism $g : Y \rightarrow Z$ in $\mathcal{C}$, the diagram of sets

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{C}}(X, Y) & \xrightarrow{g \circ} & \mathrm{Hom}_{\mathcal{C}}(X, Z) \\ \downarrow \alpha_Y & & \downarrow \alpha_Z \\ \mathcal{F}(Y) & \xrightarrow{\mathcal{F}(g)} & \mathcal{F}(Z) \end{array}$$

is commutative. This follows from the observation that, for every morphism $f : X \rightarrow Y$ of $\mathcal{C}$, we have an equality $\mathcal{F}(g \circ f)(x) = (\mathcal{F}(g) \circ \mathcal{F}(f))(x)$ in the set $\mathcal{F}(Z)$. $\square$

Our goal in this section is prove a generalization of Yoneda's lemma, where we replace $\mathcal{C}$ by an ∞ -category and $\mathbf{Set}$ by the ∞ -category $\mathcal{S}$ of spaces (Proposition 8.3.1.3). In the ∞ -categorical setting, the proof is more subtle: to construct a natural transformation α between functors $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$, it is not enough to specify a collection of morphisms $\{\alpha_Y : \mathcal{G}(Y) \rightarrow \mathcal{F}(Y)\}_{Y \in \mathcal{C}}$ and to verify a compatibility condition. To address this difficulty, we will use the formalism of Kan extensions developed in §7.3 (see Lemma 8.3.1.7).

Notation 8.3.1.2. Let $\mathcal{S}$ denote the ∞ -category of spaces (Construction 5.5.1.1). Let $\mathcal{C}$ be an ∞ -category and suppose we are given a pair of functors $\mathcal{F}, \mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$. Fix an object $X \in \mathcal{C}$ and a vertex $\eta \in \mathcal{F}(X)$. We then obtain a comparison morphism

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G}) & \xrightarrow{\mathrm{ev}_X} \mathrm{Hom}_{\mathcal{S}}(\mathcal{F}(X), \mathcal{G}(X)) \\ & \xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{G}(X)) \\ & \simeq \mathcal{G}(X) \end{aligned}$$

in the homotopy category $\mathbf{hKan}$, where the first map is given by evaluation on the object X , the second by the composition law of Notation 4.6.9.15, and the third is (the inverse of) the homotopy equivalence of Remark 5.5.1.5.

Proposition 8.3.1.3 (∞ -Categorical Yoneda Lemma). *Let $\mathcal{C}$ be an ∞ -category containing an object X , let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let $\eta \in \mathcal{F}(X)$ be a vertex which exhibits the functor $\mathcal{F}$ as corepresented by X (see Definition 5.6.6.1). Then, for every functor $\mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$, the comparison map*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{G}(X)$$

of Notation 8.3.1.2 is an isomorphism in the homotopy category $\mathbf{hKan}$.

Remark 8.3.1.4. In the special case where $\mathcal{C}$ is (the nerve of) an ordinary category and $\mathcal{G}$ is a set-valued functor, Proposition 8.3.1.3 reduces to Proposition 8.3.1.1.

03M7 **Remark 8.3.1.5.** Let $\mathcal{C}$ be a locally small ∞ -category and let X be an object of $\mathcal{C}$. In §5.6.6, we proved that there exists a functor $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ which is corepresented by X , and that $\mathcal{F}$ is uniquely determined up to isomorphism (Theorem 5.6.6.13). Proposition 8.3.1.3 can be regarded as a more refined version of this uniqueness assertion: the functor $\mathcal{F}$ is characterized, up to isomorphism, by the requirement that it corepresents the evaluation functor

$$\mathrm{ev}_X : \mathrm{Fun}(\mathcal{C}, \mathcal{S}) \rightarrow \mathcal{S} \quad \mathcal{G} \mapsto \mathcal{G}(X).$$

03M8 **Corollary 8.3.1.6.** *Let $\mathcal{C}$ be an ∞ -category containing an object X . Suppose that, for every object $Y \in \mathcal{C}$, the Kan complex $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is essentially small (this condition is satisfied, for example, if $\mathcal{C}$ is small). Let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let η be a vertex of the Kan complex $\mathcal{F}(X)$. The following conditions are equivalent:*

- (1) *The vertex η exhibits the functor $\mathcal{F}$ as corepresented by X , in the sense of Definition 5.6.6.1.*
- (2) *For every functor $\mathcal{G} : \mathcal{C} \rightarrow \mathcal{S}$, the comparison map of Notation 8.3.1.2 is a homotopy equivalence $\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{G}(X)$.*
- (3) *For every functor $\mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$, the comparison map of Notation 8.3.1.2 induces a bijection $\pi_0(\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{F}')) \rightarrow \pi_0(\mathcal{F}(X))$.*

Proof. The implication (1) $\Rightarrow$ (2) follows from Proposition 8.3.1.3, and the implication (2) $\Rightarrow$ (3) is immediate. We will complete the proof by showing that (3) implies (1). Our assumption that the morphism space $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is essentially small for each $Y \in \mathcal{C}$ guarantees that there exists a functor $\mathcal{F}' : \mathcal{C} \rightarrow \mathcal{S}$ and a vertex $\eta' \in \mathcal{F}'(X)$ which exhibits $\mathcal{F}'$ as corepresented by X (see Theorem 5.6.6.13). Applying assumption (3), we deduce that there exists a natural transformation $\alpha : \mathcal{F}' \rightarrow \mathcal{F}$ such that $\alpha_X(\eta')$ and η lie in the same connected component of $\mathcal{F}(X)$. Since the pair $(\mathcal{F}', \eta')$ also satisfies condition (3), composition with α induces a bijection $\pi_0(\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G})) \rightarrow \pi_0(\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}', \mathcal{G}))$ for each object $\mathcal{G} \in \mathrm{Fun}(\mathcal{C}, \mathcal{S})$. It follows that α is an isomorphism. Applying Remark 5.6.6.4, we deduce that $\alpha_X(\eta') \in \mathcal{F}(X)$ exhibits the functor $\mathcal{F}$ as corepresented by X . Since η and $\alpha_X(\eta')$ belong to the same connected component of $\mathcal{F}(X)$, it follows that η has the same property (Remark 5.6.6.3). $\square$

Proposition 8.3.1.3 is an easy consequence of the following:

03M9 **Lemma 8.3.1.7.** *Let $\mathcal{C}$ be an ∞ -category containing an object X , let κ be an uncountable cardinal, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be a functor, and let $\eta \in \mathcal{F}(X)$ be a vertex. The following conditions are equivalent:*

- (1) *The vertex η exhibits $\mathcal{F}$ as corepresented by the object X , in the sense of Definition 5.6.6.1.*

- (2) Let $\iota : \{X\} \hookrightarrow \mathcal{C}$ denote the inclusion map and let $\mathcal{F}_0 : \{X\} \rightarrow \mathcal{S}$ denote the constant functor taking the value Δ^0 , so that η can be regarded as a natural transformation from $\mathcal{F}_0$ to the composite functor $\mathcal{F} \circ \iota$. Then η exhibits $\mathcal{F}$ as a left Kan extension of $\mathcal{F}_0$ along ι , in the sense of Variant 7.3.1.5. Moreover, for each object $Y \in \mathcal{C}$, the mapping space $\mathrm{Hom}_{\mathcal{C}}(X, Y)$ is essentially κ -small.

Proof. Fix an object $Y \in \mathcal{C}$ and set $M = \mathrm{Hom}_{\mathcal{C}}(X, Y)$. We may assume without loss of generality that M is essentially κ -small (this follows immediately from condition (2), and also follows from (1) since the Kan complex $\mathcal{F}(Y)$ is essentially small). For every Kan complex K , let $\underline{K}_M$ denote the constant functor $M \rightarrow \mathcal{S}$ taking the value K , so that the functor $\mathcal{F}$ determines a natural transformation $\gamma : \underline{\mathcal{F}(X)}_M \rightarrow \underline{\mathcal{F}(Y)}_M$. We will show that the following pair of conditions is equivalent:

- (1_Y) The composite map

$$\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathrm{Hom}_{\mathcal{S}}(\mathcal{F}(X), \mathcal{F}(Y)) \xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{F}(Y))$$

is a homotopy equivalence of Kan complexes.

- (2_Y) The composite natural transformation

$$\underline{\Delta^0}_M \xrightarrow{\eta} \underline{\mathcal{F}(X)}_M \xrightarrow{\gamma} \underline{\mathcal{F}(Y)}_M$$

exhibits $\mathcal{F}(Y)$ as a colimit of the constant diagram $\underline{\Delta^0}|_M$ in the ∞ -category $\mathcal{S}$.

The equivalence of (1_Y) and (2_Y) is a special case of Proposition 7.1.2.8 (see Example 7.1.2.10). Lemma 8.3.1.7 follows by allowing the object $Y \in \mathcal{C}$ to vary. $\square$

Proof of Proposition 8.3.1.3. Combine Lemma 8.3.1.7 and 7.3.6.1. $\square$

For later use, let us record another consequence of Lemma 8.3.1.7.

Corollary 8.3.1.8. *Let κ be an uncountable cardinal, let $T : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between 04B5 locally κ -small ∞ -categories, let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ and $\mathcal{G} : \mathcal{D} \rightarrow \mathcal{S}_{<\kappa}$ be functors, and let $\beta : \mathcal{F} \rightarrow \mathcal{G} \circ T$ be a natural transformation of functors from $\mathcal{C}$ to $\mathcal{S}$. Fix an object $C \in \mathcal{C}$ and a vertex $\eta \in \mathcal{F}(C)$ which exhibits the functor $\mathcal{F}$ as corepresented by C . The following conditions are equivalent:*

- (1) *The natural transformation β carries η to a vertex of $\mathcal{G}(T(C))$ which exhibits the functor $\mathcal{G}$ as corepresented by the object $T(C) \in \mathcal{D}$.*
- (2) *The natural transformation β exhibits $\mathcal{G}$ as a left Kan extension of $\mathcal{F}$ along the functor T (see Variant 7.3.1.5).*

Proof. Combine Lemma 8.3.1.7 with Proposition 7.3.8.23. $\square$

04B6 **Corollary 8.3.1.9.** *Let κ be an uncountable cardinal, let $T : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between locally κ -small ∞ -categories and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}$ be a functor which is corepresented by an object $C \in \mathcal{C}$. Then a functor $\mathcal{G} : \mathcal{D} \rightarrow \mathcal{S}$ is a left Kan extension of $\mathcal{F}$ along T if and only if it is corepresentable by the object $T(C) \in \mathcal{D}$.*

Proof. Assume that $\mathcal{G}$ is corepresentable by $T(C)$; we will show that it is a left Kan extension of $\mathcal{F}$ along T (the reverse implication follows immediately from Corollary 8.3.1.8). Fix a vertex $\eta \in \mathcal{F}(C)$ which exhibits $\mathcal{F}$ as corepresented by C . It follows from Proposition 8.3.1.3 that evaluation at η induces a homotopy equivalence of Kan complexes

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}, \mathcal{S})}(\mathcal{F}, \mathcal{G} \circ T) \rightarrow \mathcal{G}(T(C)).$$

We can therefore choose a natural transformation $\beta : \mathcal{F} \rightarrow \mathcal{G} \circ T$ which carries η to a vertex which exhibits $\mathcal{G}$ as corepresented by $T(C)$. Applying Corollary 8.3.1.8, we see that β exhibits $\mathcal{G}$ as a left Kan extension of $\mathcal{F}$ along T . $\square$

8.3.2 Profunctors of ∞ -Categories

03MA Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be categories. A *profunctor* from $\mathcal{C}_+$ to $\mathcal{C}_-$ is a Set-valued functor on the product category $\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$. This notion has an evident ∞ -categorical analogue, where we replace the ordinary category of sets by the ∞ -category $\mathcal{S}$ of spaces (see Construction 5.5.1.1).

03MB **Definition 8.3.2.1.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. A *profunctor* from $\mathcal{C}_+$ to $\mathcal{C}_-$ is a functor $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$.

03MC **Example 8.3.2.2.** Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ordinary categories. Then every functor $K : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathrm{Set}$ determines a morphism of simplicial sets

$$N_{\bullet}(K) : N_{\bullet}(\mathcal{C}_-)^{\mathrm{op}} \times N_{\bullet}(\mathcal{C}_+) \rightarrow N_{\bullet}(\mathrm{Set}) \subset \mathcal{S}.$$

This construction determines a monomorphism from the collection of profunctors from $\mathcal{C}_+$ to $\mathcal{C}_-$ (in the sense of classical category theory) to the collection of profunctors from $N_{\bullet}(\mathcal{C}_+)$ to $N_{\bullet}(\mathcal{C}_-)$ (in the sense of Definition 8.3.2.1). Beware that this map is (usually) not bijective: its image consists of those profunctors

$$\mathcal{K} : N_{\bullet}(\mathcal{C}_-)^{\mathrm{op}} \times N_{\bullet}(\mathcal{C}_+) \rightarrow \mathcal{S}$$

having the property that for every pair of objects $X \in \mathcal{C}_-$ and $Y \in \mathcal{C}_+$, the Kan complex $\mathcal{K}(X, Y)$ is a constant simplicial set (see Proposition 1.3.3.1 and Remark 5.5.1.7).

Remark 8.3.2.3 (Symmetry). Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. Then, by transposing its arguments, we can also regard $\mathcal{K}$ as a profunctor from $\mathcal{C}_-^{\text{op}}$ to $\mathcal{C}_+^{\text{op}}$. 03MD

Example 8.3.2.4 (From Profunctors to Couplings). Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories, let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$ (Definition 8.3.2.1). Applying the construction of Definition 5.6.2.1, we obtain an ∞ -category $\int_{\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+} \mathcal{K}$ whose objects are triples (X, Y, η) where X is an object of $\mathcal{C}_-$, Y is an object of $\mathcal{C}_+$, and η is a vertex of the Kan complex $\mathcal{K}(X, Y)$. This ∞ -category is equipped with a left fibration 0463

$$\lambda : \int_{\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+} \mathcal{K} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+,$$

given on objects by the construction $\lambda(X, Y, \eta) = (X, Y)$ (see Example 5.6.2.9). The left fibration λ is a coupling of $\mathcal{C}_+$ with $\mathcal{C}_-$, in the sense of Definition 8.2.0.1; we will refer to it as the *coupling associated to the profunctor $\mathcal{K}$* .

Modulo set-theoretic issues, every coupling can be obtained from the construction of Example 8.3.2.4:

Remark 8.3.2.5 (From Couplings to Profunctors). Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. By virtue of Corollary 5.6.0.6, the construction of Example 8.3.2.4 induces a monomorphism 0464

$$\begin{array}{c} \{\text{Profunctors } \mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}\} / \text{Isomorphism} \\ \downarrow \\ \{\text{Couplings } \lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+\} / \text{Equivalence,} \end{array}$$

whose image consists of equivalence classes of couplings $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ having essentially small fibers.

In particular, to every coupling $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ with essentially small fibers, we can associate a profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$, which is characterized (up to isomorphism) by the requirement that it is a covariant transport representation for λ (see Definition 5.6.5.1).

Variant 8.3.2.6. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories, and let κ be an uncountable cardinal. Then the construction of Example 8.3.2.4 induces a monomorphism 0465

$$\begin{array}{c} \{\text{Profunctors } \mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}_{<\kappa}\} / \text{Isomorphism} \\ \downarrow \\ \{\text{Couplings } \lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+\} / \text{Equivalence,} \end{array}$$

whose image consists of equivalence classes of couplings $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ whose fibers are essentially κ -small.

Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. A profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ can be identified with a functor from $\mathcal{C}_-^{\text{op}}$ to the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{S})$. Our primary goal in this section is to formulate a condition which guarantees that this functor is fully faithful. First, it will be convenient to introduce some terminology.

0466 Definition 8.3.2.7. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor. Let X be an object of $\mathcal{C}_-$, let Y be an object of $\mathcal{C}_+$, and let η be a vertex of the Kan complex $\mathcal{K}(X, Y)$. We will say that η is *universal* if it exhibits the functor $\mathcal{K}(-, Y) : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ as represented by the object $X \in \mathcal{C}_-$. We say that η is *couniversal* if it exhibits the functor $\mathcal{K}(X, -) : \mathcal{C}_+ \rightarrow \mathcal{S}$ as corepresented by the object $Y \in \mathcal{C}_+$.

0467 Remark 8.3.2.8. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a covariant transport representation for λ . Let C be an object of $\mathcal{C}$ and set $\lambda(C) = (X, Y)$. Then the isomorphism class of C (as an object of the fiber $\lambda^{-1}\{(X, Y)\}$) can be identified with a connected component $[\eta]$ of the Kan complex $\mathcal{K}(X, Y)$. Invoking Proposition 5.6.6.21, we deduce the following:

- The object $C \in \mathcal{C}$ is universal (in the sense of Definition 8.2.1.1) if and only if the vertex $\eta \in \mathcal{K}(X, Y)$ is universal (in the sense of Definition 8.3.2.7).
- The object $C \in \mathcal{C}$ is couniversal (in the sense of Definition 8.2.1.1) if and only if the vertex $\eta \in \mathcal{K}(X, Y)$ is couniversal (in the sense of Definition 8.3.2.7).

03ME Definition 8.3.2.9. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories, and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. We say that $\mathcal{K}$ is *representable* if, for each object $Y \in \mathcal{C}_+$, the functor $\mathcal{K}(-, Y) : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ is representable (in the sense of Variant 5.6.6.2). We will say that $\mathcal{K}$ is *corepresentable* if, for each object $X \in \mathcal{C}_-$, the functor $\mathcal{K}(X, -) : \mathcal{C}_+ \rightarrow \mathcal{S}$ is corepresentable (in the sense of Definition 5.6.6.1).

03MF Warning 8.3.2.10. The terminology of Definition 8.3.2.9 is potentially confusing. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories, let $\mathcal{C}$ denote the product $\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$, and let $\mathcal{K} : \mathcal{C} \rightarrow \mathcal{S}$ be a morphism of simplicial sets. In general, there is no relationship between the corepresentability of $\mathcal{K}$ as a $\mathcal{S}$ -valued functor on $\mathcal{C}$ (in the sense of Definition 5.6.6.1) and the corepresentability of $\mathcal{K}$ as a *profunctor* from $\mathcal{C}_+$ to $\mathcal{C}_-$ (in the sense of Definition 8.3.2.9). However, these notions of corepresentability coincide when $\mathcal{C}_-$ is a contractible Kan complex (see Example 8.3.2.13).

03MG Remark 8.3.2.11 (Symmetry). Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. Then $\mathcal{K}$ is representable if and only if it is corepresentable when regarded as a profunctor from $\mathcal{C}_-^{\text{op}}$ to $\mathcal{C}_+^{\text{op}}$ (see Remark 8.3.2.3).

Remark 8.3.2.12. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories and let $\mathcal{K}$ and $\mathcal{K}'$ be profunctors from $\mathcal{C}_+$ to $\mathcal{C}_-$ which are isomorphic (as objects of the ∞ -category $\text{Fun}(\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+, \mathcal{S})$). Then $\mathcal{K}$ is representable if and only if $\mathcal{K}'$ is representable. Similarly, $\mathcal{K}$ is corepresentable if and only if $\mathcal{K}'$ is corepresentable. See Remark 5.6.6.4. 03MH

Example 8.3.2.13. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor. If $\mathcal{C}_- = \Delta^0$, then the profunctor $\mathcal{K}$ is corepresentable (in the sense of Definition 8.3.2.9) if and only if it is corepresentable when regarded as a functor $\mathcal{C}_+ \rightarrow \mathcal{S}$ (in the sense of Definition 5.6.6.1). Similarly, if $\mathcal{C}_+ = \Delta^0$, then the profunctor $\mathcal{K}$ is representable (in the sense of Definition 8.3.2.9) if and only if it is representable when viewed as a functor $\mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ (in the sense of Variant 5.6.6.2). 03MJ

Exercise 8.3.2.14. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ordinary categories. Show that a profunctor 03MK

$$\mathcal{K} : \mathbf{N}_\bullet(\mathcal{C}_-)^{\text{op}} \times \mathbf{N}_\bullet(\mathcal{C}_+) \rightarrow \mathcal{S}$$

is representable (in the sense of Definition 8.3.2.9) if and only if it is isomorphic to the profunctor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}_-}(X, G(Y))$, for some functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$. See Proposition 8.3.4.1 for a more general result.

Remark 8.3.2.15. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor. Then $\mathcal{K}$ is representable if and only if, for every object $Y \in \mathcal{C}_+$, there exists an object $X \in \mathcal{C}_-$ and a universal vertex $\eta \in \mathcal{K}(X, Y)$. Similarly, $\mathcal{K}$ is corepresentable if and only if, for every object $X \in \mathcal{C}_-$, there exists an object $Y \in \mathcal{C}_+$ and a couniversal vertex $\eta \in \mathcal{K}(X, Y)$. 0468

Remark 8.3.2.16. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a covariant transport representation for λ . Using Remark 8.3.2.8, we deduce the following: 0469

- The coupling λ is representable (in the sense of Definition 8.2.1.3) if and only if the profunctor $\mathcal{K}$ is representable (in the sense of Definition 8.3.2.9).
- The coupling λ is corepresentable (in the sense of Definition 8.2.1.3) if and only if the profunctor $\mathcal{K}$ is corepresentable (in the sense of Definition 8.3.2.9).

The main result of this section is the following variant of Proposition 8.2.6.9:

Proposition 8.3.2.17. *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories, and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a corepresentable profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. The following conditions are equivalent:* 03ML

- (1) *The profunctor $\mathcal{K}$ determines a fully faithful functor*

$$\mathcal{C}_-^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}) \quad X \mapsto \mathcal{K}(X, -).$$

(2) Let X be an object of $\mathcal{C}_-$ and let Y be an object of $\mathcal{C}_+$. Then every couniversal vertex $\eta \in \mathcal{K}(X, Y)$ is also universal.

Proof. Choose an object $X \in \mathcal{C}_-$. Since the functor $\mathcal{K}(X, -) : \mathcal{C}_+ \rightarrow \mathcal{S}$ is corepresentable, we can choose an object $Y \in \mathcal{C}_+$ and a couniversal vertex $\eta \in \mathcal{K}(X, Y)$. We will show that the following conditions are equivalent:

(1_X) For every object $X' \in \mathcal{C}_-$, the profunctor $\mathcal{K}$ induces a homotopy equivalence

$$\mathrm{Hom}_{\mathcal{C}_-^{\mathrm{op}}}(X, X') \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{S})}(\mathcal{K}(X, -), \mathcal{K}(X', -)).$$

(2_X) The vertex η is universal.

Proposition 8.3.2.17 will then follow by allowing the triple (X, Y, η) to vary.

Condition (2_X) is the assertion that, for each object $X' \in \mathcal{C}_-$, the composite map

$$\begin{aligned} \mathrm{Hom}_{\mathcal{C}_-^{\mathrm{op}}}(X, X') &\rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}_+, \mathcal{S})}(\mathcal{K}(X, -), \mathcal{K}(X', -)) \\ &\rightarrow \mathrm{Hom}_{\mathcal{S}}(\mathcal{K}(X, Y), \mathcal{K}(X', Y)) \\ &\xrightarrow{\circ[\eta]} \mathrm{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{K}(X', Y)) \\ &\simeq \mathcal{K}(X', Y) \end{aligned}$$

is an isomorphism in the homotopy category hKan . The equivalence of this assertion with (1_X) follows immediately from Proposition 8.3.1.3. $\square$

03MM Definition 8.3.2.18 (Balanced Profunctors). Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. We say that a profunctor $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ is *balanced* if it satisfies the following conditions:

- The profunctor $\mathcal{K}$ is representable and corepresentable (Definition 8.3.2.9).
- Let X be an object of $\mathcal{C}_-$, let Y be an object of $\mathcal{C}_+$, and let η be a vertex of the Kan complex $\mathcal{K}(X, Y)$. Then η is universal if and only if it is couniversal.

In other words, $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ is balanced if it satisfies the hypotheses of Proposition 8.3.2.17 both when regarded as a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$ and when regarded as a profunctor from $\mathcal{C}_-^{\mathrm{op}}$ to $\mathcal{C}_+^{\mathrm{op}}$.

046A Remark 8.3.2.19. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a covariant transport representation for λ . Then the coupling λ is balanced (in the sense of Definition 8.2.6.1) if and only if the profunctor $\mathcal{K}$ is balanced (in the sense of Definition 8.3.2.18). See Remark 8.3.2.8.

03MN Corollary 8.3.2.20. Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories and let $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ be a profunctor from $\mathcal{C}_-$ to $\mathcal{C}_+$. The following conditions are equivalent:

- (1) The profunctor $\mathcal{K}$ is balanced (in the sense of Definition 8.3.2.18).
 (2) The ∞ -category $\mathcal{C}_+$ is locally small and $\mathcal{K}$ induces a fully faithful functor

$$\mathcal{C}_-^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}) \quad X \mapsto \mathcal{K}(X, -),$$

whose essential image is spanned by the corepresentable functors $\mathcal{C}_+ \rightarrow \mathcal{S}$.

- (3) The ∞ -category $\mathcal{C}_-$ is locally small and $\mathcal{K}$ induces a fully faithful functor

$$\mathcal{C}_+ \rightarrow \text{Fun}(\mathcal{C}_-^{\text{op}}, \mathcal{S}) \quad Y \mapsto \mathcal{K}(-, Y),$$

whose essential image is spanned by the representable functors $\mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$.

Proof. We will prove the equivalence of (1) and (2); the equivalence of (1) and (3) follows by a similar argument. Assume first that $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ is a balanced profunctor. Invoking Proposition 8.3.2.17, we see that the functor

$$\Phi : \mathcal{C}_-^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}) \quad X \mapsto \mathcal{K}(X, -)$$

is fully faithful, and that the essential image of Φ consists of corepresentable functors from $\mathcal{C}_+$ to $\mathcal{S}$. Fix an object $Y \in \mathcal{C}_+$. Since $\mathcal{K}$ is representable, there exists an object $X \in \mathcal{C}_-$ and a universal vertex $\eta \in \mathcal{K}(X, Y)$. Our assumption that $\mathcal{K}$ is balanced guarantees that η is also couniversal. In particular, for every object $Y' \in \mathcal{C}_+$, η induces a homotopy equivalence $\text{Hom}_{\mathcal{C}_+}(Y, Y') \xrightarrow{\sim} \mathcal{K}(X, Y')$, so that the Kan complex $\text{Hom}_{\mathcal{C}_+}(X, Y')$ is essentially small. If $F : \mathcal{C}_+ \rightarrow \mathcal{S}$ is any functor corepresented by Y , then Theorem 5.6.6.13 guarantees that F is isomorphic to $\mathcal{K}(X, -)$ (as an object of the ∞ -category $\text{Fun}(\mathcal{C}_+, \mathcal{S})$), and therefore belongs to the essential image of Φ . Allowing the object Y to vary, we deduce that the profunctor $\mathcal{K}$ satisfies condition (2).

We now prove the converse. Assume that the functor Φ is fully faithful and that the essential image of Φ is spanned by the corepresentable functors $\mathcal{C}_+ \rightarrow \mathcal{S}$. We wish to show that the profunctor $\mathcal{K}$ is balanced. Since Φ takes values in the full subcategory of $\text{Fun}(\mathcal{C}_+, \mathcal{S})$ spanned by the corepresentable functors, the profunctor $\mathcal{K}$ is corepresentable. We next show that $\mathcal{K}$ is representable. Fix an object $Y \in \mathcal{C}_+$; we wish to show that the functor $\mathcal{K}(-, Y) : \mathcal{C}_-^{\text{op}} \rightarrow \mathcal{S}$ is representable. Since $\mathcal{C}_-$ is locally small, there exists a functor $F : \mathcal{C}_- \rightarrow \mathcal{S}$ which is corepresentable by Y (Theorem 5.6.6.13). Then F belongs to the essential image of Φ . We may therefore assume without loss of generality that $F = \mathcal{K}(X_0, -)$ for some object $X_0 \in \mathcal{C}_-$. Choose a couniversal vertex $\eta_0 \in \mathcal{K}(X_0, Y) = F(Y)$. Since Φ is fully faithful, Proposition 8.3.2.17 implies that η_0 is also universal, so that $\mathcal{K}(-, Y)$ is representable by X_0 .

To complete the proof, we must show that the pairing $\mathcal{K}$ satisfies the second condition of Definition 8.3.2.18. Let $Y \in \mathcal{C}_+$ be as above, let X be any object of $\mathcal{C}_-$, and let η be a

vertex of the Kan complex $\mathcal{K}(X, Y)$. Assume that η is universal; we wish to show that it is also couniversal (the reverse implication follows from Proposition 8.3.2.17). Choose $\eta_0 \in \mathcal{K}(X_0, Y)$ as above. Since η_0 is universal, there exists an isomorphism $u : X \rightarrow X_0$ in the ∞ -category $\mathcal{C}_-$ such that $\mathcal{K}(u, \text{id}_Y)(\eta_0)$ and η belong to the same connected component of the Kan complex $\mathcal{K}(X, Y)$ (Remark 5.6.6.6). We may therefore assume without loss of generality that $\eta = \mathcal{K}(u, \text{id}_Y)(\eta_0)$ (Remark 5.6.6.3). The desired result now follows by applying Remark 5.6.6.4 to the isomorphism of functors $\mathcal{K}(u, -) : \mathcal{K}(X_0, -) \rightarrow \mathcal{K}(X, -)$. $\square$

03MP Corollary 8.3.2.21. *Let $\mathcal{C}$ be a locally small ∞ -category, and let $\text{Fun}^{\text{corep}}(\mathcal{C}, \mathcal{S})$ denote the full subcategory of $\text{Fun}(\mathcal{C}, \mathcal{S})$ spanned by the corepresentable functors. Then the evaluation map*

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{C}, \mathcal{S}) \times \mathcal{C} \rightarrow \mathcal{S} \quad (F, C) \mapsto F(C)$$

is a balanced profunctor.

03MQ Remark 8.3.2.22. Up to equivalence, every balanced profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}$ can be obtained from the construction of Corollary 8.3.2.21. More precisely, let $\text{Fun}^{\text{corep}}(\mathcal{C}_+, \mathcal{S})$ denote the full subcategory of $\text{Fun}(\mathcal{C}_+, \mathcal{S})$ spanned by the corepresentable functors. If $\mathcal{K}$ is balanced, then it factors as a composition

$$\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \xrightarrow{\Phi \times \text{id}} \text{Fun}^{\text{corep}}(\mathcal{C}_+, \mathcal{S}) \times \mathcal{C}_+ \xrightarrow{\text{ev}} \mathcal{S},$$

where Φ is an equivalence of ∞ -categories by virtue of Corollary 8.3.2.20.

8.3.3 Hom-Functors for ∞ -Categories

03MR Let $\mathcal{C}$ be an ∞ -category. In §4.6.1, we associated to every pair of objects $X, Y \in \mathcal{C}$ a Kan complex $\text{Hom}_{\mathcal{C}}(X, Y)$ parametrizing morphisms from X to Y . In this section, we will promote the construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ to a functor of ∞ -categories.

046B Definition 8.3.3.1. Let $\mathcal{C}$ be an ∞ -category. We say that a profunctor

$$\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$$

is a *Hom-functor for $\mathcal{C}$* if it is a covariant transport representation for the twisted arrow coupling $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$.

03N2 Proposition 8.3.3.2 (Existence and Uniqueness). *Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ admits a Hom-functor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ if and only if it is locally small. If this condition is satisfied, then $\mathcal{H}$ is uniquely determined up to isomorphism.*

Proof. Combine Remark 8.3.5.3 with Corollary 5.6.0.6 (applied to the left fibration $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$). $\square$

Remark 8.3.3.3. Let $\mathcal{C}$ be an ∞ -category and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a Hom-functor 03MX for $\mathcal{C}$. Passing to homotopy categories, we obtain a functor $H : \text{h}\mathcal{C}^{\text{op}} \times \text{h}\mathcal{C} \rightarrow \text{hKan}$. It follows from Corollary 8.1.2.18 (and Remark 5.6.5.10) that H is isomorphic to the functor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ determined by the hKan enrichment of the homotopy category $\text{h}\mathcal{C}$ (see Construction 4.6.9.13). See Remark 8.3.5.4 for a more precise statement.

Example 8.3.3.4. Let $\mathcal{C}$ be a category. The construction $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y)$ determines 03MW a functor

$$\mathcal{H} : \mathbf{N}_{\bullet}(\mathcal{C})^{\text{op}} \times \mathbf{N}_{\bullet}(\mathcal{C}) \rightarrow \mathbf{N}_{\bullet}(\text{Set}) \subset \mathcal{S} \quad (X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, Y),$$

which is a Hom-functor for the ∞ -category $\mathbf{N}_{\bullet}(\mathcal{C})$. For a more general statement, see Proposition 8.3.6.2.

Variant 8.3.3.5. Let κ be an uncountable cardinal and let $\mathcal{S}_{<\kappa}$ denote the ∞ -category of 03V2 κ -small spaces (Variant 5.5.4.13). Then an ∞ -category $\mathcal{C}$ admits a Hom-functor

$$\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$$

if and only if it is locally κ -small. If this condition is satisfied, then $\mathcal{H}$ is uniquely determined up to isomorphism.

Remark 8.3.3.6 (Duality). Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a functor, 03MY and let $\mathcal{H}' : \mathcal{C} \times \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ be the functor obtained from $\mathcal{H}$ by transposing its arguments. If $\mathcal{H}$ is a Hom-functor for $\mathcal{C}$, then $\mathcal{H}'$ is a Hom-functor for the opposite ∞ -category $\mathcal{C}^{\text{op}}$.

Notation 8.3.3.7. Let $\mathcal{C}$ be a locally small ∞ -category. We will often use the notation 03N4 $\text{Hom}_{\mathcal{C}}(-, -)$ to denote a Hom-functor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$. Beware that this convention introduces a slight potential for confusion. Given a pair of objects $X, Y \in \mathcal{C}$, we have two potentially different definitions of $\text{Hom}_{\mathcal{C}}(X, Y)$:

- (a) The Kan complex $\{X\} \tilde{\times}_{\mathcal{C}} \{Y\}$ of Construction 4.6.1.1, which is well-defined up to canonical isomorphism.
- (b) The Kan complex $\mathcal{H}(X, Y)$, which is only well-defined up to homotopy equivalence (since it depends on a choice of Hom-functor $\mathcal{H}$).

However, the danger is slight: Remark 8.3.3.3 guarantees the existence of homotopy equivalences $\{X\} \tilde{\times}_{\mathcal{C}} \{Y\} \simeq \mathcal{H}(X, Y)$, which can be chosen to depend functorially on X and Y (as morphisms in the homotopy category hKan). Consequently, we can always modify the choice of Hom-functor $\mathcal{H}$ to arrange that definitions (a) and (b) coincide (see Corollary 4.4.5.3).

046C **Proposition 8.3.3.8.** *Let $\mathcal{C}$ be an ∞ -category and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a Hom-functor for $\mathcal{C}$. Then $\mathcal{H}$ is a balanced profunctor (see Definition 8.3.2.18).*

Proof. By virtue of Remark 8.3.2.19, it suffices to observe that the twisted arrow coupling $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ is balanced; see Example 8.2.6.2. $\square$

03NF **Definition 8.3.3.9.** Let $\mathcal{C}$ be an ∞ -category and let

$$h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad Y \mapsto h_Y$$

be a functor. We say that $h_{\bullet}$ is a *covariant Yoneda embedding for $\mathcal{C}$* if the construction $(X, Y) \mapsto h_Y(X)$ is a Hom-functor for $\mathcal{C}$, in the sense of Definition 8.3.3.1. Similarly, we say that a functor

$$h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S}) \quad X \mapsto h^X$$

is a *contravariant Yoneda embedding for $\mathcal{C}$* if the construction $(X, Y) \mapsto h^X(Y)$ is a Hom-functor for $\mathcal{C}$.

03NG **Remark 8.3.3.10** (Duality). A functor $h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S})$ is a contravariant Yoneda embedding for $\mathcal{C}$ if and only if it is a covariant Yoneda embedding for the opposite ∞ -category $\mathcal{C}^{\text{op}}$; see Remark 8.3.3.6.

03NH **Remark 8.3.3.11.** Let $\mathcal{C}$ be an ∞ -category. By virtue of Proposition 8.3.3.2, the following conditions are equivalent:

- The ∞ -category $\mathcal{C}$ is locally small.
- The ∞ -category $\mathcal{C}$ admits a covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$.
- The ∞ -category $\mathcal{C}$ admits a contravariant Yoneda embedding $h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S})$.

If these conditions are satisfied, then the functors $h_{\bullet}$ and $h^{\bullet}$ are uniquely determined up to isomorphism. Moreover, for every object $X \in \mathcal{C}$, the functor $h_X : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ is representable by X , and the functor $h^X : \mathcal{C} \rightarrow \mathcal{S}$ is corepresentable by X (Proposition 8.3.5.5).

03V4 **Variant 8.3.3.12.** Let κ be an uncountable cardinal and let $\mathcal{S}_{<\kappa}$ denote the ∞ -category of κ -small spaces (see Variant 5.5.4.13). For every ∞ -category $\mathcal{C}$, the following conditions are equivalent:

- The ∞ -category $\mathcal{C}$ is locally κ -small.
- The ∞ -category $\mathcal{C}$ admits a covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$.
- The ∞ -category $\mathcal{C}$ admits a contravariant Yoneda embedding $h^{\bullet} : \mathcal{C}^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S}_{<\kappa})$.

See Variant 8.3.5.7.

Theorem 8.3.3.13 (Yoneda’s Lemma for ∞ -Categories). *Let $\mathcal{C}$ be a locally small ∞ -category. 03NJ Then the covariant and contravariant Yoneda embeddings*

$$h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \quad h^{\bullet} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{S})$$

are fully faithful functors, whose essential images are the full subcategories

$$\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \quad \mathrm{Fun}^{\mathrm{corep}}(\mathcal{C}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}, \mathcal{S})$$

spanned by the representable and corepresentable functors, respectively.

Proof. By virtue of Corollary 8.3.2.20, this is a reformulation of Proposition 8.3.3.8. $\square$

We close this section with some observation about the behavior of the Yoneda embedding with respect to limits.

Proposition 8.3.3.14. *Let $\mathcal{C}$ be a locally small ∞ -category and let $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be 03NP a covariant Yoneda embedding for $\mathcal{C}$. Suppose we are given a diagram $\bar{f} : K^{\triangleleft} \rightarrow \mathcal{C}$, where K is a small simplicial set. The following conditions are equivalent:*

- (1) *The morphism $\bar{f}$ is a limit diagram in $\mathcal{C}$.*
- (2) *The composition $h_{\bullet} \circ \bar{f}$ is a limit diagram in the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.*

Following the convention of Remark 4.7.0.5, we can regard Proposition 8.3.3.14 as a special case of the following more precise assertion (applied in the special case where $\kappa = \lambda$ is a strongly inaccessible cardinal):

Variant 8.3.3.15. Let λ be an uncountable cardinal, let $\mathcal{C}$ be a locally λ -small ∞ -category, 03V5 and let $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$ be a covariant Yoneda embedding for $\mathcal{C}$. Let $\kappa = \mathrm{ecf}(\lambda)$ be the exponential cofinality of λ , let K be a κ -small simplicial set, and let $\bar{f} : K^{\triangleleft} \rightarrow \mathcal{C}$ be a diagram. Then the following conditions are equivalent:

- (1) The morphism $\bar{f}$ is a limit diagram in $\mathcal{C}$.
- (2) The composition $h_{\bullet} \circ \bar{f}$ is a limit diagram in the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$.

Proof. Since K is κ -small, the ∞ -category $\mathcal{S}_{<\lambda}$ admits K -indexed limits (Example 7.6.6.11). For each object $X \in \mathcal{C}$, let $\mathrm{ev}_X : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda}) \rightarrow \mathcal{S}_{<\lambda}$ denote the functor given by evaluation at X . By virtue of Proposition 7.1.8.2, condition (2) is equivalent to the requirement that for each object $X \in \mathcal{C}$, the composition

$$K^{\triangleleft} \xrightarrow{\bar{f}} \mathcal{C} \xrightarrow{h_{\bullet}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda}) \xrightarrow{\mathrm{ev}_X} \mathcal{S}_{<\lambda}$$

is a limit diagram in the ∞ -category $\mathcal{S}_{<\lambda}$. Since the composite functor $(\mathrm{ev}_X \circ h_{\bullet}) : \mathcal{C} \rightarrow \mathcal{S}_{<\lambda}$ is corepresentable by X , the equivalence (1) $\Leftrightarrow$ (2) follows from Proposition 7.4.1.18. $\square$

03V6 **Remark 8.3.3.16.** In the situation of Variant 8.3.3.15, suppose that the ∞ -category $\mathcal{C}$ admits K -indexed limits. Then the ∞ -category of representable functors $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$ also admits K -indexed limits, which are preserved by the inclusion functor $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda}) \hookrightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$.

03Y7 **Corollary 8.3.3.17.** *Let $\mathcal{C}$ be an ∞ -category and let κ be an infinite cardinal. Then there exists a fully faithful functor $F : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, where $\widehat{\mathcal{C}}$ is κ -complete and κ -cocomplete. Moreover, we can arrange that F preserves the limits of all κ -small diagrams which exist in $\mathcal{C}$.*

Proof. Using Remark 4.7.3.19, we can choose an uncountable cardinal λ of exponential cofinality $\geq \kappa$. Enlarging λ if necessary, we may assume that $\mathcal{C}$ is locally λ -small. Let $\widehat{\mathcal{C}}$ denote the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$ and let $F = h_{\bullet}$ be a covariant Yoneda embedding for $\mathcal{C}$. Since $\mathcal{S}_{<\lambda}$ is κ -complete and κ -cocomplete (Corollary 7.4.3.8 and Variant 7.4.1.15), the ∞ -category $\widehat{\mathcal{C}}$ has the same property (Remark 7.6.6.20). Moreover, the functor F is fully faithful (Theorem 8.3.3.13) and preserves limits of κ -small diagrams (Remark 8.3.3.16). $\square$

8.3.4 Representable Profunctors

03NQ Let $\mathcal{C}$ and $\mathcal{D}$ be categories. There is a fully faithful embedding from the category of functors $\mathrm{Fun}(\mathcal{D}, \mathcal{C})$ to the category of profunctors $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathrm{Set})$, which assigns to each functor $G : \mathcal{D} \rightarrow \mathcal{C}$ the representable profunctor

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathrm{Set} \quad (X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, G(Y)).$$

This construction has an ∞ -categorical counterpart:

03NR **Proposition 8.3.4.1** (Classification of Representable Profunctors). *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories. Let κ be an uncountable cardinal for which $\mathcal{C}$ is locally κ -small, and let*

$$\mathrm{Hom}_{\mathcal{C}}(-, -) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$$

be a Hom-functor for $\mathcal{C}$ (see Notation 8.3.3.7). Then the construction $G \mapsto \mathrm{Hom}_{\mathcal{C}}(-, G(-))$ determines a fully faithful functor

$$\mathrm{Fun}(\mathcal{D}, \mathcal{C}) \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa}),$$

whose essential image is spanned by the representable profunctors from $\mathcal{D}$ to $\mathcal{C}$.

Proof. Let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ spanned by the representable functors. By virtue of Theorem 8.3.3.13, the construction $Y \mapsto \mathrm{Hom}_{\mathcal{C}}(-, Y)$ determines an equivalence of ∞ -categories $h^{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. It follows that postcomposition with $h^{\bullet}$ induces an equivalence of ∞ -categories

$$\mathrm{Fun}(\mathcal{D}, \mathcal{C}) \rightarrow \mathrm{Fun}(\mathcal{D}, \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})),$$

which is a restatement of Proposition 8.3.4.1. $\square$

Definition 8.3.4.2. Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories. Assume that $\mathcal{C}$ is locally κ -small and let $\mathrm{Hom}_{\mathcal{C}}(-, -) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ be a Hom-functor for $\mathcal{C}$. We say that a profunctor $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ is *representable by G* if it is isomorphic to the composition

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{\mathrm{id} \times G} \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \xrightarrow{\mathrm{Hom}_{\mathcal{C}}(-, -)} \mathcal{S} \quad (X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, G(Y))$$

as an object of the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa})$. By virtue of Proposition 8.3.3.2, this condition does not depend on the choice of Hom-functor $\mathrm{Hom}_{\mathcal{C}}(-, -)$.

Example 8.3.4.3. Let $\mathcal{C}$ be a locally κ -small ∞ -category, and let $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}^{<\kappa}$ be a functor. Then $\mathcal{F}$ is representable by an object $X \in \mathcal{C}$ (in the sense of Variant 5.6.6.2) if and only if, when regarded as a profunctor from Δ^0 to $\mathcal{C}$, it is representable by the functor $\Delta^0 \rightarrow \{X\} \hookrightarrow \mathcal{C}$ (in the sense of Definition 8.3.4.2).

Interchanging the roles of $\mathcal{C}$ and $\mathcal{D}$, we obtain the following dual notion:

Variant 8.3.4.4. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that $\mathcal{D}$ is locally κ -small and let $\mathrm{Hom}_{\mathcal{D}}(-, -) : \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}^{<\kappa}$ be a Hom-functor for $\mathcal{D}$. We say that a profunctor $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ is *corepresentable by F* if it is isomorphic to the composition

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{F^{\mathrm{op}} \times \mathrm{id}} \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{\mathrm{Hom}_{\mathcal{D}}(-, -)} \mathcal{S} \quad (X, Y) \mapsto \mathrm{Hom}_{\mathcal{D}}(F(X), Y)$$

as an object of the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S}^{<\kappa})$. By virtue of Proposition 8.3.3.2, this condition does not depend on the choice of Hom-functor $\mathrm{Hom}_{\mathcal{D}}(-, -)$.

Example 8.3.4.5. Let $\mathcal{C}$ be a locally κ -small ∞ -category and let $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}^{<\kappa}$ be a profunctor from $\mathcal{C}$ to itself. The following conditions are equivalent:

- The profunctor $\mathcal{H}$ is a Hom-functor for $\mathcal{C}$.
- The profunctor $\mathcal{H}$ is representable by the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$ (Definition 8.3.4.2).
- The profunctor $\mathcal{H}$ is corepresentable by the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$ (Variant 8.3.4.4).

Remark 8.3.4.6. Let $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+$ be a coupling of ∞ -categories which is essentially κ -small for some uncountable cardinal κ and let $\mathcal{K} : \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}^{<\kappa}$ be a covariant transport representation for λ . Then the profunctor $\mathcal{K}$ is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ (in the sense of Definition 8.3.4.2) if and only if the coupling λ is representable by G (in the sense of Definition 8.2.3.1). Similarly, $\mathcal{K}$ is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ if and only if λ is corepresentable by F .

03NW **Remark 8.3.4.7** (Uniqueness). Let κ be an uncountable cardinal and let $\mathcal{K} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}^{<\kappa}$ be a profunctor of ∞ -categories. If $\mathcal{C}$ is locally κ -small, then Proposition 8.3.4.1 guarantees that $\mathcal{K}$ is representable (in the sense of Definition 8.3.2.9 if and only if it is representable by G , for some functor $G : \mathcal{D} \rightarrow \mathcal{C}$. Moreover, if this condition is satisfied, then the functor G is determined uniquely to up isomorphism. Similarly, if $\mathcal{D}$ is locally κ -small, then $\mathcal{K}$ is corepresentable if and only if it is corepresentable by some functor $F : \mathcal{C} \rightarrow \mathcal{D}$. In this case, the functor F is also uniquely determined up to isomorphism.

046E **Example 8.3.4.8.** Let κ be an uncountable cardinal, let $\mathcal{C}_-$ and $\mathcal{C}_+$ be locally κ -small ∞ -categories, and let $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}_{<\kappa}$ be a profunctor from $\mathcal{C}_+$ to $\mathcal{C}_-$. The following conditions are equivalent:

- The profunctor $\mathcal{K}$ is balanced (Definition 8.3.2.18).
- The profunctor $\mathcal{K}$ is representable by a functor $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ which is an equivalence of ∞ -categories.
- The profunctor $\mathcal{K}$ is corepresentable by a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which is an equivalence of ∞ -categories.

By virtue of Theorem 8.3.3.13, this is a reformulation of Corollary 8.3.2.20.

03PA **Proposition 8.3.4.9** (Adjunctions as Profunctors). *Let $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ be a functor of ∞ -categories which represents a profunctor $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}^{<\kappa}$. Then a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ is left adjoint to G if and only if it corepresents the profunctor $\mathcal{K}$. In particular, $\mathcal{K}$ is corepresentable if and only if the functor G admits a left adjoint.*

Proof. Choose a realization of $\mathcal{K}$ as the covariant transport representation of a coupling of ∞ -categories $\lambda : \mathcal{C} \rightarrow \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+$ (see Remark 8.3.2.5). By virtue of Remark 8.3.4.6, the coupling λ is representable by the functor G . By virtue of Theorem 8.2.5.1, a functor $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ is left adjoint to G if and only if it corepresents the coupling λ . Invoking Remark 8.3.4.6 again, we see that this is equivalent to the requirement that F corepresents the profunctor $\mathcal{K}$. $\square$

Recall that, if $\mathcal{C}_-$ and $\mathcal{C}_+$ are ∞ -categories, then we write $\text{LFun}(\mathcal{C}_-, \mathcal{C}_+)$ for the full subcategory of $\text{Fun}(\mathcal{C}_-, \mathcal{C}_+)$ spanned by those functors $F : \mathcal{C}_- \rightarrow \mathcal{C}_+$ which are left adjoints (Notation 6.2.1.3). Similarly, we write $\text{RFun}(\mathcal{C}_+, \mathcal{C}_-)$ for the full subcategory of $\text{Fun}(\mathcal{C}_+, \mathcal{C}_-)$ spanned by those functors $G : \mathcal{C}_+ \rightarrow \mathcal{C}_-$ which are right adjoints.

04B7 **Corollary 8.3.4.10.** *Let $\mathcal{C}_-$ and $\mathcal{C}_+$ be ∞ -categories. Let κ be an uncountable cardinal for which $\mathcal{C}_-$ and $\mathcal{C}_+$ are locally κ -small, and let $\mathcal{E} \subseteq \text{Fun}(\mathcal{C}_-^{\text{op}} \times \mathcal{C}_+, \mathcal{S}_{<\kappa})$ denote the full subcategory spanned by those profunctors $\mathcal{K} : \mathcal{C}_-^{\text{op}} \times \mathcal{C}_+ \rightarrow \mathcal{S}_{<\kappa}$ which are both representable and corepresentable. Then:*

- (1) Composition with the covariant Yoneda embedding $\mathcal{C}_- \rightarrow \text{Fun}(\mathcal{C}_-^{\text{op}}, \mathcal{S}_{<\kappa})$ induces an equivalence of ∞ -categories $\rho : \text{RFun}(\mathcal{C}_+, \mathcal{C}_-) \rightarrow \mathcal{E}$.
- (2) Composition with the contravariant Yoneda embedding $\mathcal{C}_+^{\text{op}} \rightarrow \text{Fun}(\mathcal{C}_+, \mathcal{S}_{<\kappa})$ induces an equivalence of ∞ -categories $\lambda : \text{LFun}(\mathcal{C}_-, \mathcal{C}_+) \rightarrow \mathcal{E}^{\text{op}}$.
- (3) The composition $[\rho]^{-1} \circ [\lambda^{\text{op}}]$ determines a canonical isomorphism $\text{LFun}(\mathcal{C}_-, \mathcal{C}_+)^{\text{op}} \simeq \text{RFun}(\mathcal{C}_+, \mathcal{C}_-)$ in the homotopy category hQCat , which carries each functor $F \in \text{LFun}(\mathcal{C}_-, \mathcal{C}_+)$ to a functor $G \in \text{RFun}(\mathcal{C}_+, \mathcal{C}_-)$ which is right adjoint to F .

Proof. Assertion (1) follows by combining Propositions 8.3.4.1 and 8.3.4.9, and assertion (2) follows by a similar argument. Assertion (3) follows by combining (1) and (2) with Proposition 8.3.4.9. $\square$

For many applications, Definition 8.3.4.2 is insufficiently precise. Given a functor of ∞ -categories $G : \mathcal{D} \rightarrow \mathcal{C}$, we would like to be able to consider not only profunctors which are *representable* by G (meaning that they are *abstractly* isomorphic to the profunctor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, G(Y))$) but profunctors which are *represented* by G (meaning that we have *chosen* an isomorphism with the profunctor $(X, Y) \mapsto \text{Hom}_{\mathcal{C}}(X, G(Y))$, or some essentially equivalent datum). Here it is inconvenient that the functor $\text{Hom}_{\mathcal{C}}(-, -)$ is well-defined only up to isomorphism. To address this point, it is convenient to encode representability in a different way.

Notation 8.3.4.11. Let $\mathcal{S}$ denote the ∞ -category of spaces (Construction 5.5.1.1). We will regard the contractible Kan complex Δ^0 as an object of $\mathcal{S}$. For every ∞ -category $\mathcal{E}$, we let $\underline{\Delta}_{\mathcal{E}}^0$ denote the constant functor $\mathcal{E} \rightarrow \mathcal{S}$ taking the value Δ^0 . 03MS

Definition 8.3.4.12. Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories, let $\mathcal{K} : \mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor from $\mathcal{D}$ to $\mathcal{C}$, and let $\mathcal{K}|_{\text{Tw}(\mathcal{D})}$ denote the composite functor 03NX

$$\text{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\text{op}} \times \mathcal{D} \xrightarrow{G^{\text{op}} \times \text{id}} \mathcal{C}^{\text{op}} \times \mathcal{D} \xrightarrow{\mathcal{K}} \mathcal{S}.$$

Suppose we are given a natural transformation $\beta : \underline{\Delta}_{\text{Tw}(\mathcal{D})}^0 \rightarrow \mathcal{K}|_{\text{Tw}(\mathcal{D})}$, where $\underline{\Delta}_{\text{Tw}(\mathcal{D})}^0$ denotes the constant functor $\text{Tw}(\mathcal{D}) \rightarrow \mathcal{S}$ taking the value Δ^0 . We say that β *exhibits the profunctor $\mathcal{K}$ as represented by G* if, for every object $D \in \mathcal{D}$, the evaluation of β at the object $\text{id}_D \in \text{Tw}(\mathcal{D})$ determines a vertex $\beta(\text{id}_D) \in \mathcal{K}(G(D), D)$ which exhibits the functor $\mathcal{K}(-, D)$ as represented by the object $G(D) \in \mathcal{C}$ (see Variant 5.6.6.2).

Remark 8.3.4.13. In the situation of Definition 8.3.4.12, the natural transformation β can 046F

be identified with a functor $\tilde{G}$ which fits into a commutative diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{D}) & \xrightarrow{\tilde{G}} & \{\Delta^0\} \tilde{\times}_{\mathcal{S}}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}) \\ \downarrow & & \downarrow \lambda \\ \mathcal{D}^{\mathrm{op}} \times \mathcal{D} & \xrightarrow{G^{\mathrm{op}} \times \mathrm{id}} & \mathcal{C}^{\mathrm{op}} \times \mathcal{D}. \end{array}$$

Moreover, the natural transformation β exhibits $\mathcal{K}$ as represented by G (in the sense of Definition 8.3.4.12) if and only if $\tilde{G}$ exhibits the coupling λ as represented by G (in the sense of Definition 8.2.4.1).

03NY Example 8.3.4.14. In the situation of Definition 8.3.4.12, suppose that $\mathcal{D} = \Delta^0$. In this case, we can identify the profunctor $\mathcal{K}$ with a functor $K : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$, we can identify the functor G with an object $X \in \mathcal{C}$, and we can identify β with a vertex of the Kan complex $K(X)$. Then β exhibits the profunctor $\mathcal{K}$ as represented by the functor G (in the sense of Definition 8.3.4.12) if and only if it exhibits the functor K as represented by the object X (in the sense of Variant 5.6.6.2).

03P5 Proposition 8.3.4.15. Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories, where $\mathcal{C}$ is locally small, and let $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor. The following conditions are equivalent:

- (1) The profunctor $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ is representable by G , in the sense of Definition 8.3.4.2.
- (2) There exists a natural transformation $\beta : \underline{\Delta}^0_{\mathrm{Tw}(\mathcal{D})} \rightarrow \mathcal{K}|_{\mathrm{Tw}(\mathcal{D})}$ which exhibits $\mathcal{K}$ as represented by G , in the sense of Definition 8.3.4.12.

Proof. By virtue of Remarks 8.3.4.6 and 8.3.4.13, this follows by applying Proposition 8.2.4.3 to the coupling

$$\{\Delta^0\} \tilde{\times}_{\mathcal{S}}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{D}.$$

□

03P8 Variant 8.3.4.16 (Corepresentable Profunctors). Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories and let $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor. We say that a natural transformation $\beta : \underline{\Delta}^0_{\mathrm{Tw}(\mathcal{C})} \rightarrow \mathcal{K}|_{\mathrm{Tw}(\mathcal{C})}$ exhibits $\mathcal{K}$ as corepresented by F if, for every object $X \in \mathcal{C}$, the image $\beta(\mathrm{id}_X) \in \mathcal{K}(X, F(X))$ exhibits the functor $\mathcal{K}(X, -) : \mathcal{D} \rightarrow \mathcal{S}$ as corepresented by the object $F(X) \in \mathcal{D}$, in the sense of Definition 5.6.6.1. Equivalently, β exhibits $\mathcal{K}$ as corepresented by F if it exhibits $\mathcal{K}$ as represented by the opposite functor F^{op} , when regarded as a profunctor from $\mathcal{C}^{\mathrm{op}}$ to $\mathcal{D}^{\mathrm{op}}$ (see Remark 8.3.2.3).

Remark 8.3.4.17 (Homotopy Invariance). In the situation of Definition 8.3.4.12, the condition that β exhibits $\mathcal{K}$ as corepresented by G depends only on the homotopy class $[\beta]$ (as a morphism in the homotopy category $\mathbf{hFun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})$) (see Remark 5.6.6.3). 03P0

Remark 8.3.4.18 (Change of $\mathcal{K}$). Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories. Suppose we are given a pair of profunctors $\mathcal{K}, \mathcal{K}' : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$, a natural transformation $\alpha : \mathcal{K} \rightarrow \mathcal{K}'$, and a commutative diagram 03P1

$$\begin{array}{ccc} & \underline{\Delta}_{\mathrm{Tw}(\mathcal{D})}^0 & \\ \beta \swarrow & & \searrow \beta' \\ \mathcal{K}|_{\mathrm{Tw}(\mathcal{D})} & \xrightarrow{\alpha|_{\mathrm{Tw}(\mathcal{D})}} & \mathcal{K}'|_{\mathrm{Tw}(\mathcal{D})} \end{array}$$

in the ∞ -category $\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})$. Then any two of the following conditions imply the third:

- The natural transformation β exhibits the profunctor $\mathcal{K}$ as represented by G .
- The natural transformation β' exhibits the profunctor $\mathcal{K}'$ as represented by G .
- The natural transformation α is an isomorphism.

See Remark 5.6.6.4.

Proposition 8.3.4.19. Suppose we are given a functor of ∞ -categories $G : \mathcal{D} \rightarrow \mathcal{C}$, a profunctor $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$, and a natural transformation $\beta : \underline{\Delta}_{\mathrm{Tw}(\mathcal{D})}^0 \rightarrow \mathcal{K}|_{\mathrm{Tw}(\mathcal{D})}$. Then β exhibits $\mathcal{K}$ as represented by G (in the sense of Definition 8.3.4.12) if and only if the induced map $\mathrm{Tw}(\mathcal{D}) \rightarrow \{\Delta^0\} \tilde{\times}_{\mathcal{S}}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D})$ is left cofinal. 03P2

Proof. By virtue of Remark 8.3.4.13, this is a special case of Proposition 8.2.4.9. $\square$

Proposition 8.3.4.20 (Representable Profunctors as Kan Extensions). Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories, let $\mathcal{K} : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$ be a profunctor, and let $\beta : \underline{\Delta}_{\mathrm{Tw}(\mathcal{D})}^0 \rightarrow \mathcal{K}|_{\mathrm{Tw}(\mathcal{D})}$ be a natural transformation which exhibits $\mathcal{K}$ as represented by G . Then β exhibits $\mathcal{K}$ as a left Kan extension of the constant diagram $\underline{\Delta}_{\mathrm{Tw}(\mathcal{D})}^0$ along the composite map 03P3

$$\mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \xrightarrow{G^{\mathrm{op}} \times \mathrm{id}} \mathcal{C}^{\mathrm{op}} \times \mathcal{D}.$$

Proof. Let $\mathcal{E}$ denote the oriented fiber product $\{\Delta^0\} \tilde{\times}_{\mathcal{S}}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D})$ and let $\mu : \mathcal{E} \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{D}$ be the projection onto the second factor, so that we have a tautological natural transformation $\tilde{\beta} : \underline{\Delta}_{\mathcal{E}}^0 \rightarrow \mathcal{K} \circ \mu$. It follows from Proposition 7.4.2.13 that $\tilde{\beta}$ exhibits $\mathcal{K}$ as a left Kan extension of $\underline{\Delta}_{\mathcal{E}}^0$ along μ . The natural transformation β then determines a functor

$T : \mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{E}$ such that precomposition with T carries $\tilde{\beta}$ to β . By the transitivity of the formation of Kan extensions (Proposition 7.3.8.23), we are reduced to showing that the identity transformation $\mathrm{id} : \underline{\Delta}^0_{\mathrm{Tw}(\mathcal{D})} \rightarrow \underline{\Delta}^0_{\mathcal{E}} \circ T$ exhibits $\underline{\Delta}^0_{\mathcal{E}}$ as a left Kan extension of $\mathrm{Tw}(\mathcal{D})$ along T . This is a special case of Example 7.3.1.9, since the functor T is left cofinal (Proposition 8.3.4.19). $\square$

046K Corollary 8.3.4.21 (The Universal Mapping Property of Representable Profunctors). *Let $G : \mathcal{D} \rightarrow \mathcal{C}$ be a functor of ∞ -categories. Suppose we are given a pair of profunctors $\mathcal{K}, \mathcal{K}' : \mathcal{C}^{\mathrm{op}} \times \mathcal{D} \rightarrow \mathcal{S}$, and let $\beta : \underline{\Delta}^0_{\mathrm{Tw}(\mathcal{D})} \rightarrow \mathcal{K}|_{\mathrm{Tw}(\mathcal{D})}$ be a natural transformation which exhibits $\mathcal{K}$ as represented by G . Then precomposition with β induces a homotopy equivalence of Kan complexes*

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S})}(\mathcal{K}, \mathcal{K}') \rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})}(\underline{\Delta}^0_{\mathrm{Tw}(\mathcal{D})}, \mathcal{K}'|_{\mathrm{Tw}(\mathcal{D})}).$$

Proof. Combine Propositions 8.3.4.20 and 7.3.6.1. $\square$

03P7 Example 8.3.4.22 (Spaces of Natural Transformation). Let $G, G' : \mathcal{D} \rightarrow \mathcal{C}$ be functors of ∞ -categories and let $\mathcal{H}$ be a Hom-functor for $\mathcal{C}$. Combining Corollary 8.3.4.21 with Proposition 8.3.4.1, we obtain homotopy equivalences of Kan complexes

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}, \mathcal{C})}(G, G') &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}} \times \mathcal{D}, \mathcal{S})}(\mathcal{H} \circ (\mathrm{id} \times G), \mathcal{H} \circ (\mathrm{id} \times G')) \\ &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathcal{S})}(\underline{\Delta}^0_{\mathrm{Tw}(\mathcal{D})}, \mathcal{H}|_{\mathrm{Tw}(\mathcal{D})}) \\ &\simeq \varprojlim (\mathcal{H}|_{\mathrm{Tw}(\mathcal{D})}). \end{aligned}$$

Stated more informally, the space of natural transformations from G to G' can be viewed as a limit of the diagram

$$\mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{S} \quad (f : X \rightarrow Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(G(X), G'(Y)).$$

8.3.5 Recognition of Hom-Functors

046H Let $\mathcal{C}$ be an ∞ -category. If $\mathcal{C}$ is locally small, then Proposition 8.3.3.2 guarantees that it admits a Hom-functor $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$, which is uniquely determined up to isomorphism. Our goal in this section is to formulate a more precise statement, which characterizes the functor $\mathcal{H}$ up to *canonical* isomorphism (see Proposition 8.3.5.6).

03MT Definition 8.3.5.1. Let $\mathcal{C}$ be an ∞ -category, let $\lambda : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ denote the left fibration of Proposition 8.1.1.11, and let $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor. We say that a natural transformation $\alpha : \underline{\Delta}^0_{\mathrm{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\mathrm{Tw}(\mathcal{C})}$ *exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$* if it satisfies the following condition:

(*) For every pair of objects $X, Y \in \mathcal{C}$, the natural transformation α induces a homotopy equivalence of Kan complexes

$$\alpha_{X,Y} : \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \rightarrow \text{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{H}(X, Y)).$$

Remark 8.3.5.2. Let $\mathcal{C}$ be an ∞ -category and let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor. 03MZ
The datum of a natural transformation $\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ can be identified with a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}) & \longrightarrow & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \\ \downarrow & & \downarrow \\ \mathcal{C}^{\text{op}} \times \mathcal{C} & \xrightarrow{\mathcal{H}} & \mathcal{S}. \end{array} \quad (8.46) \quad 03N0$$

In this case, the natural transformation α exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$ if and only if the diagram (8.46) is a categorical pullback square (see Corollary 5.1.7.16).

Remark 8.3.5.3. Let $\mathcal{C}$ be an ∞ -category. A profunctor $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ is a Hom-functor 03N1
for $\mathcal{C}$ (in the sense of Definition 8.3.3.1) if and only if there exists a natural transformation $\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ which exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$ (in the sense of Definition 8.3.5.1).

Remark 8.3.5.4. Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor, and let 03MV
 $\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ be a natural transformation. For every pair of objects $X, Y \in \mathcal{C}$, Notation 8.1.2.14 and Remark 5.5.1.5 supply canonical isomorphisms

$$\text{Hom}_{\mathcal{C}}(X, Y) \simeq \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{Y\} \quad \mathcal{H}(X, Y) \simeq \text{Hom}_{\mathcal{S}}(\Delta^0, \mathcal{H}(X, Y))$$

in the homotopy category hKan . Consequently, the homotopy class of the morphism $\alpha_{X,Y}$ appearing in Definition 8.3.5.1 can be identified with a map $[\alpha_{X,Y}] : \text{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathcal{H}(X, Y)$ in hKan , which depends functorially on X and Y (see Corollary 8.1.2.18). The natural transformation α exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$ (in the sense of Definition 8.3.5.1) if and only if each $[\alpha_{X,Y}]$ is an isomorphism in the category hKan .

Proposition 8.3.5.5. Let $\mathcal{C}$ be an ∞ -category, let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a profunctor, and let 03NK
 $\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ be a natural transformation. The following conditions are equivalent:

- (1) The natural transformation α exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$ (in the sense of Definition 8.3.5.1).

- (2) The natural transformation α exhibits the profunctor $\mathcal{H}$ as represented by the identity functor $\text{id} : \mathcal{C} \rightarrow \mathcal{C}$ (in the sense of Definition 8.3.4.12). That is, for every object $X \in \mathcal{C}$, the vertex $\alpha(\text{id}_X) \in \mathcal{H}(X, X)$ exhibits the functor $\mathcal{H}(-, X) : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ as represented by the object X .
- (3) The natural transformation α exhibits the profunctor $\mathcal{H}$ as corepresented by the identity functor $\text{id} : \mathcal{C} \rightarrow \mathcal{C}$ (in the sense of Variant 8.3.4.16). That is, for every object $X \in \mathcal{C}$, the vertex $\alpha(\text{id}_X) \in \mathcal{H}(X, X)$ exhibits the functor $\mathcal{H}(X, -) : \mathcal{C} \rightarrow \mathcal{S}$ as corepresented by the object X .

Proof. We will show that $(1) \Leftrightarrow (3)$; the proof of the equivalence $(1) \Leftrightarrow (2)$ is similar. The natural transformation α can be identified with a functor $T : \text{Tw}(\mathcal{C}) \rightarrow \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S}$. For each object $X \in \mathcal{C}$, let T_X denote the restriction of T to the simplicial subset $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \subseteq \text{Tw}(\mathcal{C})$, and consider the following condition:

(1_X) The diagram of ∞ -categories

$$\begin{array}{ccc}
 \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T_X} & \{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{S} \\
 \downarrow & & \downarrow \\
 \mathcal{C} & \xrightarrow{\mathcal{H}(X, -)} & \mathcal{S}
 \end{array} \tag{8.47}$$

is a categorical pullback square.

By virtue of Corollary 5.1.7.16, the natural transformation α exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$ if and only if it satisfies condition (1_X) for every object $X \in \mathcal{C}$. To complete the proof, it will suffice to show that (1_X) is satisfied if and only if $\alpha(\text{id}_X) \in \mathcal{H}(X, X)$ exhibits the functor $\mathcal{H}(X, -)$ as corepresented by X . This is a special case of Proposition 5.6.6.21, since the id_X is an initial object of the ∞ -category $\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ (Proposition 8.1.2.1). $\square$

03N3 Proposition 8.3.5.6. *Let $\mathcal{C}$ be a locally small ∞ -category, let $\mathcal{H} : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a functor, and let $\alpha : \underline{\Delta}^0_{\text{Tw}(\mathcal{C})} \rightarrow \mathcal{H}|_{\text{Tw}(\mathcal{C})}$ be a natural transformation. The following conditions are equivalent:*

- (1) *The natural transformation α exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$: that is, it satisfies condition $(*)$ of Definition 8.3.5.1.*

(2) *The diagram*

$$\begin{array}{ccc}
 & \mathcal{C}^{\text{op}} \times \mathcal{C} & \\
 \lambda \nearrow & \Uparrow \alpha & \searrow \mathcal{H} \\
 \text{Tw}(\mathcal{C}) & \xrightarrow{\underline{\Delta}_{\text{Tw}(\mathcal{C})}^0} & \mathcal{S}
 \end{array}$$

exhibits $\mathcal{H}$ as a left Kan extension of the constant functor $\underline{\Delta}_{\text{Tw}(\mathcal{C})}^0$ along the left fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$.

(3) *The pair $(\mathcal{H}, \alpha)$ is initial when viewed as an object of the oriented fiber product $\{\underline{\Delta}_{\text{Tw}(\mathcal{C})}^0\} \tilde{\times}_{\text{Fun}(\text{Tw}(\mathcal{C}), \mathcal{S})} \text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{C}, \mathcal{S})$*

Proof. The equivalence (1) $\Leftrightarrow$ (2) follows from Proposition 7.4.2.13 and Remark 8.3.5.2. Since $\mathcal{C}$ is locally small, Proposition 8.3.3.2 guarantees that the functor $\underline{\Delta}_{\text{Tw}(\mathcal{C})}^0$ admits a left Kan extension along λ , so the equivalence (2) $\Leftrightarrow$ (3) follows from Corollary 7.3.6.5. $\square$

Variant 8.3.5.7. Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which is locally κ -small. Then, in the statement of Proposition 8.3.5.6, we can replace $\mathcal{S}$ with the ∞ -category $\mathcal{S}_{<\kappa}$ of κ -small spaces (Variant 5.5.4.13). 03V3

Corollary 8.3.5.8 (Functoriality of Hom-Functors). *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between ∞ -categories. Choose natural transformations* 046J

$$\alpha : \underline{\Delta}_{\text{Tw}(\mathcal{C})}^0 \rightarrow \mathcal{H}_{\mathcal{C}}|_{\text{Tw}(\mathcal{C})} \quad \beta : \underline{\Delta}_{\text{Tw}(\mathcal{D})}^0 \rightarrow \mathcal{H}_{\mathcal{D}}|_{\text{Tw}(\mathcal{D})}$$

which exhibit $\mathcal{H}_{\mathcal{C}}$ and $\mathcal{H}_{\mathcal{D}}$ as Hom-functors for $\mathcal{C}$ and $\mathcal{D}$, respectively. Then there exists a natural transformation $\gamma : \mathcal{H}_{\mathcal{C}}(-, -) \rightarrow \mathcal{H}_{\mathcal{D}}(F(-), F(-))$ for which the diagram

$$\begin{array}{ccc}
 & \underline{\Delta}_{\text{Tw}(\mathcal{C})}^0 & \\
 [\alpha] \swarrow & & \searrow [\beta] \\
 \mathcal{H}_{\mathcal{C}}|_{\text{Tw}(\mathcal{C})} & \xrightarrow{[\gamma]} & \mathcal{H}_{\mathcal{D}}|_{\text{Tw}(\mathcal{C})}
 \end{array} \tag{8.48}$$

commutes (in the homotopy category $\text{hFun}(\text{Tw}(\mathcal{C}), \mathcal{S})$). Moreover, the natural transformation γ is uniquely determined up to homotopy. 03PC

Proof. This is a special case of Proposition 7.3.6.1, since α exhibits $\mathcal{H}_{\mathcal{C}}$ as a left Kan extension of $\underline{\Delta}_{\text{Tw}(\mathcal{C})}^0$ along the left fibration $\text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ (Proposition 8.3.5.6). $\square$

03PD **Remark 8.3.5.9.** In the situation of Corollary 8.3.5.8, suppose that we are given a pair of objects $X, Y \in \mathcal{C}$. The commutativity of (8.48) guarantees that the diagram

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{C}}(X, Y) & \xrightarrow{F} & \mathrm{Hom}_{\mathcal{D}}(F(X), F(Y)) \\ \downarrow \sim & & \downarrow \sim \\ \mathcal{H}_{\mathcal{C}}(X, Y) & \xrightarrow{\gamma} & \mathcal{H}_{\mathcal{D}}(F(X), F(Y)) \end{array}$$

commutes in the homotopy category hKan , where the vertical maps are the isomorphisms of Remark 8.3.5.4. We can summarize the situation more informally as follows: if $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor between (locally small) ∞ -categories, then the induced map of Kan complexes $\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathrm{Hom}_{\mathcal{D}}(F(X), F(Y))$ depends functorially on the pair (X, Y) (as an object of the ∞ -category $\mathcal{C}^{\mathrm{op}} \times \mathcal{C}$).

8.3.6 Strict Models for Hom-Functors

03N5 Let $\mathcal{E}$ be a (locally small) ∞ -category. Proposition 8.3.3.2 guarantees the existence of a Hom-functor $\mathcal{H} : \mathcal{E}^{\mathrm{op}} \times \mathcal{E} \rightarrow \mathcal{S}$, which is well-defined up to isomorphism. Our goal in this section is to give an explicit construction of a Hom-functor in the special case where $\mathcal{E} = \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})$ arises as the homotopy coherent nerve of a (locally Kan) simplicial category $\mathcal{C}$.

03N6 **Construction 8.3.6.1.** Let $\mathcal{C}$ be a locally Kan simplicial category. Then the construction $(X, Y) \mapsto \mathrm{Hom}_{\mathcal{C}}(X, Y)_{\bullet}$ determines a simplicial functor $\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathrm{Kan}$. Passing to homotopy coherent nerves, we obtain a functor of ∞ -categories

$$\mathcal{H}_{\mathcal{C}} : \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})^{\mathrm{op}} \times \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C}) \rightarrow \mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathrm{Kan}) = \mathcal{S}.$$

03N7 **Proposition 8.3.6.2.** *Let $\mathcal{C}$ be a locally Kan simplicial category. Then the functor $\mathcal{H}_{\mathcal{C}}$ of Construction 8.3.6.1 is a Hom-functor for the ∞ -category $\mathrm{N}_{\bullet}^{\mathrm{hc}}(\mathcal{C})$.*

03N8 **Remark 8.3.6.3.** Let $\mathcal{C}$ be an ordinary category, which we identify with the corresponding constant simplicial category (see Example 2.4.2.4). In this case, Proposition 8.3.6.2 reduces to Example 8.3.3.4.

03N9 **Remark 8.3.6.4.** By combining Proposition 8.3.6.2 with the rectification results of §[?], we can give an explicit construction of a Hom-functor for an arbitrary (small) ∞ -category $\mathcal{E}$. Let $\mathrm{Path}[\mathcal{E}]_{\bullet}$ denote the simplicial path category of $\mathcal{E}$ (Definition 2.4.4.1) and let $\mathcal{C}$ be the locally Kan simplicial having the same objects, with morphism spaces given by $\mathrm{Hom}_{\mathcal{C}}(X, Y)_{\bullet} = \mathrm{Ex}^{\infty}(\mathrm{Hom}_{\mathrm{Path}[\mathcal{E}]}(X, Y)_{\bullet})$ (see Example [?]). It follows from Proposition 3.3.6.7 that the tautological map $\mathrm{Path}[\mathcal{E}]_{\bullet} \rightarrow \mathcal{C}$ is a weak equivalence of simplicial categories

(in the sense of Definition 4.6.8.7), and therefore corresponds to an equivalence of ∞ -categories $F : \mathcal{E} \rightarrow \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})$ (Theorem [?]). Using Proposition 8.3.6.2, we deduce that the composition

$$\mathcal{E}^{\text{op}} \times \mathcal{E} \xrightarrow{F^{\text{op}} \times F} \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})^{\text{op}} \times \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C}) \xrightarrow{\mathcal{H}_{\mathcal{C}}} \mathcal{S}$$

is a Hom-functor for $\mathcal{E}$, given on objects by $(X, Y) \mapsto \text{Ex}^{\infty}(\text{Hom}_{\text{Path}[\mathcal{E}]}(X, Y))$.

Beware that, although this construction is completely explicit in principle, it is hard to use in practice (since the operations $\mathcal{E} \mapsto \text{Path}[\mathcal{E}]_{\bullet}$ and $S \mapsto \text{Ex}^{\infty}(S)$ are both difficult to control).

Proposition 8.3.6.2 asserts that the functor $\mathcal{H}_{\mathcal{C}}$ is a covariant transport representation for the left fibration $\text{Tw}(\mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})) \rightarrow \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})^{\text{op}} \times \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})$ (Remark 8.3.5.3). We will prove this by constructing a categorical pullback square of ∞ -categories

$$\begin{array}{ccc} \text{Tw}(\mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})) & \xrightarrow{\widetilde{\mathcal{H}_{\mathcal{C}}}} & \mathcal{S}_* \\ \downarrow & & \downarrow U \\ \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})^{\text{op}} \times \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C}) & \xrightarrow{\mathcal{H}_{\mathcal{C}}} & \mathcal{S}. \end{array}$$

To define the upper horizontal map, we will use a variant of Construction 8.3.6.1.

Construction 8.3.6.5. Let $\mathcal{C}$ be a locally Kan simplicial category, let $\mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})$ denote its homotopy coherent nerve. Let J be a linearly ordered set and let $\bar{J}$ denote its opposite; for each element $j \in J$, we write $\bar{j}$ for the corresponding element of $\bar{J}$. Suppose we are given a morphism of simplicial sets $\sigma : \mathbf{N}_{\bullet}(J) \rightarrow \text{Tw}(\mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C}))$, which we identify with a simplicial functor $f : \text{Path}[\bar{J} \star J]_{\bullet} \rightarrow \mathcal{C}$ (see Warning 8.1.1.9 and Proposition 2.4.4.15). Note that the composition

$$\mathbf{N}_{\bullet}(J) \xrightarrow{\sigma} \text{Tw}(\mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})) \rightarrow \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C})^{\text{op}} \times \mathbf{N}_{\bullet}^{\text{hc}}(\mathcal{C}) \xrightarrow{\mathcal{H}_{\mathcal{C}}} \mathcal{S}$$

can be identified with a simplicial functor $F_{\sigma} : \text{Path}[J]_{\bullet} \rightarrow \text{Kan}$, given on objects by the formula $F_{\sigma}(j) = \text{Hom}_{\mathcal{C}}(f(\bar{j}), f(j))_{\bullet}$ (see Proposition 2.4.4.15). Let $J^{\triangleleft} = \{x\} \star J$ denote the linearly ordered set obtained from J by adding a new smallest element x . We extend F_{σ} to a simplicial functor $\tilde{F}_{\sigma} : \text{Path}[J^{\triangleleft}]_{\bullet} \rightarrow \text{Kan}$ as follows:

- (a) The functor $\tilde{F}_{\sigma}$ carries the element $x \in J^{\triangleleft}$ to the Kan complex Δ^0 .
- (b) Let j be an element of J . Let us identify $\text{Hom}_{\text{Path}[J^{\triangleleft}]}(x, j)_{\bullet}$ with the nerve $\mathbf{N}_{\bullet}(Q)$, where Q is the collection of finite subsets $I \subseteq J$ satisfying $\max(I) = j$ (partially ordered by reverse inclusion). Similarly, we identify $\text{Hom}_{\text{Path}[\bar{J} \star J]}(\bar{j}, j)_{\bullet}$ with the nerve $\mathbf{N}_{\bullet}(Q')$, where Q' is the collection of finite subsets $I' \subseteq \bar{J} \star J$ satisfying $\max(I') = j$

and $\min(I') = \bar{j}$ (partially ordered by reverse inclusion). Then $\tilde{F}_\sigma$ is defined on the morphism space $\text{Hom}_{\text{Path}[J^{\triangleleft}]}(x, j)_\bullet$ by the composition

$$\begin{aligned} \text{Hom}_{\text{Path}[J^{\triangleleft}]}(x, j)_\bullet &\simeq \mathbf{N}_\bullet(Q) \\ &\xrightarrow{I \mapsto \bar{I} \cup I} \mathbf{N}_\bullet(Q') \\ &\simeq \text{Hom}_{\text{Path}[\bar{J} \star J]}(\bar{j}, j)_\bullet \\ &\xrightarrow{f} \text{Hom}_{\mathcal{C}}(f(\bar{j}), f(j))_\bullet \\ &\simeq \text{Fun}(\tilde{F}_\sigma(x), \tilde{F}_\sigma(j)). \end{aligned}$$

In the special case where J is the linearly ordered set $[n] = \{0 < 1 < \cdots < n\}$, we can identify $\tilde{F}_\sigma$ with an n -simplex of the ∞ -category of pointed spaces $\mathcal{S}_* = \mathbf{N}_\bullet^{\text{hc}}(\text{Kan})_{\Delta^0/}$. The assignment $\sigma \mapsto \tilde{F}_\sigma$ depends functorially on $[n]$, and therefore determines a functor $\tilde{\mathcal{H}}_{\mathcal{C}} : \text{Tw}(\mathbf{N}_\bullet^{\text{hc}}(\mathcal{C})) \rightarrow \mathcal{S}_*$. By construction, this functor fits into a commutative diagram

$$\begin{array}{ccc} \text{Tw}(\mathbf{N}_\bullet^{\text{hc}}(\mathcal{C})) & \xrightarrow{\tilde{\mathcal{H}}_{\mathcal{C}}} & \mathcal{S}_* \\ \downarrow & & \downarrow U \\ \mathbf{N}_\bullet^{\text{hc}}(\mathcal{C})^{\text{op}} \times \mathbf{N}_\bullet^{\text{hc}}(\mathcal{C}) & \xrightarrow{\mathcal{H}_{\mathcal{C}}} & \mathcal{S}, \end{array} \quad (8.49)$$

where the left vertical map is the twisted arrow fibration of Proposition 8.1.1.11 and the right vertical map is the forgetful functor.

03NC Exercise 8.3.6.6. Verify that Construction 8.3.6.5 is well-defined. That is, for every linearly ordered set J and every morphism $\sigma : \mathbf{N}_\bullet(J) \rightarrow \text{Tw}(\mathbf{N}_\bullet^{\text{hc}}(\mathcal{C}))$, show that the simplicial functor F_σ admits a unique extension $\tilde{F}_\sigma : \text{Path}[J^{\triangleleft}]_\bullet \rightarrow \text{Kan}$ which satisfies conditions (a) and (b).

Proposition 8.3.6.2 is an immediate consequence of the following more precise result:

03ND Proposition 8.3.6.7. *Let $\mathcal{C}$ be a locally Kan simplicial category. Then the diagram (8.49) is a categorical pullback square.*

Proof. Note that the vertical maps in the diagram (8.49) are left fibrations (Propositions 8.1.1.11 and 5.5.3.2). It will therefore suffice to show that, for every pair of objects $X, Y \in \mathcal{C}$, the induced map of fibers

$$\begin{aligned} \tilde{\mathcal{H}}_{X,Y} : \{X\} \times_{\mathcal{E}^{\text{op}}} \text{Tw}(\mathcal{E}) \times_{\mathcal{E}} \{Y\} &\rightarrow \{\mathcal{H}_{\mathcal{C}}(X, Y)\} \times_{\mathcal{S}} \mathcal{S}_* \\ &= \text{Hom}_{\mathcal{S}}^{\mathbf{L}}(\Delta^0, \text{Hom}_{\mathcal{C}}(X, Y)_\bullet) \end{aligned}$$

is a homotopy equivalence of Kan complexes (see Corollary 5.1.7.16). Note that the coslice inclusion of Construction 8.1.2.7 induces a monomorphism of simplicial sets $\iota : \mathrm{Hom}_{\mathcal{E}}^{\mathrm{L}}(X, Y) \hookrightarrow \{X\} \times_{\mathcal{E}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{E}) \times_{\mathcal{E}} \{Y\}$. Unwinding the definitions, we see that the composite map

$$(\widetilde{\mathcal{H}}_{X,Y} \circ \iota) : \mathrm{Hom}_{\mathcal{E}}^{\mathrm{L}}(X, Y) \rightarrow \mathrm{Hom}_{\mathcal{S}}^{\mathrm{L}}(\Delta^0, \mathrm{Hom}_{\mathcal{C}}(X, Y)_{\bullet})$$

coincides with isomorphism described in Remark 4.6.8.18. It will therefore suffice to show that ι is a homotopy equivalence, which is a special case of Corollary 8.1.2.10. $\square$

8.3.7 Hom-Functors for Oriented Fiber Products

Let $F_- : \mathcal{C}_- \rightarrow \mathcal{C}$ and $F_+ : \mathcal{C}_+ \rightarrow \mathcal{C}$ be functors of ∞ -categories, which we regard as fixed 06BY throughout this section. Let $\mathcal{C}_{\pm} = \mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C}_+$ be the oriented fiber product of Definition 4.6.4.1, so that we have projection maps $\mathrm{ev}_- : \mathcal{C}_{\pm} \rightarrow \mathcal{C}_-$ and $\mathrm{ev}_+ : \mathcal{C}_{\pm} \rightarrow \mathcal{C}_+$. Recall that objects of $\mathcal{C}_{\pm}$ can be identified with triples $C = (C_-, C_+, \alpha_C)$, where $C_- = \mathrm{ev}_-(C)$ is an object of $\mathcal{C}_-$, $C_+ = \mathrm{ev}_+(C)$ is an object of $\mathcal{C}_+$, and $\alpha_C : F_-(C_-) \rightarrow F_+(C_+)$ is a morphism in the ∞ -category $\mathcal{C}$. Let $D = (D_-, D_+, \alpha_D)$ be another object of $\mathcal{C}_{\pm}$. Our goal in this section is to show that there is a pullback diagram

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{C}_{\pm}}(C, D) & \longrightarrow & \mathrm{Hom}_{\mathcal{C}_+}(C_+, D_+) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\mathcal{C}_-}(C_-, D_-) & \longrightarrow & \mathrm{Hom}_{\mathcal{C}}(F_-(C_-), F_+(D_+)) \end{array}$$

in the ∞ -category $\mathcal{S}$. Moreover, this pullback diagram can be chosen to depend functorially on both C and D .

Theorem 8.3.7.1. *Let $\mathrm{Hom}_{\mathcal{C}}(\bullet, \bullet) : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}$ be a Hom-functor for the ∞ -category $\mathcal{C}$, 06BZ and define $\mathrm{Hom}_{\mathcal{C}_-}(\bullet, \bullet)$, $\mathrm{Hom}_{\mathcal{C}_+}(\bullet, \bullet)$, and $\mathrm{Hom}_{\mathcal{C}_{\pm}}(\bullet, \bullet)$ similarly. Then there is a pullback diagram*

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{C}_{\pm}}(\bullet, \bullet) & \longrightarrow & \mathrm{Hom}_{\mathcal{C}_+}(\mathrm{ev}_+(\bullet), \mathrm{ev}_+(\bullet)) & 06C0 \\ \downarrow & & \downarrow & \\ \mathrm{Hom}_{\mathcal{C}_-}(\mathrm{ev}_-(\bullet), \mathrm{ev}_-(\bullet)) & \longrightarrow & \mathrm{Hom}_{\mathcal{C}}((F_- \circ \mathrm{ev}_-)(\bullet), (F_+ \circ \mathrm{ev}_+)(\bullet)) & (8.50) \end{array}$$

in the ∞ -category $\mathrm{Fun}(\mathcal{C}_{\pm}^{\mathrm{op}} \times \mathcal{C}_{\pm}, \mathcal{S})$.

06C1 **Remark 8.3.7.2.** In the formulation of Theorem 8.3.7.1, we have implicitly assumed that the ∞ -categories $\mathcal{C}_-$, $\mathcal{C}_+$ and $\mathcal{C}$ are locally small (so that the functors $\mathrm{Hom}_{\mathcal{C}_-}$, $\mathrm{Hom}_{\mathcal{C}_+}$, and $\mathrm{Hom}_{\mathcal{C}}$ are well-defined). More generally, if we assume that $\mathcal{C}_-$, $\mathcal{C}_+$, and $\mathcal{C}$ are locally λ -small (for some uncountable cardinal λ , which need not be small), then our proof of Theorem 8.3.7.1 will supply a pullback diagram (8.50) in the ∞ -category $\mathrm{Fun}(\mathcal{C}_{\pm}^{\mathrm{op}} \times \mathcal{C}_{\pm}, \mathcal{S}_{<\lambda})$.

Our proof of Theorem 8.3.7.1 will require several auxiliary constructions.

06C2 **Notation 8.3.7.3.** By definition, the oriented fiber product $\mathcal{C}_{\pm} = \mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C}_+$ is universal among ∞ -categories equipped with functors $\mathrm{ev}_- : \mathcal{C}_{\pm} \rightarrow \mathcal{C}_-$ and $\mathrm{ev}_+ : \mathcal{C}_{\pm} \rightarrow \mathcal{C}_+$, together with a natural transformation $\alpha : F_- \circ \mathrm{ev}_- \rightarrow F_+ \circ \mathrm{ev}_+$ of functors from $\mathcal{C}_{\pm}$ to $\mathcal{C}$. Let us identify α with a functor $\Delta^1 \times \mathcal{C}_{\pm} \rightarrow \mathcal{C}$. Applying the twisted arrow construction, we obtain a functor $\mathrm{Tw}(\alpha) : \mathrm{Tw}(\Delta^1) \times \mathrm{Tw}(\mathcal{C}_{\pm}) \rightarrow \mathrm{Tw}(\mathcal{C})$, which we can identify with a diagram $\Xi : \mathrm{Tw}(\Delta^1) \rightarrow \mathrm{Fun}(\mathrm{Tw}(\mathcal{C}_{\pm}), \mathrm{Tw}(\mathcal{C}))$.

Recall that objects of $\mathrm{Tw}(\Delta^1)$ can be identified with ordered pairs (i, j) satisfying $0 \leq i \leq j \leq 1$. By construction, $\Xi(0, 0)$ is the functor $\mathrm{Tw}(F_- \circ \mathrm{ev}_-) : \mathrm{Tw}(\mathcal{C}_{\pm}) \rightarrow \mathrm{Tw}(\mathcal{C})$, and $\Xi(1, 1)$ is the functor $\mathrm{Tw}(F_+ \circ \mathrm{ev}_+) : \mathrm{Tw}(\mathcal{C}_{\pm}) \rightarrow \mathrm{Tw}(\mathcal{C})$. Setting $T = \Xi(0, 1)$, we obtain a pair of natural transformations $\mathrm{Tw}(F_- \circ \mathrm{ev}_-) \xrightarrow{\xi_-} T \xleftarrow{\xi_+} \mathrm{Tw}(F_+ \circ \mathrm{ev}_+)$. The triple $(\mathrm{Tw}(\mathrm{ev}_-), T, \xi_-)$ determines a functor $Q_- : \mathrm{Tw}(\mathcal{C}_{\pm}) \rightarrow \mathrm{Tw}(\mathcal{C}_-) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C})$, and the triple $(\mathrm{Tw}(\mathrm{ev}_+), T, \xi_+)$ determines a functor $Q_+ : \mathrm{Tw}(\mathcal{C}_{\pm}) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C})$.

The diagonal embedding $\mathcal{C} \hookrightarrow \mathrm{Fun}(\Delta^1, \mathcal{C})$ and its opposite determine monomorphisms of simplicial sets

$$\delta_- : \mathcal{C}_-^{\mathrm{op}} \hookrightarrow \mathcal{C}_-^{\mathrm{op}} \tilde{\times}_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}} \quad \delta_+ : \mathcal{C}_+ \hookrightarrow \mathcal{C}_+ \tilde{\times}_{\mathcal{C}} \mathcal{C} \quad \mathcal{C} \mapsto (\mathcal{C}, F_+(\mathcal{C}), \mathrm{id}).$$

We let $\mathcal{E}_- \subseteq \mathrm{Tw}(\mathcal{C}_-) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C})$ denote the inverse image of the image of δ_- and $\mathcal{E}_+ \subseteq \mathrm{Tw}(\mathcal{C}_+) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C})$ the inverse image of the image of δ_+ , so that we have pullback diagrams of simplicial sets

$$\begin{array}{ccc} \mathcal{E}_- & \longrightarrow & \mathrm{Tw}(\mathcal{C}_-) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C}) \\ \downarrow & & \downarrow \\ \mathcal{C}_- & \xrightarrow{\delta_-} & \mathcal{C}_-^{\mathrm{op}} \tilde{\times}_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}} \end{array} \quad \begin{array}{ccc} \mathcal{E}_+ & \longrightarrow & \mathrm{Tw}(\mathcal{C}_+) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C}) \\ \downarrow & & \downarrow \\ \mathcal{C}_+ & \xrightarrow{\delta_+} & \mathcal{C}_+ \tilde{\times}_{\mathcal{C}} \mathcal{C} . \end{array}$$

Note that the functors Q_- and Q_+ factor through $\mathcal{E}_-$ and $\mathcal{E}_+$, respectively. Moreover, projection onto the second factor determines morphisms $\pi_- : \mathcal{E}_- \rightarrow \mathrm{Tw}(\mathcal{C})$ and $\pi_+ : \mathcal{E}_+ \rightarrow$

$\mathrm{Tw}(\mathcal{C})$ satisfying $\pi_- \circ Q_- = T = \pi_+ \circ Q_+$, so that we have a commutative diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{C}_\pm) & \xrightarrow{Q_+} & \mathcal{E}_+ \\ \downarrow Q_- & & \downarrow \pi_+ \\ \mathcal{E}_- & \xrightarrow{\pi_-} & \mathrm{Tw}(\mathcal{C}). \end{array}$$

Our first goal is to analyze the simplicial sets $\mathcal{E}_-$ and $\mathcal{E}_+$ appearing in Notation 8.3.7.3. The twisted arrow fibration for $\mathcal{C}_-$, $\mathcal{C}_+$ and $\mathcal{C}$ determine morphisms

$$\bar{U}_- : \mathrm{Tw}(\mathcal{C}_-) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C}) \rightarrow (\mathcal{C}_-^{\mathrm{op}} \tilde{\times}_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}}) \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C})$$

$$\bar{U}_+ : \mathrm{Tw}(\mathcal{C}_+) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C}) \rightarrow (\mathcal{C}_+^{\mathrm{op}} \tilde{\times}_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}}) \times (\mathcal{C}_+ \tilde{\times}_{\mathcal{C}} \mathcal{C}).$$

Restricting to the inverse images of $\mathcal{C}_-^{\mathrm{op}} \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C})$ and $(\mathcal{C}_+^{\mathrm{op}} \tilde{\times}_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}}) \times \mathcal{C}_+$, respectively, we obtain morphisms

$$U_- : \mathcal{E}_- \rightarrow \mathcal{C}_-^{\mathrm{op}} \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C}) \quad U_+ : \mathcal{E}_+ \rightarrow (\mathcal{C}_+^{\mathrm{op}} \tilde{\times}_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}}) \times \mathcal{C}_+.$$

Lemma 8.3.7.4. *The morphism $U_- : \mathcal{E}_- \rightarrow \mathcal{C}_-^{\mathrm{op}} \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C})$ is a left fibration, with covariant transport representation given by the composition*

$$\mathcal{C}_-^{\mathrm{op}} \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C}) \rightarrow \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_- \xrightarrow{\mathrm{Hom}_{\mathcal{C}_-}(\bullet, \bullet)} \mathcal{S}.$$

Similarly, U_+ is a left fibration with covariant transport representation given by the composition

$$(\mathcal{C}_+^{\mathrm{op}} \tilde{\times}_{\mathcal{C}^{\mathrm{op}}} \mathcal{C}^{\mathrm{op}}) \times \mathcal{C}_+ \rightarrow \mathcal{C}_+^{\mathrm{op}} \times \mathcal{C}_+ \xrightarrow{\mathrm{Hom}_{\mathcal{C}_+}(\bullet, \bullet)} \mathcal{S}.$$

Proof. Projection onto the first factor determines morphism $\mathcal{E}_- \subseteq \mathrm{Tw}(\mathcal{C}_-) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathrm{Tw}(\mathcal{C}_-)$ which fits into a commutative diagram

$$\begin{array}{ccc} \mathcal{E}_- & \longrightarrow & \mathrm{Tw}(\mathcal{C}_-) \\ \downarrow U_- & & \downarrow \\ \mathcal{C}_-^{\mathrm{op}} \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C}) & \longrightarrow & \mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-. \end{array} \tag{8.51}$$

To prove the first assertion, it will suffice to show that the diagram (8.51) induces a trivial Kan fibration

$$\theta_- : \mathcal{E}_- \rightarrow (\mathcal{C}_-^{\mathrm{op}} \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C})) \times_{(\mathcal{C}_-^{\mathrm{op}} \times \mathcal{C}_-)} \mathrm{Tw}(\mathcal{C}_-).$$

Unwinding the definitions, we see that θ_- is a pullback of the map

$$\bar{\theta}_- : \text{Fun}(\Delta^1, \text{Tw}(\mathcal{C})) \rightarrow \text{Fun}(\{0\}, \text{Tw}(\mathcal{C})) \times_{\text{Fun}(\{0\}, \mathcal{C}^{\text{op}} \times \mathcal{C})} \text{Fun}(\Delta^1, \mathcal{C}^{\text{op}} \times \mathcal{C})$$

induced by the projection map $\lambda : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$. Since λ is a left fibration (Proposition 8.1.1.11), the morphism $\bar{\theta}_-$ is a trivial Kan fibration (Proposition 4.2.6.1), so that θ_- is also a trivial Kan fibration. The proof of the second assertion is similar. $\square$

06C5 **Remark 8.3.7.5.** The composite map

$$\mathcal{E}_+ \hookrightarrow \text{Tw}(\mathcal{C}_+) \tilde{\times}_{\text{Tw}(\mathcal{C})} \text{Tw}(\mathcal{C}) \rightarrow \text{Tw}(\mathcal{C}) \tilde{\times}_{\text{Tw}(\mathcal{C})} \text{Tw}(\mathcal{C}) = \text{Fun}(\Delta^1, \text{Tw}(\mathcal{C}))$$

fits into a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E}_+ & \xrightarrow{\quad} & \text{Fun}(\Delta^1, \text{Tw}(\mathcal{C})) \\ \downarrow V_+ & & \downarrow \\ \text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}} \text{Tw}(\mathcal{C}) & \xrightarrow{\quad} & \text{Fun}(\partial\Delta^1, \text{Tw}(\mathcal{C})) \times_{\text{Fun}(\partial\Delta^1, \mathcal{C})} \text{Fun}(\Delta^1, \mathcal{C}), \end{array}$$

where the right vertical map is induced by the projection functor $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ of Notation 8.1.1.6. The functor λ_+ is a cocartesian fibration (Corollary 8.1.1.14) and therefore an isofibration (Proposition 5.1.4.9). Applying Proposition 4.4.5.1 (and Remark 4.5.5.11), we deduce that V_+ is also an isofibration. Note that the functor π_+ factors as a composition

$$\mathcal{E}_+ \xrightarrow{V} \text{Tw}(\mathcal{C}_+) \times_{\mathcal{C}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}_+ \times_{\mathcal{C}} \text{Tw}(\mathcal{C}) \rightarrow \text{Tw}(\mathcal{C}),$$

where the second map is a cocartesian fibration (Corollary 8.1.1.14) and the third map is a pullback of F_+ . It follows that, if the functor F_+ is an isofibration, then the functor $\pi_+ : \mathcal{E}_+ \rightarrow \text{Tw}(\mathcal{C})$ is also an isofibration. Similarly, if F_- is an isofibration, then $\pi_- : \mathcal{E}_- \rightarrow \text{Tw}(\mathcal{C})$ is an isofibration.

The main content of Theorem 8.3.7.1 is contained in the following:

06C6 **Proposition 8.3.7.6.** *The diagram of ∞ -categories*

$$\begin{array}{ccc} \text{Tw}(\mathcal{C}_{\pm}) & \xrightarrow{Q_+} & \mathcal{E}_+ \\ \downarrow Q_- & & \downarrow \pi_+ \\ \mathcal{E}_- & \xrightarrow{\pi_-} & \text{Tw}(\mathcal{C}) \end{array} \tag{8.52}$$

is a categorical pullback square (see Notation 8.3.7.3).

Proof. Using Corollary 4.5.2.24, we can factor the functor F_- as a composition $\mathcal{C}_- \xrightarrow{G} \mathcal{C}'_- \xrightarrow{F'_-} \mathcal{C}$, where G is an equivalence of ∞ -categories and F'_- is an isofibration. Set $\mathcal{C}'_{\pm} = \mathcal{C}'_- \tilde{\times}_{\mathcal{C}} \mathcal{C}_+$ and define $\mathcal{E}'_- \subseteq \mathrm{Tw}(\mathcal{C}'_-) \tilde{\times}_{\mathrm{Tw}(\mathcal{C})} \mathrm{Tw}(\mathcal{C})$ as in Notation 8.3.7.3. Then (8.52) can be identified with the outer rectangle in a commutative diagram

$$\begin{array}{ccccc} \mathrm{Tw}(\mathcal{C}_{\pm}) & \longrightarrow & \mathrm{Tw}(\mathcal{C}'_{\pm}) & \longrightarrow & \mathcal{E}_+ \\ \downarrow Q_- & & \downarrow & & \downarrow \pi_+ \\ \mathcal{E}_- & \longrightarrow & \mathcal{E}'_- & \longrightarrow & \mathrm{Tw}(\mathcal{C}). \end{array}$$

It follows from Remark 4.6.4.4 and Corollary 8.1.2.16 that the horizontal map on the upper left is an equivalence of ∞ -categories. The proof of Lemma 8.3.7.4 shows that the horizontal map on the lower left is also an equivalence of ∞ -categories, so the left half of the diagram is a categorical pullback square (Proposition 4.5.2.22). Consequently, to show that the outer rectangle is a categorical pullback square, it will suffice to show that the right half of the diagram is a categorical pullback square (Proposition 4.5.2.19). We may therefore replace $\mathcal{C}_-$ by $\mathcal{C}'_-$, and thereby reduce to proving Proposition 8.3.7.6 in the special case where F_- is an isofibration of ∞ -categories. Similarly, we may assume that F_+ is an isofibration of ∞ -categories. In this case, the functors π_- and π_+ are also isofibrations. We are therefore reduced to proving that the functors Q_- and Q_+ induce an equivalence of ∞ -categories $Q : \mathrm{Tw}(\mathcal{C}_{\pm}) \rightarrow \mathcal{E}_- \times_{\mathrm{Tw}(\mathcal{C})} \mathcal{E}_+$ (see Proposition 4.5.2.27).

The functor Q fits into a commutative diagram of ∞ -categories

$$\begin{array}{ccccc} \mathrm{Tw}(\mathcal{C}_{\pm}) & \xrightarrow{Q} & \mathcal{E}_- \times_{\mathrm{Tw}(\mathcal{C})} \mathcal{E}_+ & \longrightarrow & \mathrm{Tw}(\mathcal{C}_-) \times \mathrm{Tw}(\mathcal{C}_+) \\ \downarrow & & \downarrow & & \downarrow \mathrm{Tw}(F_-) \times \mathrm{Tw}(F_+) \\ \mathrm{Tw}(\mathrm{Fun}(\Delta^1, \mathcal{C})) & \xrightarrow{\bar{Q}} & \mathrm{Fun}_{\pm}(\mathrm{Tw}(\Delta^1), \mathrm{Tw}(\mathcal{C})) & \longrightarrow & \mathrm{Tw}(\mathcal{C}) \times \mathrm{Tw}(\mathcal{C}), \end{array}$$

where E is the equivalence of ∞ -categories appearing in Example 8.2.4.8. Since the outer rectangle and right half of this diagram are pullback square, the left half of the diagram is also a pullback square. Consequently, to show that Q is an equivalence of ∞ -categories, it will suffice to show that the vertical maps are isofibrations of ∞ -categories (Corollary 4.5.2.30). This follows from Corollary 8.1.1.16, by virtue of our assumption that F_- and F_+ are isofibrations. $\square$

To deduce Theorem 8.3.7.1 from Proposition 8.3.7.6, we will use the following general observation:

06C8 **Lemma 8.3.7.7.** *Suppose we are given a commutative diagram of ∞ -categories*

06C9

$$\begin{array}{ccccc}
 \mathcal{E}_{00} & \xrightarrow{\quad} & \mathcal{E}_{01} & & \\
 \downarrow & \searrow U_{00} & \downarrow & \searrow U_{01} & \\
 & \mathcal{D}_{00} & \xrightarrow{\quad} & \mathcal{D}_{01} & \\
 & \downarrow & & \downarrow & \\
 \mathcal{E}_{10} & \xrightarrow{\quad} & \mathcal{E}_{11} & & \\
 \searrow U_{10} & & \searrow U_{11} & & \\
 & \mathcal{D}_{10} & \xrightarrow{\quad} & \mathcal{D}_{11} &
 \end{array}$$

(8.53)

satisfying the following conditions:

(1) *The front face σ :*

$$\begin{array}{ccc}
 \mathcal{D}_{00} & \xrightarrow{\quad} & \mathcal{D}_{01} \\
 \downarrow & & \downarrow \\
 \mathcal{D}_{10} & \xrightarrow{\quad} & \mathcal{D}_{11}
 \end{array}$$

is a categorical pullback square.

(2) *The back face τ :*

$$\begin{array}{ccc}
 \mathcal{E}_{00} & \xrightarrow{\quad} & \mathcal{E}_{01} \\
 \downarrow & & \downarrow \\
 \mathcal{E}_{10} & \xrightarrow{\quad} & \mathcal{E}_{11}
 \end{array}$$

is a categorical pullback square.

(3) *Each of the functors $U_{ij} : \mathcal{E}_{ij} \rightarrow \mathcal{D}_{ij}$ is a left fibration with covariant transport representation $\mathcal{F}_{ij} : \mathcal{D}_{ij} \rightarrow \mathcal{S}$.*

Then there exists a pullback square

$$\begin{array}{ccc} \mathcal{F}_{00} & \longrightarrow & \mathcal{F}_{01}|_{\mathcal{D}_{00}} \\ \downarrow & & \downarrow \\ \mathcal{F}_{10}|_{\mathcal{D}_{00}} & \longrightarrow & \mathcal{F}_{11}|_{\mathcal{D}_{00}} \end{array}$$

in the ∞ -category $\mathrm{Fun}(\mathcal{D}_{00}, \mathcal{S})$.

Proof. Let us regard σ and τ as functors from the partially ordered set $[1] \times [1]$ to the category of simplicial sets, and let $\mathcal{D} = \mathbf{N}_{\bullet}^{\sigma}([1] \times [1])$ and $\mathcal{E} = \mathbf{N}_{\bullet}^{\tau}([1] \times [1])$ denote the weighted nerves of Definition 5.3.3.1. The diagram (8.53) can be identified with a natural transformation from τ to σ , which induces a functor of ∞ -categories $U : \mathcal{E} \rightarrow \mathcal{D}$. By construction, we have a commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{U} & \mathcal{D} \\ & \searrow & \swarrow \\ & \Delta^1 \times \Delta^1, & \end{array}$$

where the vertical maps are cocartesian fibrations (Corollary 5.3.3.16). In what follows, we will identify each $\mathcal{D}_{ij}$ and $\mathcal{E}_{ij}$ with the full subcategories of $\mathcal{D}$ and $\mathcal{E}$ given by the fiber of the vertex $(i, j) \in \Delta^1 \times \Delta^1$, so that $U_{ij} = U|_{\mathcal{D}_{ij}}$.

It follows from Corollary 5.3.3.18 that U is a left fibration. Let $\mathcal{F} : \mathcal{D} \rightarrow \mathcal{S}$ be a covariant transport representation for U . Without loss of generality, we may assume that each $\mathcal{F}_{ij}$ coincides with the restriction $\mathcal{F}|_{\mathcal{D}_{ij}}$. Let $\tilde{\sigma} : [1] \times [1] \rightarrow \mathrm{Set}_{\Delta}$ be the constant functor taking the value $\mathcal{D}_{00}$. There is a unique natural transformation $\tilde{\sigma} \rightarrow \sigma$ which is the identity when evaluated at $(0, 0) \in [1] \times [1]$, which induces a functor

$$T : \mathcal{D}_{00} \times \Delta^1 \times \Delta^1 \simeq \mathbf{N}_{\bullet}^{\tilde{\sigma}}([1] \times [1]) \rightarrow \mathbf{N}_{\bullet}^{\sigma}([1] \times [1]) = \mathcal{D}.$$

We can then identify the composition $\mathcal{F} \circ T$ with a commutative diagram

$$\begin{array}{ccc} \mathcal{F}_{00} & \longrightarrow & \mathcal{F}_{01}|_{\mathcal{D}_{00}} \\ \downarrow & & \downarrow \\ \mathcal{F}_{10}|_{\mathcal{D}_{00}} & \longrightarrow & \mathcal{F}_{11}|_{\mathcal{D}_{00}} \end{array}$$

06CA

(8.54)

in the ∞ -category $\mathrm{Fun}(\mathcal{D}_{00}, \mathcal{S})$. We will complete the proof by showing that this diagram is a (levelwise) pullback square.

Fix an object $D_{00} \in \mathcal{D}_{00}$, having image $D_{ij} \in \mathcal{D}_{ij}$ for each pair $i, j \in [1]$. Evaluation at D_{00} then carries (8.54) to a diagram

$$\begin{array}{ccc}
 \mathcal{F}_{00}(D_{00}) & \longrightarrow & \mathcal{F}_{01}(D_{01}) \\
 \downarrow & & \downarrow \\
 \mathcal{F}_{10}(D_{10}) & \longrightarrow & \mathcal{F}_{11}(D_{11})
 \end{array} \tag{8.55}$$

in the ∞ -category $\mathcal{S}$, and we wish to show that (8.55) is a pullback square. Using Example 5.6.5.6, we can identify (8.55) with the homotopy coherent nerve $N_{\bullet}^{\mathrm{hc}}(\tau_0)$, where $\tau_0 : [1] \times [1] \rightarrow \mathrm{Kan}$ is the commutative diagram of Kan complexes

$$\begin{array}{ccc}
 U_{00}^{-1}(D_{00}) & \longrightarrow & U_{01}^{-1}(D_{01}) \\
 \downarrow & & \downarrow \\
 U_{10}^{-1}(D_{10}) & \longrightarrow & U_{11}^{-1}(D_{11}).
 \end{array}$$

By construction, we have a pullback diagram

$$\begin{array}{ccc}
 \tau_0 & \longrightarrow & \tau \\
 \downarrow & & \downarrow \\
 \underline{\Delta}^0 & \longrightarrow & \sigma
 \end{array} \tag{8.56}$$

in the category $\mathrm{Fun}([1] \times [1], \mathcal{QC})$. For each pair $i, j \in [1]$, assumption (3) guarantees that $U_{ij} : \mathcal{E}_{ij} \rightarrow \mathcal{D}_{ij}$ is an isofibration of ∞ -categories, so that evaluation at (i, j) carries (8.56) to a categorical pullback square of ∞ -categories. Applying Example 7.6.3.4, we obtain a pullback diagram

$$\begin{array}{ccc}
 N_{\bullet}^{\mathrm{hc}}(\tau_0) & \longrightarrow & N_{\bullet}^{\mathrm{hc}}(\tau) \\
 \downarrow & & \downarrow \\
 \underline{\Delta}^0 & \longrightarrow & N_{\bullet}^{\mathrm{hc}}(\sigma)
 \end{array}$$

in the ∞ -category $\text{Fun}(\Delta^1 \times \Delta^1, \mathcal{QC})$. Assumptions (2) and (3) guarantee that $N_{\bullet}^{\text{hc}}(\sigma)$ and $N_{\bullet}(\tau)$ are limit diagrams in the ∞ -category $\mathcal{QC}$ (Example 7.6.3.4). Applying Corollary 7.3.8.7, we conclude that $N_{\bullet}^{\text{hc}}(\tau_0)$ is also a limit diagram in the ∞ -category $\mathcal{QC}$, and therefore also in the full subcategory $\mathcal{S} \subset \mathcal{QC}$. $\square$

Proof of Theorem 8.3.7.1. Let $U_{\pm} : \text{Tw}(\mathcal{C}_{\pm}) \rightarrow \mathcal{C}_{\pm}^{\text{op}} \times \mathcal{C}_{\pm}$ and $U : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ be the projection maps of Notation 8.1.1.6. We have a commutative diagram of ∞ -categories

$$\begin{array}{ccccc}
 \text{Tw}(\mathcal{C}_{\pm}) & \xrightarrow{Q_+} & \mathcal{E}_+ & & \\
 \downarrow Q_- & \searrow U_{\pm} & \downarrow & \searrow U_+ & \\
 & \mathcal{C}_{\pm}^{\text{op}} \times \mathcal{C}_{\pm} & \xrightarrow{\quad} & (\mathcal{C}_+^{\text{op}} \tilde{\times}_{\mathcal{C}^{\text{op}}} \mathcal{C}^{\text{op}}) \times \mathcal{C}_+ & \\
 & \downarrow & & \downarrow & \\
 \mathcal{E}_- & \xrightarrow{\quad} & \text{Tw}(\mathcal{C}) & \xrightarrow{U} & \mathcal{C}^{\text{op}} \times \mathcal{C} \\
 & \searrow U_- & \downarrow & \searrow & \\
 & \mathcal{C}_-^{\text{op}} \times (\mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C}) & \xrightarrow{\quad} & \mathcal{C}^{\text{op}} \times \mathcal{C} &
 \end{array}$$

where the diagonal maps are left fibrations whose covariant transport representations are given by (the restrictions of) Hom-functors for the ∞ -categories $\mathcal{C}$, $\mathcal{C}_-$, $\mathcal{C}_+$, and $\mathcal{C}_{\pm}$ (Lemma 8.3.7.4). By virtue of Lemma 8.3.7.7, it will suffice to show that the front and back faces of this diagram are categorical pullback squares. For the back face, this follows from Proposition 8.3.7.6. The front face is a cartesian product of a pair of pullback diagrams

$$\begin{array}{ccc}
 \mathcal{C}_{\pm}^{\text{op}} & \xrightarrow{\quad} & \mathcal{C}_+^{\text{op}} \tilde{\times}_{\mathcal{C}^{\text{op}}} \mathcal{C}^{\text{op}} \\
 \downarrow & & \downarrow \\
 \mathcal{C}_-^{\text{op}} & \xrightarrow{\quad} & \mathcal{C}^{\text{op}}
 \end{array}
 \qquad
 \begin{array}{ccc}
 \mathcal{C}_{\pm} & \xrightarrow{\quad} & \mathcal{C}_+ \\
 \downarrow & & \downarrow \\
 \mathcal{C}_- \tilde{\times}_{\mathcal{C}} \mathcal{C} & \xrightarrow{\quad} & \mathcal{C}
 \end{array}$$

We are therefore reduced to showing that these pullback squares are categorical pullback squares (Remark 4.5.2.10). This follows from Corollary 4.5.2.28, since vertical maps of the left square and horizontal maps of the right square are isofibrations (Proposition 4.6.4.2). $\square$

8.4 Cocompletion

03V7 Let $\mathcal{C}$ be a small ∞ -category. It is very rare for $\mathcal{C}$ to admit small colimits: this is possible only if $\mathcal{C}$ is (equivalent to the nerve of) a partially ordered set (Proposition 7.1.2.15). However, it is always possible to *embed* $\mathcal{C}$ into a larger ∞ -category which admits small colimits. Our goal in this section is to study the universal example of such an enlargement.

04B8 **Definition 8.4.0.1.** Let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories. We will say that h *exhibits* $\widehat{\mathcal{C}}$ *as a cocompletion of* $\mathcal{C}$ if the following conditions are satisfied:

- (1) The ∞ -category $\widehat{\mathcal{C}}$ is cocomplete: that is, it admits small colimits (Definition 7.6.6.1).
- (2) Let $\mathcal{D}$ be a cocomplete ∞ -category and let $\mathrm{Fun}^{\mathrm{cocont}}(\widehat{\mathcal{C}}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\widehat{\mathcal{C}}, \mathcal{D})$ spanned by those functors which preserve small colimits. Then precomposition with h induces an equivalence of ∞ -categories $\mathrm{Fun}^{\mathrm{cocont}}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

04B9 **Remark 8.4.0.2.** Stated more informally, condition (2) of Definition 8.4.0.1 asserts that if $f : \mathcal{C} \rightarrow \mathcal{D}$ is a functor of ∞ -categories where $\mathcal{D}$ is cocomplete, then f factors (up to isomorphism) as a composition $\mathcal{C} \xrightarrow{h} \widehat{\mathcal{C}} \xrightarrow{F} \mathcal{D}$, where the functor F preserves small colimits; moreover, this factorization is required to be essentially unique. In other words, the ∞ -category $\widehat{\mathcal{C}}$ should be “freely generated” by $\mathcal{C}$ under small colimits.

It follows immediately from the definition that if an ∞ -category $\mathcal{C}$ admits a cocompletion $\widehat{\mathcal{C}}$, then $\widehat{\mathcal{C}}$ is determined uniquely up to equivalence. Our primary goal in this section is to prove the following existence result:

03W9 **Theorem 8.4.0.3.** *Let $\mathcal{C}$ be an essentially small ∞ -category and let $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding for $\mathcal{C}$ (Definition 8.3.3.9). Then $h_{\bullet}$ exhibit $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ as a cocompletion of $\mathcal{C}$ (in the sense of Definition 8.4.0.1).*

03WC **Example 8.4.0.4.** Let X be a contractible Kan complex, which we identify with a vertex x of the simplicial set $\mathcal{S}$. Applying Theorem 8.4.0.3 in the special case where $\mathcal{C} = \Delta^0$, we deduce that the map $x : \Delta^0 \rightarrow \mathcal{S}$ exhibits $\mathcal{S}$ as a cocompletion of the 0-simplex Δ^0 . That is, for every ∞ -category $\mathcal{D}$ which admits small colimits, the evaluation map

$$\mathrm{Fun}^{\mathrm{cocont}}(\mathcal{S}, \mathcal{D}) \rightarrow \mathcal{D} \quad F \mapsto F(X)$$

is an equivalence of ∞ -categories. Note that this property characterizes the ∞ -category $\mathcal{S}$ up to equivalence: it is “freely generated” under small colimits by the object Δ^0 .

04BA **Warning 8.4.0.5.** In §8.4.5, we will show that *every* ∞ -category $\mathcal{C}$ admits a cocompletion $\widehat{\mathcal{C}}$ (Proposition 8.4.5.3). Beware that, if $\mathcal{C}$ is not essentially small, then $\widehat{\mathcal{C}}$ cannot necessarily be identified with the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (Warning 8.4.3.3). However, if $\mathcal{C}$ is *locally* small, then it can be identified with a full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (see Construction 8.4.5.6).

Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{C}$ is essentially small and $\mathcal{D}$ admits small colimits. Using the ∞ -categorical version of Yoneda's lemma (Theorem 8.3.3.13), we see that f factors (up to isomorphism) as a composition

$$\mathcal{C} \xrightarrow{h\bullet} \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{F_0} \mathcal{D},$$

where $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ denotes the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ spanned by the representable functors. Theorem 8.4.0.3 asserts that F_0 admits an essentially unique extension to a functor $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ which preserves small colimits. To prove this, it will be useful to characterize this extension in a different way. For any functor $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$, we will show that the following conditions are equivalent:

- (a) The functor F preserves small colimits.
- (b) The functor F is left Kan extended from the subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.

Granting this equivalence, the proof of Theorem 8.4.0.3 is reduced to showing that every functor $F_0 : \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ admits an essentially unique left Kan extension $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$, which follows from the general results of §7.3.

To establish the equivalence of (a) and (b), we will proceed by reduction to an important special case. Suppose that $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ and that $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ is the identity functor. In this case, condition (a) is automatically satisfied. Condition (b) then asserts that the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is *dense*: that is, every object $\mathcal{G} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ can be recovered as the colimit of the diagram

$$\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \times_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$$

of representable functors over $\mathcal{G}$ (see Definition 8.4.1.5). In §8.4.1, we discuss dense subcategories in general and provide a concrete criterion can be used to show that a subcategory is dense (Proposition 8.4.1.8). In §8.4.2, we apply this criterion to establish the density of the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (Corollary 8.4.2.2). In §8.4.3, we use this result to establish the equivalence of (a) and (b) in general (Theorem 8.4.3.5), and deduce Theorem 8.4.0.3 as an easy consequence.

Let us now specialize the preceding discussion to the situation where the ∞ -category $\mathcal{D}$ is locally small. In this case, we will show that conditions (a) and (b) above are equivalent to the following:

- (c) The functor $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ admits a right adjoint $G : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.

The implication (c) $\Rightarrow$ (a) is formal (by virtue of Corollary 7.1.4.23, every left adjoint preserves colimits). In §8.4.4, we prove the reverse implication by giving an explicit construction of the right adjoint G : it carries each object $D \in \mathcal{D}$ to the functor

$$\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S} \quad C \mapsto \mathrm{Hom}_{\mathcal{D}}(f(C), D)$$

where $\mathrm{Hom}_{\mathcal{D}}(\bullet, \bullet)$ is a Hom-functor for the ∞ -category $\mathcal{D}$ (see Proposition 8.4.4.1). The equivalence of (a) and (c) is a special case of the ∞ -categorical adjoint functor theorem (Theorem [?]), which we discuss in §[?] .

If $\mathcal{C}$ is an essentially small ∞ -category, then its cocompletion $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is a drastic enlargement of $\mathcal{C}$, obtained by (freely) adjoining a colimit for *every* small diagram. In practice, it will be useful to consider a variant of Definition 8.4.0.1, where we restrict our attention to diagrams indexed by some collection of simplicial sets $\mathbb{K}$. We say that a functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ *exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$* if it exhibits $\widehat{\mathcal{C}}$ as universal among $\mathbb{K}$ -cocomplete ∞ -categories equipped with a functor from $\mathcal{C}$ (see Definition 8.4.5.1). In §8.4.5, we show that every ∞ -category $\mathcal{C}$ admits a $\mathbb{K}$ -cocompletion $\widehat{\mathcal{C}}$ (Proposition 8.4.5.3). Our proof proceeds by explicit construction. Assume for simplicity that the ∞ -category $\mathcal{C}$ and each of the simplicial sets $K \in \mathbb{K}$ is essentially small; in this case, we show that we can take $\widehat{\mathcal{C}}$ to be the smallest full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ which contains all representable functors and is closed under K -indexed colimits, for each $K \in \mathbb{K}$ (Construction 8.4.5.6 and Proposition 8.4.5.8).

Let us isolate another important feature of the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ associated to an essentially small ∞ -category $\mathcal{C}$. For every pair of objects $X \in \mathcal{C}$ and $\mathcal{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, the ∞ -categorical analogue of Yoneda’s lemma supplies a homotopy equivalence

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})}(h_X, \mathcal{F}) \xrightarrow{\sim} \mathcal{F}(X)$$

(Proposition 8.3.1.3). It follows that h_X is an *atomic* object of the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$: that is, it corepresents a functor which preserves small colimits (Definition 8.4.7.1). The Yoneda embedding is essentially characterized by this property, together with the fact that it is dense and fully faithful. More precisely, suppose that we are given a functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, where $\mathcal{C}$ is small and $\widehat{\mathcal{C}}$ admits small colimits. In §8.4.7, we show that h exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$ if and only if it is dense, fully faithful, and carries each object of $\mathcal{C}$ to an atomic object of $\widehat{\mathcal{C}}$ (Proposition 8.4.7.6). In §8.4.8, we apply this characterization to show that the formation of cocompletions is compatible with the formation of slice ∞ -categories (Proposition 8.4.8.1). In particular, if $U : \widetilde{\mathcal{C}} \rightarrow \mathcal{C}$ is a right fibration between essentially small ∞ -categories, we show that there is an equivalence of ∞ -categories $\mathrm{Fun}(\widetilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \simeq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}}$, where $\mathcal{F}$ denotes a covariant transport representation for the left fibration U^{op} (Corollary 8.4.8.2).

8.4.1 Dense Functors

03V8 To study the behavior of a (large) category $\mathcal{D}$, it is often useful to approximate $\mathcal{D}$ by well-chosen (small) subcategory $\mathcal{C} \subseteq \mathcal{D}$. The following condition guarantees that, for some purposes, passage from $\mathcal{D}$ to $\mathcal{C}$ does not lose too much information:

Definition 8.4.1.1. Let $\mathcal{D}$ be a (locally small) category. We say that a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is *dense* if the functor

$$\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \text{Set}) \quad Y \mapsto \text{Hom}_{\mathcal{D}}(\bullet, Y)$$

is fully faithful.

Remark 8.4.1.2. Definition 8.4.1.1 was introduced by Isbell in [31]. Beware that Isbell uses the term *left adequate* subcategory for what we refer to as a *dense* subcategory.

Example 8.4.1.3. Let Cat denote the ordinary category whose objects are small categories and whose morphisms are functors, and let $\Delta \subset \text{Cat}$ be the simplex category. Proposition 1.3.3.1 asserts that the restricted Yoneda embedding

$$\text{Cat} \rightarrow \text{Fun}(\Delta^{\text{op}}, \text{Set}) = \text{Set}_{\Delta} \quad \mathcal{C} \mapsto \mathbf{N}_{\bullet}(\mathcal{C})$$

is fully faithful, so that Δ is a dense subcategory of Cat .

Exercise 8.4.1.4. Let $\mathcal{C}$ denote the category of partially ordered sets, and let $\Delta_{\leq 1}$ denote the full subcategory of $\mathcal{C}$ spanned by the objects $[0]$ and $[1]$. Show that $\Delta_{\leq 1}$ is a dense subcategory of $\mathcal{C}$.

We now introduce an ∞ -categorical counterpart of Definition 8.4.1.1.

Definition 8.4.1.5. Let $\mathcal{D}$ be an ∞ -category. We will say that a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is *dense* if, for every object $X \in \mathcal{D}$, the composition

$$(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X})^{\triangleright} \hookrightarrow \mathcal{D}_{/X}^{\triangleright} \rightarrow \mathcal{D}$$

is a colimit diagram.

Remark 8.4.1.6. Let $\mathcal{D}$ be an ∞ -category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense if and only if the identity functor $\text{id}_{\mathcal{D}}$ is left Kan extended from $\mathcal{C}$.

Example 8.4.1.7. Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ is a dense full subcategory of itself (see Example 7.3.3.8).

In the situation of Definition 8.4.1.5, suppose that the ∞ -category $\mathcal{D}$ is locally small, and let $h_{\bullet} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S})$ be a covariant Yoneda embedding for $\mathcal{D}$ (see Definition 8.3.3.9). Composing with the restriction functor $\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}) \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$, we obtain a functor

$$\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad Y \mapsto h_Y^{\circ}$$

which we will refer to as the *restricted Yoneda embedding*.

03VG **Proposition 8.4.1.8.** *Let $\mathcal{D}$ be a locally small ∞ -category. A full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense if and only if the restricted Yoneda embedding $\mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is fully faithful.*

We will deduce Proposition 8.4.1.8 from a more general result (Proposition 8.4.1.22), which we prove at the end of this section.

03VH **Corollary 8.4.1.9.** *Let $\mathcal{D}$ be a locally small category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense (in the sense of Definition 8.4.1.1) if and only if $N_{\bullet}(\mathcal{C})$ is a dense subcategory of the ∞ -category $N_{\bullet}(\mathcal{D})$ (in the sense of Definition 8.4.1.5).*

03VJ **Warning 8.4.1.10.** Let $\mathcal{D}$ be an ∞ -category. Consider the following conditions on a full subcategory $\mathcal{C} \subseteq \mathcal{D}$:

- (1) The ∞ -category $\mathcal{C} \subseteq \mathcal{D}$ is dense, in the sense of Definition 8.4.1.5.
- (2) Every object $X \in \mathcal{D}$ can be realized as the colimit of a diagram taking values in the full subcategory $\mathcal{C} \subseteq \mathcal{D}$.
- (3) The ∞ -category $\mathcal{D}$ is generated by $\mathcal{C}$ under colimits. That is, if $\mathcal{D}_0 \subseteq \mathcal{D}$ is a full subcategory which contains $\mathcal{C}$ and is closed under the formation of colimits in $\mathcal{D}$, then $\mathcal{D}_0 = \mathcal{D}$.

It follows immediately from the definitions that $(1) \Rightarrow (2) \Rightarrow (3)$. Beware that neither of these implications is reversible. See Exercises 8.4.1.11 and 8.4.1.12.

03VK **Exercise 8.4.1.11.** Let $\mathcal{D}$ denote the category of free abelian groups, and let $\mathcal{C} \subseteq \mathcal{D}$ denote the full subcategory spanned by object $\mathbf{Z}$. Show that $\mathcal{C}$ is not a dense subcategory of $\mathcal{D}$. Consequently, the inclusion map $N_{\bullet}(\mathcal{C}) \subset N_{\bullet}(\mathcal{D})$ satisfies condition (2) of Warning 8.4.1.10, but does not satisfy condition (1).

03VL **Exercise 8.4.1.12.** Let $\mathbf{Cat}$ denote the (ordinary) category of small categories, and let $\Delta_{\leq 1} \subset \mathbf{Cat}$ denote the full subcategory spanned by the objects $[0]$ and $[1]$. Show that:

- The full subcategory $\Delta_{\leq 1}$ generates $\mathbf{Cat}$ under colimits.
- A small category $\mathcal{C}$ can be realized as the colimit (in $\mathbf{Cat}$) of a diagram $\mathcal{K} \rightarrow \Delta_{\leq 1}$ if and only if the category $\mathcal{C}$ is free, in the sense of Definition 1.3.7.7.

In particular, the inclusion $N_{\bullet}(\Delta_{\leq 1}) \subset N_{\bullet}(\mathbf{Cat})$ satisfies condition (3) of Warning 8.4.1.10, but does not satisfy condition (2).

03VM **Warning 8.4.1.13** (Failure of Transitivity). Let $\mathcal{E}$ be an ∞ -category and let $\mathcal{C} \subseteq \mathcal{D} \subseteq \mathcal{E}$ be full subcategories. Suppose that $\mathcal{C}$ is a dense subcategory of $\mathcal{E}$. Then $\mathcal{C}$ is also a dense subcategory of $\mathcal{D}$, and $\mathcal{D}$ is a dense subcategory of $\mathcal{E}$ (see Corollary 7.3.8.13). Beware that the converse is false (Example 8.4.1.14).

Example 8.4.1.14. Let $\mathbf{Cat}$ denote the (ordinary) category of small categories. Then the 03VN
 simplex category Δ is a dense full subcategory of $\mathbf{Cat}$ (Example 8.4.1.3), and $\Delta_{\leq 1}$ is a dense
 full subcategory of Δ (Exercise 8.4.1.4). However, $\Delta_{\leq 1}$ is not a dense full subcategory of
 $\mathbf{Cat}$ (Exercise 8.4.1.12).

For some applications, it will be useful to consider the following generalization of
 Definition 8.4.1.5.

Definition 8.4.1.15. Let $\mathcal{D}$ be an ∞ -category and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of 03VP
 simplicial sets. We say that F is *dense* if the identity transformation $\mathrm{id}_F : F \rightarrow \mathrm{id}_{\mathcal{D}} \circ F$
 exhibits the identity functor $\mathrm{id}_{\mathcal{D}}$ as a left Kan extension of F along F (see Variant 7.3.1.5).

Example 8.4.1.16. Let $\mathcal{D}$ be an ∞ -category. Then a full subcategory $\mathcal{C} \subseteq \mathcal{D}$ is dense (in 03VQ
 the sense of Definition 8.4.1.5) if and only if the inclusion functor $\mathcal{C} \hookrightarrow \mathcal{D}$ is dense (in the
 sense of Definition 8.4.1.15). See Proposition 7.3.2.6.

Remark 8.4.1.17 (Homotopy Invariance). Let $\mathcal{D}$ be an ∞ -category, let $\mathcal{C}$ be a simplicial 03VS
 set, and let $F, F' : \mathcal{C} \rightarrow \mathcal{D}$ be diagrams which are isomorphic (when viewed as objects of
 the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$). Then F is dense if and only if F' is dense. This follows by
 combining Remarks 7.3.1.11 and 7.3.1.12.

Remark 8.4.1.18 (Change of Source). Let $\mathcal{D}$ be an ∞ -category, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a 03VT
 morphism of simplicial sets, and let $G : \mathcal{B} \rightarrow \mathcal{C}$ be a categorical equivalence of simplicial sets.
 Then F is dense if and only if $F \circ G$ is dense. See Proposition 7.3.1.15.

Remark 8.4.1.19 (Change of Target). Let $G : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories and let 03VU
 $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Then:

- If G is fully faithful and $G \circ F$ is dense, then F is dense.
- If G is an equivalence of ∞ -categories and F is dense, then $G \circ F$ is dense.

See Remark 7.3.1.14.

Remark 8.4.1.20. Let $\mathcal{D}$ be an ∞ -category and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial 03VV
 sets. Then f is dense if and only if, for every object $Y \in \mathcal{D}$, the composite map

$$(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/Y})^{\triangleright} \rightarrow \mathcal{D}_{/Y}^{\triangleright} \rightarrow \mathcal{D}$$

is a colimit diagram in $\mathcal{D}$.

Remark 8.4.1.21. Let κ be an uncountable regular cardinal and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a 03VW
 morphism of simplicial sets. Assume that $\mathcal{C}$ is essentially κ -small and that $\mathcal{D}$ is a locally
 κ -small ∞ -category. Then, for each object $X \in \mathcal{D}$, the fiber product $\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/X}$ is also

essentially κ -small (Corollary 5.6.7.7). Let λ be an infinite cardinal satisfying $\text{ecf}(\lambda) \geq \kappa$ (see Definition 4.7.3.16). Then F is dense if and only if, for every representable functor $h_Y : \mathcal{D}^{\text{op}} \rightarrow \mathcal{S}_{<\lambda}$, the identity transformation $\text{id} : h_Y \circ F^{\text{op}} \rightarrow h_Y \circ F^{\text{op}}$ exhibits the functor h_Y as a right Kan extension of $h_Y \circ F^{\text{op}}$ along F^{op} . This follows by combining Remark 8.4.1.20 with Proposition 7.4.1.18.

03VX **Proposition 8.4.1.22.** *Let λ be an uncountable cardinal, let $\mathcal{D}$ be an ∞ -category which is locally λ -small, and let*

$$h_{\bullet} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda}) \quad Y \mapsto h_Y$$

be a covariant Yoneda embedding for $\mathcal{D}$ (Definition 8.3.3.9). If $\mathcal{C}$ is a simplicial set, then a diagram $F : \mathcal{C} \rightarrow \mathcal{D}$ is dense if and only if the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda}) \xrightarrow{\circ F^{\text{op}}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda})$$

is fully faithful.

Proof. Choose an uncountable cardinal κ such that $\mathcal{C}$ is essentially κ -small and $\mathcal{D}$ is locally κ -small. Enlarging λ if necessary, we may assume that the exponential cofinality of λ is $\geq \kappa$ (see Remark 4.7.3.19). For each object $Y \in \mathcal{D}$, let $h_Y^{\circ} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}_{<\lambda}$ denote the composite functor $h_Y \circ F^{\text{op}}$, given on objects by the construction $C \mapsto \text{Hom}_{\mathcal{D}}(F(C), Y)$. By virtue of Remark 8.4.1.21, it will suffice to show that the following conditions are equivalent:

- (1_Y) The identity transformation $\text{id} : h_Y \circ F^{\text{op}} \rightarrow h_Y^{\circ}$ exhibits h_Y as a right Kan extension of h_Y° along the functor F^{op} .
- (2_Y) For each object $X \in \mathcal{D}$, the composite map

$$\text{Hom}_{\mathcal{D}}(X, Y) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X, h_Y) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X^{\circ}, h_Y^{\circ})$$

is a homotopy equivalence of Kan complexes.

Since the covariant Yoneda embedding $X \mapsto h_X$ is fully faithful (Theorem 8.3.3.13), we can reformulate (2_Y) as follows:

- (2'_Y) The restriction map

$$\text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X, h_Y) \rightarrow \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X^{\circ}, h_Y^{\circ})$$

is a homotopy equivalence of Kan complexes.

The inequality $\kappa \leq \text{ecf}(\lambda)$ guarantees that the ∞ -category $\mathcal{S}_{<\lambda}$ admits κ -small limits (Variant 7.4.4.14). Using Proposition 7.6.6.18, we can choose a functor $\mathcal{G} : \mathcal{D}^{\text{op}} \rightarrow \mathcal{S}^{<\lambda}$ and a natural transformation $\alpha : \mathcal{G} \circ F^{\text{op}} \rightarrow h_Y^\circ$ which exhibits $\mathcal{G}$ as a right Kan extension of h_Y° along the functor F^{op} . Invoking the universal mapping property of $\mathcal{G}$ (Proposition 7.3.6.1), we see that there exists a natural transformation $\beta : h_Y \rightarrow \mathcal{G}$ and a commutative diagram

$$\begin{array}{ccc} & \mathcal{G} \circ F^{\text{op}} & \\ \beta \nearrow & & \searrow \alpha \\ h_Y \circ F^{\text{op}} & \xrightarrow{\text{id}} & h_Y^\circ \end{array} \quad (8.57) \quad \text{03VY}$$

in the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda})$. Using Remark 7.3.1.13, we see that condition (1_Y) is satisfied if and only if the natural transformation β is an isomorphism: that is, it induces a homotopy equivalence of Kan complexes $\beta_X : h_Y(X) \rightarrow \mathcal{G}(X)$ for each object $X \in \mathcal{D}$ (Theorem 4.4.4.4). Combining this observation with Proposition 8.3.1.3, we can reformulate (1_Y) as follows:

$(1'_Y)$ For each object $X \in \mathcal{C}$, precomposition with β induces a homotopy equivalence

$$\text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X, h_Y) \xrightarrow{\circ[\beta]} \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X, \mathcal{G}).$$

Using the commutativity of (8.57), we see that the diagram of Kan complexes

$$\begin{array}{ccc} & \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X, \mathcal{G}) & \\ \circ[\beta] \nearrow & & \searrow \\ \text{Hom}_{\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X, h_Y) & \xrightarrow{\quad} & \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda})}(h_X^\circ, h_Y^\circ) \end{array}$$

commutes up to homotopy, where the diagonal map on the right is the homotopy equivalence of Proposition 7.3.6.1. It follows that conditions $(1'_Y)$ and $(2'_Y)$ are equivalent. $\square$

Proof of Proposition 8.4.1.8. Let $\mathcal{D}$ be a locally small ∞ -category and let $\mathcal{C} \subseteq \mathcal{D}$ be a full subcategory. By virtue of Example 8.4.1.16, it will suffice to show that the inclusion functor $\mathcal{C} \hookrightarrow \mathcal{D}$ is dense if and only if the restricted Yoneda embedding $\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ is fully faithful. Following the convention of Remark 4.7.0.5, this is a special case of Proposition 8.4.1.22. $\square$

Proposition 8.4.1.23. *Let $\mathcal{D}$ be an ∞ -category, let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets, and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be a full subcategory which contains the image of F . If F is dense, then the subcategory $\mathcal{D}_0$ is dense.* 03VZ

Proof. Using Proposition 4.1.3.2, we can factor F as a composition $\mathcal{C} \xrightarrow{F'} \mathcal{C}' \xrightarrow{F''} \mathcal{D}$, where F' is inner anodyne and F'' is an inner fibration. Using Remark 8.4.1.18, we see that the functor F' is dense. Replacing F by F'' , we can reduce to proving Proposition 8.4.1.23 in the special case where $\mathcal{C}$ is an ∞ -category.

Let γ denote the identity map id_F , which we regard as a natural transformation from F to $\mathrm{id}_{\mathcal{D}} \circ F$. Our assumption that F is dense guarantees that γ exhibits $\mathrm{id}_{\mathcal{D}}$ as a left Kan extension of F along F . To avoid confusion, let us write F_0 to denote the functor F , regarded as a functor from $\mathcal{C}$ to $\mathcal{D}_0$. Let $\iota : \mathcal{D}_0 \hookrightarrow \mathcal{D}$ denote the inclusion map, so that $F = \iota \circ F_0$. We can therefore also regard the identity map id_F as a natural transformation $\alpha : F \rightarrow \iota \circ F_0$. Our assumption that F is dense also guarantees that α exhibits ι as a left Kan extension of F along F_0 . Note that $\gamma = \mathrm{id}_F$ is a composition of $\alpha = \mathrm{id}_F$ with $\beta|_{\mathcal{C}}$, where $\beta = \mathrm{id}_{\iota}$ is the identity transformation from ι to itself. Invoking the transitivity of Kan extensions (Proposition 7.3.8.23), we deduce that β exhibits the identity functor $\mathrm{id}_{\mathcal{D}}$ as a left Kan extension of ι along itself: that is, the functor ι is dense. Applying Example 8.4.1.16, we conclude that $\mathcal{D}_0$ is a dense subcategory of $\mathcal{D}$. $\square$

03W0 Remark 8.4.1.24. Let $\mathcal{D}$ be an ∞ -category and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a dense diagram. Choose another diagram $q : K \rightarrow \mathcal{D}$ and set $\tilde{\mathcal{D}} = \mathcal{D}_{/q}$, so that the projection map $\pi : \tilde{\mathcal{D}} \rightarrow \mathcal{D}$ is a right fibration. Then the projection map $\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}} \rightarrow \tilde{\mathcal{D}}$ is dense. To prove this, it will suffice to show that for every object $Y \in \tilde{\mathcal{D}}$, the induced map

$$\theta : (\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}}_{/Y})^{\triangleright} \rightarrow \tilde{\mathcal{D}}_{/Y}^{\triangleright} \rightarrow \tilde{\mathcal{D}}$$

is a colimit diagram in $\tilde{\mathcal{D}}$ (Remark 8.4.1.20). By virtue of Proposition 7.1.4.21, this is equivalent to the requirement that $\pi \circ \theta$ is a colimit diagram in $\mathcal{D}$. Unwinding the definitions, we see that $\pi \circ \theta$ is given by the composition

$$(\mathcal{C} \times_{\mathcal{D}} \tilde{\mathcal{D}}_{/Y})^{\triangleright} \rightarrow (\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/\pi(Y)})^{\triangleright} \rightarrow \mathcal{D}_{/\pi(Y)}^{\triangleright} \rightarrow \mathcal{D}.$$

Since π is a right fibration, the map $\tilde{\mathcal{D}}_{/Y} \rightarrow \mathcal{D}_{/\pi(Y)}$ is a trivial Kan fibration (Proposition 4.3.7.12). Using Corollary 7.2.2.2, we are reduced to showing that the map $(\mathcal{C} \times_{\mathcal{D}} \mathcal{D}_{/\pi(Y)})^{\triangleright} \rightarrow \mathcal{D}_{/\pi(Y)}^{\triangleright} \rightarrow \mathcal{D}$ is a colimit diagram, which follows from our assumption that F is dense (Remark 8.4.1.20).

8.4.2 Density of Yoneda Embeddings

03W1 Our goal in this section is to prove the following result, which supplies an important source of examples of dense functors:

03W2 Theorem 8.4.2.1. *Let $\mathcal{C}$ be a locally small ∞ -category, and let $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ be a covariant Yoneda embedding (Definition 8.3.3.9). Then $h_{\bullet}$ is a dense functor.*

Since the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is fully faithful, Theorem 8.4.2.1 can be reformulated as follows:

Corollary 8.4.2.2. *Let $\mathcal{C}$ be a locally small ∞ -category and let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ 03W3 denote the full subcategory spanned by the representable functors. Then $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is a dense subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.*

Proof. By virtue of Example 8.4.1.16, it will suffice to show that the inclusion map $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \hookrightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is a dense functor. Since the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is an equivalence of ∞ -categories (Theorem 8.3.3.13), this is equivalent to the assertion that $h_\bullet$ is a dense functor from $\mathcal{C}$ to $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ (Remark 8.4.1.18), which follows from Theorem 8.4.2.1. $\square$

Example 8.4.2.3. Let $\mathcal{S}_{\mathrm{cont}}$ denote the full subcategory of $\mathcal{S}$ spanned by the contractible 03W4 Kan complexes. Then $\mathcal{S}_{\mathrm{cont}}$ is a dense subcategory of $\mathcal{S}$. This follows by applying Corollary 8.4.2.2 in the special case $\mathcal{C} = \Delta^0$. Moreover, the same assertion holds if we replace $\mathcal{S}_{\mathrm{cont}}$ by any nonempty subcategory of itself; for example, the full subcategory of $\mathcal{S}$ spanned by the standard 0-simplex Δ^0 .

By virtue of the convention of Remark 4.7.0.5, Theorem 8.4.2.1 can be regarded as a special case of the following:

Variant 8.4.2.4. Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which is 03W5 locally κ -small. Then the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is a dense functor.

We will deduce Variant 8.4.2.4 from a more precise result. Recall that, if X is an object of a (locally small) ∞ -category $\mathcal{C}$, then the representable functor $h_X \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ corepresents the evaluation functor $\mathrm{ev}_X : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{S}$ (Remark 8.3.1.5). That is, for every functor $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$, there is a canonical homotopy equivalence

$$\mathcal{F}(X) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})}(h_X, \mathcal{F}),$$

which depends functorially on $\mathcal{F}$. The following result guarantees that this homotopy equivalence can also be chosen to depend functorially on X :

Proposition 8.4.2.5. *Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which 03W6 is locally κ -small. Then the profunctor*

$$\mathrm{ev} : \mathcal{C}^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{S}_{<\kappa} \quad (X, \mathcal{F}) \mapsto \mathcal{F}(X)$$

is corepresentable by the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$.

Proof. Let $\mathrm{Tw}(\mathcal{C})$ denote the twisted arrow ∞ -category of $\mathcal{C}$, let $\lambda : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ be the left fibration of Proposition 8.1.1.11, and let $\underline{\Delta}_{\mathrm{Tw}(\mathcal{C})}^0$ denote the constant functor $\mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{S}_{<\kappa}$. Let $\mathcal{H} : \mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ denote the composition $\mathrm{ev} \circ (\mathrm{id} \times h_{\bullet})$, so that $\mathcal{H}$ is a Hom-functor for $\mathcal{C}$. We can therefore choose a natural transformation

$$\alpha : \underline{\Delta}_{\mathrm{Tw}(\mathcal{C})}^0 \rightarrow \mathcal{H} \circ \lambda = \mathrm{ev} \circ (\mathrm{id} \times h_{\bullet}) \circ \lambda$$

which exhibits $\mathcal{H}$ as a Hom-functor for $\mathcal{C}$, in the sense of Definition 8.3.5.1. By virtue of Proposition 8.3.4.15, it will suffice to show that the natural transformation α also exhibits the profunctor ev as corepresented by the functor $h_{\bullet}$, in the sense of Variant 8.3.4.16. Fix an object $X \in \mathcal{C}$, so that α carries the object $\mathrm{id}_X \in \mathrm{Tw}(\mathcal{C})$ to a vertex $\eta \in \mathcal{H}(X, X) = \mathrm{ev}(X, h_X)$. We wish to show that η exhibits evaluation functor $\mathrm{ev}_X : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{S}_{<\kappa}$ as corepresented by h_X . This follows from Proposition 8.3.1.3, since η exhibits the functor h_X as represented by X . $\square$

03W7 **Example 8.4.2.6.** Let $\mathcal{C}$ be a locally small category. Then the evaluation profunctor

$$\mathrm{ev} : \mathcal{C}^{\mathrm{op}} \times \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{S} \quad (X, \mathcal{F}) \mapsto \mathcal{F}(X)$$

is corepresentable by the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.

Proof of Variant 8.4.2.4. Let κ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which is locally κ -small. We wish to show that the covariant Yoneda embedding $h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is dense. Choose a cardinal $\lambda \geq \kappa$ for which the ∞ -category $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is locally λ -small, and let $h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$ be a covariant Yoneda embedding for $\mathcal{D}$. By virtue of Proposition 8.4.1.22, it will suffice to show that the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}^{\mathcal{D}}} \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\lambda}) \xrightarrow{\circ h_{\bullet}^{\mathcal{C}}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$$

is fully faithful. Applying Proposition 8.4.2.5, we see that this functor is isomorphic to the inclusion of $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ as a full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$. $\square$

Using Proposition 8.4.2.5, we can also give an alternative characterization of the covariant transport representation associated to a left fibration of ∞ -categories.

04BB **Corollary 8.4.2.7.** *Let $\mathcal{C}$ be a locally κ -small ∞ -category, let $U : \tilde{\mathcal{C}} \rightarrow \mathcal{C}$ be a right fibration, and let $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$ be a functor. The following conditions are equivalent:*

- (1) *The functor $\mathcal{F}$ is a covariant transport representation for the left fibration $U^{\mathrm{op}} : \tilde{\mathcal{C}}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$.*

(2) *There exists a categorical pullback square*

$$\begin{array}{ccc} \tilde{\mathcal{C}} & \xrightarrow{\quad} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})/\mathcal{F} \\ \downarrow U & & \downarrow \\ \mathcal{C} & \xrightarrow{h_{\bullet}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}), \end{array}$$

where $h_{\bullet}$ is a covariant Yoneda embedding for $\mathcal{C}$.

Proof. Choose a cardinal $\lambda \geq \kappa$ such that $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is locally λ -small, and let $H : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})^{\mathrm{op}} \rightarrow \mathcal{S}_{<\lambda}$ be a functor represented by $\mathcal{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$. It follows from Proposition 5.6.6.21 that H is a covariant transport representation for the left fibration $(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})/\mathcal{F})^{\mathrm{op}} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})^{\mathrm{op}}$. Consequently, if condition (2) is satisfied, then $H \circ h_{\bullet}^{\mathrm{op}}$ is a covariant transport representation for the left fibration U^{op} . Proposition 8.4.2.5 implies that $H \circ h_{\bullet}^{\mathrm{op}}$ is isomorphic to $\mathcal{F}$. This proves the implication (2) $\Rightarrow$ (1), and the reverse implication follows from the fact that the equivalence class of a left fibration is determined by its covariant transport representation (Corollary 5.6.0.6). $\square$

Corollary 8.4.2.8. *Let κ be an uncountable cardinal, let $\mathcal{C}$ be an ∞ -category which is locally κ -small, and let $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ be a covariant Yoneda embedding for $\mathcal{C}$. Suppose we are given a diagram $f : K \rightarrow \mathcal{C}$. Assume that K is $\mathrm{ecf}(\kappa)$ -small, so that $F = h_{\bullet} \circ f$ admits a limit $\hat{C} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$. Then $\hat{C}$ is a covariant transport representation for the left fibration $(\mathcal{C}/f)^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$.* 05WB

Proof. Since the functor $h_{\bullet}$ is fully faithful, it induces a categorical pullback square

$$\begin{array}{ccc} \mathcal{C}/f & \xrightarrow{\quad} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})/F \\ \downarrow U & & \downarrow U \\ \mathcal{C} & \xrightarrow{h_{\bullet}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}^{<\kappa}). \end{array}$$

Our assumption that $\hat{C}$ is a limit of F guarantees that U is equivalent to the right fibration $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})/\hat{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$. The desired result now follows from Corollary 8.4.2.7. $\square$

8.4.3 Cocompletion via the Yoneda Embedding

Let $\mathcal{C}$ be an essentially small ∞ -category. Our goal in this section is to prove Theorem 8.4.0.3, which asserts that the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ exhibits $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ as a cocompletion of $\mathcal{C}$. We begin by formulating a slightly more general assertion. 03W8

04BD **Definition 8.4.3.1.** Let κ be an uncountable regular cardinal. We say that a functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a κ -cocompletion of $\mathcal{C}$ if the following conditions are satisfied:

- (1) The ∞ -category $\widehat{\mathcal{C}}$ is κ -cocomplete.
- (2) For every κ -cocomplete ∞ -category $\mathcal{D}$, precomposition with h induces an equivalence of ∞ -categories $\mathrm{Fun}^{\kappa\text{-cocont}}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Here $\mathrm{Fun}^{\kappa\text{-cocont}}(\widehat{\mathcal{C}}, \mathcal{D})$ denotes the ∞ -category of κ -cocontinuous functors from $\widehat{\mathcal{C}}$ to $\mathcal{D}$ (Notation 7.6.6.7).

Following the convention of Remark 4.7.0.5, we can regard Theorem 8.4.0.3 as a special case of the following more general assertion:

04BE **Theorem 8.4.3.2.** Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞ -category which is essentially κ -small, and let $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ be a covariant Yoneda embedding for $\mathcal{C}$. Then $h_{\bullet}$ exhibits $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ as a κ -cocompletion of $\mathcal{C}$.

03WF **Warning 8.4.3.3.** The conclusion of Theorem 8.4.3.2 is not necessarily satisfied if we assume only that $\mathcal{C}$ is locally κ -small. For example, suppose that $\mathcal{C} = S$ is a set of cardinality κ (regarded as a discrete simplicial set), and let $\mathcal{D}$ be (the nerve of) the partially ordered set $\{0 < 1\}$. Then we can identify objects of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ with collections of κ -small Kan complexes $\{X_s\}_{s \in S}$. Define a functor $\lambda : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{D}$ by the formula

$$\lambda(\{X_s\}_{s \in S}) = \begin{cases} 0 & \text{if } |\{s \in S : X_s \neq \emptyset\}| < \kappa \\ 1 & \text{otherwise,} \end{cases}$$

and let $\lambda_0 : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{D}$ be the constant functor taking the value 0. The functors λ and λ_0 both preserve κ -small colimits and coincide on the image of the Yoneda embedding $h_{\bullet}$, but do not coincide in general.

The proof of Theorem 8.4.3.2 will require some preliminaries. Let κ be an uncountable cardinal, and let $\mathcal{C}$ be an ∞ -category which is locally κ -small. In what follows, we let $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ spanned by the representable functors $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$. We will need the following elementary observation:

03WG **Lemma 8.4.3.4.** Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞ -category which is essentially κ -small, and let $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$ be a functor. Then the ∞ -category

$$\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}} = \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \times_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}}$$

is essentially κ -small.

Proof. The ∞ -category $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is equivalent to $\mathcal{C}$ (Theorem 8.3.3.13), and is therefore essentially κ -small. Since κ is regular, it will suffice to show that each fiber of the right fibration $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}} \rightarrow \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is an essentially κ -small Kan complex (Corollary 5.6.7.7). Equivalently, we must show that for each object $\mathcal{G} \in \mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$, the mapping space $X = \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})}(\mathcal{G}, \mathcal{F})$ is essentially κ -small. This follows from Proposition 8.3.1.3: if $\mathcal{G}$ is representable by the object $C \in \mathcal{C}$, then X is homotopy equivalent to the κ -small Kan complex $\mathcal{F}(C)$. $\square$

We will deduce Theorem 8.4.3.2 from the following more precise assertion:

Theorem 8.4.3.5. *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞ -category which is essentially κ -small, and let $T : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{D}$ be a functor of ∞ -categories. The following conditions are equivalent:* 03WH

- (1) *The functor T preserves κ -small colimits.*
- (2) *The functor T is left Kan extended from the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$.*

Proof. We first show that (1) implies (2). Assume that the functor T preserves κ -small colimits and let $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$ be a functor; we wish to show that the composite functor

$$\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}}^{\triangleright} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \xrightarrow{T} \mathcal{D}$$

is a colimit diagram in the ∞ -category $\mathcal{D}$. Lemma 8.4.3.4 guarantees that the ∞ -category $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}}$ is essentially κ -small. Since T preserves κ -small colimits, it will suffice to show that the map $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}}^{\triangleright} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is a colimit diagram (Remark 7.6.6.13), which follows from Corollary 8.4.2.2.

We now show that (2) implies (1). Assume that T is left Kan extended from the ∞ -category $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$; we wish to show that it preserves κ -small colimits. Choose a cardinal λ such that $\mathcal{D}$ is locally λ -small. Enlarging λ if necessary, we may assume that it has exponential cofinality $\geq \kappa$ (Remark 4.7.3.19). By virtue of Proposition 7.4.1.18, it will suffice to show that for every representable functor $H : \mathcal{D}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\lambda}$, the composition $H^{\mathrm{op}} \circ T$ preserves κ -small colimits. Since H^{op} preserves κ -small colimits (Proposition 7.4.1.18), the functor $H^{\mathrm{op}} \circ T$ is left Kan extended from $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$. Consequently, to show that (2) implies (1), we may replace T by $H^{\mathrm{op}} \circ T$ and thereby reduce to the case where $\mathcal{D} = \mathcal{S}_{<\lambda}^{\mathrm{op}}$, for some cardinal λ of exponential cofinality $\geq \kappa$.

Let $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ be a covariant Yoneda embedding for $\mathcal{C}$, and let $\mathcal{F}$ denote the composite functor

$$\mathcal{C}^{\mathrm{op}} \xrightarrow{h_{\bullet}^{\mathrm{op}}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})^{\mathrm{op}} \xrightarrow{T^{\mathrm{op}}} \mathcal{S}_{<\lambda}.$$

Using Remark 4.7.3.19 again, we can choose a cardinal $\lambda' \geq \lambda$ of exponential cofinality $\geq \kappa$ such that $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\lambda})$ is locally λ' -small. In what follows, we abuse notation by identifying

T with the composite functor $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}) \xrightarrow{T} (\mathcal{S}_{<\lambda})^{\text{op}} \hookrightarrow \mathcal{S}_{<\lambda'}^{\text{op}}$. Note that, since the inclusion $\mathcal{S}_{<\lambda} \hookrightarrow \mathcal{S}_{<\lambda'}$ preserves κ -small limits (see Variant 7.4.1.15), this composite functor is also left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$.

Let $H' : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda}^{\text{op}}) \rightarrow \mathcal{S}_{<\lambda'}$ be a functor represented by $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda})$, and let U denote the composite functor

$$\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}) \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\lambda}) \xrightarrow{H'^{\text{op}}} \mathcal{S}_{<\lambda'}^{\text{op}}.$$

Applying Proposition 8.4.2.5, we see that the composition $U \circ h_{\bullet}$ is isomorphic to the functor $\mathcal{F} = T \circ h_{\bullet}$. Since the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ is an equivalence of ∞ -categories (Theorem 8.3.3.13), it follows that the functors U and T are isomorphic when restricted to $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. Proposition 7.4.1.18 guarantees that the functor U preserves κ -small colimits. Invoking the implication (1) $\Rightarrow$ (2), we see that U is left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. Applying the universal property of Kan extensions (Corollary 7.3.6.13), we deduce that the functor T is isomorphic to U , and therefore also preserves κ -small colimits. $\square$

03WJ Remark 8.4.3.6. In the statement of Theorem 8.4.3.5, it is not necessary to assume that the ∞ -category $\mathcal{D}$ admits κ -small colimits (though we will primarily be interested in cases where this condition is satisfied).

03WK Example 8.4.3.7. Let $\mathcal{C}$ be a small ∞ -category and let $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ denote the full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ spanned by the representable functors. Then a functor of ∞ -categories $F : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ preserves small colimits if and only if it is left Kan extended from $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S})$.

Proof of Theorem 8.4.3.2. Let κ be an uncountable regular cardinal and let $\mathcal{C}$ be an ∞ -category which is essentially κ -small. It follows from Example 7.6.6.10 that the ∞ -category $\mathcal{S}_{<\kappa}$ is κ -cocomplete, so that the functor ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ is also κ -cocomplete (Remark 7.6.6.20). Let $\mathcal{D}$ be an ∞ -category which admits κ -small colimits. We wish to show that that the composite functor

$$\text{Fun}^{\kappa\text{-cocont}}(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D}) \rightarrow \text{Fun}(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D}) \xrightarrow{oh_{\bullet}} \text{Fun}(\mathcal{C}, \mathcal{D})$$

is an equivalence of ∞ -categories. Theorem 8.3.3.13 guarantees that the covariant Yoneda embedding $\mathcal{C} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ is an equivalence of ∞ -categories. We are therefore reduced to showing that the restriction functor

$$U : \text{Fun}^{\kappa\text{-cocont}}(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D}) \rightarrow \text{Fun}(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D}) \quad F \mapsto F|_{\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})}$$

is an equivalence of ∞ -categories. It follows from Theorem 8.4.3.5 that a functor $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{D}$ is κ -cocontinuous if and only if it is left Kan extended from

$\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. Applying Corollary 7.3.6.15, we see that U restricts to a trivial Kan fibration

$$\text{Fun}^{\kappa\text{-cocont}}(\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D}) \rightarrow \text{Fun}'(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D}),$$

where $\text{Fun}'(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D})$ denotes the full subcategory of $\text{Fun}(\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}), \mathcal{D})$ spanned by those functors which admit a left Kan extension to $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$.

We will complete the proof by showing that every functor $f : \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{D}$ admits a left Kan extension to $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. Fix an object $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ and let $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}}$ be as in the statement of Lemma 8.4.3.4. By virtue of Corollary 7.3.5.8, it will suffice to show the diagram

$$\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}} \rightarrow \text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}) \xrightarrow{f} \mathcal{D}$$

admits a colimit in the ∞ -category $\mathcal{D}$. Since $\mathcal{D}$ admits κ -small colimits, we are reduced to showing that the ∞ -category $\text{Fun}^{\text{rep}}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})_{/\mathcal{F}}$ is essentially κ -small (see Remark 7.6.6.13), which follows from Lemma 8.4.3.4. $\square$

Corollary 8.4.3.8. *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞ -category which is essentially κ -small, and let $h_{\bullet} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ be a covariant Yoneda embedding for $\mathcal{C}$. Then every object $\mathcal{F} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ can be realized as the colimit of a diagram* 03WL

$$\mathcal{K} \rightarrow \mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}),$$

where $\mathcal{K}$ is a κ -small ∞ -category.

Proof. Let $\mathcal{K}'$ denote the fiber product $\mathcal{C} \times_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}}$. Combining Lemma 8.4.3.4 with Theorem 8.3.3.13, we deduce that $\mathcal{K}'$ is essentially κ -small. We can therefore choose an equivalence of ∞ -categories $e : \mathcal{K} \rightarrow \mathcal{K}'$, where $\mathcal{K}$ is κ -small. Applying Theorem 8.4.3.2, we deduce that $\mathcal{F}$ is a colimit of the composite functor

$$\mathcal{K} \xrightarrow{e} \mathcal{K}' = \mathcal{C} \times_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})_{/\mathcal{F}} \rightarrow \mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}).$$

$\square$

Corollary 8.4.3.9. *Let κ be an uncountable regular cardinal and let $\mathcal{C}$ be an ∞ -category which is essentially κ -small, and let $h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ be a covariant Yoneda embedding. Suppose we are given a functor* 05JC

$$T : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})^{\text{op}} \rightarrow \mathcal{S}_{<\lambda},$$

where λ is a cardinal of exponential cofinality $\geq \kappa$. Then T is representable if and only if the following conditions are satisfied:

- (1) For each object $C \in \mathcal{C}$, the Kan complex $T(h_C^{\mathcal{C}})$ is essentially κ -small.

(2) *The functor T preserves κ -small limits.*

Moreover, if these conditions are satisfied, then the functor T is representable by the object $\mathcal{F} = T \circ (h_{\bullet}^{\mathcal{C}})^{\text{op}}$.

Proof. Assume first that T is representable by an object $\mathcal{G} \in \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. In this case, Corollary 7.4.1.19 guarantees that T satisfies condition (2). To verify (1), we note that for each object $C \in \mathcal{C}$, Proposition 8.3.1.3 supplies a homotopy equivalence

$$T(h_C^{\mathcal{C}}) \simeq \text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})}(h_C^{\mathcal{C}}, \mathcal{G}) \xrightarrow{\sim} \mathcal{G}(C);$$

the desired result now follows from the observation that $\mathcal{G}(C)$ is essentially κ -small.

We now prove the converse. Assume that T satisfies conditions (1) and (2) and set $\mathcal{F} = T \circ (h_{\bullet}^{\mathcal{C}})^{\text{op}}$. Condition (1) guarantees that we can view $\mathcal{F}$ as an object of the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. Since λ has exponential cofinality $\geq \kappa$, the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ is locally λ -small (Corollary 4.7.8.8). We can therefore choose a functor $T' : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})^{\text{op}} \rightarrow \mathcal{S}_{<\lambda}$ which is representable by $\mathcal{F}$ (Theorem 5.6.6.13). It follows from Proposition 8.4.2.5 that the composition $T' \circ (h_{\bullet}^{\mathcal{C}})^{\text{op}}$ is isomorphic to the functor $\mathcal{F} = T \circ (h_{\bullet}^{\mathcal{C}})^{\text{op}}$. Using condition (2) (and Corollary 7.4.1.19), we see that the functors T and T' both preserve κ -small limits. Applying Theorem 8.4.3.2, we conclude that T' is isomorphic to T , so that the functor T is also representable by the object $\mathcal{F}$. $\square$

8.4.4 Cocontinuous Extensions

03WM Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{C}$ is small and $\mathcal{D}$ admits small colimits. It follows from Theorem 8.4.0.3 that, up to isomorphism, the functor f factors as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where $h_{\bullet}$ denotes a covariant Yoneda embedding for $\mathcal{C}$ and F is a functor which preserves small colimits. The functor F is uniquely determined up to isomorphism: by virtue of Theorem 8.4.3.5, it can be characterized as a left Kan extension of f along $h_{\bullet}$. Our goal in this section is to show that, if the ∞ -category $\mathcal{D}$ is locally small, then we can give another characterization of the functor F : it is left adjoint to the functor

$$\mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad D \mapsto \text{Hom}_{\mathcal{D}}(f(\bullet), D).$$

03WN **Proposition 8.4.4.1.** *Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that $\mathcal{C}$ is essentially small, that $\mathcal{D}$ is cocomplete and locally small, and let*

$$h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \quad h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S})$$

be covariant Yoneda embeddings for $\mathcal{C}$ and $\mathcal{D}$, respectively. Let G denote the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}^{\mathcal{D}}} \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{\circ f^{\mathrm{op}}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}).$$

Then the functor G admits a left adjoint $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$. Moreover, the composition $F \circ h_{\bullet}^{\mathcal{C}}$ is isomorphic to f .

Corollary 8.4.4.2. *Let $\mathcal{C}$ be an essentially κ -small ∞ -category, let $\mathcal{D}$ be an ∞ -category 04BF which is cocomplete and locally small, and let $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ be a functor. The following conditions are equivalent:*

- (1) *The functor F preserves small colimits.*
- (2) *The functor F admits a right adjoint $G : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$.*

Proof. Assume that F preserves small colimits; we will show that it admits a right adjoint (the reverse implication follows from Corollary 7.1.4.23). Choose covariant Yoneda embeddings

$$h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \quad h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}),$$

set $f = F \circ h_{\bullet}^{\mathcal{C}}$, and let G denote the composite functor

$$\mathcal{D} \xrightarrow{h_{\bullet}^{\mathcal{D}}} \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{\circ f^{\mathrm{op}}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}).$$

It follows from Proposition 8.4.4.1 that G admits a left adjoint $F' : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{D}$ such that $F' \circ h_{\bullet}^{\mathcal{C}}$ is isomorphic to $f = F \circ h_{\bullet}^{\mathcal{C}}$. Since the functor F' also preserves small colimits (Corollary 7.1.4.23), Theorem 8.4.0.3 implies that it is isomorphic to F . It follows that G is also a right adjoint of F . $\square$

Corollary 8.4.4.3. *Let $\mathcal{C}$ be an essentially small ∞ -category and let $\mathcal{F} : \mathrm{Fun}(\mathcal{C}, \mathcal{S})^{\mathrm{op}} \rightarrow \mathcal{S}$ 04BG be a functor. The following conditions are equivalent:*

- (1) *The functor $\mathcal{F}$ admits a left adjoint.*
- (2) *The functor $\mathcal{F}$ is representable by an object of $\mathrm{Fun}(\mathcal{C}, \mathcal{S})$.*
- (3) *The functor $\mathcal{F}$ preserves small limits.*

Proof. Since the identity functor $\mathrm{id} : \mathcal{S} \rightarrow \mathcal{S}$ is corepresentable (by the object $\Delta^0 \in \mathcal{S}$), the implication (1) $\Rightarrow$ (2) follows from Corollary 6.2.6.2. The equivalence (2) $\Leftrightarrow$ (3) is a special case of Corollary 8.4.3.9. The implication (3) $\Rightarrow$ (1) follows by applying Corollary 8.4.4.2 to the opposite functor $\mathcal{F}^{\mathrm{op}} : \mathrm{Fun}(\mathcal{C}, \mathcal{S}) \rightarrow \mathcal{S}^{\mathrm{op}}$. $\square$

Following the convention of Remark 4.7.0.5, we will deduce Proposition 8.4.4.1 from the following more general assertion:

03WP **Variant 8.4.4.4.** Let κ be an uncountable regular cardinal and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that $\mathcal{C}$ is essentially κ -small, that $\mathcal{D}$ admits κ -small colimits, and that the morphism space $\mathrm{Hom}_{\mathcal{D}}(f(C), D)$ is essentially κ -small for every pair of objects $C \in \mathcal{C}$, $D \in \mathcal{D}$. Then the functor

$$G : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \quad D \mapsto \mathrm{Hom}_{\mathcal{D}}(f(\bullet), D)$$

admits a left adjoint $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{D}$ which preserves κ -small colimits. Moreover, the composite functor $\mathcal{C} \xrightarrow{h_{\bullet}^{\mathcal{C}}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \xrightarrow{F} \mathcal{D}$ is isomorphic to f .

Proof. We first prove the existence of the functor F . Fix a cardinal λ of exponential cofinality $\geq \kappa$, so that the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ is locally λ -small (see Corollary 4.7.8.8). By virtue of Proposition 6.2.6.1, it will suffice to show that for every functor $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$, the composite functor

$$\mathcal{D} \xrightarrow{G} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \xrightarrow{\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})}(\mathcal{F}, \bullet)} \mathcal{S}_{<\lambda}$$

is corepresentable by an object of $\mathcal{D}$. Since $\mathcal{D}$ admits κ -small colimits, the collection of functors $\mathcal{F}$ which satisfy this condition is closed under κ -small colimits (Remark 8.3.3.16). Using Corollary 8.4.3.8, we can reduce to the case where the functor $\mathcal{F}$ is representable by an object $C \in \mathcal{C}$. In this case, the object $\mathcal{F} \in \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ corepresents the evaluation functor $\mathrm{ev}_C : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ (Remark 8.3.1.5). It now follows from the definition of the functor G that the composition $\mathrm{ev}_C \circ G$ is corepresentable by the object $f(C) \in \mathcal{D}$.

Choose functor $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{D}$ and a natural transformation $\epsilon : (F \circ G) \rightarrow \mathrm{id}_{\mathcal{D}}$ which exhibits F as a left adjoint to the functor G . It follows from Corollary 7.1.4.23 that the functor F preserves all colimits which exist in $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$; in particular, it preserves κ -small colimits. We will complete the proof by showing that $F \circ h_{\bullet}^{\mathcal{C}}$ is isomorphic to f .

For every pair of objects $X, Y \in \mathcal{C}$, let $\alpha_{X,Y}$ denote the morphism of Kan complexes

$$h_Y^{\mathcal{C}}(X) = \mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathrm{Hom}_{\mathcal{D}}(f(X), f(Y)) = G(f(Y))(X).$$

By virtue of Corollary 8.3.5.8, we can promote the construction $(X, Y) \mapsto \alpha_{X,Y}$ to a natural transformation of functors $\alpha : h_{\bullet}^{\mathcal{C}} \rightarrow G \circ f$. Let β denote a composition of the natural transformations

$$F \circ h_{\bullet}^{\mathcal{C}} \xrightarrow{F(\alpha)} F \circ G \circ f \xrightarrow{\epsilon} \mathrm{id}_{\mathcal{D}} \circ f = f.$$

We claim that β is an isomorphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. By virtue of Theorem 4.4.4.4, it will suffice to show that β induces an isomorphism $\beta_X : F(h_X^{\mathcal{C}}) \rightarrow f(X)$ for each object $X \in \mathcal{C}$. Fix an object $D \in \mathcal{D}$; we wish to show that precomposition with β_X induces a homotopy equivalence of Kan complexes

$$\beta_{X,D} : \mathrm{Hom}_{\mathcal{D}}(f(X), D) \rightarrow \mathrm{Hom}_{\mathcal{D}}(F(h_X^{\mathcal{C}}), D) \simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})}(h_X^{\mathcal{C}}, G(D))$$

We conclude by observing that $\beta_{X,D}$ is left homotopy inverse to the morphism

$$\mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})}(h_X^{\mathcal{C}}, G(D)) \rightarrow G(D)(X) \simeq \mathrm{Hom}_{\mathcal{D}}(f(X), D)$$

given by evaluation at $\mathrm{id}_X \in h_X^{\mathcal{C}}(X)$, which is a homotopy equivalence by virtue of Proposition 8.3.1.3 $\square$

Example 8.4.4.5 (Functoriality of the Presheaf Construction). Let κ be an uncountable regular cardinal, let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Assume that $\mathcal{C}$ is essentially κ -small and that $\mathcal{D}$ is locally κ -small, and fix covariant Yoneda embeddings

$$h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \quad h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa}).$$

Let $G : \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ be given by precomposition with f . Then the functor G admits a left adjoint $F : \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$. Moreover, the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{h_{\bullet}^{\mathcal{C}}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \\ \downarrow f & & \downarrow F \\ \mathcal{D} & \xrightarrow{h_{\bullet}^{\mathcal{D}}} & \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa}). \end{array}$$

commutes up to isomorphism. This follows by applying Variant 8.4.4.4 to the composite functor $(h_{\bullet}^{\mathcal{D}} \circ f) : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$.

Proposition 8.4.4.6. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which exhibits $\mathcal{D}$ as a localization of $\mathcal{C}$ with respect to some collections of morphisms W , and let C be an object of $\mathcal{C}$. The following conditions are equivalent:

- (1) The object C is W -local, in the sense of Definition 6.2.3.1.
- (2) For every object $C' \in \mathcal{C}$, the functor F induces a homotopy equivalence of mapping spaces $\theta_{C',C} : \mathrm{Hom}_{\mathcal{C}}(C', C) \rightarrow \mathrm{Hom}_{\mathcal{D}}(F(C'), F(C))$.

Proof. Fix an uncountable regular cardinal κ for which both $\mathcal{C}$ and $\mathcal{D}$ are essentially κ -small. Precomposition with F determines a functor $F^* : \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$. It follows from Proposition 7.6.6.18 that the functor F^* admits a left adjoint $F_!$ (given by left Kan extension along F^{op}). Let $h_{\bullet}^{\mathcal{C}} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ and $h_{\bullet}^{\mathcal{D}} : \mathcal{D} \rightarrow \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ be

covariant Yoneda embeddings for $\mathcal{C}$ and $\mathcal{D}$, respectively, so that the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{h_{\bullet}^{\mathcal{C}}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \\ \downarrow F & & \downarrow F_! \\ \mathcal{D} & \xrightarrow{h_{\bullet}^{\mathcal{D}}} & \mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \end{array}$$

commutes up to isomorphism (Example 8.4.4.5), where the horizontal maps are fully faithful (Theorem 8.3.3.13). It follows that, for every pair of objects $C', C \in \mathcal{C}$, we can identify $\theta_{C', C}$ with the comparison map

$$\begin{aligned} \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})}(h_{C'}^{\mathcal{C}}, h_C^{\mathcal{C}}) &\rightarrow \mathrm{Hom}_{\mathrm{Fun}(\mathcal{D}^{\mathrm{op}}, \mathcal{S}_{<\kappa})}(F_! h_{C'}^{\mathcal{C}}, F_! h_C^{\mathcal{C}}) \\ &\simeq \mathrm{Hom}_{\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})}(h_{C'}^{\mathcal{C}}, F^* F_! h_C^{\mathcal{C}}) \end{aligned}$$

given by precomposition with the unit $u : h_C^{\mathcal{C}} \rightarrow F^* F_! h_C^{\mathcal{C}}$. Combining this observation with Proposition 8.3.1.1, we see that condition (2) can be restated as follows:

(2') The unit map $u : h_C^{\mathcal{C}} \rightarrow F^* F_! h_C^{\mathcal{C}}$ is an isomorphism in the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$.

Our assumption that F exhibits $\mathcal{D}$ as a localization of $\mathcal{C}$ guarantees that the pullback functor F^* is fully faithful. Using Remark 6.2.2.26, we see that u is an isomorphism if and only if the representable functor $h_C^{\mathcal{C}}$ belongs to the essential image of F^* : that is, the collection of functors $\mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$ which carry every morphism of W to an isomorphism in $\mathcal{S}_{<\kappa}$. This is a reformulation of (1). $\square$

04KU Corollary 8.4.4.7. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which exhibits $\mathcal{D}$ as a localization of $\mathcal{C}$ with respect to some collection of morphisms W . Suppose that F admits a right adjoint $G : \mathcal{D} \rightarrow \mathcal{C}$. Then G is fully faithful, and the essential image of G is spanned by the collection of W -local objects of $\mathcal{C}$.*

Proof. The assertion that G is fully faithful follows from Proposition 6.3.3.6. Let $\eta : \mathrm{id}_{\mathcal{C}} \rightarrow G \circ F$ be the unit of an adjunction between F and G . Then an object $C \in \mathcal{C}$ belongs to the essential image of G if and only if the morphism $\eta_C : C \rightarrow (G \circ F)(C)$ is an isomorphism. This is equivalent to the requirement that, for every object $B \in \mathcal{C}$, composition with η_C induces a homotopy equivalence of mapping spaces $\theta : \mathrm{Hom}_{\mathcal{C}}(B, C) \rightarrow \mathrm{Hom}_{\mathcal{C}}(B, (G \circ F)(C))$. We conclude by observing that θ factors as a composition

$$\mathrm{Hom}_{\mathcal{C}}(B, C) \xrightarrow{F} \mathrm{Hom}_{\mathcal{D}}(F(B), F(C)) \xrightarrow{\sim} \mathrm{Hom}_{\mathcal{C}}(B, (G \circ F)(C))$$

where the second map is the homotopy equivalence of Proposition 6.2.1.17. $\square$

8.4.5 Adjoining Colimits to ∞ -Categories

Let $\mathcal{C}$ be an essentially small ∞ -category and set $\widehat{\mathcal{C}} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. Theorem 8.4.0.3 04BH asserts that the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$: that is, it is freely generated from $\mathcal{C}$ by adjoining colimits of small diagrams. In this section, we consider a variant of this construction, where we adjoint colimits of an arbitrary collection of diagrams (and we drop the assumption that $\mathcal{C}$ is essentially small).

Definition 8.4.5.1. Let $\mathbb{K}$ be a collection of simplicial sets and let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories. We say that h exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$ if the following conditions are satisfied: 04BJ

- The ∞ -category $\widehat{\mathcal{C}}$ is $\mathbb{K}$ -cocomplete.
- For every $\mathbb{K}$ -cocomplete ∞ -category $\mathcal{D}$, precomposition with h induces an equivalence of ∞ -categories $\mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Here $\mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{C}}, \mathcal{D})$ denotes the ∞ -category of $\mathbb{K}$ -cocontinuous functors from $\widehat{\mathcal{C}}$ to $\mathcal{D}$ (see Definition 7.6.6.21).

Example 8.4.5.2. Let κ be an uncountable regular cardinal, and let $\mathbb{K}$ denote the collection of all κ -small simplicial sets. A functor of ∞ -categories $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$ if and only if it exhibits $\widehat{\mathcal{C}}$ as a κ -cocompletion of $\mathcal{C}$, in the sense of Definition 8.4.3.1. 04BK

In particular, if $\mathbb{K}$ is the collection of all small simplicial sets, then an ∞ -category $\mathcal{C}$ is a $\mathbb{K}$ -cocomplete if and only if it is cocomplete, and a functor $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$ if and only if it exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$.

Our goal in this section is to prove the following existence result:

Proposition 8.4.5.3. Let $\mathbb{K}$ be a collection of simplicial sets and let $\mathcal{C}$ be an ∞ -category. 04BL Then there exists an ∞ -category $\widehat{\mathcal{C}}$ and a functor $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Moreover, the functor h is dense and fully faithful.

Warning 8.4.5.4. Let $\mathbb{K}$ be a collection of simplicial sets and let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. In general, it is not true that every object of $\widehat{\mathcal{C}}$ can be recovered as the colimit of a diagram 04BM

$$K \rightarrow \mathcal{C} \xrightarrow{h} \widehat{\mathcal{C}}$$

for some $K \in \mathbb{K}$.

05ZY **Remark 8.4.5.5.** Let $\mathbb{K}$ be a collection of simplicial sets and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{D}$ is $\mathbb{K}$ -cocomplete. It follows from Proposition 8.4.5.3 that there exists a functor $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. In this case, there exists a $\mathbb{K}$ -cocontinuous functor $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ and an isomorphism of functors $\alpha : F \rightarrow f \circ h$, as indicated in the diagram

$$\begin{array}{ccc}
 & \widehat{\mathcal{C}} & \\
 h \nearrow & & \searrow F \\
 \mathcal{C} & \xrightarrow{f} & \mathcal{D}
 \end{array}
 \quad \begin{array}{c} \sim \\ \uparrow \\ \alpha \end{array}$$

Moreover, the pair (F, α) is unique up to isomorphism. In this situation, we say that α *exhibits F as the $\mathbb{K}$ -cocontinuous extension of f* .

Let κ be an uncountable regular cardinal. If $\mathbb{K}$ is the collection of all κ -small simplicial sets and the ∞ -category $\mathcal{C}$ is essentially κ -small, then Proposition 8.4.5.3 follows from Theorem 8.4.3.2; in this case, we can take $\widehat{\mathcal{C}}$ to be the ∞ -category of functors $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. To prove Proposition 8.4.5.3 in general, we will build on this special case.

04BN **Construction 8.4.5.6.** Let $\mathbb{K}$ be a collection of simplicial sets and let $\mathcal{C}$ be an ∞ -category. Choose an uncountable regular cardinal κ such that $\mathcal{C}$ is locally κ -small and every simplicial set $K \in \mathbb{K}$ is essentially κ -small. We let $\widehat{\mathcal{C}}$ denote the smallest full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ which contains all representable functors and is closed under the formation of K -indexed colimits, for each $K \in \mathbb{K}$. Note that covariant Yoneda embedding for $\mathcal{C}$ determines a functor $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, which is dense (by virtue of Variant 8.4.2.4 and Remark 8.4.1.19) and fully faithful (by virtue of Theorem 8.3.3.13).

04BP **Remark 8.4.5.7.** In the situation of Construction 8.4.5.6, the ∞ -category $\widehat{\mathcal{C}}$ is independent of the choice of κ (provided that κ is chosen large enough that $\mathcal{C}$ is locally κ -small and each $K \in \mathbb{K}$ is essentially κ -small).

Proposition 8.4.5.3 is an immediate consequence of the following more precise result:

04BQ **Proposition 8.4.5.8.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞ -category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.6. Then the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$.*

The proof of Proposition 8.4.5.8 will require some preliminaries.

04BR **Lemma 8.4.5.9.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞ -category, and define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.6. Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where*

$\mathcal{D}$ is $\mathbb{K}$ -cocomplete. Then there exists a functor $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ and an isomorphism $f \rightarrow F|_{\mathcal{C}}$, where the functor F is left Kan extended from the essential image of the Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$. Moreover, the functor F is $\mathbb{K}$ -cocontinuous.

Proof. Fix an uncountable regular cardinal κ such that $\mathcal{C}$ is essentially κ -small and each $K \in \mathbb{K}$ is essentially κ -small. By virtue of Corollary 8.3.3.17, we may assume without loss of generality that $\mathcal{D}$ is a replete full subcategory of a κ -cocomplete ∞ -category $\mathcal{D}'$, and that the inclusion map $\mathcal{D} \hookrightarrow \mathcal{D}'$ preserves all κ -small colimits which exist in $\mathcal{D}$. By virtue of Theorem 8.4.3.2, we can also assume that f factors as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \xrightarrow{F'} \mathcal{D}',$$

where F' preserves κ -small colimits. The full subcategory $F'^{-1}(\mathcal{D}) \subseteq \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ contains all representable functors and is closed under K -indexed colimits for each $K \in \mathbb{K}$, and therefore contains $\widehat{\mathcal{C}}$. It follows that F' restricts to a $\mathbb{K}$ -cocontinuous functor $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$. Theorem 8.4.3.5 implies that F' is left Kan extended from the full subcategory $\mathrm{Fun}^{\mathrm{rep}}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$, so the functor $F = F'|_{\widehat{\mathcal{C}}}$ has the same property. $\square$

Lemma 8.4.5.10. *Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞ -category, and 04BS define $\widehat{\mathcal{C}}$ as in Construction 8.4.5.6. Let $\mathcal{D}$ be a $\mathbb{K}$ -cocomplete ∞ -category and let $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ be a functor. The following conditions are equivalent:*

- (1) *The functor F is left Kan extended from the essential image of the Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$.*
- (2) *The functor F is $\mathbb{K}$ -cocontinuous.*

Proof. Let F_0 denote the restriction of F to the essential image of $h_{\bullet}$. Applying Lemma 8.4.5.9, we deduce that F_0 admits a left Kan extension $F' : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ which is $\mathbb{K}$ -cocontinuous. Invoking the universal property of Kan extensions (Corollary 7.3.6.9), we see that there is an essentially unique natural transformation $\alpha : F' \rightarrow F$ which restricts to the identity transformation from F_0 to itself. We can then reformulate condition (1) as follows:

- (1') *The natural transformation α is an isomorphism. That is, for each object $X \in \widehat{\mathcal{C}}$, the induced map $\alpha_X : F'(X) \rightarrow F(X)$ is an isomorphism in the ∞ -category $\mathcal{D}$.*

The implication (1') $\Rightarrow$ (2) follows from the fact that F' is $\mathbb{K}$ -cocontinuous. To prove the converse, let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ denote the full subcategory spanned by those objects X for which α_X is an isomorphism in the ∞ -category $\mathcal{D}$. By construction, $\widehat{\mathcal{C}}'$ contains all representable functors $\mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}_{<\kappa}$. If condition (2) is satisfied, then $\widehat{\mathcal{C}}'$ is closed under the formation of K -indexed colimits for each $K \in \mathbb{K}$, and therefore coincides with $\widehat{\mathcal{C}}$. $\square$

Proof of Proposition 8.4.5.8. Let $\mathbb{K}$ be a collection of simplicial sets, let $\mathcal{C}$ be an ∞ -category, and let $\widehat{\mathcal{C}}$ be as in Construction 8.4.5.6. By construction, the ∞ -category $\widehat{\mathcal{C}}$ is $\mathbb{K}$ -cocomplete. To complete the proof, we must show that if $\mathcal{D}$ is any $\mathbb{K}$ -cocomplete ∞ -category, then composition with the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ induces an equivalence of ∞ -categories $\theta : \mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D})$.

Let $\mathcal{C}' \subseteq \widehat{\mathcal{C}}$ be the essential image of $h_{\bullet}$, so that θ factors as a composition

$$\mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{C}}, \mathcal{D}) \xrightarrow{\theta'} \mathrm{Fun}(\mathcal{C}', \mathcal{D}) \xrightarrow{\theta''} \mathrm{Fun}(\mathcal{C}, \mathcal{D})$$

where θ'' is an equivalence of ∞ -categories (Theorem 8.3.3.13). Using Lemma 8.4.5.10, we see that $\mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{C}}, \mathcal{D})$ is the full subcategory of $\mathrm{Fun}(\widehat{\mathcal{C}}, \mathcal{D})$ spanned by those functors which are left Kan extended from $\mathcal{C}'$. It follows from Corollary 7.3.6.15 that θ' is a trivial Kan fibration onto a full subcategory of $\mathrm{Fun}(\mathcal{C}', \mathcal{D})$; in particular, it is fully faithful, so that θ is fully faithful. Lemma 8.4.5.9 implies that θ is essentially surjective, and therefore an equivalence of ∞ -categories (Theorem 4.6.2.21). $\square$

05ZZ Corollary 8.4.5.11. *Let $\mathbb{K}$ be a collection of simplicial sets, let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{D}$ is $\mathbb{K}$ -cocomplete. Suppose we are given a functor $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ and a natural transformation $\alpha : f \rightarrow F \circ h$, as indicated in the diagram*

$$\begin{array}{ccc} & \widehat{\mathcal{C}} & \\ h \nearrow & & \searrow F \\ \mathcal{C} & \xrightarrow{f} & \mathcal{D} \end{array} \quad \begin{array}{c} \uparrow \alpha \\ \sim \end{array}$$

The following conditions are equivalent:

- (1) *The natural transformation α exhibits F as a $\mathbb{K}$ -cocontinuous extension of f (see Remark 8.4.5.5). That is, F is $\mathbb{K}$ -cocontinuous and α is an isomorphism.*
- (2) *The natural transformation α exhibits F as a left Kan extension of f along h .*

Proof. By virtue of Proposition 8.4.5.8, we may assume without loss of generality that the functor h is obtained from Construction 8.4.5.6. In this case, the equivalence of (1) and (2) is a reformulation of Lemma 8.4.5.10. $\square$

05JD Corollary 8.4.5.12. *Let $\mathbb{K}$ be a collection of simplicial sets and let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Let $U : \mathcal{E} \rightarrow \widehat{\mathcal{C}}$ be a left fibration of ∞ -categories. The following conditions are equivalent:*

(1) The covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\widehat{\mathcal{C}}} : \widehat{\mathcal{C}} \rightarrow \mathcal{S}$ is $\mathbb{K}$ -cocontinuous.

(2) The projection map $\mathcal{E} \times_{\widehat{\mathcal{C}}} \mathcal{C} \rightarrow \mathcal{C}$ is left cofinal.

Proof. It follows from Proposition 8.4.5.3 that the functor h is fully faithful. We can therefore replace $\mathcal{C}$ by its essential image and thereby reduce to the case where $\mathcal{C}$ is a replete full subcategory of $\widehat{\mathcal{C}}$ (and h is the inclusion functor). In this case, condition (1) is equivalent to the requirement that the functor $\mathrm{Tr}_{\mathcal{E}/\widehat{\mathcal{C}}}$ is left Kan extended from $\mathcal{C}$ (Lemma 8.4.5.10). The equivalence (1) $\Leftrightarrow$ (2) is now a special case of Corollary 7.4.3.15. $\square$

Proposition 8.4.5.13. *Let $\mathbb{K}$ be a collection of simplicial sets and let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. The following conditions are equivalent:*

(1) The ∞ -category $\mathcal{C}$ is $\mathbb{K}$ -cocomplete.

(2) The functor h admits a left adjoint $F : \widehat{\mathcal{C}} \rightarrow \mathcal{C}$.

Moreover, if these conditions are satisfied, then F is the $\mathbb{K}$ -cocontinuous extension of the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$ (see Remark 8.4.5.5).

Proof. We first show that (2) implies (1). Assume that h admits a left adjoint $F : \widehat{\mathcal{C}} \rightarrow \mathcal{C}$. Since h is fully faithful (Proposition 8.4.5.3), it induces an equivalence from $\mathcal{C}$ to a reflective subcategory of $\widehat{\mathcal{C}}$ (Remark 6.3.3.4). For each $K \in \mathbb{K}$, our assumption the existence of K -indexed colimits in $\widehat{\mathcal{C}}$ then guarantees the existence of K -indexed colimits in $\mathcal{C}$ (Corollary 7.1.4.24).

We now prove the converse. Assume that $\mathcal{C}$ is $\mathbb{K}$ -cocomplete. Let $F : \widehat{\mathcal{C}} \rightarrow \mathcal{C}$ be a $\mathbb{K}$ -cocontinuous extension of the identity functor $\mathrm{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$, so that there exists an isomorphism of functors $\epsilon : F \circ h \rightarrow \mathrm{id}_{\mathcal{C}}$. We will complete the proof by showing that ϵ is the counit of an adjunction between F and h . By virtue of Corollary 6.2.6.5, it will suffice to show that for every pair of objects $\widehat{X} \in \widehat{\mathcal{C}}$, $Y \in \mathcal{C}$, the composite map

$$\theta_{X,Y} : \mathrm{Hom}_{\widehat{\mathcal{C}}}(\widehat{X}, h(Y)) \rightarrow \mathrm{Hom}_{\mathcal{C}}(F(\widehat{X}), (F \circ h)(Y)) \xrightarrow{[\epsilon_Y]_0} \mathrm{Hom}_{\mathcal{C}}(F(\widehat{X}), Y)$$

is a homotopy equivalence of Kan complexes. Let us regard the object Y as fixed. Since the functor F is $\mathbb{K}$ -cocontinuous, the collection of objects $\widehat{X} \in \widehat{\mathcal{C}}$ which satisfy this condition is closed under the formation of K -indexed colimits for each $K \in \mathbb{K}$ (see Proposition 7.4.1.18). We may therefore assume without loss of generality that $\widehat{X} = h(X)$ for some $X \in \mathcal{C}$. In this case, we can identify $\theta_{X,Y}$ with a left homotopy inverse of the natural map $\mathrm{Hom}_{\mathcal{C}}(X, Y) \rightarrow \mathrm{Hom}_{\widehat{\mathcal{C}}}(h(X), h(Y))$, which is a homotopy equivalence because h is fully faithful (Proposition 8.4.5.3). $\square$

Remark 8.4.5.14. The $\mathbb{K}$ -cocompletion construction of this section has been studied in more detail by Rezk; we refer the reader to [51] for more details. 04BT

8.4.6 Functoriality of Cocompletion

060N Let $\mathcal{QC}$ denote the ∞ -category of λ -small ∞ -categories. For every collection of simplicial sets $\mathbb{K}$, we let $\mathcal{QC}^{\mathbb{K}\text{-cocont}}$ denote the subcategory of $\mathcal{QC}$ whose objects are $\mathbb{K}$ -cocomplete ∞ -categories and whose morphisms are $\mathbb{K}$ -cocontinuous functors (see Notation 7.6.6.25). In §7.6.6, we showed that the inclusion functor

$$\iota : \mathcal{QC}^{\mathbb{K}\text{-cocont}} \hookrightarrow \mathcal{QC}$$

preserves small limits (Proposition 7.6.6.26). In this section, we give an explanation for this phenomenon: up to set-theoretic considerations, the functor ι admits a left adjoint, given by the $\mathbb{K}$ -cocompletion construction studied in §8.4.5.

060P **Definition 8.4.6.1.** Let $\mathbb{K}$ be a collection of simplicial sets. We say that a functor $T : \mathcal{QC} \rightarrow \mathcal{QC}$ is a $\mathbb{K}$ -cocompletion functor if there exists a natural transformation $\eta : \text{id}_{\mathcal{QC}} \rightarrow T$ satisfying the following conditions:

- For every small ∞ -category $\mathcal{C}$, the functor $\eta_{\mathcal{C}} : \mathcal{C} \rightarrow T(\mathcal{C})$ exhibits $T(\mathcal{C})$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$.
- For every functor $F : \mathcal{C} \rightarrow \mathcal{D}$ between small ∞ -categories, the functor $T(F) : T(\mathcal{C}) \rightarrow T(\mathcal{D})$ is $\mathbb{K}$ -cocontinuous.

If these conditions are satisfied, we say that η exhibits T as a $\mathbb{K}$ -cocompletion functor.

We can state a preliminary version of our main result as follows:

060Q **Proposition 8.4.6.2** (Functoriality of Cocompletion). *Let $\mathbb{K}$ be a small collection of small simplicial sets. Then there exists a $\mathbb{K}$ -cocompletion functor $T : \mathcal{QC} \rightarrow \mathcal{QC}$, which is uniquely determined up to isomorphism.*

We will deduce Proposition 8.4.6.2 from a more precise result, which allows us to control the sizes of the cocompletions under consideration.

060R **Definition 8.4.6.3.** Let $\mathbb{K}$ be a collection of simplicial sets and let λ be an uncountable cardinal. We say that a functor $T : \mathcal{QC}_{<\lambda} \rightarrow \mathcal{QC}_{<\lambda}$ is a $\mathbb{K}$ -cocompletion functor if there exists a natural transformation $\eta : \text{id}_{\mathcal{QC}} \rightarrow T$ satisfying the following conditions:

- For every λ -small ∞ -category $\mathcal{C}$, the functor $\eta_{\mathcal{C}} : \mathcal{C} \rightarrow T(\mathcal{C})$ exhibits $T(\mathcal{C})$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$.
- For every functor $F : \mathcal{C} \rightarrow \mathcal{D}$ between λ -small ∞ -categories, the functor $T(F) : T(\mathcal{C}) \rightarrow T(\mathcal{D})$ is $\mathbb{K}$ -cocontinuous.

If these conditions are satisfied, we say that η *exhibits* T as a $\mathbb{K}$ -cocompletion functor.

In the special case where $\mathbb{K}$ is the collection of all small simplicial sets, we say that T is a *cocompletion functor* if it is $\mathbb{K}$ -cocompletion functor. More generally, if $\mathbb{K}$ is the collection of all κ -small simplicial sets (for some infinite cardinal κ), we say that T is a κ -cocompletion functor if it is a $\mathbb{K}$ -cocompletion functor.

Remark 8.4.6.4. In the situation of Definition 8.4.6.3, suppose that $\eta : \text{id}_{\mathcal{Q}\mathcal{C}} \rightarrow T$ exhibits T as a $\mathbb{K}$ -cocompletion functor. Then, for every functor $F : \mathcal{C} \rightarrow \mathcal{D}$ between λ -small ∞ -categories, the diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \eta_{\mathcal{C}} \downarrow & & \downarrow \eta_{\mathcal{D}} \\ T(\mathcal{C}) & \xrightarrow{T(F)} & T(\mathcal{D}) \end{array}$$

commutes up to isomorphism. It follows that $T(F)$ can be identified with the $\mathbb{K}$ -cocomplete extension of the functor $\eta_{\mathcal{D}} \circ F$, in the sense of Remark 8.4.5.5.

Proposition 8.4.6.2 can be regarded as a special case of the following result, which we prove at the end of this section:

Proposition 8.4.6.5. Let $\kappa < \lambda$ be infinite cardinals, where λ is regular and exponential cofinality $\geq \kappa$, and let $\mathbb{K}$ be a collection of κ -small simplicial sets. Then there exists a $\mathbb{K}$ -cocompletion functor $T : \mathcal{Q}\mathcal{C}_{<\lambda} \rightarrow \mathcal{Q}\mathcal{C}_{<\lambda}$, which is uniquely determined up to isomorphism.

Example 8.4.6.6. Following the convention of Remark 4.7.0.5, we say that a simplicial set is small if it is Ω -small, for some fixed strongly inaccessible cardinal Ω . Applying Proposition 8.4.6.5 in the special case $\kappa = \Omega$ and $\lambda = \Omega^+$, we deduce that there exists a cocompletion functor $T : \mathcal{Q}\mathcal{C}_{<\Omega^+} \rightarrow \mathcal{Q}\mathcal{C}_{<\Omega^+}$. The restriction of T to small ∞ -categories can be described more informally as follows:

- For every small ∞ -category $\mathcal{C}$, the functor T assigns the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ (see Theorem 8.4.0.3).
- To every functor $F : \mathcal{C} \rightarrow \mathcal{D}$ between small ∞ -categories, $T(F) : \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \rightarrow \text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S})$ is left adjoint to the functor given by precomposition with F^{op} (see Remark 8.4.6.4 and Example 8.4.4.5).

In what follows, we write $\mathcal{Q}\mathcal{C}_{<\lambda}^{\mathbb{K}\text{-cocont}}$ denote the ∞ -category of λ -small $\mathbb{K}$ -cocomplete ∞ -categories, with morphisms given by $\mathbb{K}$ -cocontinuous functors (see Notation 7.6.6.25).

060W **Lemma 8.4.6.7.** *Let $\mathbb{K}$ be a collection of simplicial sets, let λ be an uncountable cardinal, and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between λ -small ∞ -categories. Suppose that $\mathcal{D}$ is $\mathbb{K}$ -cocomplete, and that the $\mathbb{K}$ -cocompletion of $\mathcal{C}$ is essentially λ -small. Then the following conditions are equivalent:*

- (1) *The functor F exhibits $\mathcal{D}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$ (Definition 8.4.5.1).*
- (2) *For every ∞ -category $\mathcal{E}$ which is $\mathbb{K}$ -cocomplete and λ -small, precomposition with F induces an equivalence of ∞ -categories $\mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\mathcal{D}, \mathcal{E}) \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{E})$.*
- (3) *For every ∞ -category $\mathcal{E}$ which is $\mathbb{K}$ -cocomplete and λ -small, precomposition with F induces a homotopy equivalence of Kan complexes*

$$\mathrm{Fun}^{\mathbb{K}\text{-cocont}}(\mathcal{D}, \mathcal{E})^{\simeq} \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{E})^{\simeq}.$$

- (4) *For every ∞ -category $\mathcal{E}$ which is $\mathbb{K}$ -cocomplete and λ -small, precomposition with F induces a bijection*

$$\mathrm{Hom}_{\mathrm{h}\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}}(\mathcal{D}, \mathcal{E}) \rightarrow \mathrm{Hom}_{\mathrm{h}\mathcal{QC}_{<\lambda}}(\mathcal{C}, \mathcal{E}).$$

Proof. The implications (1) $\Rightarrow$ (2) $\Rightarrow$ (3) $\Rightarrow$ (4) are immediate. We complete the proof by showing that (4) $\Rightarrow$ (1). Choose a λ -small ∞ -category $\widehat{\mathcal{C}}$ and a functor $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. We may then assume without loss of generality that $F = \widehat{F} \circ h$, where $\widehat{F} : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ is $\mathbb{K}$ -cocontinuous. If condition (4) is satisfied, then for every $\mathcal{E} \in \mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}$, precomposition with the isomorphism class of the functor $\widehat{F}$ induces a bijection

$$\mathrm{Hom}_{\mathrm{h}\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}}(\mathcal{D}, \mathcal{E}) \rightarrow \mathrm{Hom}_{\mathrm{h}\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}}(\widehat{\mathcal{C}}, \mathcal{E}).$$

It follows that $[\widehat{F}]$ is an isomorphism in the homotopy category $\mathrm{h}\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}$, so that $\widehat{F}$ is an equivalence of ∞ -categories. Since h exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$, it follows that $F = \widehat{F} \circ h$ exhibits $\mathcal{D}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. $\square$

060X **Proposition 8.4.6.8.** *Let $\mathbb{K}$ be a collection of simplicial sets and let λ be an uncountable cardinal. Assume that every λ -small ∞ -category $\mathcal{C}$ admits a λ -small $\mathbb{K}$ -cocompletion. Then:*

- (1) *The inclusion functor $\iota : \mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}} \hookrightarrow \mathcal{QC}_{<\lambda}$ admits a left adjoint.*
- (2) *If $T : \mathcal{QC}_{<\lambda} \rightarrow \mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}$ is a functor, then a natural transformation $\eta : \mathrm{id}_{\mathcal{QC}_{<\lambda}} \rightarrow \iota \circ T$ is the unit of an adjunction between T and ι (in the sense of Definition 6.2.1.1) if and only if it exhibits T as a $\mathbb{K}$ -cocompletion functor (in the sense of Definition 8.4.6.3).*

Proof. Assertion (1) follows by combining Lemma 8.4.6.7 with Proposition 6.2.6.1. Assertion (2) follows by combining Lemma 8.4.6.7 with Corollary 6.2.6.5. $\square$

Corollary 8.4.6.9. *Let $\mathbb{K}$ be a collection of simplicial sets and let λ be an uncountable cardinal. The following conditions are equivalent:* 060Y

- (1) *Every λ -small ∞ -category $\mathcal{C}$ admits a $\mathbb{K}$ -cocompletion which is also λ -small.*
- (2) *There exists a $\mathbb{K}$ -cocompletion functor $T : \mathcal{QC}_{<\lambda} \rightarrow \mathcal{QC}_{<\lambda}$.*

Moreover, if these conditions are satisfied, then a functor $T : \mathcal{QC}_{<\lambda} \rightarrow \mathcal{QC}_{<\lambda}$ is a $\mathbb{K}$ -cocompletion functor if and only if it factors through the subcategory $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}}$ and is left adjoint to the inclusion functor $\mathcal{QC}_{<\lambda}^{\mathbb{K}\text{-cocont}} \hookrightarrow \mathcal{QC}_{<\lambda}$.

To deduce Proposition 8.4.6.5 from Corollary 8.4.6.9, we need to control the sizes of $\mathbb{K}$ -cocompletions.

Proposition 8.4.6.10. *Let λ be an uncountable cardinal and let $\mathcal{C}$ be an ∞ -category which is locally λ -small. Let $\mathbb{K}$ be a collection of κ -small simplicial sets, where $\kappa = \text{ecf}(\lambda)$ is the exponential cofinality of λ . Then the $\mathbb{K}$ -cocompletion of $\mathcal{C}$ is also locally λ -small.* 060Z

Proof. Choose a functor $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Fix objects $\widehat{X}, \widehat{Y} \in \widehat{\mathcal{C}}$; we wish to show that the morphism space $\text{Hom}_{\widehat{\mathcal{C}}}(\widehat{X}, \widehat{Y})$ is essentially λ -small. Let us first regard the object $\widehat{Y}$ as fixed, and let $\widehat{\mathcal{C}}_0$ denote the full subcategory of $\widehat{\mathcal{C}}$ spanned by those objects $\widehat{X}$ for which the morphism space $\text{Hom}_{\widehat{\mathcal{C}}}(\widehat{X}, \widehat{Y})$ is essentially λ -small. Since λ has exponential cofinality $\geq \kappa$, the collection of λ -small spaces is closed under formation of κ -small limits (Variant 7.4.1.4). It follows that $\widehat{\mathcal{C}}$ is closed under κ -small colimits in $\widehat{\mathcal{C}}$ (see Proposition 7.4.1.18). In particular, it is closed under K -indexed colimits for each $K \in \mathbb{K}$. Consequently, to show that $\widehat{\mathcal{C}}_0 = \widehat{\mathcal{C}}$, it will suffice to show that the mapping space $\text{Hom}_{\widehat{\mathcal{C}}}(\widehat{X}, \widehat{Y})$ is essentially λ -small in the special case $\widehat{X} = h(X)$ for some object $X \in \mathcal{C}$.

Let us now regard the object $\widehat{X} = h(X)$ as fixed, and let $\widehat{\mathcal{C}}_1$ denote the full subcategory of $\widehat{\mathcal{C}}$ spanned by those objects $\widehat{Y}$ for which the morphism space $\text{Hom}_{\widehat{\mathcal{C}}}(\widehat{X}, \widehat{Y})$ is essentially λ -small. For each $K \in \mathbb{K}$, the $\text{Hom}_{\widehat{\mathcal{C}}}(h(X), \bullet)$ preserves $\mathbb{K}$ -indexed colimits. Since the collection of λ -small spaces is closed under K -indexed colimits (Corollary 7.4.3.8), it follows that the subcategory $\widehat{\mathcal{C}}_1 \subseteq \widehat{\mathcal{C}}$ is closed under K -indexed colimits. Consequently, to prove that $\widehat{\mathcal{C}}_1 = \widehat{\mathcal{C}}$, it will suffice to show that it contains every object of the form $h(Y)$, for $Y \in \mathcal{C}$. Since h is fully faithful, we are reduced to proving that the morphism space $\text{Hom}_{\mathcal{C}}(X, Y)$ is essentially λ -small, which follows from our assumption that $\mathcal{C}$ is locally λ -small. $\square$

Example 8.4.6.11. Let κ be a regular cardinal and let λ be an uncountable cardinal of exponential cofinality $\geq \kappa$. If $\mathcal{C}$ is a locally λ -small ∞ -category, then the κ -cocompletion of $\mathcal{C}$ is also locally λ -small. 0610

Corollary 8.4.6.12. *Let $\mathbb{K}$ be a collection of small simplicial sets and let $\mathcal{C}$ be a locally small ∞ -category. Then the $\mathbb{K}$ -cocompletion of $\mathcal{C}$ is also locally small.* 0611

Proof. Apply Proposition 8.4.6.10 in the special case where $\lambda = \Omega$ is a strongly inaccessible cardinal (see Remark 8.4.6.10). $\square$

0612 **Example 8.4.6.13.** If $\mathcal{C}$ is a locally small ∞ -category, then the cocompletion of $\mathcal{C}$ is also locally small.

0613 **Proposition 8.4.6.14.** *Let $\kappa < \lambda$ be infinite cardinals, where λ is regular and has exponential cofinality $\geq \kappa$. Let $\mathbb{K}$ be a collection of κ -small simplicial sets. If $\mathcal{C}$ is an essentially λ -small ∞ -category, then its $\mathbb{K}$ -cocompletion is essentially λ -small.*

Proof. Let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibit $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Proposition 8.4.6.10 guarantees that the ∞ -category $\widehat{\mathcal{C}}$ is locally λ -small. It will therefore suffice to show that the set of isomorphism classes $\pi_0(\widehat{\mathcal{C}}^\sim)$ is λ -small (Proposition 4.7.8.7).

We define a transfinite sequence of full subcategories $\{\widehat{\mathcal{C}}_\beta \subseteq \widehat{\mathcal{C}}\}_{\beta \leq \kappa}$ as follows:

- We define $\widehat{\mathcal{C}}_0$ to be the essential image of the functor h .
- If $\beta = \alpha + 1$ is a successor ordinal, we define $\widehat{\mathcal{C}}_\beta$ to be the smallest replete full subcategory of $\widehat{\mathcal{C}}$ which contains $\widehat{\mathcal{C}}_\alpha$ and the colimit of every diagram $K \rightarrow \widehat{\mathcal{C}}_\alpha$ for $K \in \mathbb{K}$.
- If $\beta \leq \lambda$ is a nonzero limit ordinal, we set $\widehat{\mathcal{C}}_\beta = \bigcup_{\alpha < \beta} \widehat{\mathcal{C}}_\alpha$.

By assumption, every $K \in \mathbb{K}$ is κ -small. Consequently, every diagram $K \rightarrow \widehat{\mathcal{C}}_\kappa$ factors through $\widehat{\mathcal{C}}_\alpha$ for some $\alpha < \kappa$, and therefore has a colimit in $\widehat{\mathcal{C}}_{\alpha+1} \subseteq \widehat{\mathcal{C}}_\kappa$. It follows that $\widehat{\mathcal{C}}_\kappa$ contains the essential image of h and is closed under K -indexed colimits for each $K \in \mathbb{K}$, and therefore coincides with $\widehat{\mathcal{C}}$. We are therefore reduced to showing that the set of isomorphism classes $\pi_0(\widehat{\mathcal{C}}_\kappa^\sim)$ is λ -small. Suppose otherwise. Then there is some smallest ordinal $\beta \leq \kappa$ such that $\pi_0(\widehat{\mathcal{C}}_\beta^\sim)$ is not λ -small. Our assumption that $\mathcal{C}$ is essentially λ -small guarantees that $\beta > 0$. Since λ has cofinality $> \kappa$, β cannot be a limit ordinal. We must therefore have $\beta = \alpha + 1$, for some ordinal $\alpha < \kappa$. In this case, the ∞ -category $\widehat{\mathcal{C}}_\alpha$ is essentially μ -small.

Note that every object of $\widehat{\mathcal{C}}_{\alpha+1}$ either belongs to $\widehat{\mathcal{C}}_\alpha$ or can be realized as the colimit of a diagram $F : K \rightarrow \widehat{\mathcal{C}}_\alpha$, for some $K \in \mathbb{K}$. Note that we may assume that $\mathbb{K}$ is λ -small (Remark 4.7.4.22). Moreover, if $K \in \mathbb{K}$ is fixed, our assumption that λ has exponential cofinality $\geq \kappa$ guarantees that the set of isomorphism classes $\pi_0(\text{Fun}(K, \widehat{\mathcal{C}}_\alpha)^\sim)$ is λ -small (Corollary 4.7.8.8). The regularity of λ now guarantees that $\pi_0(\widehat{\mathcal{C}}_{\alpha+1}^\sim)$ is λ -small, contradicting our choice of β . $\square$

0615 **Example 8.4.6.15.** Let $\kappa < \lambda$ be infinite cardinals, where λ is regular and of exponential cofinality $\geq \kappa$. If an ∞ -category $\mathcal{C}$ is essentially λ -small, then its κ -cocompletion is also essentially λ -small.

Example 8.4.6.16. Let $\mathbb{K}$ be a small collection of small simplicial sets. If $\mathcal{C}$ is an essentially small ∞ -category, then its $\mathbb{K}$ -cocompletion is also essentially small. Beware that the smallness condition on $\mathbb{K}$ cannot be omitted: for example, the cocompletion of a (nonempty) ∞ -category $\mathcal{C}$ is never essentially small (see Proposition 7.1.2.15). 0616

Proof of Proposition 8.4.6.5. Combine Proposition 8.4.6.14 with Corollary 8.4.6.9. $\square$

8.4.7 Recognition of Cocompletions

Let $\mathcal{C}$ be an essentially small ∞ -category, let $\widehat{\mathcal{C}}$ denote the ∞ -category $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, and let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a covariant Yoneda embedding for $\mathcal{C}$. Then: 03WR

- (1) The functor h is fully faithful (Theorem 8.3.3.13).
- (2) For each object $X \in \mathcal{C}$, the functor

$$\mathrm{Hom}_{\widehat{\mathcal{C}}}(h(X), \bullet) : \widehat{\mathcal{C}} \rightarrow \mathcal{S}$$

preserves small colimits (see Example 8.4.7.2 below).

- (3) The ∞ -category $\widehat{\mathcal{C}}$ is generated (under small colimits) by the essential image of h (in fact, the functor h is dense: see Theorem 8.4.2.1).

Our goal in this section is to prove the converse: if $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ is *any* functor which satisfies conditions (1) through (3), then h exhibits $\widehat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$ (Proposition 8.4.7.6) and is therefore equivalent to the covariant Yoneda embedding of $\mathcal{C}$. First, let us introduce a bit of terminology.

Definition 8.4.7.1. Let $\mathcal{D}$ be a locally small ∞ -category which admits small colimits. We say that an object $X \in \mathcal{D}$ is *atomic* if the corepresentable functor 03WS

$$h^X : \mathcal{D} \rightarrow \mathcal{S} \quad Y \mapsto \mathrm{Hom}_{\mathcal{D}}(X, Y)$$

preserves small colimits.

Example 8.4.7.2 (Representable Functors are Atomic). Let $\mathcal{C}$ be an essentially small ∞ -category. Then every representable functor $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$ is atomic when regarded as an object of the ∞ -category $\widehat{\mathcal{C}} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$. To see this, suppose that $\mathcal{F}$ is representable by an object $C \in \mathcal{C}$. Using Remark 8.3.1.5, we see that $\mathcal{F}$ corepresents the evaluation functor 03WT

$$\mathrm{ev}_C : \widehat{\mathcal{C}} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathcal{S} \quad \mathcal{G} \mapsto \mathcal{G}(C),$$

and therefore preserves small colimits by virtue of Proposition 7.1.8.2.

03WU **Definition 8.4.7.3.** Let $\widehat{\mathcal{C}}$ be an ∞ -category. We say that a full subcategory $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ is *weakly dense* if the following condition is satisfied:

- Let $f : Y \rightarrow Z$ be a morphism of $\widehat{\mathcal{C}}$ such that, for every object $X \in \mathcal{C}$, the induced map

$$\mathrm{Hom}_{\widehat{\mathcal{C}}}(X, Y) \xrightarrow{[f]^\circ} \mathrm{Hom}_{\widehat{\mathcal{C}}}(X, Z)$$

is a homotopy equivalence of Kan complexes. Then f is an isomorphism.

We say that a collection of objects $\{X_i\}_{i \in I}$ of $\widehat{\mathcal{C}}$ is *weakly dense* if it spans a weakly dense full subcategory of $\widehat{\mathcal{C}}$.

03WV **Remark 8.4.7.4.** Let $\widehat{\mathcal{C}}$ be a locally small ∞ -category. A full subcategory $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ is weakly dense if and only if the restricted Yoneda embedding $\widehat{\mathcal{C}} \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ is conservative.

03WW **Example 8.4.7.5.** Let $\widehat{\mathcal{C}}$ be an ∞ -category and let $\mathcal{C} \subseteq \widehat{\mathcal{C}}$ be a full subcategory which generates $\widehat{\mathcal{C}}$ under colimits (see Warning 8.4.1.10). Then the full subcategory $\mathcal{C}$ is weakly dense. In particular, every dense subcategory of $\widehat{\mathcal{C}}$ is weakly dense.

03WX **Proposition 8.4.7.6.** Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{C}$ is essentially small. Then f exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{C}$ (in the sense of Definition 8.4.0.1) if and only if the following conditions are satisfied:

- (0) The ∞ -category $\mathcal{D}$ is locally small and cocomplete.
- (1) The functor f is fully faithful.
- (2) For each object $C \in \mathcal{C}$, the image $f(C) \in \mathcal{D}$ is atomic.
- (3) The collection of objects $\{f(C)\}_{C \in \mathcal{C}}$ is weakly dense in $\mathcal{D}$.

03WY **Corollary 8.4.7.7.** Let $\mathcal{D}$ be an ∞ -category. The following conditions are equivalent:

- (a) There exists an essentially small ∞ -category $\mathcal{C}$ and a functor $h : \mathcal{C} \rightarrow \mathcal{D}$ which exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{C}$.
- (b) The ∞ -category $\mathcal{D}$ is locally small and cocomplete. Moreover, it contains a small collection of atomic objects $\{X_i\}_{i \in I}$ which is weakly dense.

Proof. We first show that (a) implies (b). Without loss of generality, we may assume that $\mathcal{D} = \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$, where $\mathcal{C}$ is a small ∞ -category. Since the ∞ -category $\mathcal{S}$ is cocomplete (Corollary 7.4.3.3), the ∞ -category $\mathcal{D}$ is also cocomplete (Remark 7.6.6.20). Corollary 4.7.8.9 guarantees that $\mathcal{D}$ is locally small. For each object $X \in \mathcal{C}$, let $h_X \in \mathcal{D}$ be a functor represented by X . The collection of objects $\{h_X\}_{X \in \mathcal{C}}$ span a full subcategory of $\mathcal{D}$ which is dense (Corollary 8.4.2.2), and therefore weakly dense (Example 8.4.7.5). We conclude

by observing that each of the representable functors h_X is a atomic object of $\mathcal{D}$ (Example 8.4.7.2).

We now show that (b) implies (a). Assume that $\mathcal{D}$ is locally small and cocomplete. Let $\{X_i\}_{i \in I}$ be a small collection of atomic objects of $\mathcal{D}$, and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be the full subcategory that they span. It follows from Proposition 4.7.8.7 that the ∞ -category $\mathcal{D}_0$ is essentially small. If $\mathcal{D}_0$ is weakly dense in $\mathcal{D}$, then the inclusion map $\mathcal{D}_0 \hookrightarrow \mathcal{D}$ satisfies the hypotheses of Proposition 8.4.7.6, and therefore exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{D}_0$. $\square$

Let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, where $\mathcal{C}$ is essentially small and $\mathcal{D}$ is cocomplete. Using Theorem 8.4.0.3, we see that f admits an essentially unique factorization as a composition

$$\mathcal{C} \xrightarrow{h_\bullet} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where the functor F preserves small colimits. As a first step towards the proof of Proposition 8.4.7.6, we study conditions which guarantee that F is fully faithful. With an eye towards future applications, we consider a slightly more general situation.

Lemma 8.4.7.8. *Let $\mathbb{K}$ be a collection of simplicial sets, let $h : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$, and let $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ a functor which satisfies the following conditions:*

- (0) *The ∞ -category $\mathcal{D}$ is $\mathbb{K}$ -cocomplete and the functor F preserves K -indexed colimits, for each $K \in \mathbb{K}$.*
- (1) *The functor $f = F \circ h$ is fully faithful.*
- (2) *Let κ be an uncountable regular cardinal such that $\mathcal{D}$ is locally κ -small and each $K \in \mathbb{K}$ is essentially κ -small. Then, for each $C \in \mathcal{C}$, the corepresentable functor*

$$\mathcal{D} \rightarrow \mathcal{S}_{<\kappa} \quad D \mapsto \mathrm{Hom}_{\mathcal{D}}(f(C), D)$$

is $\mathbb{K}$ -cocontinuous.

Then F is fully faithful.

Proof. By virtue of Proposition 8.4.5.8, we may assume without loss of generality that $\widehat{\mathcal{C}}$ is the smallest replete full subcategory of $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ which contains all representable functors and is closed under the formation of K -indexed colimits for $K \in \mathbb{K}$ (see Construction 8.4.5.6). For every pair of objects $\mathcal{G}, \mathcal{G}' \in \widehat{\mathcal{C}}$, the functor F induces a morphism of Kan complexes

$$\theta_{\mathcal{G}, \mathcal{G}'} : \mathrm{Hom}_{\widehat{\mathcal{C}}}(\mathcal{G}, \mathcal{G}') \rightarrow \mathrm{Hom}_{\mathcal{D}}(F(\mathcal{G}), F(\mathcal{G}')).$$

By virtue of Corollary 8.3.5.8 (and Remark 8.3.5.9), we can promote the construction $(\mathcal{G}, \mathcal{G}') \mapsto \theta_{\mathcal{G}, \mathcal{G}'}$ to a functor of ∞ -categories

$$\theta : \widehat{\mathcal{C}}^{\text{op}} \times \widehat{\mathcal{C}} \rightarrow \text{Fun}(\Delta^1, \mathcal{S}_{<\kappa}).$$

We wish to show that, for every pair of objects $\mathcal{G}, \mathcal{G}' \in \widehat{\mathcal{C}}$, the morphism $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence. Let us first regard the functor $\mathcal{G}'$ as fixed. Let $\widehat{\mathcal{C}}'$ denote the full subcategory of $\widehat{\mathcal{C}}$ spanned by those objects $\mathcal{G}$ for which $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence. For each $K \in \mathbb{K}$, our assumption that F preserves K -indexed colimits guarantees that the functor $\mathcal{G} \mapsto \theta_{\mathcal{G}, \mathcal{G}'}$ preserves K^{op} -indexed limits (Proposition 7.4.1.18). Consequently, the full subcategory $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ is closed under the formation of K -indexed colimits. It will therefore suffice to show that $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence in the special case where $\mathcal{G} = h_C$ is the functor represented by some object $C \in \mathcal{C}$.

Let us now regard $\mathcal{G} = h_C$ as fixed. Combining Example 8.4.7.2 with assumption (2), we deduce that the functor

$$\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa}) \rightarrow \text{Fun}(\Delta^1, \mathcal{S}_{<\lambda}) \quad \mathcal{G}' \mapsto \theta_{\mathcal{G}, \mathcal{G}'}$$

is $\mathbb{K}$ -cocontinuous. Invoking Corollary 8.4.3.8 again, we are reduced to proving that $\theta_{\mathcal{G}, \mathcal{G}'}$ is a homotopy equivalence in the special case where $\mathcal{G}' = h_{C'}$ for some object $C' \in \mathcal{C}$. In this case, we have a commutative diagram of Kan complexes

$$\begin{array}{ccc} & \text{Hom}_{\mathcal{C}}(C, C') & \\ \swarrow & & \searrow \\ \text{Hom}_{\widehat{\mathcal{C}}}(\mathcal{G}, \mathcal{G}') & \xrightarrow{\theta_{\mathcal{G}, \mathcal{G}'}} & \text{Hom}_{\mathcal{D}}(F(\mathcal{G}), F(\mathcal{G}')), \end{array}$$

where the left vertical map is a homotopy equivalence by virtue of Yoneda's lemma (Theorem 8.3.3.13) and the right vertical map is a homotopy equivalence by virtue of assumption (1). It follows that lower horizontal map is also a homotopy equivalence. $\square$

Proof of Proposition 8.4.7.6. Let $\mathcal{C}$ be an essentially small ∞ -category, let $\mathcal{D}$ be a cocomplete ∞ -category, and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor. By virtue of Theorem 8.4.0.3, the functor f admits an essentially unique factorization as a composition

$$\mathcal{C} \xrightarrow{h_{\bullet}} \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}) \xrightarrow{F} \mathcal{D},$$

where $h_{\bullet}$ is the covariant Yoneda embedding for $\mathcal{C}$ and the functor F preserves small colimits. Moreover, f exhibits $\mathcal{D}$ as a cocompletion of $\mathcal{C}$ if and only if the functor F is an equivalence of ∞ -categories. If this condition is satisfied, then $\mathcal{D}$ is locally small (Corollary 4.7.8.9), the

functor f is fully faithful (Theorem 8.3.3.13), the essential image of f consists of atomic objects of $\mathcal{D}$ (Example 8.4.7.2). We may therefore assume without loss of generality that f satisfies conditions (0), (1), and (2) of Proposition 8.4.7.6, so that F is fully faithful (Lemma 8.4.7.8). Using Proposition 8.4.4.1, we see that the functor F admits a right adjoint $G : \mathcal{D} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$, given on objects by the formula $G(D)(C) = \text{Hom}_{\mathcal{D}}(f(C), D)$. By virtue of Corollary 6.2.2.27, the functor F is an equivalence if and only if the functor G is conservative: that is, if and only if the collection of objects $\{f(C)\}_{C \in \mathcal{C}}$ is weakly dense. $\square$

Proposition 8.4.7.6 has a counterpart for more general cocompletions:

Variant 8.4.7.9. Let $\mathbb{K}$ be a collection of simplicial sets and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor 03WZ of ∞ -categories. Then f exhibits $\mathcal{D}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$ (in the sense of Definition 8.4.5.1) if and only if the following conditions are satisfied:

- (0) The ∞ -category $\mathcal{D}$ is $\mathbb{K}$ -cocomplete.
- (1) The functor f is fully faithful.
- (2) Let κ be an uncountable regular cardinal such that $\mathcal{D}$ is locally κ -small and each $K \in \mathbb{K}$ is essentially κ -small. Then, for each $C \in \mathcal{C}$, the corepresentable functor

$$\mathcal{D} \rightarrow \mathcal{S}_{<\kappa} \quad D \mapsto \text{Hom}_{\mathcal{D}}(f(C), D)$$

is $\mathbb{K}$ -cocontinuous.

- (3) The ∞ -category $\mathcal{D}$ is generated by the objects $\{f(C)\}_{C \in \mathcal{C}}$ under the formation of K -indexed colimits for $K \in \mathbb{K}$.

Proof. Let κ be as in (2), and let $\widehat{\mathcal{C}} \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ denote the smallest replete full subcategory which contains all representable functors and is closed under the formation of K -indexed colimits, for each $K \in \mathbb{K}$ (see Construction 8.4.5.6). By virtue of Proposition 8.4.5.8, the covariant Yoneda embedding $h_{\bullet} : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Assume that $\mathcal{D}$ is $\mathbb{K}$ -complete, so that f factors (up to isomorphism) as a composition $\mathcal{C} \xrightarrow{h_{\bullet}} \widehat{\mathcal{C}} \xrightarrow{F} \mathcal{D}$, where the functor F preserves K -indexed colimits for each $K \in \mathbb{K}$. To complete the proof, it will suffice to show that if f satisfies conditions (1), (2), and (3), then the functor F is an equivalence of ∞ -categories (the reverse implication follows from Theorem 8.3.3.13 and Example 8.4.7.2). Applying Lemma 8.4.7.8, we see that the functor F is fully faithful and therefore restricts to an equivalence of $\widehat{\mathcal{C}}$ with a replete full subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$. For each $K \in \mathbb{K}$, our assumption that F preserves K -indexed colimits guarantees that the subcategory $\mathcal{D}_0 \subseteq \mathcal{D}$ is closed under the formation of K -indexed colimits. Since $\mathcal{D}_0$ contains the essential image of the functor f , the equality $\mathcal{D}_0 = \mathcal{D}$ follows from assumption (3). $\square$

05JE **Corollary 8.4.7.10.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $f : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which exhibits $\mathcal{D}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory, and let $\mathcal{D}_0 \subseteq \mathcal{D}$ be the smallest full subcategory which contains the essential image of $f_0 = f|_{\mathcal{C}_0}$ and is closed under the formation of K -indexed colimits, for each $K \in \mathbb{K}$. Then the functor $f_0 : \mathcal{C}_0 \rightarrow \mathcal{D}_0$ exhibits $\mathcal{D}_0$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}_0$.*

8.4.8 Slices of Cocompletions

04BU Let $U : \tilde{\mathcal{C}} \rightarrow \mathcal{C}$ be a functor between essentially small ∞ -categories. Using Example 8.4.4.5, we see that U admits an essentially unique extension $\mathrm{Fun}(\tilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})$ which preserves small colimits. Our goal in this section is to show that, up to equivalence, this construction carries right fibrations to right fibrations. More precisely, if U is a right fibration, we show that $\mathrm{Fun}(\tilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S})$ is equivalent to the slice ∞ -category $\mathrm{Fun}(\tilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}}$, where $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$ is a covariant transport representation for the left fibration U^{op} (Corollary 8.4.8.2). This is a consequence of the following:

04BV **Proposition 8.4.8.1.** *Let $h : \mathcal{C} \rightarrow \hat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\hat{\mathcal{C}}$ as a cocompletion of $\mathcal{C}$, let $\mathcal{F} \in \hat{\mathcal{C}}$ be an object, and let*

$$\begin{array}{ccc} \tilde{\mathcal{C}} & \xrightarrow{\tilde{h}} & \hat{\mathcal{C}}_{/\mathcal{F}} \\ \downarrow & & \downarrow \\ \mathcal{C} & \xrightarrow{h} & \hat{\mathcal{C}} \end{array}$$

be a categorical pullback square of ∞ -categories. Then $\tilde{h}$ exhibits $\hat{\mathcal{C}}_{/\mathcal{F}}$ as a cocompletion of $\tilde{\mathcal{C}}$.

04BW **Corollary 8.4.8.2.** *Let $U : \tilde{\mathcal{C}} \rightarrow \mathcal{C}$ be a right fibration between essentially small ∞ -categories and let $\mathcal{F} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{S}$ be a covariant transport representation for the left fibration U^{op} . Then there exists an equivalence of ∞ -categories $T : \mathrm{Fun}(\tilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \rightarrow \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}}$ for which the*

diagram of ∞ -categories

$$\begin{array}{ccc}
 \tilde{\mathcal{C}} & \xrightarrow{h_{\bullet}^{\tilde{\mathcal{C}}}} & \mathrm{Fun}(\tilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \\
 \downarrow U & & \downarrow T \\
 & & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}} \\
 \downarrow & & \downarrow \\
 \mathcal{C} & \xrightarrow{h_{\bullet}^{\mathcal{C}}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})
 \end{array}$$

commutes up to isomorphism. Here $h_{\bullet}^{\mathcal{C}}$ and $h_{\bullet}^{\tilde{\mathcal{C}}}$ denote covariant Yoneda embeddings for $\mathcal{C}$ and $\tilde{\mathcal{C}}$, respectively.

Proof. Using Corollary 8.4.2.7, we can choose categorical pullback square

$$\begin{array}{ccc}
 \tilde{\mathcal{C}} & \xrightarrow{\tilde{h}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}} \\
 \downarrow U & & \downarrow \\
 \mathcal{C} & \xrightarrow{h_{\bullet}^{\mathcal{C}}} & \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S}).
 \end{array}$$

It follows from Theorem 8.4.0.3 that the functor $\tilde{h}$ factors (up to isomorphism) as a composition

$$\tilde{\mathcal{C}} \xrightarrow{h_{\bullet}^{\tilde{\mathcal{C}}}} \mathrm{Fun}(\tilde{\mathcal{C}}^{\mathrm{op}}, \mathcal{S}) \xrightarrow{T} \mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}},$$

where the functor T preserves small colimits. To complete the proof, it will suffice to show that T is an equivalence of ∞ -categories. This is equivalent to the assertion that $\tilde{h}$ exhibits $\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{S})_{/\mathcal{F}}$ as a cocompletion of $\tilde{\mathcal{C}}$, which is a special case of Proposition 8.4.8.1. $\square$

Proposition 8.4.8.1 is a special case of the following more general assertion:

Proposition 8.4.8.3. *Let $\mathbb{K}$ be a collection of simplicial sets, let $h : \mathcal{C} \rightarrow \hat{\mathcal{C}}$ be a functor which exhibits $\hat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$, let $f : L \rightarrow \hat{\mathcal{C}}$ be any morphism of simplicial sets,*

and let

04BY

$$\begin{array}{ccc} \tilde{\mathcal{C}} & \xrightarrow{\tilde{h}} & \hat{\mathcal{C}}_{/f} \\ \downarrow & & \downarrow \\ \mathcal{C} & \xrightarrow{h} & \hat{\mathcal{C}} \end{array} \quad (8.58)$$

be a categorical pullback square of ∞ -categories. Then $\tilde{h}$ exhibits $\hat{\mathcal{C}}_{/f}$ as a $\mathbb{K}$ -cocompletion of $\tilde{\mathcal{C}}$.

Proof. We will show that $\tilde{h}$ satisfies the hypotheses of Variant 8.4.7.9:

- (0) The ∞ -category $\hat{\mathcal{C}}_{/f}$ is $\mathbb{K}$ -cocomplete: that is, it admits K -indexed colimits, for each $K \in \mathbb{K}$. This follows from Corollary 7.1.4.22, since the ∞ -category $\hat{\mathcal{C}}$ is $\mathbb{K}$ -cocomplete.
- (1) The functor $\tilde{h}$ is fully faithful. This is a special case of Remark 4.6.2.7, since the diagram (8.58) is a categorical pullback square and the functor h is fully faithful.
- (2) Choose an uncountable regular cardinal κ such that $\hat{\mathcal{C}}$ and $\hat{\mathcal{C}}_{/f}$ are locally κ -small, and each simplicial set $K \in \mathbb{K}$ is essentially κ -small. Choose an object $\tilde{C} \in \tilde{\mathcal{C}}$ having image $C \in \mathcal{C}$, and let

$$\mathcal{F} : \hat{\mathcal{C}} \rightarrow \mathcal{S}_{<\kappa} \quad \tilde{\mathcal{F}} : \hat{\mathcal{C}}_{/f} \rightarrow \mathcal{S}_{<\kappa}$$

be functors corepresented by the objects $X = h(C)$ and $\tilde{X} = \tilde{h}(\tilde{C})$, respectively. For every simplicial set $K \in \mathbb{K}$, the functor $\mathcal{F}$ preserves K -indexed colimits, and we must show that $\tilde{\mathcal{F}}$ has the same property. Choose a colimit diagram $\tilde{g} : K^\triangleright \rightarrow \hat{\mathcal{C}}_{/f}$; we wish to show that $\tilde{\mathcal{F}} \circ \tilde{g}$ is a colimit diagram in the ∞ -category $\mathcal{S}_{<\kappa}$. Let $g : K^\triangleright \rightarrow \hat{\mathcal{C}}$ denote the composition of $\tilde{g}$ with the projection map. Then g is a colimit diagram in $\hat{\mathcal{C}}$ (Corollary 7.1.4.22), so $\mathcal{F} \circ g$ is a colimit diagram in the ∞ -category $\mathcal{S}_{<\kappa}$. Define

$$\mathcal{E} = K^\triangleright \times_{\hat{\mathcal{C}}} \hat{\mathcal{C}}_{X/} \quad \tilde{\mathcal{E}} = K^\triangleright \times_{\hat{\mathcal{C}}} \hat{\mathcal{C}}_{X/}.$$

Using Proposition 5.6.6.21, we see that $\mathcal{F} \circ g$ and $\tilde{\mathcal{F}} \circ \tilde{g}$ are covariant transport representations for the left fibrations $\mathcal{E} \rightarrow K^\triangleleft$ and $\tilde{\mathcal{E}} \rightarrow K^\triangleleft$, respectively. Our assumption that $\mathcal{F} \circ g$ is a colimit diagram guarantees that the inclusion map $K \times_{K^\triangleleft} \mathcal{E} \hookrightarrow \mathcal{E}$ is left cofinal, and we wish to show that the inclusion map $K \times_{K^\triangleleft} \tilde{\mathcal{E}} \hookrightarrow \tilde{\mathcal{E}}$ is also left cofinal (Corollary 7.4.3.14). This follows from Proposition 7.2.3.12, since the tautological map $\tilde{\mathcal{E}} \rightarrow \mathcal{E}$ is a pullback of the projection map $(\hat{\mathcal{C}}_{X/})_{/f} \rightarrow \hat{\mathcal{C}}_{X/}$, and therefore a right fibration (Proposition 4.3.6.1).

- (3) Let $\hat{\mathcal{C}}'_{/f}$ denote the smallest replete full subcategory of $\hat{\mathcal{C}}_{/f}$ which contains the essential image of $\tilde{h}$ and is closed under the formation of K -indexed colimits for $K \in \mathbb{K}$. We

wish to show that $\widehat{\mathcal{C}}'_{/f} = \widehat{\mathcal{C}}_{/f}$. Let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ denote the full subcategory spanned by those objects $X \in \widehat{\mathcal{C}}$ having the property that every object $\tilde{X} \in \widehat{\mathcal{C}}_{/f}$ lying over X belongs to $\widehat{\mathcal{C}}^0_{/f}$. We will complete the proof by showing that $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$. Since the diagram (8.58) is a categorical pullback square, $\widehat{\mathcal{C}}'$ contains the essential image of the functor h . It will therefore suffice to show that $\widehat{\mathcal{C}}'$ is closed under the formation of K -indexed colimits, for each $K \in \mathbb{K}$. Fix a colimit diagram $g : K^\triangleright \rightarrow \widehat{\mathcal{C}}$ carrying the cone point of $K^\triangleright$ to an object $X \in \widehat{\mathcal{C}}$. Assume that $g|_K$ factors through $\widehat{\mathcal{C}}'$; we wish to show that X also belongs to $\widehat{\mathcal{C}}'$. Let $\tilde{X}$ be an object of $\widehat{\mathcal{C}}_{/f}$ lying over X . Since the inclusion of the cone point into $K^\triangleright$ is right anodyne (Example 4.3.7.11), we can lift g to a diagram $\tilde{g} : K^\triangleright \rightarrow \widehat{\mathcal{C}}_{/f}$ carrying the cone point to $\tilde{X}$ (Proposition 4.2.4.5). The assumption that $g|_K$ factors through $\widehat{\mathcal{C}}'$ guarantees that $\tilde{g}|_K$ factors through $\widehat{\mathcal{C}}^0_{/f}$. Since g is a colimit diagram, $\tilde{g}$ is also a colimit diagram (Corollary 7.1.4.22). It follows that $\tilde{X}$ belongs to $\widehat{\mathcal{C}}'_{/f}$. Allowing the object $\tilde{X}$ to vary, we conclude that X belongs to $\widehat{\mathcal{C}}'$, as desired.

□

8.5 Retracts and Idempotents

Let $\mathcal{C}$ be a category containing an object X . Recall that an object $Y \in \mathcal{C}$ is a *retract of* 03Y9 X if there exist morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ satisfying $\text{id}_Y = r \circ i$, so that we have a commutative diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array} \quad (8.59) \quad \begin{array}{l} \text{03YA} \end{array}$$

In this case, we will refer to (8.59) as a *retraction diagram in* $\mathcal{C}$.

Remark 8.5.0.1. Let X and Y be objects of a category $\mathcal{C}$. Then a retraction diagram 04BZ (8.59) can be viewed as a morphism from id_X to id_Y in the twisted arrow category $\text{Tw}(\mathcal{C})$ of Construction 8.1.0.1. In particular, Y is a retract of X if and only if there exists a morphism $\text{id}_X \rightarrow \text{id}_Y$ in $\text{Tw}(\mathcal{C})$.

There is a universal example of a retraction diagram:

Construction 8.5.0.2. We define a category Ret as follows:

03YB

- The category Ret has exactly two objects, which we denote by $\tilde{X}$ and $\tilde{Y}$.

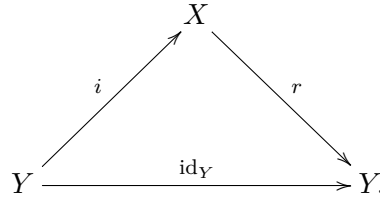

- The morphisms sets in $\mathbf{Ret}$ are given by

$$\begin{aligned}\mathrm{Hom}_{\mathbf{Ret}}(\tilde{X}, \tilde{X}) &= \{\mathrm{id}_{\tilde{X}}, \tilde{e}\} & \mathrm{Hom}_{\mathbf{Ret}}(\tilde{X}, \tilde{Y}) &= \{\tilde{r}\} \\ \mathrm{Hom}_{\mathbf{Ret}}(\tilde{Y}, \tilde{X}) &= \{\tilde{i}\} & \mathrm{Hom}_{\mathbf{Ret}}(\tilde{Y}, \tilde{Y}) &= \{\mathrm{id}_{\tilde{Y}}\}.\end{aligned}$$

- The composition law in $\mathbf{Ret}$ is given (on non-identity morphisms) by the formulae

$$\begin{aligned}\tilde{r} \circ \tilde{i} &= \mathrm{id}_{\tilde{Y}} & \tilde{i} \circ \tilde{r} &= \tilde{e} \\ \tilde{e} \circ \tilde{i} &= \tilde{i} & \tilde{e} \circ \tilde{e} &= \tilde{e} & \tilde{r} \circ \tilde{e} &= \tilde{r}.\end{aligned}$$

03YC **Exercise 8.5.0.3.** Let $\mathcal{C}$ be a category containing a retraction diagram

Show that there is a unique functor $F : \mathbf{Ret} \rightarrow \mathcal{C}$ which is given on objects by $F(\tilde{X}) = X$ and $F(\tilde{Y}) = Y$, and also satisfies $F(\tilde{i}) = i$ and $F(\tilde{r}) = r$. We therefore obtain a bijection

$$\{\text{Functors } \mathbf{Ret} \rightarrow \mathcal{C}\} \xrightarrow{\sim} \{\text{Retraction diagrams in } \mathcal{C}\}.$$

In particular, an object $Y \in \mathcal{C}$ is a retract of another object $X \in \mathcal{C}$ if and only if there exists a functor $F : \mathbf{Ret} \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{Y}) = Y$.

Our first goal in this section is to extend the theory of retracts to the setting of higher category theory. Here there are (at least) two ways that we might choose to proceed:

- Let $\mathcal{C}$ be an ∞ -category containing an object X . We could define an object $Y \in \mathcal{C}$ to be a retract of X if there exist morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ such that the identity morphism id_Y is a composition of r with i , in the sense of Definition 1.4.4.1.
- Let $\mathcal{C}$ be an ∞ -category containing an object X . We could define an object $Y \in \mathcal{C}$ to be a retract of X if there exists a functor of ∞ -categories $F : \mathbf{N}_\bullet(\mathbf{Ret}) \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{Y}) = Y$.

In §8.5.1, we show that these definitions are equivalent. Note that objects $X, Y \in \mathcal{C}$ satisfy condition (a) if and only if there exists a 2-simplex σ of $\mathcal{C}$ whose boundary is indicated in

the diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y; \end{array}$$

in this case, we will say that σ is a *retraction diagram in $\mathcal{C}$* (Definition 8.5.1.19). We will establish the equivalence of (a) and (b) by showing that every retraction diagram in $\mathcal{C}$ can be extended to a functor $F : \mathbf{N}_\bullet(\mathbf{Ret}) \rightarrow \mathcal{C}$ (Corollary 8.5.1.28). In contrast with Exercise 8.5.0.3, the functor F is not necessarily unique; however, it is uniquely determined up to isomorphism (in fact, up to a contractible space of choices).

Our second goal in this section is to address the following:

Question 8.5.0.4. Given an ∞ -category $\mathcal{C}$ and an object $X \in \mathcal{C}$, how can one classify the retracts of X ? 03YD

In §8.5.2, we recall the answer to Question 8.5.0.4 in the situation where $\mathcal{C}$ is an ordinary category. We say that an endomorphism $e : X \rightarrow X$ is *idempotent* if it satisfies the identity $e \circ e = e$ (Definition 8.5.2.1). Every retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array} \tag{8.60} \quad \text{03YE}$$

determines an idempotent endomorphism of X , given by the composition $e = i \circ r$ (Example 8.5.2.3). We say that an idempotent endomorphism is *split* if it can be obtained in this way (Example 8.5.2.3). In this case, we can recover the retraction diagram (8.60) up to (unique) isomorphism from e ; for example the object Y can be recovered as the equalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ (see Corollary 8.5.2.5 and its proof). We therefore obtain a bijection

$$\{\text{Split idempotent endomorphisms of } X\} \simeq \{\text{Retraction Diagrams}\} / \text{Isomorphism}.$$

We can therefore reformulate Question 8.5.0.4 as follows:

Question 8.5.0.5. What is the correct ∞ -categorical counterpart of the notion of an idempotent endomorphism? 03YF

In §8.5.3, we propose an answer to Question 8.5.0.5. Let Idem denote the full subcategory of Ret spanned by the object $\tilde{X}$ (Construction 8.5.2.7). We define an *idempotent in $\mathcal{C}$* to be a functor of ∞ -categories $F : \mathbf{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ (Definition 8.5.3.1). Every retraction diagram in $\mathcal{C}$ can be extended to a functor $\bar{F} : \mathbf{N}_\bullet(\text{Ret}) \rightarrow \mathcal{C}$, which we can restrict to obtain an idempotent $F : \mathbf{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$. We will say that an idempotent in $\mathcal{C}$ is *split* if it can be obtained in this way. In this case, we will show that $\bar{F}$ can be recovered from the idempotent F up to isomorphism (Corollary 8.5.3.10). Consequently, we obtain a bijection

$$\{\text{Split idempotents in } \mathcal{C}\} / \text{Isomorphism} \simeq \{\text{Retraction diagrams in } \mathcal{C}\} / \text{Isomorphism}.$$

To fully address Question 8.5.0.4, we also need to provide a criterion to determine when an idempotent splits. Here we have several closely related results:

- If $\mathcal{C}$ is (the nerve of) an ordinary category, then an idempotent endomorphism $e : X \rightarrow X$ is split if and only if the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ admits an equalizer (or a coequalizer); see Corollary 8.5.2.5. If this condition is satisfied, then the (co)equalizer is the associated retract of X .
- If $\mathcal{C}$ is an ∞ -category, then an idempotent $F : \mathbf{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ is split if and only if it admits a limit (or a colimit); see Corollary 8.5.3.11. If this condition is satisfied, then the (co)limit is the associated retract of $X = F(\tilde{X})$.
- Let $\mathcal{C}$ be an ∞ -category and let $F : \mathbf{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent, carrying the morphism $\tilde{e} : \tilde{X} \rightarrow \tilde{X}$ of Idem to a morphism $e : X \rightarrow X$ of $\mathcal{C}$. Then F is split if and only if the sequential diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

admits a limit (or a colimit); see Proposition 8.5.4.17. If this condition is satisfied, then the (co)limit is the associated retract of X .

In §8.5.4, we study ∞ -categories $\mathcal{C}$ in which every idempotent is split; if this condition is satisfied, we say that $\mathcal{C}$ is *idempotent-complete* (Definition 8.5.4.1). Many ∞ -categories which arise in practice are idempotent-complete. For example, any ∞ -category which is sequentially complete (or seequentially complete) is automatically idempotent-complete (Corollary 8.5.4.18). In §8.5.5, we show that every ∞ -category $\mathcal{C}$ admits an *idempotent-completion* $\hat{\mathcal{C}}$ which is characterized (up to equivalence) by the existence of a functor $H : \mathcal{C} \rightarrow \hat{\mathcal{C}}$ having the following properties:

- The ∞ -category $\hat{\mathcal{C}}$ is idempotent-complete.
- The functor H is fully faithful.

- Every object of $\widehat{\mathcal{C}}$ is a retract of $H(X)$, for some object $X \in \mathcal{C}$.

Moreover, the idempotent-completion $\widehat{\mathcal{C}}$ can be characterized by a universal mapping property: for every idempotent-complete ∞ -category $\mathcal{D}$, composition with H induces an equivalence of ∞ -categories $\mathrm{Fun}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ (see Proposition 8.5.5.3).

Let $\mathcal{C}$ be an ∞ -category, let X be an object of $\mathcal{C}$, and let $e : X \rightarrow X$ be an endomorphism of X . We will say that e is *idempotent* if there exists a functor $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ satisfying $F(\widetilde{X}) = X$ and $F(\widetilde{e}) = e$. If $\mathcal{C}$ is (the nerve of) an ordinary category, then the functor F is completely determined by the pair (X, e) . In general, this need not be true: the simplicial set $\mathbf{N}_\bullet(\mathrm{Idem})$ contains a nondegenerate simplex of every dimension (Remark 8.5.3.3), so the specification of F requires an infinite quantity of data. Nevertheless, we prove in §8.5.7 that F is determined by the pair (X, e) up to (canonical) isomorphism (Corollary 8.5.7.5). This motivates the following:

Question 8.5.0.6. Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. 03YG
How can one determine if e is idempotent?

Let us first record a necessary condition. We say that an endomorphism $e : X \rightarrow X$ is *homotopy idempotent* if the homotopy class $[e]$ is an idempotent endomorphism in the homotopy category $\mathrm{h}\mathcal{C}$ (Definition 8.5.8.1). It follows immediately from the definitions that every idempotent endomorphism in $\mathcal{C}$ is homotopy idempotent. In §8.5.8, we show that the converse is false in general (Proposition 8.5.8.15), though it is true in some important special cases (see Corollary 8.5.8.6 and Exercise 8.5.8.8).

For every integer $n \geq 0$, let $\mathbf{N}_{\leq n}(\mathrm{Idem})$ denote the n -skeleton of the simplicial set $\mathbf{N}_\bullet(\mathrm{Idem})$ (Variant 1.3.1.6). Note that an endomorphism $e : X \rightarrow X$ in $\mathcal{C}$ can be identified with a diagram $F : \mathbf{N}_{\leq 1}(\mathrm{Idem}) \rightarrow \mathcal{C}$ (Example 8.5.9.2), and that e is homotopy idempotent if and only if F admits an extension to $\mathbf{N}_{\leq 2}(\mathrm{Idem})$ (Example 8.5.9.3). In §8.5.9, we address Question 8.5.0.6 by showing that e is idempotent if and only if F admits an extension to $\mathbf{N}_{\leq 3}(\mathrm{Idem})$ (Corollary 8.5.9.8). As an application, we show that the construction $\mathcal{C} \mapsto \mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C})$ commutes with filtered colimits, up to equivalence (Corollary 8.5.9.9).

8.5.1 Retracts in ∞ -Categories

The notion of retract has an obvious counterpart in the setting of ∞ -categories. 03YH

Definition 8.5.1.1. Let $\mathcal{C}$ be an ∞ -category containing an object X . We say that an object 03YJ
 $Y \in \mathcal{C}$ is a *retract* of X if there exist morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ for which the identity morphism id_Y is a composition of i and r , in the sense of Definition 1.4.4.1.

Remark 8.5.1.2. Let $\mathcal{C}$ be an ∞ -category containing an object X . Then an object $Y \in \mathcal{C}$ 03YK
is a retract of X (in the sense of Definition 8.5.1.1) if and only if it is a retract of X when viewed as an object of the homotopy category $\mathrm{h}\mathcal{C}$.

04K9 **Variant 8.5.1.3.** Let $\mathcal{C}$ be an ∞ -category containing morphisms $f : X \rightarrow X'$ and $g : Y \rightarrow Y'$. The following conditions are equivalent:

- (1) The morphism g is a retract of f in the ∞ -category $\mathrm{Fun}(\Delta^1, \mathcal{C})$.
- (2) The homotopy class $[g]$ is a retract of $[f]$ in the ordinary category $\mathrm{Fun}([1], \mathrm{h}\mathcal{C})$.

The implication (1) $\Rightarrow$ (2) is immediate. Conversely, suppose that (2) is satisfied. Then we can choose a commutative diagram

$$\begin{array}{ccccc}
 Y & \xrightarrow{[i]} & X & \xrightarrow{[r]} & Y \\
 \downarrow [g] & & \downarrow [f] & & \downarrow [g] \\
 Y' & \xrightarrow{[i']} & X' & \xrightarrow{[r']} & Y'
 \end{array}$$

in the homotopy category $\mathrm{h}\mathcal{C}$, where the horizontal compositions are the identity morphisms $[\mathrm{id}_Y]$ and $[\mathrm{id}_{Y'}]$, respectively. By virtue of Exercise 1.5.2.10, the squares on the left and right of this diagram can be lifted to commutative diagrams in the ∞ -category $\mathcal{C}$, which we can identify with morphisms $\alpha : g \rightarrow f$ and $\beta : f \rightarrow g$ in the ∞ -category $\mathrm{Fun}(\Delta^1, \mathcal{C})$. Beware that the composition $(\beta \circ \alpha) : g \rightarrow g$ need not be homotopic to the identity morphism id_g . However, the criterion of Theorem 4.4.4.4 guarantees that $\beta \circ \alpha$ is an isomorphism in $\mathrm{Fun}(\Delta^1, \mathcal{C})$. In particular, α admits a left homotopy inverse, and therefore exhibits g as a retract of f .

03YL **Remark 8.5.1.4.** Let $\mathcal{C}$ be a category containing an object X . Then an object $Y \in \mathcal{C}$ is retract of X if and only if it is a retract of X when viewed as an object of the ∞ -category $\mathbf{N}_\bullet(\mathcal{C})$ (in the sense of Definition 8.5.1.1). Consequently, Definition 8.5.1.1 can be viewed as a generalization of the classical notion of retract.

03YM **Example 8.5.1.5.** Let $\mathcal{C}$ be an ∞ -category containing an object X . If an object $Y \in \mathcal{C}$ is isomorphic to X , then Y is a retract of X . In particular, the object X is a retract of itself.

03YN **Remark 8.5.1.6** (Transitivity). Let $\mathcal{C}$ be an ∞ -category containing objects X , Y , and Z . If Y is a retract of X and Z is a retract of Y , then Z is a retract of X . To prove this, it suffices to establish the analogous result for the homotopy category $\mathrm{h}\mathcal{C}$ (Remark 8.5.1.2), which follows immediately from Remark 8.5.0.1.

In practice, many important properties of an object X of an ∞ -category $\mathcal{C}$ are inherited by any retract of X . We record a few examples of this phenomenon which will be useful later.

Proposition 8.5.1.7 (Retracts of Isomorphisms). *Let $\mathcal{C}$ be an ∞ -category containing morphisms $f : X \rightarrow X'$ and $g : Y \rightarrow Y'$. Suppose that g is a retract of f (when regarded as objects of the arrow ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$). If f is an isomorphism, then g is also an isomorphism.*

Proof. By virtue of Variant 8.5.1.3, we may assume that $\mathcal{C}$ is (the nerve of) an ordinary category. Choose a commutative diagram

$$\begin{array}{ccccc} Y & \xrightarrow{i} & X & \xrightarrow{r} & Y \\ \downarrow g & & \downarrow f & & \downarrow g \\ Y' & \xrightarrow{i'} & X' & \xrightarrow{r'} & Y', \end{array}$$

where the horizontal compositions are the identity morphisms id_Y and $\text{id}_{Y'}$, respectively. If f is an isomorphism, then g is also an isomorphism, with inverse given by the composition $Y' \xrightarrow{i'} X' \xrightarrow{f^{-1}} X \xrightarrow{r} Y$. This follows from the calculations

$$\begin{aligned} g \circ r \circ f^{-1} \circ i' &= r' \circ f \circ f^{-1} \circ i' = r' \circ \text{id}_{X'} \circ i' = r' \circ i' = \text{id}_{Y'}, \\ r \circ f^{-1} \circ i' \circ g &= r \circ f^{-1} \circ f \circ i = r \circ \text{id}_X \circ i = r \circ i = \text{id}_Y. \end{aligned}$$

□

Proposition 8.5.1.8. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that every object $Y \in \mathcal{C}$ is a retract of some object $X \in \mathcal{C}^0$. Then F is left and right Kan extended from $\mathcal{C}^0$.*

Proof. We will show that F is left Kan extended from $\mathcal{C}^0$; the assertion that F is right Kan extended from $\mathcal{C}^0$ follows by a similar argument. Choose a regular cardinal κ for which $\mathcal{C}$ is essentially κ -small. Using Corollary 8.3.3.17, we can choose a fully faithful functor $\mathcal{D} \rightarrow \widehat{\mathcal{D}}$, where $\widehat{\mathcal{D}}$ admits κ -small colimits. By virtue of Remark 7.3.1.14, we can replace $\mathcal{D}$ by $\widehat{\mathcal{D}}$ and thereby reduce to proving Proposition 8.5.1.8 in the special case where $\mathcal{D}$ admits κ -small colimits.

Set $F^0 = F|_{\mathcal{C}^0}$. Using Proposition 7.6.6.18, we can extend F^0 to a functor $F' : \mathcal{C} \rightarrow \mathcal{D}$ which is left Kan extended from $\mathcal{C}^0$. Invoking the universal mapping property of Corollary 7.3.6.9, we deduce that there is a natural transformation $\alpha : F' \rightarrow F$ which restricts to the identity transformation from F^0 to itself. The natural transformation α carries each object $Y \in \mathcal{C}$ to a morphism $\alpha_Y : F'(Y) \rightarrow F(Y)$ in the ∞ -category $\mathcal{D}$. By assumption, the object Y is a retract of some object $X \in \mathcal{C}^0$. It follows that α_Y is a retract of the morphism $\alpha_X = \text{id}_{F(X)}$, and is therefore an isomorphism (Proposition 8.5.1.7). Invoking Theorem 4.4.4.4, we deduce that the natural transformation α is an isomorphism, so that F is left Kan extended from $\mathcal{C}^0$ by virtue of Remark 7.3.3.17. □

Proposition 8.5.1.8 immediately implies the following stronger version of Proposition 7.3.3.7:

03YR Corollary 8.5.1.9. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that F is U -left Kan extended from $\mathcal{C}^0$ at an object $X \in \mathcal{C}$. If $Y \in \mathcal{C}$ is a retract of X , then F is also U -left Kan extended from $\mathcal{C}^0$ at Y .*

Proof. Without loss of generality, we may assume that $\mathcal{C}$ is spanned by $\mathcal{C}^0$ together with the objects X and Y . By virtue of Proposition 7.3.8.11, we can further assume that $\mathcal{C}^0$ contains the object X . In this case, Proposition 8.5.1.8 implies that the functors F and $U \circ F$ are left Kan extended from $\mathcal{C}^0$, so that F is U -left Kan extended from $\mathcal{C}^0$ by virtue of Remark 7.3.3.20. $\square$

03YS Corollary 8.5.1.10. *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories. Suppose that F is U -left Kan extended from a full subcategory $\mathcal{C}^0 \subseteq \mathcal{C}$. Then any functor $G : \mathcal{C} \rightarrow \mathcal{D}$ which is a retract of F (in the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$) is also U -left Kan extended from $\mathcal{C}^0$.*

Proof. Let $\text{ev} : \mathcal{C} \times \text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \mathcal{D}$ denote the evaluation functor. By virtue of Remark 7.3.3.3, the functor F is U -left Kan extended from $\mathcal{C}^0$ at an object $C \in \mathcal{C}$ if and only if the functor ev is U -left Kan extended from $\mathcal{C}^0 \times \text{Fun}(\mathcal{C}, \mathcal{D})$ at the object (C, F) . If this condition is satisfied, then Corollary 8.5.1.9 guarantees that ev is also U -left Kan extended from $\mathcal{C}^0 \times \text{Fun}(\mathcal{C}, \mathcal{D})$ at the object (C, G) , so that G is U -left Kan extended from $\mathcal{C}^0$ at C . The desired result now follows by allowing the object $C \in \mathcal{C}$ to vary. $\square$

03YT Corollary 8.5.1.11. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be a functor of ∞ -categories, let K be a simplicial set, and suppose we are given a pair of diagrams $f, g : K^\triangleright \rightarrow \mathcal{D}$. If f is a U -colimit diagram and g is a retract of f (in the ∞ -category $\text{Fun}(K^\triangleright, \mathcal{D})$), then g is also a U -colimit diagram.*

Proof. Using Corollary 4.1.3.3, we can choose an inner anodyne morphism $K \hookrightarrow \mathcal{K}$, where $\mathcal{K}$ is an ∞ -category. Using Remark 4.3.6.7, we see that the induced map $K^\triangleright \hookrightarrow \mathcal{K}^\triangleright$ is also inner anodyne. We may therefore extend f and g to functors $F, G : \mathcal{K}^\triangleright \rightarrow \mathcal{D}$. Since the restriction functor $\text{Fun}(\mathcal{K}^\triangleright, \mathcal{D}) \rightarrow \text{Fun}(K^\triangleright, \mathcal{D})$ is a trivial Kan fibration (Proposition 1.5.7.6), it follows that G is a retract of F . By virtue of Corollary 7.2.2.2, we can replace K by $\mathcal{K}$ and thereby reduce to proving Corollary 8.5.1.11 in the special case where K is an ∞ -category. In this case, the desired result is a special case of Corollary 8.5.1.10 (see Example 7.3.3.9). $\square$

05E6 Corollary 8.5.1.12. *Let $\mathcal{D}$ be an ∞ -category and let $f, g : K^\triangleright \rightarrow \mathcal{D}$ be diagrams. If f is a colimit diagram and g is a retract of f , then g is also a colimit diagram.*

Proof. Apply Corollary 8.5.1.11 in the special case $\mathcal{E} = \Delta^0$. $\square$

Corollary 8.5.1.13. *Let $U : \mathcal{D} \rightarrow \mathcal{E}$ be an inner fibration of ∞ -categories and let f be a U -cocartesian morphism in $\mathcal{D}$. Then any retract of f (in the ∞ -category $\mathrm{Fun}(\Delta^1, \mathcal{C})$) is also U -cocartesian.* 04KA

Proof. Apply Corollary 8.5.1.11 in the special case $K = \Delta^0$ (see Example 7.1.7.2). $\square$

Corollary 8.5.1.14. *Let K be a simplicial set and let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which preserves K -indexed colimits. If $G : \mathcal{C} \rightarrow \mathcal{D}$ is a retract of F (in the ∞ -category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$), then G also preserves K -indexed colimits.* 03YU

Proposition 8.5.1.15. *Let $\mathcal{X}$ and $\mathcal{Y}$ be ∞ -categories and let κ be an uncountable cardinal. Suppose that $\mathcal{Y}$ is a retract of $\mathcal{X}$ in the ∞ -category $\mathcal{QC}$. If $\mathcal{X}$ is essentially κ -small, then $\mathcal{Y}$ is also essentially κ -small.* 03YV

Proof. By virtue of Proposition 4.7.6.15, we may assume that the ∞ -categories $\mathcal{X}$ and $\mathcal{Y}$ are minimal, so that $\mathcal{X}$ is a κ -small simplicial set (Corollary 4.7.6.12). Choose functors $i : \mathcal{Y} \rightarrow \mathcal{X}$ and $r : \mathcal{X} \rightarrow \mathcal{Y}$ such that the composition $(r \circ i) : \mathcal{Y} \rightarrow \mathcal{Y}$ is isomorphic to the identity functor. Then $r \circ i$ is an equivalence of ∞ -categories. Since $\mathcal{Y}$ is minimal, it follows that $r \circ i$ is an isomorphism of simplicial sets (Proposition 4.7.6.13). In particular, the functor $i : \mathcal{Y} \rightarrow \mathcal{X}$ is a monomorphism of simplicial sets. It follows that $\mathcal{Y}$ is κ -small (Remark 4.7.4.8), and therefore essentially κ -small. $\square$

Remark 8.5.1.16. In the situation of Proposition 8.5.1.15, suppose that the ∞ -category $\mathcal{X}$ is a Kan complex. Then $\mathcal{Y}$ is also a Kan complex, and is therefore a retract of $\mathcal{X}$ in the homotopy category hKan . To prove this, it will suffice to show that every morphism $f : Y \rightarrow Y'$ in the ∞ -category $\mathcal{Y}$ is an isomorphism (Proposition 4.4.2.1). Since $\mathcal{X}$ is a Kan complex, the morphism $i(f) : i(Y) \rightarrow i(Y')$ is an isomorphism in $\mathcal{X}$ (Proposition 1.4.6.10). It follows that $(r \circ i)(f)$ is an isomorphism in $\mathcal{Y}$ (Remark 1.5.1.6). Since f is isomorphic to $(r \circ i)(f)$ (as an object of the ∞ -category $\mathrm{Fun}(\Delta^1, \mathcal{Y})$), it is also an isomorphism (Example 4.4.1.14). 03YW

Corollary 8.5.1.17. *Let X and Y be Kan complexes and let κ be an uncountable cardinal. Suppose that Y is a retract of X in the ∞ -category $\mathcal{S}$. If X is essentially κ -small, then Y is essentially κ -small.* 03YX

Warning 8.5.1.18. In the statement of Corollary 8.5.1.17, the uncountability assumption on κ cannot be omitted. That is, if X is a Kan complex for which there exists a weak homotopy equivalence $K \rightarrow X$ for a *finite* simplicial set K , then a retract of X need not inherit the same property. See §[?]. 03YY

We now make Definition 8.5.1.1 slightly more explicit.

03YZ **Definition 8.5.1.19.** Let $\mathcal{C}$ be an ∞ -category. A *retraction diagram in $\mathcal{C}$* is a 2-simplex $\sigma : \Delta^2 \rightarrow \mathcal{C}$ for which the “long” face $d_1^2(\sigma)$ is an identity morphism of $\mathcal{C}$. In this case, we indicate σ by a diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y, \end{array}$$

in the ∞ -category $\mathcal{C}$, and we say that σ *exhibits Y as a retract of X* .

03Z0 **Remark 8.5.1.20.** Let $\mathcal{C}$ be an ∞ -category containing an object X . Then an object $Y \in \mathcal{C}$ is a retract of X (in the sense of Definition 8.5.1.1) if and only if there exists a retraction diagram which exhibits Y as a retract of X (in the sense of Definition 8.5.1.19).

03Z1 **Warning 8.5.1.21.** If $\mathcal{C}$ is (the nerve of) an ordinary category, then a retraction diagram in $\mathcal{C}$ can be identified with a pair of morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ satisfying the condition $r \circ i = \text{id}_Y$. Beware that, if $\mathcal{C}$ is a general ∞ -category, then a retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array}$$

generally cannot be recovered (even up to isomorphism) from the morphisms i and r alone: one also needs a homotopy which witnesses the identity $[r] \circ [i] = [\text{id}_Y]$ in the homotopy category $\text{h}\mathcal{C}$.

03Z2 **Remark 8.5.1.22.** Let $\mathcal{C}$ be an ∞ -category. A 2-simplex σ of $\mathcal{C}$ is a retraction diagram if and only if it is a retraction diagram when viewed as an object of the opposite ∞ -category $\mathcal{C}^{\text{op}}$. Consequently, if X and Y are objects of $\mathcal{C}$, then Y is a retract of X in $\mathcal{C}$ if and only if it is a retract of X in the ∞ -category $\mathcal{C}^{\text{op}}$.

04KB **Remark 8.5.1.23** (Lifting Retraction Diagrams). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of ∞ -categories. Suppose we are given a retraction diagram

04KC

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array} \tag{8.61}$$

in $\mathcal{C}$ and an object $\tilde{Y} \in \mathcal{E}$ satisfying $U(\tilde{Y}) = Y$. Our assumption that U is a cartesian fibration guarantees the existence of a U -cartesian morphism $\tilde{r} : \tilde{X} \rightarrow \tilde{Y}$ in $\mathcal{E}$ satisfying $U(\tilde{r}) = r$. Since $\tilde{r}$ is U -cartesian, we can lift (8.61) to a retraction diagram

$$\begin{array}{ccc} & \tilde{X} & \\ \tilde{i} \nearrow & & \searrow \tilde{r} \\ \tilde{Y} & \xrightarrow{\text{id}_{\tilde{Y}}} & \tilde{Y} \end{array}$$

In particular, the object $\tilde{Y}$ can be realized as a retract of an object $\tilde{X}$ satisfying $U(\tilde{X}) = X$.

Our goal in this section is carry out an ∞ -categorical analogue of Exercise 8.5.0.3.

Notation 8.5.1.24. Let Ret denote the category introduced in Construction 8.5.0.2. By 03Z3 construction, the ∞ -category $\mathbf{N}_\bullet(\text{Ret})$ contains a retraction diagram $\sigma : \Delta^2 \rightarrow \mathbf{N}_\bullet(\text{Ret})$, which we depict as

$$\begin{array}{ccc} & \tilde{X} & \\ \tilde{i} \nearrow & & \searrow \tilde{r} \\ \tilde{Y} & \xrightarrow{\text{id}} & \tilde{Y}. \end{array}$$

We let $\mathcal{R}$ denote the image of σ , which we regard as a simplicial subset of $\mathbf{N}_\bullet(\text{Ret})$.

Remark 8.5.1.25. In the situation of Notation 8.5.1.24, the map $\sigma : \Delta^2 \rightarrow \mathcal{R}$ is an 03Z4 epimorphism of simplicial sets, which fits into a pushout square

$$\begin{array}{ccc} \mathbf{N}_\bullet(\{0 < 2\}) & \xrightarrow{\quad} & \Delta^0 \\ \downarrow & & \downarrow \\ \Delta^2 & \xrightarrow{\quad \sigma \quad} & \mathcal{R}. \end{array}$$

It follows that, for every ∞ -category $\mathcal{C}$, composition with σ induces a bijection from $\text{Hom}_{\text{Set}_\Delta}(\mathcal{R}, \mathcal{C})$ to the set of retraction diagrams in $\mathcal{C}$ (in the sense of Definition 8.5.1.19).

Remark 8.5.1.26. Let $\sigma : \Delta^2 \rightarrow \mathcal{R}$ be the epimorphism of Notation 8.5.1.24. For every ∞ - 03Z5 category $\mathcal{C}$, precomposition with σ induces a fully faithful functor $\text{Fun}(\mathcal{R}, \mathcal{C}) \hookrightarrow \text{Fun}(\Delta^2, \mathcal{C})$, whose essential image is the full subcategory $\text{Fun}'(\Delta^2, \mathcal{C}) \subseteq \text{Fun}(\Delta^2, \mathcal{C})$ spanned by those

diagrams

$$\begin{array}{ccc}
 & X & \\
 i \nearrow & & \searrow r \\
 Y & \xrightarrow{u} & Y'
 \end{array}$$

where u is an isomorphism. This follows by applying Corollary 4.5.2.30 to the pullback square

$$\begin{array}{ccc}
 \mathrm{Fun}(\mathcal{R}, \mathcal{C}) & \longrightarrow & \mathrm{Fun}'(\Delta^2, \mathcal{C}) \\
 \downarrow & & \downarrow \\
 \mathcal{C} & \longrightarrow & \mathrm{Isom}(\mathcal{C}),
 \end{array}$$

since the vertical maps are isofibrations (Corollary 4.4.5.3) and the lower horizontal map is an equivalence of ∞ -categories by virtue of Corollary 4.5.3.13.

Our main result can now be stated as follows:

03Z6 **Proposition 8.5.1.27.** *The inclusion map $\mathcal{R} \hookrightarrow \mathbf{N}_\bullet(\mathrm{Ret})$ is an inner anodyne morphism of simplicial sets.*

03Z7 **Corollary 8.5.1.28.** *Let $\mathcal{C}$ be an ∞ -category. Then composition with the inclusion map $\mathcal{R} \hookrightarrow \mathbf{N}_\bullet(\mathrm{Ret})$ induces a trivial Kan fibration*

$$\mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \rightarrow \mathrm{Fun}(\mathcal{R}, \mathcal{C}) \simeq \mathrm{Fun}(\Delta^2, \mathcal{C}) \times_{\mathrm{Fun}(\mathbf{N}_\bullet(\{0<2\}), \mathcal{C})} \mathcal{C}.$$

In particular, every retraction diagram in $\mathcal{C}$ can be extended to a functor $\mathbf{N}_\bullet(\mathrm{Ret}) \rightarrow \mathcal{C}$, which is uniquely determined up to isomorphism.

Proof. Combine Propositions 8.5.1.27 and 1.5.7.6. □

03Z8 **Remark 8.5.1.29.** Exercise 8.5.0.3 is an immediate consequence of Proposition 8.5.1.27 (see Variant 1.5.6.8).

03Z9 **Corollary 8.5.1.30.** *Let $\mathcal{C}$ be an ∞ -category. Then composition with the retraction diagram of Notation 8.5.1.24 induces a fully faithful functor $\mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Ret}), \mathcal{C}) \rightarrow \mathrm{Fun}(\Delta^2, \mathcal{C})$, whose essential image is spanned by those diagrams*

$$\begin{array}{ccc}
 & X & \\
 i \nearrow & & \searrow r \\
 Y & \xrightarrow{u} & Y'
 \end{array}$$

where u is an isomorphism.

Proof. Combine Corollary 8.5.1.28 with Remark 8.5.1.26. $\square$

Remark 8.5.1.31. Corollary 8.5.1.30 asserts that the map $\sigma : \Delta^2 \rightarrow \mathbf{N}_\bullet(\mathbf{Ret})$ exhibits $\mathbf{N}_\bullet(\mathbf{Ret})$ as a localization of the standard 2-simplex Δ^2 with respect to the “long edge” $0 \rightarrow 2$ (see Definition 6.3.1.9). 04KD

Corollary 8.5.1.32. Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category $\mathcal{I}$. Suppose that each $\mathcal{C}_i$ is an ∞ -category. Then the tautological map 03ZA

$$\theta : \varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathbf{N}_\bullet(\mathbf{Ret}), \mathcal{C}_i) \rightarrow \mathrm{Fun}(\mathbf{N}_\bullet(\mathbf{Ret}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i)$$

is an equivalence of ∞ -categories.

Proof. The morphism θ fits into a commutative diagram

$$\begin{array}{ccc} \varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathbf{N}_\bullet(\mathbf{Ret}), \mathcal{C}_i) & \xrightarrow{\theta} & \mathrm{Fun}(\mathbf{N}_\bullet(\mathbf{Ret}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i) \\ \downarrow & & \downarrow \\ \varinjlim_{i \in \mathcal{I}} \mathrm{Fun}(\mathcal{R}, \mathcal{C}_i) & \xrightarrow{\theta'} & \mathrm{Fun}(\mathcal{R}, \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i), \end{array}$$

where the vertical maps are trivial Kan fibrations (Corollary 8.5.1.30). It will therefore suffice to show that θ' is an equivalence of ∞ -categories. In fact, θ' is an isomorphism of simplicial sets, since the simplicial set $\mathcal{R}$ is finite (Corollary 3.6.1.10). $\square$

The proof of Proposition 8.5.1.27 will require the following:

Lemma 8.5.1.33 (Sparse Horns). Let $n \geq 0$ be an integer and let S be a subset of $[n] = \{0 < 1 < \cdots < n\}$. Let $K \subseteq \Delta^n$ be the simplicial subset spanned by those nondegenerate simplices which do not contain every element of S . Suppose that there exist $0 \leq i < j < k \leq n$ such that $i, k \in S$, $j \notin S$. Then the inclusion $K \hookrightarrow \Delta^n$ is inner anodyne. 03ZB

Example 8.5.1.34. In the situation of Lemma 8.5.1.33, suppose that $S = [n] \setminus \{j\}$ for some $0 \leq j \leq n$. Then K is the horn $\Lambda_j^n \subseteq \Delta^n$. The hypothesis of Lemma 8.5.1.33 guarantees that K is an inner horn, so that the inclusion map $K \hookrightarrow \Delta^n$ is inner anodyne by definition. 03ZC

Proof of Lemma 8.5.1.33. Let P denote the collection of all subsets $S' \subseteq [n]$ which contain $S \cup \{j\}$. Choose a linear ordering

$$\{S(1) \leq \cdots \leq S(c)\}$$

of P with the property that if $S(a) \subseteq S(b)$, then $a \leq b$. Let For $0 \leq b \leq c$, let $K(b) \subseteq \Delta^n$ denote the union of K with the faces $\{N_\bullet(S(a)) \subseteq \Delta^n\}_{1 \leq a \leq b}$. We then have inclusion maps

$$K = K(0) \subseteq K(1) \subseteq K(2) \subseteq \cdots \subseteq K(c-1) \subseteq K(c) = \Delta^n.$$

It will therefore suffice to show that, for every positive integer $b \leq c$, the inclusion map $K(b-1) \hookrightarrow K(b)$ is inner anodyne.

Let us identify $N_\bullet(S(b))$ with the image of a nondegenerate simplex $\sigma : \Delta^m \hookrightarrow \Delta^n$. Let $L \subseteq \Delta^m$ be the inverse image $\sigma^{-1}(S(b-1))$, so that we have a pushout diagram of simplicial sets

$$\begin{array}{ccc} L & \xrightarrow{\quad} & \Delta^m \\ \downarrow & & \downarrow \sigma \\ S(b-1) & \xrightarrow{\quad} & S(b). \end{array}$$

It will therefore suffice to show that the inclusion map $L \subseteq \Delta^m$ is inner anodyne. Because $S(b)$ contains the integers $i < j < k$, we can write $j = \sigma(\bar{j})$ for some $0 < \bar{j} < n$. We conclude by observing that L can be identified with the inner horn $\Lambda_{\bar{j}}^m \subseteq \Delta^m$. $\square$

Proof of Proposition 8.5.1.27. Let τ be a nondegenerate m -simplex of the simplicial set $N_\bullet(\text{Ret})$. We define the *weight* $w(\tau)$ to be the cardinality of the set $\{i \in [m] : \tau(i) = \tilde{X}\}$. Note that, if τ' is any nondegenerate facet of τ , then $w(\tau') \leq w(\tau)$. For $n \geq 1$, the collection of nondegenerate simplices of weight $\leq n$ span a simplicial subset $\mathcal{R}(n) \subseteq N_\bullet(\text{Ret})$. It follows that we can write $N_\bullet(\text{Ret})$ as the union of an increasing sequence

$$\mathcal{R}(1) \hookrightarrow \mathcal{R}(2) \hookrightarrow \mathcal{R}(3) \hookrightarrow \cdots,$$

where $\mathcal{R}(1)$ coincides with the simplicial set $\mathcal{R}$ introduced in Notation 8.5.1.24. We will complete the proof by showing that, for each $n \geq 2$, the inclusion map $\mathcal{R}(n-1) \hookrightarrow \mathcal{R}(n)$ is inner anodyne.

Let $\sigma_n : \Delta^{2n} \rightarrow N_\bullet(\text{Ret})$ denote the simplex corresponding to the diagram

$$\tilde{Y} \xrightarrow{\tilde{i}} \tilde{X} \xrightarrow{\tilde{r}} \tilde{Y} \xrightarrow{\tilde{i}} \tilde{X} \rightarrow \cdots \rightarrow \tilde{X} \xrightarrow{\tilde{r}} \tilde{Y} \xrightarrow{\tilde{i}} \tilde{X} \xrightarrow{\tilde{r}} \tilde{Y}.$$

Note that σ_n is a nondegenerate simplex of weight n , and therefore factors through $\mathcal{R}(n)$. Let $K \subseteq \Delta^{2n}$ denote the inverse image $\sigma_n^{-1}\mathcal{R}(n-1)$, so that we have a commutative diagram of simplicial sets

$$\begin{array}{ccc} K & \xrightarrow{\quad} & \Delta^{2n} \\ \downarrow & & \downarrow \sigma_n \\ \mathcal{R}(n-1) & \xrightarrow{\quad} & \mathcal{R}(n). \end{array} \tag{8.62}$$

Note that a nondegenerate simplex of Δ^{2n} belongs to K if and only if it does not contain $N_\bullet(\{1 < 3 < \cdots < 2n - 1\}) \subseteq \Delta^{2n}$. Applying Lemma 8.5.1.33, we deduce that the inclusion map $K \hookrightarrow \Delta^{2n}$ is inner anodyne. It will therefore suffice to show that the diagram (8.62) is a pushout square.

Let τ be an m -simplex of $N_\bullet(\text{Ret})$ which belongs to $\mathcal{R}(n)$, but does not belong to $\mathcal{R}(n - 1)$. We wish to show that τ factors uniquely through σ_n . We first prove the existence of the desired factorization. For this, we may assume without loss of generality that τ is nondegenerate. Then τ has weight n , so we can write

$$\{i \in [m] : \tau(i) = X\} = \{d_1 < d_2 < \cdots < d_n\}.$$

Let $\alpha : \Delta^m \rightarrow \Delta^{2n}$ be the unique morphism of simplices which is given on vertices by the formula $\alpha(d_i) = 2i - 1$ for $1 \leq i \leq n$. We claim that $\tau = \sigma_n \circ \alpha$. Note that τ and $\sigma_n \circ \alpha$ can both be regarded as functors from the linearly ordered set $[m]$ to the category Ret . By construction, these functors coincide on objects. It will therefore suffice to show that, for $0 \leq j < j' < m$, the functors τ and $\sigma_n \circ \alpha$ determine the same element of $\text{Hom}_{\text{Ret}}(\tau(j), \tau(j'))$. If $\tau(j) = \tilde{Y}$ or $\tau(j') = \tilde{Y}$, this condition is automatic (since the set $\text{Hom}_{\text{Ret}}(\tau(j), \tau(j'))$ has only one element). We may therefore assume without loss of generality that $\tau(j) = \tilde{X} = \tau(j')$: that is, we have $j = d_i$ and $j' = d_{i'}$ for some $i < i'$. In this case, the functors τ and $\sigma_n \circ \alpha$ both carry the pair $(j < j')$ to the element $e \in \text{Hom}_{\text{Ret}}(X, X)$.

We now prove uniqueness. Suppose we are given a pair of maps $\alpha, \beta : \Delta^m \rightarrow \Delta^{2n}$ satisfying $\sigma_n \circ \alpha = \tau = \sigma_n \circ \beta$; we wish to show that $\alpha = \beta$. Suppose otherwise. Then there is some smallest integer $j \in [m]$ such that $\alpha(j) \neq \beta(j)$. Without loss of generality, we may assume that $\alpha(j) < \beta(j)$. Assume first that $\alpha(j)$ is odd. Since τ does not belong to K , $\alpha(j)$ is contained in the image of β ; that is, we can write $\alpha(j) = \beta(i)$ for some $i < j$. Then minimality of j then guarantees that $\alpha(i) = \alpha(j)$, so that $\sigma_n \circ \alpha$ carries the pair $(i < j)$ to the identity morphism $\text{id}_{\tilde{X}}$ in the category Ret . Since $\sigma_n \circ \beta = \tau = \sigma_n \circ \alpha$, the morphism $\sigma_n \circ \beta$ also carries $(i < j)$ to the identity morphism $\text{id}_{\tilde{X}}$. It follows that $\beta(i) = \beta(j)$, contradicting our assumption that $\beta(i) = \alpha(j) < \beta(j)$.

We now treat the case where $\alpha(j)$ is even, so that $\tau(j) = (\sigma_n \circ \alpha)(j) = Y$. Using the equality $\sigma_n \circ \beta = \tau$, we deduce that $\beta(j)$ is also even. Since τ does not belong to K , the odd number $\beta(j) - 1$ belongs to the image of β . We therefore have $\beta(j) - 1 = \beta(i)$ for some integer $i < j$. We then have

$$\alpha(i) \leq \alpha(j) < \alpha(j) + 1 \leq \beta(j) - 1 = \beta(i),$$

contradicting the minimality of j . □

8.5.2 Idempotents in Ordinary Categories

Let M be a monoid. Recall that an element $e \in M$ is *idempotent* if it satisfies the equation $e^2 = e$. We now consider the special case where $M = \text{End}_{\mathcal{C}}(X) = \text{Hom}_{\mathcal{C}}(X, X)$ is the set of endomorphisms of an object X of some category $\mathcal{C}$.

03ZF **Definition 8.5.2.1.** Let $\mathcal{C}$ be a category. An *idempotent endomorphism in $\mathcal{C}$* is a pair (X, e) , where X is an object of $\mathcal{C}$ and $e : X \rightarrow X$ is an endomorphism of X which satisfies the identity $e = e \circ e$, so that we have a commutative diagram

$$\begin{array}{ccc} & X & \\ e \nearrow & & \searrow e \\ X & \xrightarrow{e} & X. \end{array}$$

In this situation, we will also say that e is an *idempotent endomorphism of X* .

03ZG **Example 8.5.2.2** (Identity Morphisms). Let $\mathcal{C}$ be a category. For every object $X \in \mathcal{C}$, the identity morphism $\text{id}_X : X \rightarrow X$ is an idempotent endomorphism in $\mathcal{C}$. Conversely, if $e : X \rightarrow X$ is an idempotent endomorphism in $\mathcal{C}$ which is also an isomorphism, then $e = \text{id}_X$.

03ZH **Example 8.5.2.3** (Split Idempotents). Let $\mathcal{C}$ be a category containing a retraction diagram

03ZJ

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array} \tag{8.63}$$

(see Definition 8.5.1.19). Then $e = i \circ r$ is an idempotent endomorphism of X . This follows from the calculation

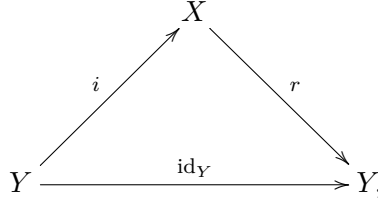

$$e \circ e = (i \circ r) \circ (i \circ r) = i \circ \text{id}_Y \circ r = i \circ r = e.$$

We will say that an idempotent endomorphism $e : X \rightarrow X$ is *split* if it can be obtained in this way (that is, if $e = i \circ r$, for some pair of morphisms $i : Y \rightarrow X$ and $r : X \rightarrow Y$ satisfying $r \circ i = \text{id}_Y$).

In the situation of Example 8.5.2.3, the diagram (8.63) can be recovered (up to isomorphism) from the idempotent endomorphism $e : X \rightarrow X$, by virtue of the following:

Proposition 8.5.2.4. *Let $\mathcal{C}$ be a category containing a retraction diagram*

03ZK

and let $e = i \circ r$ be the idempotent endomorphism Example 8.5.2.3. Then:

- (1) *The morphism i exhibits Y as an equalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$.*
- (2) *The morphism r exhibits Y as a coequalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$.*

Proof. We will prove (1); the proof of (2) is similar. Fix an object $Z \in \mathcal{C}$ and a morphism $f : Z \rightarrow X$ satisfying $e \circ f = \text{id}_X \circ f$; we wish to show that there is a unique morphism $g : Z \rightarrow Y$ satisfying $i \circ g = f$. To prove uniqueness, we note that g is determined by the identity

$$g = \text{id}_Y \circ g = (r \circ i) \circ g = r \circ (i \circ g) = r \circ f.$$

To establish existence, we observe that the composition $g = r \circ f$ satisfies the identity

$$i \circ g = i \circ (r \circ f) = (i \circ r) \circ f = e \circ f = \text{id}_X \circ f = f.$$

□

Corollary 8.5.2.5. *Let $\mathcal{C}$ be a category and let $e : X \rightarrow X$ be an idempotent endomorphism in $\mathcal{C}$. The following conditions are equivalent:*

- (1) *The idempotent endomorphism e splits. That is, e admits a factorization $X \xrightarrow{r} Y \xrightarrow{i} X$, where $r \circ i = \text{id}_Y$.*
- (2) *The pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ admits an equalizer in $\mathcal{C}$.*
- (3) *The pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$ admits a coequalizer in $\mathcal{C}$.*

Proof. The implications (1) $\Rightarrow$ (2) and (1) $\Rightarrow$ (3) follow from Proposition 8.5.2.4. We will show that (2) implies (1); the proof of the implication (3) $\Rightarrow$ (1) is similar. Suppose that there exists a morphism $i : Y \rightarrow X$ which exhibits Y as an equalizer of the pair of morphisms $(e, \text{id}_X) : X \rightrightarrows X$. Since e is idempotent, we have $e \circ e = e = \text{id}_X \circ e$. Invoking the universal property of Y , we deduce that there is a unique morphism $r : X \rightarrow Y$ satisfying $e = i \circ r$. To complete the proof, it will suffice to show that $r \circ i$ is the identity morphism from Y to itself. Since i is a monomorphism, this follows from the calculation

$$i \circ (r \circ i) = (i \circ r) \circ i = e \circ i = \text{id}_X \circ i = i = i \circ \text{id}_Y.$$

□

03ZM **Corollary 8.5.2.6.** *Let $\mathcal{C}$ be a category which admits equalizers (or coequalizers). Then every idempotent endomorphism in $\mathcal{C}$ is split.*

03ZN **Construction 8.5.2.7** (The Universal Idempotent). We define a category Idem as follows:

- The category Idem has single object $\tilde{X}$.
- Morphisms in Idem are given by $\text{Hom}_{\text{Idem}}(\tilde{X}, \tilde{X}) = \{\text{id}_{\tilde{X}}, \tilde{e}\}$.
- The composition law on Idem is given (on non-identity morphisms) by $\tilde{e} \circ \tilde{e} = \tilde{e}$.

03ZP **Remark 8.5.2.8.** Let $\mathcal{C}$ be a category and let $e : X \rightarrow X$ be an idempotent endomorphism in $\mathcal{C}$. Then there is a unique functor $F : \text{Idem} \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{e}) = e$.

03ZQ **Exercise 8.5.2.9.** Show that the category Idem is filtered (see Definition 9.1.0.1).

03ZR **Remark 8.5.2.10.** Let Ret denote the category introduced in Construction 8.5.0.2. Then Idem can be identified with the full subcategory of Ret spanned by the object $\tilde{X}$. Let $\mathcal{C}$ be a category and let $\bar{F} : \text{Ret} \rightarrow \mathcal{C}$ be the functor determined by a retraction diagram in $\mathcal{C}$ (see Exercise 8.5.0.3). Then the restriction $F = \bar{F}|_{\text{Idem}}$ corresponds (under the identification of Remark 8.5.2.8) to the idempotent endomorphism of Example 8.5.2.3.

8.5.3 Idempotents in ∞ -Categories

03ZS We now consider an ∞ -categorical counterpart of Definition 8.5.2.1.

03ZT **Definition 8.5.3.1.** Let $\mathcal{C}$ be an ∞ -category. An *idempotent in $\mathcal{C}$* is a functor of ∞ -categories $N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$. Here Idem denotes the category introduced in Construction 8.5.2.7.

03ZU **Remark 8.5.3.2.** Let $\mathcal{C}$ be a category. It follows from Remark 8.5.2.8 (and Proposition 1.3.3.1) that evaluation on the morphism $\tilde{e} \in \text{Hom}_{\text{Idem}}(\tilde{X}, \tilde{X})$ supplies a bijection from the set of idempotents in the ∞ -category $N_{\bullet}(\mathcal{C})$ (in the sense of Definition 8.5.3.1) to the set of idempotent endomorphisms (X, e) in the category $\mathcal{C}$ (in the sense of Definition 8.5.2.1). We can therefore view Definition 8.5.3.1 as a generalization of Definition 8.5.2.1.

03ZV **Remark 8.5.3.3** (The Structure of $N_{\bullet}(\text{Idem})$). For every integer $n \geq 0$, the simplicial set $N_{\bullet}(\text{Idem})$ contains a unique nondegenerate n -simplex σ_n , given by the diagram

$$\tilde{X} \xrightarrow{\tilde{e}} \tilde{X} \xrightarrow{\tilde{e}} \tilde{X} \xrightarrow{\tilde{e}} \cdots \rightarrow \tilde{X} \xrightarrow{\tilde{e}} \tilde{X}.$$

Moreover, the face morphisms of $N_{\bullet}(\text{Idem})$ satisfy $d_i^n(\sigma_n) = \sigma_{n-1}$ for $0 \leq i \leq n$. Applying Corollary 3.3.1.8, we obtain an isomorphism of $N_{\bullet}(\text{Idem})$ with the simplicial set $(\Delta^0)^+$ introduced in Construction 3.3.1.6. Here we abuse notation by identifying Δ^0 with its underlying semisimplicial set.

Remark 8.5.3.4. The simplicial set $N_\bullet(\text{Idem})$ is weakly contractible. This is a special case 03ZW of Lemma 3.4.5.9, applied to the (discrete) category $[0]$.

Definition 8.5.3.5 (Split Idempotents). Let $\mathcal{C}$ be an ∞ -category and let $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ 03ZX be an idempotent in the ∞ -category $\mathcal{C}$. A *splitting of F* is a functor $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ satisfying $\bar{F}|_{N_\bullet(\text{Idem})} = F$. We say that F is *split* if there exists a splitting of F .

Example 8.5.3.6. Let $\mathcal{C}$ be a category and let $e : X \rightarrow X$ be an idempotent endomorphism 03ZY in $\mathcal{C}$. Then e is split (in the sense of Example 8.5.2.3) if and only if the induced map $N_\bullet(\text{Idem}) \rightarrow N_\bullet(\mathcal{C})$ is a split idempotent in the ∞ -category $N_\bullet(\mathcal{C})$ (in the sense of Definition 8.5.3.5).

Remark 8.5.3.7. Let $\mathcal{C}$ be an ∞ -category and let $F, F' : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be idempotents 03ZZ which are isomorphic (when regarded as objects of the ∞ -category $\text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$). Then F is split if and only if F' is split. See Corollary 4.4.5.3.

Let $\mathcal{C}$ be an ∞ -category and let $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in $\mathcal{C}$. If F is split, then the splitting is essentially unique.

Proposition 8.5.3.8. Let $\mathcal{C}$ be an ∞ -category and let $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ be a functor. Then 0400 $\bar{F}$ is both left and right Kan extended from the full subcategory $N_\bullet(\text{Idem}) \subset N_\bullet(\text{Ret})$.

Proof. This is a special case of Proposition 8.5.1.8. □

Remark 8.5.3.9. The category Ret of Construction 8.5.0.2 contains an initial object $\tilde{Y}$. 0401 It follows that the inclusion map $\text{Idem} \hookrightarrow \text{Ret}$ has a unique extension $T : \text{Idem}^\triangleleft \rightarrow \text{Ret}$ carrying the cone point of $\text{Idem}^\triangleleft$ to the object $\tilde{Y}$. Unwinding the definitions, we see that a functor of ∞ -categories $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ is right Kan extended from $N_\bullet(\text{Idem})$ if and only if the composition

$$N_\bullet(\text{Idem})^\triangleleft \xrightarrow{N_\bullet(T)} N_\bullet(\text{Ret}) \xrightarrow{F} \mathcal{C}$$

is a limit diagram. Proposition 8.5.3.8 asserts that this condition is automatically satisfied. In particular, the object $\bar{F}(\tilde{Y})$ is a limit of the underlying diagram $F = \bar{F}|_{N_\bullet(\text{Idem})}$. Similarly, $\bar{F}(\tilde{Y})$ is a colimit of the diagram F .

Corollary 8.5.3.10 (Uniqueness of Splittings). Let $\mathcal{C}$ be an ∞ -category. Then the restriction 0402 functor

$$\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$$

is fully faithful, and its essential image is the full subcategory consists of the split idempotents in $\mathcal{C}$.

Proof. Combine Proposition 8.5.3.8 with Corollary 7.3.6.15. □

0403 **Corollary 8.5.3.11.** *Let $\mathcal{C}$ be an ∞ -category and let $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in $\mathcal{C}$. The following conditions are equivalent:*

- (1) *The idempotent F is split: that is, it can be extended to a functor $N_{\bullet}(\text{Ret}) \rightarrow \mathcal{C}$.*
- (2) *The diagram F admits a limit in $\mathcal{C}$.*
- (3) *The diagram F admits a colimit in $\mathcal{C}$.*

Proof. The implications (1) $\Rightarrow$ (2) and (1) $\Rightarrow$ (3) follow from Remark 8.5.3.9, and the reverse implications follow from Corollary 7.3.5.8. $\square$

0404 **Corollary 8.5.3.12.** *Let $\mathcal{C}$ be an ∞ -category and let $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in $\mathcal{C}$. If F admits a limit (or colimit) in $\mathcal{C}$, then it is preserved by any functor of ∞ -categories $G : \mathcal{C} \rightarrow \mathcal{D}$.*

Proof. Suppose that F admits a limit in $\mathcal{C}$. Then F splits (Corollary 8.5.3.11): that is, it extends to a diagram $\overline{F} : N_{\bullet}(\text{Ret}) \rightarrow \mathcal{C}$. Let $T : \text{Idem}^{\triangleleft} \rightarrow \text{Ret}$ be as in Remark 8.5.3.9, so that $(\overline{F} \circ N_{\bullet}(T)) : N_{\bullet}(\text{Idem})^{\triangleleft} \rightarrow \mathcal{C}$ is a limit diagram in the ∞ -category $\mathcal{C}$. We wish to show that the functor $(G \circ \overline{F} \circ N_{\bullet}(T)) : N_{\bullet}(\text{Idem})^{\triangleleft} \rightarrow \mathcal{D}$ is a limit diagram in the ∞ -category $\mathcal{D}$. By virtue of Proposition 8.5.3.8, this is automatic (Remark 8.5.3.9). $\square$

0601 **Example 8.5.3.13** (Idempotent Automorphisms). Let $\mathcal{C}$ be an ∞ -category containing an idempotent $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ and let $e : X \rightarrow X$ be the morphism in $\mathcal{C}$ given by the image of the nondegenerate edge of $N_{\bullet}(\text{Idem})$. The following conditions are equivalent:

- (1) The morphism e is an isomorphism in $\mathcal{C}$.
- (2) The functor F factors through the core $\mathcal{C}^{\simeq}$.
- (3) There is an isomorphism from F to the constant functor $\underline{X} : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$.

In particular, if e is an isomorphism, then F is a split idempotent. The equivalence (1) $\Leftrightarrow$ (2) is immediate from the definition of the core $\mathcal{C}^{\simeq}$, and the equivalence (2) $\Leftrightarrow$ (3) follows from the weak contractibility of $N_{\bullet}(\text{Idem})$ (Remark 8.5.3.4).

0602 **Example 8.5.3.14.** Let $\mathcal{C}$ be an ∞ -category, let $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ be an idempotent in $\mathcal{C}$, and let $e : X \rightarrow X$ be the morphism in $\mathcal{C}$ given by the image of the nondegenerate edge of $N_{\bullet}(\text{Idem})$. Suppose that $\mathcal{C}$ is finite-dimensional when viewed as a simplicial set. Then, for $n > \dim(\mathcal{C})$, the functor F carries the unique nondegenerate n -simplex σ_n of $N_{\bullet}(\text{Idem})$ to a degenerate n -simplex of $\mathcal{C}$. Since the composition $(F \circ \sigma_n) : \Delta^n \rightarrow \mathcal{C}$ carries every nondegenerate edge of Δ^n to the morphism e , we conclude that $e = \text{id}_X$. Invoking Example 8.5.3.13, we conclude that F is isomorphic to the constant functor $\underline{X}$; in particular, it is a split idempotent.

8.5.4 Idempotent-Completeness

We now study ∞ -categories in which every idempotent splits. 0405

Definition 8.5.4.1. Let $\mathcal{C}$ be an ∞ -category. We say that $\mathcal{C}$ is *idempotent-complete* if every idempotent $N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ splits (see Definition 8.5.3.5). 0406

Example 8.5.4.2. Let $\mathcal{C}$ be a category. If $\mathcal{C}$ admits equalizers (or coequalizers), then the ∞ -category $N_\bullet(\mathcal{C})$ is idempotent-complete (this is a restatement of Corollary 8.5.2.6). In particular, if $\mathcal{C}$ admits finite limits or finite colimits, then $N_\bullet(\mathcal{C})$ is idempotent-complete. 0407

Warning 8.5.4.3. An ∞ -category which admits finite limits (or colimits) need not be idempotent-complete. See Example [?]. 0408

Example 8.5.4.4. Let X be a Kan complex. Since the simplicial set $N_\bullet(\text{Idem})$ is weakly contractible (Remark 8.5.3.4), every morphism of simplicial sets $N_\bullet(\text{Idem}) \rightarrow X$ is homotopic to a constant map. It follows that X is idempotent-complete when viewed as an ∞ -category. 0409

Example 8.5.4.5. Let $\mathcal{C}$ be an ∞ -category which is finite-dimensional when viewed as a simplicial set. Then $\mathcal{C}$ is idempotent-complete. See Example 8.5.3.14. 0603

Remark 8.5.4.6. Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ is idempotent-complete if and only if the opposite ∞ -category $\mathcal{C}^{\text{op}}$ is idempotent-complete. 040A

Remark 8.5.4.7. Let $\{\mathcal{C}_i\}_{i \in I}$ be a collection of ∞ -categories with product $\prod_{i \in I} \mathcal{C}_i$. Then an idempotent in $\mathcal{C}$ is split if and only if its image in each factor $\mathcal{C}_i$ is split. In particular, if each of the ∞ -categories $\mathcal{C}_i$ is idempotent-complete, then $\mathcal{C}$ is idempotent-complete. 0604

Proposition 8.5.4.8. Let $\mathcal{C}$ be an idempotent-complete ∞ -category and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory. Suppose that, for every object $X \in \mathcal{C}_0$ and every object $Y \in \mathcal{C}$ which is a retract of X , there exists an object $Y' \in \mathcal{C}_0$ which is isomorphic to Y . Then $\mathcal{C}_0$ is idempotent-complete. 040B

Proof. Let Ret denote the category of Construction 8.5.0.2. Suppose we are given an idempotent $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}_0$, carrying the object $\tilde{X} \in \text{Idem}$ to an object $X = F(\tilde{X}) \in \mathcal{C}_0$. We wish to show that F is a split idempotent in $\mathcal{C}_0$. Since $\mathcal{C}$ is idempotent-complete, we can extend F to a functor $\bar{F} : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}$, carrying the object $\tilde{Y} \in \text{Ret}$ to an object $Y = \bar{F}(\tilde{Y})$ which is a retract of X . By assumption, we can choose an isomorphism $\alpha_0 : Y \rightarrow Y'$, where Y' belongs to $\mathcal{C}_0$. Using Corollary 4.4.5.3, we can lift α_0 to an isomorphism of functors $\alpha : \bar{F} \rightarrow \bar{F}'$ in $\text{Fun}(N_\bullet(\text{Ret}), \mathcal{C})$, whose image in $\text{Fun}(N_\bullet(\text{Idem}), \mathcal{C})$ is the identity transformation from F to itself. Then $\bar{F}' : N_\bullet(\text{Ret}) \rightarrow \mathcal{C}_0$ is a splitting of the idempotent F . □

Proposition 8.5.4.9. Let $\mathcal{C}$ be an ∞ -category. The following conditions are equivalent: 040C

- (1) *The ∞ -category $\mathcal{C}$ is idempotent-complete.*
- (2) *The ∞ -category $\mathcal{C}$ admits limits indexed by $\mathbf{N}_\bullet(\text{Idem})$.*
- (3) *The ∞ -category $\mathcal{C}$ admits colimits indexed by $\mathbf{N}_\bullet(\text{Idem})$.*

Proof. This is an immediate consequence of Corollary 8.5.3.11. $\square$

040D **Remark 8.5.4.10.** Let $\mathcal{C}$ be an ∞ -category. Then $\mathcal{C}$ is idempotent-complete if and only if the restriction functor

$$\text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C})$$

is an equivalence of ∞ -categories. This is an immediate consequence of Corollary 8.5.3.10.

040E **Corollary 8.5.4.11.** *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories which are equivalent. Then $\mathcal{C}$ is idempotent-complete if and only if $\mathcal{D}$ is idempotent-complete.*

040F **Corollary 8.5.4.12.** *Let $\mathcal{C}$ be an ∞ -category and let K be a simplicial set. If $\mathcal{C}$ is idempotent-complete, then $\text{Fun}(K, \mathcal{C})$ is idempotent-complete.*

Proof. Combine Propositions 8.5.4.9 and 7.1.8.2. $\square$

To apply the criterion of Proposition 8.5.4.9, it is often useful to replace $\mathbf{N}_\bullet(\text{Idem})$ by a simpler simplicial set.

040H **Notation 8.5.4.13.** Let $\text{Spine}[\mathbf{Z}]$ denote the 1-dimensional simplicial set associated to the directed graph

$$\cdots \rightarrow -2 \rightarrow -1 \rightarrow 0 \rightarrow 1 \rightarrow 2 \rightarrow \cdots$$

We let $Q : \text{Spine}[\mathbf{Z}] \rightarrow \mathbf{N}_\bullet(\text{Idem})$ be the morphism of simplicial sets corresponding to the diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

in the category Idem .

040J **Remark 8.5.4.14.** Since the simplicial set $\text{Spine}[\mathbf{Z}]$ is 1-dimensional, the morphism Q of Notation 8.5.4.13 factors (uniquely) through the 1-skeleton of $\mathbf{N}_\bullet(\text{Idem})$, which we can identify with the simplicial circle $\Delta^1/\partial\Delta^1$. Under this identification, Q corresponds to a morphism of simplicial sets $q : \text{Spine}[\mathbf{Z}] \rightarrow \Delta^1/\partial\Delta^1$. This is a covering map (see Definition 3.1.4.1), which exhibits the simplicial circle $\Delta^1/\partial\Delta^1$ as the quotient of $\text{Spine}[\mathbf{Z}]$ by a free action of the group $(\mathbf{Z}, +)$ by translations. The induced map of geometric realizations $|\text{Spine}[\mathbf{Z}]| \rightarrow |\Delta^1/\partial\Delta^1|$ can be identified with the standard covering map $\mathbf{R} \rightarrow S^1$ in the category of topological spaces.

Remark 8.5.4.15. In the situation of Notation 8.5.4.13, we can regard $\text{Spine}[\mathbf{Z}]$ as a simplicial subset of the nerve $N_\bullet(\mathbf{Z})$, where we regard the set of integers $\mathbf{Z} = \{\dots < -2 < -1 < 0 < 1 < 2 < \dots\}$ as equipped with its usual linear ordering. Moreover, the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow N_\bullet(\mathbf{Z})$ is inner anodyne (this is a special case of Proposition 1.5.7.3). 040K

Remark 8.5.4.16. The simplicial set $\text{Spine}[\mathbf{Z}]$ is weakly contractible. In fact, the inclusion $\{0\} \hookrightarrow \text{Spine}[\mathbf{Z}]$ is anodyne, since it can be realized as an iterated pushout of the inclusion maps $\{0\} \hookrightarrow \Delta^1$ and $\{1\} \hookrightarrow \Delta^1$. Alternatively, it can be deduced from Example 3.6.4.4, since the geometric realization $|\text{Spine}[\mathbf{Z}]|$ is homeomorphic to the set of real numbers $\mathbf{R}$ (endowed with its usual topology). 040L

Proposition 8.5.4.17. *The morphism $Q : \text{Spine}[\mathbf{Z}] \rightarrow N_\bullet(\text{Idem})$ of Notation 8.5.4.13 is both left and right cofinal.* 040M

Proof. We will show that Q is left cofinal; a similar argument will show that it is right cofinal. By virtue of Theorem 7.2.3.1, it will suffice to show that the simplicial set $K = \text{Spine}[\mathbf{Z}] \times_{N_\bullet(\text{Idem})} N_\bullet(\text{Idem})_{/\tilde{X}}$ is weakly contractible. Let us identify the vertices of K with pairs (n, f) , where n is an integer and $f : \tilde{X} \rightarrow \tilde{X}$ is a morphism in the category Idem . Unwinding the definitions, we see that K is the 1-dimensional simplicial set associated to the direct graph given in the diagram

$$\begin{array}{ccccccc}
 \dots & \longrightarrow & (-1, \tilde{e}) & \longrightarrow & (0, \tilde{e}) & \longrightarrow & (1, \tilde{e}) & \longrightarrow & \dots \\
 & \searrow & & \searrow & & \searrow & & \searrow & \\
 \dots & & (-1, \text{id}_{\tilde{X}}) & & (0, \text{id}_{\tilde{X}}) & & (1, \text{id}_{\tilde{X}}) & & \dots
 \end{array}$$

The inclusion of the upper part of the diagram determines a monomorphism of simplicial sets $\text{Spine}[\mathbf{Z}] \hookrightarrow K$ which is left anodyne (since it is a pushout of a coproduct of countably many copies of the inclusion map $\{0\} \hookrightarrow \Delta^1$), and therefore a weak homotopy equivalence (Proposition 3.1.6.14). The desired result now follows from the weak contractibility of the simplicial set $\text{Spine}[\mathbf{Z}]$ (Remark 8.5.4.16). $\square$

Corollary 8.5.4.18. *Let $\mathcal{C}$ be an ∞ -category which is sequentially complete (or sequentially cocomplete). Then $\mathcal{C}$ is idempotent-complete.* 040N

Proof. It follows from Proposition 8.5.4.17 (and Corollary 7.2.2.12) that the ∞ -category $\mathcal{C}$ admits limits (or colimits) indexed by the ∞ -category $N_\bullet(\text{Idem})$, and is therefore idempotent-complete by virtue of Proposition 8.5.4.9. $\square$

- 040P **Remark 8.5.4.19.** Broadly speaking, Proposition 8.5.4.17 will be useful to us because it shows that the ∞ -category $\mathbf{N}_\bullet(\mathrm{Idem})$ admits a (left and right) cofinal diagram $Q : K \rightarrow \mathbf{N}_\bullet(\mathrm{Idem})$, where the simplicial set K is finite-dimensional. Beware that it is not possible to arrange that the simplicial set K is *finite*, since an ∞ -category which admits finite colimits need not be idempotent-complete (Warning 8.5.4.3). In particular, there does not exist a categorical equivalence $K \rightarrow \mathbf{N}_\bullet(\mathrm{Idem})$, where K is a finite simplicial set.
- 040Q **Example 8.5.4.20.** Let $\mathcal{QC}$ denote the ∞ -category of (small) ∞ -categories. Then $\mathcal{QC}$ is idempotent-complete. More generally, for every uncountable cardinal κ , the ∞ -category $\mathcal{QC}_{<\kappa}$ of κ -small ∞ -categories is idempotent-complete. To prove this, we can use Propositions 8.5.4.8 and 8.5.1.15 to reduce to the case where κ has uncountable cofinality. In this case, the ∞ -category $\mathcal{QC}_{<\kappa}$ is sequentially cocomplete (Example 7.6.6.10), so the desired result follows from Corollary 8.5.4.18.
- 040R **Example 8.5.4.21.** Let $\mathcal{S}$ denote the ∞ -category of spaces. Then $\mathcal{S}$ is idempotent-complete. More generally, for every uncountable cardinal κ , the ∞ -category $\mathcal{S}_{<\kappa}$ of κ -small spaces is idempotent-complete. This follows from Example 8.5.4.20 and Proposition 8.5.4.8, since the full subcategory $\mathcal{S}_{<\kappa} \subseteq \mathcal{QC}_{<\kappa}$ is closed under the formation of retracts (Remark 8.5.1.16).
- 040S **Warning 8.5.4.22.** Let $\mathcal{C}$ be an ∞ -category. If $\mathcal{C}$ is idempotent-complete, then its homotopy category $\mathrm{h}\mathcal{C}$ need not be idempotent-complete. For example, the ∞ -category of spaces $\mathcal{S}$ is idempotent-complete (Example 8.5.4.21), but its homotopy category $\mathrm{h}\mathcal{S} = \mathrm{hKan}$ is not (see Proposition 8.5.8.15).

We now record some stability properties of idempotent-completeness.

- 0605 **Proposition 8.5.4.23.** *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories, and let $\mathcal{C}_{01}$ denote the oriented fiber product $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$ (see Definition 4.6.4.1). Then an idempotent $E : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}_{01}$ splits if and only if its images in $\mathcal{C}_0$ and $\mathcal{C}_1$ split. In particular, if $\mathcal{C}_0$ and $\mathcal{C}_1$ are idempotent complete, then $\mathcal{C}_{01}$ is idempotent-complete.*

Proof. Let us identify E with a triple (E_0, E_1, u) , where $E_0 : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}_0$ and $E_1 : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}_1$ are idempotents in the ∞ -categories $\mathcal{C}_0$ and $\mathcal{C}_1$, and $u : (F_0 \circ E_0) \rightarrow (F_1 \circ E_1)$ is a natural transformation. Suppose that the idempotents E_0 and E_1 split; we wish to show that E splits (the reverse implication is trivial). Choose functors $\bar{E}_0 : \mathbf{N}_\bullet(\mathrm{Ret}) \rightarrow \mathcal{C}_0$ and $\bar{E}_1 : \mathbf{N}_\bullet(\mathrm{Ret}) \rightarrow \mathcal{C}_1$ extending E_0 and E_1 , respectively. It follows from Corollary 8.5.3.10 that u admits an (essentially unique) extension to a natural transformation $\bar{u} : (F_0 \circ \bar{E}_0) \rightarrow (F_1 \circ \bar{E}_1)$. The triple $(\bar{E}_0, \bar{E}_1, \bar{u})$ can then be regarded as a diagram $\mathbf{N}_\bullet(\mathrm{Ret}) \rightarrow \mathcal{C}_{01}$ extending E . $\square$

- 0606 **Corollary 8.5.4.24.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of ∞ -categories. If $\mathcal{C}$ is idempotent-complete, then $\mathcal{E}$ is idempotent-complete.*

Proof. Choose an uncountable regular cardinal κ such that U is essentially κ -small, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{S}_{<\kappa}$ be a covariant transport representation for U . Then the ∞ -category $\mathcal{E}$ is equivalent to the oriented fiber $\{\Delta^0\} \tilde{\times}_{\mathcal{S}} \mathcal{C}$, which is idempotent-complete by virtue of Proposition 8.5.4.23. $\square$

Corollary 8.5.4.25. *Let $F_0 : \mathcal{C}_0 \rightarrow \mathcal{C}$ and $F_1 : \mathcal{C}_1 \rightarrow \mathcal{C}$ be functors of ∞ -categories. 0607 If $\mathcal{C}_0$ and $\mathcal{C}_1$ are idempotent-complete, then the homotopy fiber product $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ is also idempotent-complete.*

Proof. It follows from Proposition 8.5.1.7 that $\mathcal{C}_0 \times_{\mathcal{C}}^h \mathcal{C}_1$ is closed under retracts in the oriented fiber product $\mathcal{C}_0 \tilde{\times}_{\mathcal{C}} \mathcal{C}_1$. The desired result now follows from Propositions 8.5.4.23 and 8.5.4.8. $\square$

Corollary 8.5.4.26. *Suppose we are given a categorical pullback diagram of ∞ -categories 0608*

$$\begin{array}{ccc} \mathcal{C}_{01} & \xrightarrow{G_0} & \mathcal{C}_0 \\ \downarrow G_1 & & \downarrow F_0 \\ \mathcal{C}_1 & \xrightarrow{F_1} & \mathcal{C} \end{array} \quad (8.64) \quad 0609$$

If $\mathcal{C}_0$ and $\mathcal{C}_1$ are idempotent-complete, then $\mathcal{C}_{01}$ is idempotent-complete.

Proof. Combine Corollaries 8.5.4.25 and Corollaries 8.5.4.11. $\square$

Corollary 8.5.4.27. *Let $\mathcal{QC}'$ be the full subcategory of $\mathcal{QC}$ spanned by the (small) idempotent- 060A complete ∞ -categories. Then $\mathcal{QC}'$ is closed under small limits in $\mathcal{QC}$.*

Proof. By virtue of Proposition 7.6.6.14 (with Remark 7.6.6.15 and Exercise 7.6.6.16), it will suffice to show that $\mathcal{QC}'$ is closed under pullbacks and small products. The case of pullbacks follows from Corollary 8.5.4.25 (see Corollary 7.6.3.9), and the case of products follows from Remark 8.5.4.7 (see Example 7.6.1.17). $\square$

Warning 8.5.4.28. The collection of idempotent-complete ∞ -categories is not closed under 060B the formation of colimits in $\mathcal{QC}$. (In fact, every ∞ -category $\mathcal{C}$ can be realized as a colimit of standard simplices Δ^n , which are idempotent-complete ∞ -categories: see Proposition [?].) However, we will see in §8.5.9 that the collection of idempotent-complete ∞ -categories is closed under filtered colimits: see Corollary 8.5.9.10.

8.5.5 Idempotent-Completion

040T Let $\mathcal{C}$ be an ∞ -category. It follows from Corollary 8.3.3.17 (together with the criterion of Proposition 8.5.4.9) that we can choose a fully faithful functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$, where $\widehat{\mathcal{C}}$ is idempotent-complete. Our goal in this section is to show that there is a canonical choice for the ∞ -category $\widehat{\mathcal{C}}$, which is characterized (up to equivalence) by the requirement that it is as small as possible.

040U **Definition 8.5.5.1.** Let $\mathcal{C}$ be an ∞ -category. We say that a functor of ∞ -categories $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ *exhibits $\widehat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$* if it satisfies the following conditions:

- (1) The functor H is fully faithful.
- (2) The ∞ -category $\widehat{\mathcal{C}}$ is idempotent-complete.
- (3) For every object $Y \in \widehat{\mathcal{C}}$, there exists an object $X \in \mathcal{C}$ such that Y is a retract of $H(X)$.

We will say that an ∞ -category $\widehat{\mathcal{C}}$ *is an idempotent-completion of $\mathcal{C}$* if there exists a functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$.

060C **Example 8.5.5.2.** The inclusion functor $N_{\bullet}(\text{Idem}) \hookrightarrow N_{\bullet}(\text{Ret})$ exhibits the ∞ -category $N_{\bullet}(\text{Ret})$ as an idempotent-completion of $N_{\bullet}(\text{Idem})$.

Our first goal is to show that the idempotent-completion of an ∞ -category $\mathcal{C}$ is uniquely determined up to equivalence. To prove this, we reformulate Definition 8.5.5.1 as a universal mapping property:

0411 **Proposition 8.5.5.3.** *Let $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories, where $\widehat{\mathcal{C}}$ is idempotent-complete. The following conditions are equivalent:*

- (a) *The functor H exhibits $\widehat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$, in the sense of Definition 8.5.5.1.*
- (b) *For every idempotent-complete ∞ -category $\mathcal{D}$, precomposition with H induces an equivalence of ∞ -categories $\text{Fun}(\widehat{\mathcal{C}}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{D})$.*

Proof. By virtue of Proposition 8.5.4.9, an ∞ -category $\mathcal{D}$ is idempotent-complete if and only if it admits $N_{\bullet}(\text{Idem})$ -indexed colimits: that is, if and only if it is $\mathbb{K}$ -cocomplete, where $\mathbb{K} = \{N_{\bullet}(\text{Idem})\}$ (see Definition 7.6.6.19). Moreover, every functor of ∞ -categories $F : \widehat{\mathcal{C}} \rightarrow \mathcal{D}$ automatically preserves $N_{\bullet}(\text{Idem})$ -indexed colimits (Corollary 8.5.3.12). We can therefore restate (b) as follows:

- (b') *The functor H exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$, in the sense of Definition 8.4.5.1.*

Using Variant 8.4.7.9, we see that this condition is satisfied if and only if H satisfies conditions (1) and (2) of Definition 8.5.5.1, together with the following variant of (3):

(3') The ∞ -category $\widehat{\mathcal{C}}$ is generated by the essential image of H under the formation of $\mathbf{N}_\bullet(\text{Idem})$ -indexed colimits. That is, if $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ is a replete full subcategory which contains the essential image of H and is closed under retracts, then $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$.

The implication (3) $\Rightarrow$ (3') is immediate. To prove the converse, let $\widehat{\mathcal{C}}' \subseteq \widehat{\mathcal{C}}$ be the full subcategory spanned by those objects Y which are retracts of $H(X)$, for some $X \in \mathcal{C}$. Condition (3) of Definition 8.5.5.1 asserts that $\widehat{\mathcal{C}}' = \widehat{\mathcal{C}}$. This is a special case of (3'), since $\widehat{\mathcal{C}}'$ is closed under the formation of retracts (Remark 8.5.1.6). $\square$

Corollary 8.5.5.4 (Existence). *Let $\mathcal{C}$ be an ∞ -category. Then there exists a functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$.* 040Z

Proof. By virtue of Proposition 8.5.5.3 (and its proof), this is a special case of Proposition 8.4.5.3. $\square$

Using the Yoneda embedding of §8.3, we can give an explicit construction of idempotent-completions. For simplicity, let us assume first that $\mathcal{C}$ is an essentially small ∞ -category. We let $\text{Fun}^{\text{atm}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ denote the full subcategory of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ spanned by those functors $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{S}$ which are *atomic*, in the sense of Definition 8.4.7.1.

Proposition 8.5.5.5. *Let $\mathcal{C}$ be an essentially small ∞ -category and let $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S})$ be a covariant Yoneda embedding for $\mathcal{C}$ (Definition 8.3.3.9). Then the functor $h_\bullet$ exhibits $\text{Fun}^{\text{atm}}(\mathcal{C}^{\text{op}}, \mathcal{S})$ as an idempotent-completion of $\mathcal{C}$.* 040X

Following the convention of Remark 4.7.0.5, we can regard Proposition 8.3.3.14 as a special case of the following more general assertion (which is essentially a special case of Proposition 8.4.5.8):

Proposition 8.5.5.6. *Let κ be an uncountable regular cardinal, let $\mathcal{C}$ be an ∞ -category which is essentially κ -small, and let $\widehat{\mathcal{C}} \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ be the full subcategory spanned by those functors $\mathcal{F}$ for which the corepresentable functor $\text{Hom}_{\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})}(\mathcal{F}, \bullet)$ commutes with κ -small colimits. Then the covariant Yoneda embedding $h_\bullet : \mathcal{C} \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ exhibits $\widehat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$.* 040Y

Proof. To simplify the notation, set $\mathcal{D} = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$. For each object $C \in \mathcal{C}$, the representable functor $h_C \in \mathcal{D}$ corepresents the functor

$$\mathcal{D} \rightarrow \mathcal{S}_{<\kappa} \quad \mathcal{F} \mapsto \mathcal{F}(C)$$

given by evaluation at C , which preserves κ -small colimits by virtue of Proposition 7.1.8.2. It follows that the covariant Yoneda embedding $h_\bullet$ factors through the subcategory $\widehat{\mathcal{C}} \subseteq \mathcal{D}$. Moreover, the functor $h_\bullet$ is fully faithful (Theorem 8.3.3.13).

The ∞ -category $\mathcal{D}$ admits κ -small colimits, and is therefore idempotent-complete by virtue of Proposition 8.5.4.9. It follows from Corollary 8.5.1.14 that the full category $\widehat{\mathcal{C}} \subseteq \mathcal{D}$ is closed under the formation of retracts, and is therefore also idempotent-complete (Proposition 8.5.4.8).

To complete the proof, it will suffice to show that every object $\mathcal{F} \in \widehat{\mathcal{C}}$ is a retract of h_C for some object $C \in \mathcal{C}$. Applying Corollary 8.4.3.8, we deduce that $\mathcal{F}$ can be realized as the colimit of a diagram

$$\mathcal{K} \xrightarrow{T} \mathcal{C} \xrightarrow{h_\bullet} \mathcal{D},$$

where $\mathcal{K}$ is an essentially κ -small ∞ -category. Since the functor $\mathrm{Hom}_{\mathcal{D}}(\mathcal{F}, \bullet)$ preserves κ -small colimits, it follows that the identity map $\mathrm{id}_{\mathcal{F}} \in \mathrm{Hom}_{\mathcal{D}}(\mathcal{F}, \mathcal{F})$ factors (up to homotopy) through $h_{T(B)}$ for some B . In particular, $\mathcal{F}$ is a retract of the representable functor $h_{T(B)}$. $\square$

Let $\mathcal{C}$ be an ∞ -category. Proposition 8.5.5.6 supplies an explicit description of its idempotent-completion $\widehat{\mathcal{C}}$ which is somewhat transcendental in nature: it locates $\widehat{\mathcal{C}}$ as a full subcategory of an ∞ -category which is much larger than $\mathcal{C}$. Let us remark that this is not necessary: the ∞ -category $\widehat{\mathcal{C}}$ is essentially of the same size as $\mathcal{C}$ itself.

0410 Proposition 8.5.5.7. *Let $\mathcal{C}$ be an ∞ -category, let $\widehat{\mathcal{C}}$ be an idempotent-completion of $\mathcal{C}$, and let κ be an uncountable cardinal. Then:*

- (1) *The ∞ -category $\mathcal{C}$ is locally κ -small if and only if $\widehat{\mathcal{C}}$ is locally κ -small.*
- (2) *The ∞ -category $\mathcal{C}$ is essentially κ -small if and only if $\widehat{\mathcal{C}}$ is essentially κ -small.*

Proof. Choose a functor $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ which exhibits $\widehat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$. We first prove (1). Assume that $\mathcal{C}$ is locally κ -small; we wish to show that $\widehat{\mathcal{C}}$ is locally κ -small (the reverse implication follows immediately from the definition). Fix a pair of objects $Y, Y' \in \widehat{\mathcal{C}}$; we wish to show that the morphism space $\mathrm{Hom}_{\widehat{\mathcal{C}}}(Y, Y')$ is essentially κ -small. By assumption, the object $Y \in \widehat{\mathcal{C}}$ is a retract of $H(X)$ for some object $X \in \mathcal{C}$. It follows that $\mathrm{Hom}_{\widehat{\mathcal{C}}}(Y, Y')$ is a retract of $\mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), Y')$ in the homotopy category hKan . By virtue of Corollary 8.5.1.17, it will suffice to show that the Kan complex $\mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), Y')$ is essentially κ -small. Applying the same argument to Y' , we are reduced to showing that the mapping space $\mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), H(X'))$ is essentially κ -small for every pair of objects $X, X' \in \mathcal{C}$. Since the functor F is fully faithful, the canonical map $\mathrm{Hom}_{\mathcal{C}}(X, X') \rightarrow \mathrm{Hom}_{\widehat{\mathcal{C}}}(H(X), H(X'))$ is a homotopy equivalence. The desired result now follows from our assumption that the ∞ -category $\mathcal{C}$ is essentially κ -small.

We now prove (2). Assume that $\mathcal{C}$ is essentially κ -small; we wish to show that $\widehat{\mathcal{C}}$ is also essentially κ -small (again, the reverse implication follows immediately from the definitions). Without loss of generality, we may assume that κ is the smallest cardinal for which $\mathcal{C}$ is

essentially κ -small, and is therefore regular (Corollary 4.7.6.17). By virtue of the criterion of Proposition 4.7.8.7, it will suffice to show that the set of isomorphism classes $S = \pi_0(\widehat{\mathcal{C}}^\sim)$ is κ -small. For each object $X \in \mathcal{C}$, let $S_X \subseteq S$ be the collection of isomorphism classes of objects $Y \in \widehat{\mathcal{C}}$ which can be realized as a retract of $H(X)$. Note that we can write S as a union of the subsets S_X , where the X ranges over a set of representatives for the isomorphism classes in $\mathcal{C}$. Since κ is regular, and the set $\pi_0(\mathcal{C}^\sim)$ is κ -small, it will suffice to show that each of the sets S_X is κ -small. Let us henceforth regard the object $X \in \mathcal{C}$ as fixed, and let Y be any retract of $H(X)$ in the ∞ -category $\widehat{\mathcal{C}}$. It follows from Proposition 8.5.2.4 that, as an object of the homotopy category $\mathbf{h}\mathcal{C}$, Y can be identified with the equalizer of a pair of morphisms $(\mathrm{id}, e) : H(X) \rightarrow H(X)$. It follows that the cardinality of the set of isomorphism classes S_X is bounded above by the cardinality of the set $\mathrm{Hom}_{\mathbf{h}\widehat{\mathcal{C}}}(H(X), H(X))$ of morphisms $e : H(X) \rightarrow H(X)$ in $\mathbf{h}\mathcal{C}$, which we can identify with the κ -small set $\mathrm{Hom}_{\mathbf{h}\mathcal{C}}(X, X)$. $\square$

Let $\mathcal{QC}$ denote the ∞ -category of (small) ∞ -categories (Construction 5.5.4.1), and let $\mathcal{QC}^{\mathrm{ic}}$ denote the full subcategory of $\mathcal{QC}$ spanned by the idempotent-complete ∞ -categories. Proposition 8.5.5.3 asserts that a functor $F : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ exhibits $\widehat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$ if and only if exhibits $\widehat{\mathcal{C}}$ as a $\mathcal{QC}^{\mathrm{ic}}$ -reflection of $\mathcal{C}$, in the sense of Definition 6.2.2.6. Consequently, Proposition 8.5.5.7 is equivalent to the assertion that $\mathcal{QC}^{\mathrm{ic}} \subseteq \mathcal{QC}$ is reflective. Combining this observation with Proposition 6.2.2.18, we obtain the following:

Corollary 8.5.5.8. *Then the inclusion functor $\mathcal{QC}^{\mathrm{ic}} \hookrightarrow \mathcal{QC}$ admits a left adjoint, which carries each ∞ -category $\mathcal{C}$ to an idempotent-completion $\widehat{\mathcal{C}}$.* 0414

Corollary 8.5.5.9. *Let $\mathcal{C}$ be an ∞ -category which can be realized as the limit of a small diagram $\mathcal{F} : \mathcal{D} \rightarrow \mathcal{QC}$. Suppose that, for each vertex $D \in \mathcal{D}$, the ∞ -category $\mathcal{F}(D)$ is idempotent-complete. Then $\mathcal{C}$ is idempotent-complete.* 0415

Proof. Combine Corollary 8.5.5.8 with Variant 7.1.4.26. $\square$

Corollary 8.5.5.10. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞ -categories. Suppose that $\mathcal{D}$ is a retract of $\mathcal{C}$ in the homotopy category $\mathbf{hQC}\mathrm{at}$. If $\mathcal{C}$ is idempotent-complete, then $\mathcal{D}$ is also idempotent-complete.* 0416

Proof. By virtue of Remark 8.5.3.9, we can identify $\mathcal{D}$ with the limit of a diagram $\mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{QC}$ carrying the unique object of Idem to the idempotent-complete ∞ -category $\mathcal{C}$. The desired result is now a special case of Corollary 8.5.5.9. $\square$

Exercise 8.5.5.11. Give a direct proof of Corollary 8.5.5.10. 0417

8.5.6 Morita Equivalence

Recall that a morphism of simplicial sets $F : \mathcal{C} \rightarrow \mathcal{D}$ is a *categorical equivalence* if, for every ∞ -category $\mathcal{E}$, precomposition with F induces an equivalence of ∞ -categories 05M8

$\text{Fun}(\mathcal{D}, \mathcal{E}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{E})$ (Definition 4.5.3.1). We now consider a slightly weaker version of this condition.

05M9 **Definition 8.5.6.1.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. We say that F is a *Morita equivalence* if, for every idempotent-complete ∞ -category $\mathcal{E}$, precomposition with F induces an equivalence of ∞ -categories $\text{Fun}(\mathcal{D}, \mathcal{E}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{E})$.

05MA **Example 8.5.6.2.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. If F is a categorical equivalence, then it is a Morita equivalence. Beware that the converse is false in general.

060D **Remark 8.5.6.3.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a Morita equivalence of simplicial sets. Then F is a weak homotopy equivalence: that is, for every Kan complex X , the induced map $\text{Fun}(\mathcal{D}, X) \rightarrow \text{Fun}(\mathcal{C}, X)$ is a homotopy equivalence. This is immediate from the definition, since X is an idempotent complete ∞ -category (Example 8.5.4.4).

05MB **Example 8.5.6.4.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories which exhibits $\mathcal{D}$ as an idempotent-completion of $\mathcal{C}$. Then F is a Morita equivalence (Proposition 8.5.5.3).

05MC **Remark 8.5.6.5.** Let $\iota : \mathcal{C}_0 \hookrightarrow \mathcal{C}$ be a monomorphism of simplicial sets and let $\mathcal{E}$ be an idempotent-complete ∞ -category. If ι is a Morita equivalence, then the functor $\text{Fun}(\mathcal{C}, \mathcal{E}) \xrightarrow{\circ \iota} \text{Fun}(\mathcal{C}_0, \mathcal{E})$ is both an isofibration (Corollary 4.4.5.3) and an equivalence of ∞ -categories, and therefore a trivial Kan fibration (Proposition 4.5.5.20). In particular, every diagram $\mathcal{C}_0 \rightarrow \mathcal{E}$ can be extended to $\mathcal{C}$.

05MD **Remark 8.5.6.6.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $G : \mathcal{D} \rightarrow \mathcal{E}$ be morphisms of simplicial sets. If two of the morphisms F , G , and $G \circ F$ are Morita equivalences, then so is the third. In particular, the collection of Morita equivalences is closed under composition.

05ME **Remark 8.5.6.7** (Isomorphism Invariance). Let $\mathcal{C}$ be a simplicial set, let $\mathcal{D}$ be an ∞ -category, and suppose we are given a pair of diagrams $F, F' : \mathcal{C} \rightarrow \mathcal{D}$ which are isomorphic (as objects of the ∞ -category $\text{Fun}(\mathcal{C}, \mathcal{D})$). Then F is a Morita equivalence if and only if F' is a Morita equivalence.

05MF **Remark 8.5.6.8.** Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Then F is a Morita equivalence if and only if it satisfies the following condition:

(*) For every idempotent-complete ∞ -category $\mathcal{E}$, precomposition with F induces a bijection of sets

$$\pi_0(\text{Fun}(\mathcal{D}, \mathcal{E})^\simeq) \rightarrow \pi_0(\text{Fun}(\mathcal{C}, \mathcal{E})^\simeq).$$

The necessity of condition (*) is immediate. Conversely, suppose that condition (*) is satisfied, and let $\mathcal{E}$ be an idempotent-complete ∞ -category; we wish to show that the functor

$\mathrm{Fun}(\mathcal{D}, \mathcal{E}) \xrightarrow{\circ F} \mathrm{Fun}(\mathcal{C}, \mathcal{E})$ is an equivalence of ∞ -categories. By virtue of Proposition 4.5.1.22, it will suffice to show that for every simplicial set K , the induced map

$$\pi_0(\mathrm{Fun}(K, \mathrm{Fun}(\mathcal{D}, \mathcal{E}))^\simeq) \rightarrow \pi_0(\mathrm{Fun}(K, \mathrm{Fun}(\mathcal{C}, \mathcal{E}))^\simeq)$$

is a bijection. This follows by applying condition $(*)$ to the ∞ -category $\mathrm{Fun}(K, \mathcal{E})$ (which is idempotent complete by virtue of Corollary 8.5.4.12).

Remark 8.5.6.9. Let $F : \mathcal{C}' \rightarrow \mathcal{C}$ be a Morita equivalence of simplicial sets. Then pullback 060E along F induces a bijection

$$\begin{array}{c} \{\text{Cocartesian Fibrations } \mathcal{E} \rightarrow \mathcal{C}\} / \text{Equivalence} \\ \downarrow \\ \{\text{Cocartesian Fibrations } \mathcal{E}' \rightarrow \mathcal{C}'\} / \text{Equivalence.} \end{array}$$

Moreover, if κ is an uncountable cardinal, then a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is essentially κ -small if and only if its pullback $\mathcal{C}' \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{C}'$ is essentially κ -small. This follows from the classification of Theorem 5.6.0.2, since the ∞ -category $\mathcal{QC}_{<\kappa}$ is idempotent-complete (Example 8.5.4.20).

Variant 8.5.6.10. Let $F : \mathcal{C}' \rightarrow \mathcal{C}$ be a Morita equivalence of simplicial sets. Then pullback 060F along F induces a bijection

$$\begin{array}{c} \{\text{Left Fibrations } \mathcal{E} \rightarrow \mathcal{C}\} / \text{Equivalence} \\ \downarrow \\ \{\text{Left Fibrations } \mathcal{E}' \rightarrow \mathcal{C}'\} / \text{Equivalence.} \end{array}$$

Proposition 8.5.6.11. Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor of ∞ -categories. Then F is a Morita 05MG equivalence if and only if it satisfies the following pair of conditions:

- (a) The functor F is fully faithful.
- (b) For every object $Y \in \mathcal{D}$, there exists an object $X \in \mathcal{C}$ such that Y is a retract of $F(X)$.

Proof. Using Corollary 8.5.5.4, we can choose a functor $H : \mathcal{D} \rightarrow \widehat{\mathcal{D}}$ which exhibits $\widehat{\mathcal{D}}$ as an idempotent-completion of $\mathcal{D}$. Then H is a Morita equivalence (Example 8.5.6.4). By virtue of Remark 8.5.6.6, we can replace F by the composite functor $H \circ F$ and thereby reduce to proving Proposition 8.5.6.11 in the special case where $\mathcal{D}$ is idempotent-complete. In this case, the desired result is a reformulation of Proposition 8.5.5.3. $\square$

05MH **Corollary 8.5.6.12.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. Then F is a categorical equivalence if and only if it is a Morita equivalence and the induced map of homotopy categories $hF : h\mathcal{C} \rightarrow h\mathcal{D}$ is essentially surjective.*

Proof. Using Remark 8.5.6.6 (and Proposition 4.1.3.2), we can reduce to the case where $\mathcal{C}$ and $\mathcal{D}$ are ∞ -categories, in which case the desired result follows from the criterion of Proposition 8.5.6.11. $\square$

05MJ **Proposition 8.5.6.13.** *Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of simplicial sets. The following conditions are equivalent:*

- (1) *The morphism F is a Morita equivalence.*
- (2) *The morphism F^{op} is a Morita equivalence.*
- (3) *For every uncountable cardinal κ , precomposition with F induces an equivalence of ∞ -categories $\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\kappa}) \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$.*
- (4) *There exists an uncountable regular cardinal κ such that $\mathcal{C}$ and $\mathcal{D}$ are essentially κ -small and precomposition with F induces an equivalence of ∞ -categories $\text{Fun}(\mathcal{D}^{\text{op}}, \mathcal{S}_{<\kappa}) \rightarrow \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$.*

Proof. The implications (1) $\Rightarrow$ (2) $\Rightarrow$ (3) $\Rightarrow$ (4) are immediate. We complete the proof by showing that (4) implies (1). Without loss of generality, we may assume that $\mathcal{C}$ and $\mathcal{D}$ are ∞ -categories. Fix a regular cardinal κ such that $\mathcal{C}$ and $\mathcal{D}$ are essentially κ -small and assume that precomposition with F induces an equivalence of ∞ -categories

$$G : \text{Fun}(\mathcal{D}, \mathcal{S}_{<\kappa}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{S}_{<\kappa}).$$

Let $\widehat{\mathcal{C}} \subseteq \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{S}_{<\kappa})$ be the full subcategory spanned by the atomic object (see Proposition 8.5.5.6) and define $\widehat{\mathcal{D}} \subseteq \text{Fun}(\mathcal{D}, \mathcal{S}_{<\kappa})$ similarly. Then G induces an equivalence of ∞ -categories $\widehat{\mathcal{D}} \rightarrow \widehat{\mathcal{C}}$, which admits a homotopy inverse $\widehat{F} : \widehat{\mathcal{C}} \rightarrow \widehat{\mathcal{D}}$. It follows from Example 8.4.4.5 that the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ \downarrow h_{\mathcal{C}}^{\bullet} & & \downarrow h_{\mathcal{D}}^{\bullet} \\ \widehat{\mathcal{C}} & \xrightarrow[\sim]{\widehat{F}} & \widehat{\mathcal{D}} \end{array}$$

commutes up to isomorphism. The vertical maps exhibit $\widehat{\mathcal{C}}$ and $\widehat{\mathcal{D}}$ as idempotent-completions of $\mathcal{C}$ and $\mathcal{D}$, respectively (Proposition 8.5.5.6), and are therefore Morita equivalences (Example 8.5.6.4). Combining this observation with Remarks 8.5.6.7 and 8.5.6.6, we conclude that F is a Morita equivalence. $\square$

Proposition 8.5.6.14. *Suppose we are given a commutative diagram of simplicial sets* 05MK

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{F} & \mathcal{E}' \\ \downarrow U' & & \downarrow U' \\ \mathcal{C} & \xrightarrow{\bar{F}} & \mathcal{C}' \end{array}$$

with the following properties:

- (1) *The morphisms U and U' are cartesian fibrations.*
- (2) *The morphism F carries U -cartesian edges of $\mathcal{E}$ to U' -cartesian edges of $\mathcal{E}'$.*
- (3) *The morphism $\bar{F}$ is a Morita equivalence of simplicial sets.*
- (4) *For each vertex $C \in \mathcal{C}$ having image $C' = \bar{F}(C)$, the functor*

$$F_C : \mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E} \rightarrow \{C'\} \times_{\mathcal{C}'} \mathcal{E}' = \mathcal{E}'_{C'}$$

is a Morita equivalence of ∞ -categories.

Then F is a Morita equivalence of simplicial sets.

Proof. Using Corollary 5.6.7.3, we can choose a pullback diagram

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{G} & \mathcal{E}'' \\ \downarrow U' & & \downarrow U'' \\ \mathcal{C}' & \xrightarrow{\bar{G}} & \mathcal{C}'', \end{array}$$

where U'' is a cartesian fibration, $\bar{G}$ is inner anodyne, and $\mathcal{C}''$ is an ∞ -category. It follows from Corollary 5.6.7.6 that G is a categorical equivalence of simplicial sets; in particular, it is a Morita equivalence (Example 8.5.6.2). Consequently, to show that F is a Morita equivalence, it will suffice to show that the composite map $G \circ F$ is a Morita equivalence (Remark 8.5.6.6). We may therefore replace U' by U'' , and thereby reduce to proving Proposition 8.5.6.14 in the special case where $\mathcal{C}'$ is an ∞ -category. Similarly, we may assume that $\mathcal{C}$ is an ∞ -category. To complete the proof, it will suffice to show that the functor $F : \mathcal{E} \rightarrow \mathcal{E}'$ satisfies the conditions of Proposition 8.5.6.11:

- (a) Since $\bar{F}$ is a Morita equivalence of ∞ -categories, it is fully faithful. Similarly, for each object $C \in \mathcal{C}$ having image $C' = \bar{F}(C)$, condition (4) guarantees that the functor $F_C : \mathcal{E}_C \rightarrow \mathcal{E}'_{C'}$ is fully faithful. Using condition (2) and Proposition 5.1.6.7, we conclude that F is fully faithful.

- (b) Let Y be an object of $\mathcal{E}'$; we wish to show that Y is a retract of $F(X)$, for some object $X \in \mathcal{E}$. Set $\bar{Y} = U'(Y)$. Since $\bar{F}$ is a Morita equivalence, $\bar{Y}$ is a retract of $C' = \bar{F}(C)$, for some object $C \in \mathcal{C}$. Choose a retraction diagram $\bar{\sigma}$:

$$\begin{array}{ccc} & C' & \\ \bar{i} \nearrow & & \searrow \bar{r} \\ \bar{Y} & \xrightarrow{\text{id}} & \bar{Y} \end{array}$$

in the ∞ -category $\mathcal{C}$. Our assumption that U' is a cartesian fibration guarantees that we can lift $\bar{\sigma}$ to a retraction diagram

$$\begin{array}{ccc} & X' & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}} & Y \end{array}$$

in the ∞ -category $\mathcal{E}'$. Since the functor F_C is a Morita equivalence, there exists an object $X \in \mathcal{E}_C$ such that X' is a retract of $F(X)$ in the ∞ -category $\mathcal{E}'_{C'}$, and therefore also in the ∞ -category $\mathcal{E}'$. Applying Remark 8.5.1.6, we conclude that Y is a retract of $F(X)$.

□

060G **Corollary 8.5.6.15.** *Suppose we are given a pullback diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{F} & \mathcal{E}' \\ \downarrow U & & \downarrow U' \\ \mathcal{C} & \xrightarrow{\bar{F}} & \mathcal{C}', \end{array}$$

where the vertical maps are right fibrations. If $\bar{F}$ is a Morita equivalence, then F is a Morita equivalence.

060H **Corollary 8.5.6.16.** *Let $F : \mathcal{C} \rightarrow \mathcal{C}'$ be a Morita equivalence of simplicial sets. Then a morphism of simplicial sets $G : K \rightarrow \mathcal{C}$ is right cofinal if and only if the composite morphism $(F \circ G) : K \rightarrow \mathcal{C}'$ is right cofinal.*

Proof. The morphism G is right cofinal if and only if, for every left fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, the projection map $K \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{E}$ is a weak homotopy equivalence (Corollary 7.2.3.15). By virtue of Variant 8.5.6.10, it suffices to verify this condition in the special case where $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}'} \mathcal{E}'$ is the pullback of a left fibration $\mathcal{E}' \rightarrow \mathcal{C}'$. In this case, the projection map $\mathcal{E} \rightarrow \mathcal{E}'$ is a Morita equivalence (Corollary 8.5.6.15), and therefore a weak homotopy equivalence (Remark 8.5.6.3). It follows that G is right cofinal if and only if, for every left fibration $\mathcal{E}' \rightarrow \mathcal{C}'$, the projection map $K \times_{\mathcal{C}'} \mathcal{E}' \rightarrow \mathcal{E}'$ is a weak homotopy equivalence. By virtue of Corollary 7.2.3.15, this is equivalent to the requirement that $F \circ G$ is right cofinal. $\square$

Corollary 8.5.6.17. *Let $F : \mathcal{C} \rightarrow \mathcal{C}'$ be a Morita equivalence of simplicial sets. Then F is right cofinal.* 060J

Proof. Apply Corollary 8.5.6.16 in the special case where G is the identity morphism $\text{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$. $\square$

Corollary 8.5.6.18. *Suppose we are given a pullback diagram of ∞ -categories* 060K

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{F} & \mathcal{E}' \\ \downarrow U & & \downarrow U' \\ \mathcal{C} & \xrightarrow{\bar{F}} & \mathcal{C}', \end{array}$$

where the vertical maps are right fibrations. If $\bar{F}$ exhibits $\mathcal{C}'$ as an idempotent-completion of $\mathcal{C}$, then F exhibits $\mathcal{E}'$ as an idempotent-completion of $\mathcal{E}$.

Proof. It follows from Corollary 8.5.6.15 that F is a Morita equivalence. It will therefore suffice to show that the ∞ -category $\mathcal{E}'$ is idempotent-complete, which follows from Corollary 8.5.4.24. $\square$

Remark 8.5.6.19 (Cofinal Idempotents). Let $\mathcal{C}$ be an ∞ -category and let $F : \mathbf{N}_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ 060L be an idempotent in $\mathcal{C}$, carrying the unique object of Idem to an object $X \in \mathcal{C}$. Using Corollary 8.5.5.4, we can choose a functor $H : \mathcal{C} \rightarrow \hat{\mathcal{C}}$ which exhibits $\hat{\mathcal{C}}$ as an idempotent-completion of $\mathcal{C}$. Then the idempotent $H \circ F$ splits: that is, it extends to a functor $\bar{F} : \mathbf{N}_{\bullet}(\text{Ret}) \rightarrow \hat{\mathcal{C}}$ carrying the final object of $\mathbf{N}_{\bullet}(\text{Ret})$ to an object $Y \in \hat{\mathcal{C}}$ which is a retract of $H(X)$. We then have a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathbf{N}_{\bullet}(\text{Idem}) & \xrightarrow{F} & \mathcal{C} \\ \downarrow & & \downarrow H \\ \mathbf{N}_{\bullet}(\text{Ret}) & \xrightarrow{\bar{F}} & \hat{\mathcal{C}}, \end{array}$$

where the vertical maps are Morita equivalences. Using Corollaries 8.5.6.16, 8.5.6.17, and 7.2.1.9, we see that the following conditions are equivalent:

- The idempotent $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ is a right cofinal functor.
- The functor $\overline{F} : \mathbf{N}_\bullet(\mathrm{Ret}) \rightarrow \widehat{\mathcal{C}}$ is right cofinal.
- The object $Y \in \widehat{\mathcal{C}}$ is final.

Similarly, the idempotent $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ is left cofinal if and only if Y is an initial object of $\widehat{\mathcal{C}}$.

060M **Corollary 8.5.6.20.** *Let $\mathcal{C}$ be an ∞ -category. Then the idempotent-completion of $\mathcal{C}$ has a final object if and only if there exists a right cofinal functor $\mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$.*

8.5.7 Idempotent Endomorphisms

0418 Let $\mathcal{C}$ be an ∞ -category and let $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ be an idempotent in $\mathcal{C}$. Then F carries the unique object of Idem to an object $X \in \mathcal{C}$, and the unique non-identity morphism of Idem to an endomorphism $e : X \rightarrow X$ in $\mathcal{C}$. If $\mathcal{C}$ is (the nerve of) an ordinary category, then the functor F is uniquely determined by the pair (X, e) (Remark 8.5.2.8). In more general situations, this is false: the simplicial set $\mathbf{N}_\bullet(\mathrm{Idem})$ contains a nondegenerate simplex of each dimension (Remark 8.5.3.3), so the specification of the functor F requires an infinite amount of data. Our goal in this section is to show that, nevertheless, the idempotent $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ can be recovered *up to isomorphism* from the underlying endomorphism (X, e) . We begin by introducing some terminology.

0419 **Notation 8.5.7.1.** Let $\Delta^1 / \partial\Delta^1$ denote the simplicial circle (Example 1.5.7.11). For every ∞ -category $\mathcal{C}$, we let $\mathrm{End}_{\mathcal{C}}$ denote the ∞ -category of diagrams $\mathrm{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C})$. Note that objects of $\mathrm{End}_{\mathcal{C}}$ can be identified with pairs (X, e) , where X is an object of $\mathcal{C}$ and $e : X \rightarrow X$ is an endomorphism of X . We will refer to $\mathrm{End}_{\mathcal{C}}$ as the *∞ -category of endomorphisms in $\mathcal{C}$* .

041A **Remark 8.5.7.2.** Let $\mathcal{C}$ be an ∞ -category. Evaluation on the unique vertex of $\Delta^1 / \partial\Delta^1$ induces an isofibration of ∞ -categories $\mathrm{End}_{\mathcal{C}} \rightarrow \mathcal{C}$. Moreover, for each object $X \in \mathcal{C}$, the fiber $\{X\} \times_{\mathcal{C}} \mathrm{End}_{\mathcal{C}}$ can be identified with the endomorphism space $\mathrm{End}_{\mathcal{C}}(X) = \mathrm{Hom}_{\mathcal{C}}(X, X)$ of Variant 4.6.1.3.

041B **Definition 8.5.7.3** (Idempotent Endomorphisms). Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. We will say that e is *idempotent* if there exists a functor $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$ satisfying $F(\tilde{e}) = e$; here $\tilde{e}$ denotes the (unique) non-identity morphism in the category Idem . We let $\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$ denote the full subcategory of $\mathrm{End}_{\mathcal{C}}$ spanned by the idempotent endomorphisms.

We can now formulate our main result.

Proposition 8.5.7.4. *Let $\mathcal{C}$ be an ∞ -category. Then the restriction functor*

041C

$$\mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C}) \rightarrow \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$$

has a left homotopy inverse.

Stated more informally, Proposition 8.5.7.4 asserts that if $e : X \rightarrow X$ is an endomorphism in the ∞ -category $\mathcal{C}$ which can be extended to an idempotent $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$, then F is uniquely determined up to isomorphism and can be chosen to depend functorially on the pair (X, e) .

Corollary 8.5.7.5. *For every ∞ -category $\mathcal{C}$, evaluation on the non-identity morphism of $\mathbf{N}_\bullet(\mathrm{Idem})$ induces a bijection*

$$\theta : \pi_0(\mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C})^\simeq) \rightarrow \pi_0((\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}})^\simeq).$$

Proof. The surjectivity of θ follows from the definition of an idempotent endomorphism, and the injectivity from Proposition 8.5.7.4. $\square$

Warning 8.5.7.6. Let $\mathcal{C}$ be an ∞ -category and let $R : \mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C}) \rightarrow \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$ be the restriction functor. Proposition 8.5.7.4 asserts that there exists a functor $S : \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}} \rightarrow \mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C})$ for which the composition

$$\mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C}) \xrightarrow{R} \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}} \xrightarrow{S} \mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C}).$$

is isomorphic to the identity functor. Let $e : X \rightarrow X$ be an idempotent endomorphism in $\mathcal{C}$, so that e can be extended to a morphism $F : \mathbf{N}_\bullet(\mathrm{Idem}) \rightarrow \mathcal{C}$. Then $S(e) = (S \circ R)(F)$ is isomorphic to F , so there is an isomorphism of $(R \circ S)(e)$ with e in the category $\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$. Beware that this isomorphism usually *cannot* be chosen to depend functorially on e . In general, the functor R is not an equivalence of ∞ -categories, so the composition

$$\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}} \xrightarrow{S} \mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C}) \xrightarrow{R} \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$$

is not isomorphic to the identity functor on $\mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}$.

Example 8.5.7.7. For any ∞ -category $\mathcal{C}$, we have a commutative diagram

041F

$$\begin{array}{ccc} & \mathcal{C} & \\ \swarrow & & \searrow \delta \\ \mathrm{Fun}(\mathbf{N}_\bullet(\mathrm{Idem}), \mathcal{C}) & \xrightarrow{\quad} & \mathrm{End}_{\mathcal{C}}^{\mathrm{idm}}, \end{array}$$

where the vertical maps are the diagonal embeddings. If $\mathcal{C}$ is a Kan complex, then the left vertical map is a homotopy equivalence of Kan complexes (since the simplicial set $N_\bullet(\text{Idem})$ is weakly contractible; see Remark 8.5.3.4). In this case, Proposition 8.5.7.4 reduces to the assertion that the diagonal map

$$\delta : \mathcal{C} \rightarrow \text{End}_{\mathcal{C}}^{\text{idm}} \subseteq \text{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C}) \quad X \mapsto (X, \text{id}_X)$$

has a left homotopy inverse. This is clear: the map δ has a left inverse in the category of simplicial sets, given by evaluation at the vertex of $\Delta^1 / \partial\Delta^1$. Beware that δ is usually not a homotopy equivalence, since the simplicial set $\Delta^1 / \partial\Delta^1$ is not contractible.

We will give the proof of Proposition 8.5.7.4 at the end of this section. First, let us introduce an important class of idempotent endomorphisms.

041G Definition 8.5.7.8. Let $\mathcal{C}$ be an ∞ -category. We say that an endomorphism $e : X \rightarrow X$ in $\mathcal{C}$ is *split idempotent* if the homotopy class $[e]$ is a split idempotent in the homotopy category $\text{h}\mathcal{C}$ (see Example 8.5.2.3).

041H Remark 8.5.7.9. Let $\mathcal{C}$ be an ∞ -category. Then an endomorphism $e : X \rightarrow X$ is split idempotent if and only there exists a retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y. \end{array}$$

in the ∞ -category $\mathcal{C}$, where e factors as a composition $X \xrightarrow{r} Y \xrightarrow{i} X$.

041J Proposition 8.5.7.10 (Lifting Split Idempotents). *Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. Then e is split idempotent endomorphism if and only if it extends to a split idempotent $N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$, in the sense of Definition 8.5.3.5. In particular, every split idempotent endomorphism is an idempotent endomorphism.*

Proof. Assume that the endomorphism e is split idempotent; we will show that e can be extended to a split idempotent $F : N_\bullet(\text{Idem}) \rightarrow \mathcal{C}$ (the reverse implication follows immediately from the definitions). Choose a retraction diagram

041K

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array} \tag{8.65}$$

in the ∞ -category $\mathcal{C}$, where $[e] = [i] \circ [r]$ in the homotopy category $\mathbf{h}\mathcal{C}$. Using Corollary 8.5.1.28, we can extend the diagram (8.65) to a functor $\overline{F} : \mathbf{N}_\bullet(\mathbf{Ret}) \rightarrow \mathcal{C}$. By construction, $\overline{F}$ carries the unique non-identity morphism of $\mathbf{Idem}$ to a morphism $e' : X \rightarrow X$ of $\mathcal{C}$ which is homotopic to e . Replacing $\overline{F}$ by an isomorphic functor if necessary, we may assume that $e' = e$ (see Corollary 4.4.5.3). Then $F = \overline{F}|_{\mathbf{N}_\bullet(\mathbf{Idem})}$ is a split idempotent in $\mathcal{C}$ extending e . $\square$

Let $\mathcal{C}$ be an ∞ -category. When restricted to *split* idempotents, Proposition 8.5.7.4 asserts every retraction diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array}$$

can be recovered (up to canonical isomorphism) from a choice of composition $e = (i \circ r)$ in the ∞ -category $\mathcal{C}$. To prove this, we will exploit the observation that Y can be realized as the limit (and colimit) of the diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots,$$

indexed by the 1-dimensional simplicial set $\mathbf{Spine}[\mathbf{Z}]$ of Notation 8.5.4.13.

Notation 8.5.7.11. Let $q : \mathbf{Spine}[\mathbf{Z}] \rightarrow \Delta^1 / \partial\Delta^1$ be the covering map of Remark 8.5.4.14. 041L
For every ∞ -category $\mathcal{C}$, precomposition with q induces a functor

$$T : \text{End}_{\mathcal{C}} = \text{Fun}(\Delta^1 / \partial\Delta^1, \mathcal{C}) \hookrightarrow \text{Fun}(\mathbf{Spine}[\mathbf{Z}], \mathcal{C}) \quad (X, e) \mapsto T_e.$$

More informally, the functor T carries each endomorphism $e : X \rightarrow X$ in the ∞ -category $\mathcal{C}$ to the associated sequential diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

Proposition 8.5.7.12. Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an idempotent 041M
endomorphism in $\mathcal{C}$. Then e splits if and only if the diagram $T_e : \mathbf{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ admits a limit.

Proof. Since e is idempotent, it can be extended to a functor $F : \mathbf{N}_\bullet(\mathbf{Idem}) \rightarrow \mathcal{C}$. Then $T_e = F \circ Q$, where $Q : \mathbf{Spine}[\mathbf{Z}] \rightarrow \mathbf{N}_\bullet(\mathbf{Idem})$ is the left cofinal morphism of Proposition 8.5.4.17. Using Corollary 7.2.2.10, we see that T_e has a limit in $\mathcal{C}$ if and only if F has a limit in $\mathcal{C}$. The desired result now follows from the criterion of Corollary 8.5.3.11 $\square$

041N **Remark 8.5.7.13.** Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an split idempotent endomorphism in $\mathcal{C}$, so that the diagram

$$\cdots \rightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \rightarrow \cdots$$

admits both a limit and colimit in $\mathcal{C}$. The limit and colimit of this diagram are automatically preserved by any functor of ∞ -categories $\mathcal{C} \rightarrow \mathcal{D}$. This follows by combining Corollary 8.5.3.12 with Proposition 8.5.4.17.

Motivated by Proposition 8.5.7.12, we introduce a variant of Definition 8.5.7.8.

041P **Definition 8.5.7.14.** Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. We will say that e is *weakly split* if it satisfies the following conditions:

- (1) The diagram T_e of Notation 8.5.7.11 can be extended to a limit diagram in $\mathcal{C}$, which we depict as

$$\begin{array}{c} Y \\ \swarrow \quad \downarrow i \quad \searrow \\ \cdots \longrightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \longrightarrow \cdots \end{array}$$

- (2) The diagram T_e of Notation 8.5.7.11 can be extended to a colimit diagram in $\mathcal{C}$, which we depict as

$$\begin{array}{c} \cdots \longrightarrow X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \xrightarrow{e} X \longrightarrow \cdots \\ \searrow \quad \swarrow \quad \downarrow r \quad \swarrow \quad \searrow \\ Z \end{array}$$

- (3) The composition $Y \xrightarrow{i} X \xrightarrow{r} Z$ is an isomorphism in $\mathcal{C}$.

Our next goal is to show that every split idempotent endomorphism is weakly split.

041Q **Notation 8.5.7.15.** Let $\mathbf{Ret}$ denote the category of Construction 8.5.0.2. Then the object $\tilde{Y} \in \mathbf{Ret}$ is both initial and final. It follows that the diagram $Q : \mathbf{Spine}[\mathbf{Z}] \rightarrow \mathbf{N}_\bullet(\mathbf{Idem})$ of Proposition 8.5.4.17 admits unique extensions

$$Q^- : \mathbf{Spine}[\mathbf{Z}]^\triangleleft \rightarrow \mathbf{N}_\bullet(\mathbf{Ret}) \quad Q^+ : \mathbf{Spine}[\mathbf{Z}]^\triangleright \rightarrow \mathbf{N}_\bullet(\mathbf{Ret})$$

which carry the cone points to the object $\tilde{Y}$.

Lemma 8.5.7.16. *Let $\mathcal{C}$ be an ∞ -category and let $F : \mathbf{N}_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ be a functor. Then 041R
the composition $\text{Spine}[\mathbf{Z}]^\triangleleft \xrightarrow{Q^-} \mathbf{N}_\bullet(\text{Ret}) \xrightarrow{F} \mathcal{C}$ is a limit diagram in $\mathcal{C}$, and the composition
 $\text{Spine}[\mathbf{Z}]^\triangleright \xrightarrow{Q^+} \mathbf{N}_\bullet(\text{Ret}) \xrightarrow{F} \mathcal{C}$ is a colimit diagram in $\mathcal{C}$.*

Proof. Combine Remark 8.5.3.9, Corollary 7.2.2.3, and Proposition 8.5.4.17. $\square$

Proposition 8.5.7.17. *Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be a split idempotent 041S
endomorphism in $\mathcal{C}$. Then e is weakly split.*

Proof. Let Ret denote the category introduced in Construction 8.5.0.2. Using Proposition 8.5.7.10, we can choose a functor $F : \mathbf{N}_\bullet(\text{Ret}) \rightarrow \mathcal{C}$ satisfying $F(\tilde{X}) = X$ and $F(\tilde{e}) = e$.

Let $Q : \text{Spine}[\mathbf{Z}] \rightarrow \mathbf{N}_\bullet(\text{Idem})$ denote the (left and right) cofinal morphism of Proposition 8.5.4.17, and let $Q^- : \text{Spine}[\mathbf{Z}]^\triangleleft \rightarrow \mathbf{N}_\bullet(\text{Ret})$ and $Q^+ : \text{Spine}[\mathbf{Z}]^\triangleright \rightarrow \mathbf{N}_\bullet(\text{Ret})$ be the extensions of Notation 8.5.7.15. Lemma 8.5.7.16 guarantees that $F \circ Q^-$ is a limit diagram in $\mathcal{C}$ extending $F \circ Q = T_e$, so that e satisfies condition (1) of Definition 8.5.7.14. Similarly, $F \circ Q^+$ is a colimit diagram extending T_e , so that e satisfies condition (2) of Definition 8.5.7.14. Condition (3) follows from the observation that any composition of $F(\tilde{i})$ with $F(\tilde{r})$ is homotopic to the morphism $F(\tilde{r} \circ \tilde{i}) = F(\text{id}_{\tilde{Y}}) = \text{id}_{F(\tilde{Y})}$, and is therefore an isomorphism. $\square$

Warning 8.5.7.18. The converse of Proposition 8.5.7.17 is false. For example, every 041T
isomorphism $e : X \rightarrow X$ is weakly split, but is split idempotent only if e is homotopic to the identity morphism id_X (see Example 8.5.2.2).

Let $\mathcal{C}$ be an ∞ -category, and let $\text{End}_{\mathcal{C}}^w$ denote the full subcategory of $\text{End}_{\mathcal{C}}$ spanned by the weakly split endomorphisms in $\mathcal{C}$. It follows from Proposition 8.5.7.17 that the restriction functor

$$\text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{End}_{\mathcal{C}} \quad F \mapsto F(e)$$

factors through $\text{End}_{\mathcal{C}}^w$. We will deduce Proposition 8.5.7.4 from the following:

Proposition 8.5.7.19. *Let $\mathcal{C}$ be an ∞ -category. Then the restriction functor 041U*

$$\text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{End}_{\mathcal{C}}^w$$

admits a left homotopy inverse.

Proof. Let $\mathcal{D} \subseteq \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C})$ denote the full subcategory spanned by those diagrams $S : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ which admit both a limit and a colimit. Let u and v be auxiliary symbols, and let $\tilde{\mathcal{D}}$ denote the full subcategory of $\text{Fun}(\{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\}, \mathcal{C})$ spanned by those diagrams $S^\pm : \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\} \rightarrow \mathcal{C}$ which satisfy the following conditions:

(1) The restriction $S^- = S^\pm|_{\{u\} \star \text{Spine}[\mathbf{Z}]}$ is a limit diagram in $\mathcal{C}$.

(2) The restriction $S^+ = S^\pm|_{\text{Spine}[\mathbf{Z}] \star \{v\}}$ is a colimit diagram in $\mathcal{C}$.

Note that the simplicial set $\text{Spine}[\mathbf{Z}]$ is weakly contractible (Remark 8.5.4.16), so that the inclusion map $\text{Spine}[\mathbf{Z}] \hookrightarrow \{u\} \star \text{Spine}[\mathbf{Z}]$ is right anodyne (Proposition 4.3.7.9). Applying Corollary 7.2.2.3, we can replace (2) by the condition that $S^\pm$ is a colimit diagram in $\mathcal{C}$. Moreover, the functor S^- admits a colimit if and only if $S = S^\pm|_{\text{Spine}[\mathbf{Z}]}$ admits a colimit (Corollary 7.2.2.10). Invoking Corollary 7.3.6.15 twice, we deduce that the restriction functor

$$R : \tilde{\mathcal{D}} \rightarrow \mathcal{D} \quad S^\pm \mapsto S^\pm|_{\text{Spine}[\mathbf{Z}]}$$

is a trivial Kan fibration of ∞ -categories.

Let $\tilde{\mathcal{D}}^w$ denote the replete full subcategory of $\tilde{\mathcal{D}}$ spanned by those functors $S^\pm$ for which the composition

$$\Delta^1 \simeq \{u\} \star \{v\} \hookrightarrow \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\} \xrightarrow{S^\pm} \mathcal{C}$$

is an isomorphism in $\mathcal{C}$. Let $\mathcal{D}^w \subseteq \mathcal{D}$ be the essential image of $\tilde{\mathcal{D}}^w$ under R , so that R restricts to a trivial Kan fibration $R^w : \tilde{\mathcal{D}}^w \rightarrow \mathcal{D}^w$.

Let $T : \text{End}_{\mathcal{C}} \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C})$ be the functor given by precomposition with the covering map $\text{Spine}[\mathbf{Z}] \rightarrow \Delta^1 / \partial \Delta^1$ (see Notation 8.5.4.13). By definition, and endomorphism e of $\mathcal{C}$ is weakly split if and only if the associated diagram $T_e : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ is an object of $\mathcal{D}^w$. Consequently, the functor T restricts to a functor $T^w : \text{End}_{\mathcal{C}} \rightarrow \mathcal{D}^w$.

Since the object $\tilde{Y} \in \text{Ret}$ is both initial and final, the diagram $Q : \text{Spine}[\mathbf{Z}] \rightarrow \mathbf{N}_\bullet(\text{Idem})$ admits a unique extension $Q^\pm : \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\} \rightarrow \mathbf{N}_\bullet(\text{Ret})$ carrying both u and v to the object $\tilde{Y}$. It follows from Lemma 8.5.7.16 that precomposition with $Q^\pm$ induces a functor

$$\tilde{T} : \text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \tilde{\mathcal{D}}^w \subseteq \text{Fun}(\{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\}, \mathcal{C}).$$

By construction, we have a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}) & \xrightarrow{\tilde{T}} & \tilde{\mathcal{D}}^w \\ \downarrow & & \downarrow \sim R^w \\ \text{End}_{\mathcal{C}}^w & \xrightarrow{T^w} & \mathcal{D}^w, \end{array}$$

where the right vertical map is a trivial Kan fibration. Consequently, to show that the left vertical map has a left homotopy inverse, it will suffice to show that the functor $\tilde{T}$ has a left homotopy inverse.

Note that precomposition with the map

$$\Delta^2 \simeq \{u\} \star \{0\} \star \{v\} \hookrightarrow \{u\} \star \text{Spine}[\mathbf{Z}] \star \{v\}$$

determines an evaluation functor $\text{ev} : \tilde{\mathcal{D}} \rightarrow \text{Fun}(\Delta^2, \mathcal{C})$. Let $\text{Fun}^w(\Delta^2, \mathcal{C})$ denote the full subcategory of $\text{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{u} & Y' \end{array}$$

where u is an isomorphism, so that ev restricts to a functor $\text{ev}^w : \tilde{\mathcal{D}}^w \rightarrow \text{Fun}^w(\Delta^2, \mathcal{C})$. It will therefore suffice to show that the composite functor

$$\text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}) \xrightarrow{\tilde{T}} \tilde{\mathcal{D}}^w \xrightarrow{\text{ev}^w} \text{Fun}^w(\Delta^2, \mathcal{C})$$

has a left homotopy inverse. We conclude by observing that this composite functor is an equivalence of ∞ -categories, by virtue of Corollary 8.5.1.30. $\square$

Proof of Proposition 8.5.7.4. Let $\mathcal{C}$ be an ∞ -category. We wish to show that the restriction functor

$$R : \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C}) \rightarrow \text{End}_{\mathcal{C}}^{\text{idm}}$$

has a left homotopy inverse. Using Corollary 8.5.5.4, we can choose a fully faithful functor $H : \mathcal{C} \rightarrow \mathcal{C}'$, where $\mathcal{C}'$ is idempotent-complete. Replacing $\mathcal{C}$ by the essential image of H , we may assume without loss of generality that $\mathcal{C}$ is a full subcategory of $\mathcal{C}'$ (and H is the inclusion functor). Then R is the restriction of a functor $R' : \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C}') \rightarrow \text{End}_{\mathcal{C}'}^{\text{idm}}$. Since $\mathcal{C}'$ is idempotent-complete, every idempotent endomorphism in $\mathcal{C}'$ is split, and therefore weakly split. Applying Proposition 8.5.7.19, we deduce that the composition

$$\text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}') \rightarrow \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C}') \xrightarrow{R'} \text{End}_{\mathcal{C}'}^{\text{idm}} \subseteq \text{End}_{\mathcal{C}'}^w$$

admits a left homotopy inverse. The restriction map $\text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}') \rightarrow \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C}')$ is an equivalence of ∞ -categories (Remark 8.5.4.10), so R' admits a left homotopy inverse $S' : \text{End}_{\mathcal{C}'}^{\text{idm}} \rightarrow \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C}')$. Restricting to the full subcategory $\text{End}_{\mathcal{C}}^{\text{idm}} \subseteq \text{End}_{\mathcal{C}'}^{\text{idm}}$, we obtain a functor $S : \text{End}_{\mathcal{C}}^{\text{idm}} \rightarrow \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C})$ which is left homotopy inverse to R . $\square$

8.5.8 Homotopy Idempotent Endomorphisms

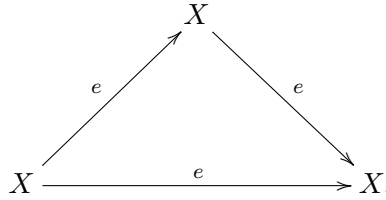

Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. If e is idempotent (in the sense of Definition 8.5.7.3), then the homotopy class $[e]$ is an idempotent endomorphism in the homotopy category $\text{h}\mathcal{C}$. One can ask if the converse is true: if the homotopy class $[e]$ is an idempotent endomorphism in $\text{h}\mathcal{C}$, does it follow that e is an idempotent endomorphism

041V

in $\mathcal{C}$? In this section, we will show that this question has a negative answer in general (Proposition 8.5.8.15), but a positive answer under some additional assumptions (Corollary 8.5.8.5). Let us begin by introducing some terminology.

041W **Definition 8.5.8.1.** Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. We say that e is *homotopy idempotent* if the homotopy class $[e]$ is an idempotent in the homotopy category $\mathrm{h}\mathcal{C}$, in the sense of Definition 8.5.2.1.

041X **Remark 8.5.8.2.** Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. Then e is homotopy idempotent if and only if there exists a 2-simplex σ of $\mathcal{C}$ whose boundary is indicated in the diagram

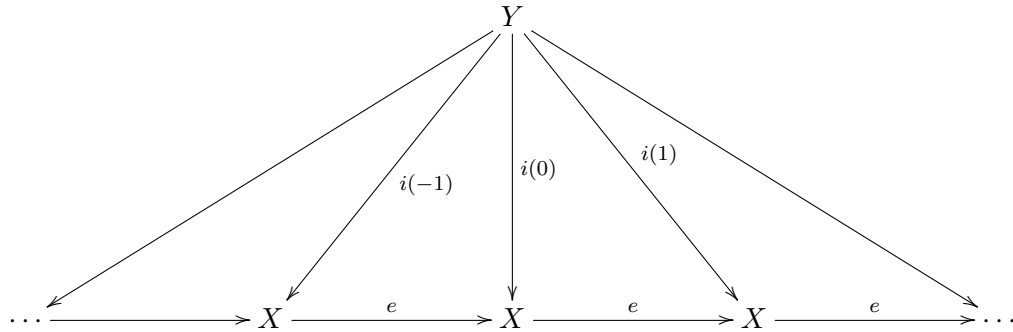

041Y **Example 8.5.8.3.** Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. If e is idempotent (that is, if it extends to a functor $N_{\bullet}(\mathrm{Idem}) \rightarrow \mathcal{C}$), then it is homotopy idempotent.

We now provide a partial converse to Example 8.5.8.3.

041Z **Proposition 8.5.8.4.** Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. The following conditions are equivalent:

- (1) The homotopy class $[e]$ is a split idempotent in the homotopy category $\mathrm{h}\mathcal{C}$.
- (2) The endomorphism e is a split idempotent in $\mathcal{C}$.
- (3) The endomorphism e is homotopy idempotent and weakly split (Definition 8.5.7.14).
- (4) The endomorphism e is homotopy idempotent and there exists a limit diagram

in $\mathcal{C}$, where the morphism $i(0)$ has a left homotopy inverse.

Proof. The equivalence (1) $\Leftrightarrow$ (2) is tautology, the implication (2) $\Rightarrow$ (3) follows from Proposition 8.5.7.17 (and Example 8.5.8.3), and the implication (3) $\Rightarrow$ (4) is immediate. We will complete the proof by showing that (4) implies (1). Assume that e is homotopy idempotent, so that there exists a 2-simplex σ of $\mathcal{C}$ whose boundary is indicated in the diagram

$$\begin{array}{ccc} & X & \\ e \nearrow & & \searrow e \\ X & \xrightarrow{e} & X. \end{array}$$

Let $\text{Spine}[\mathbf{Z}]$ denote the 1-dimensional simplicial set of Notation 8.5.4.13, and let $T_\sigma : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}_{X/}$ be the morphism of simplicial sets which carries each vertex of $\text{Spine}[\mathbf{Z}]$ to e (regarded as an object of the coslice ∞ -category $\mathcal{C}_{X/}$) and each nondegenerate edge of $\text{Spine}[\mathbf{Z}]$ to σ (regarded as a morphism of the coslice ∞ -category $\mathcal{C}_{X/}$). We will identify T_σ with a diagram $\bar{T}_e : \text{Spine}[\mathbf{Z}]^\triangleleft \rightarrow \mathcal{C}$, where the restriction $\bar{T}_e|_{\text{Spine}[\mathbf{Z}]}$ is the diagram $T_e : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$ of Notation 8.5.7.11. Let us further identify $\bar{T}_e$ with an object $\bar{X}$ of the slice ∞ -category $\mathcal{C}_{/T_e}$, lying over the object $X \in \mathcal{C}$. By virtue of assumption (4), the ∞ -category $\mathcal{C}_{/T_e}$ has a final object $\bar{Y}$, lying over a some object $Y \in \mathcal{C}$. We can therefore choose a morphism $\bar{r} : \bar{X} \rightarrow \bar{Y}$ in the ∞ -category $\mathcal{C}_{/T_e}$, having some image $r : X \rightarrow Y$ in $\mathcal{C}$. The morphism $\bar{r}$ can be identified with a diagram $\Delta^1 \star \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{C}$, which we display informally as

$$\begin{array}{ccccccc} & & X & & & & \\ & & \downarrow r & & & & \\ & & Y & & & & \\ & i(-1) \swarrow & \downarrow i(0) & \searrow i(1) & & & \\ \dots & \longrightarrow & X & \xrightarrow{e} & X & \xrightarrow{e} & X \longrightarrow \dots \end{array}$$

By construction, the restriction of this diagram to the middle column witnesses the equality $[i(0)] \circ [r] = [e]$ in the homotopy category $\text{h}\mathcal{C}$. To show that the homotopy class $[e]$ is a split idempotent, it will suffice to show that $[r] \circ [i(0)]$ is the identity morphism $[\text{id}_Y]$ in the homotopy category $\text{h}\mathcal{C}$. Since the morphism $[i(0)]$ admits a left inverse, it will suffice to

show that equality holds after postcomposition with $[i(0)]$. This follows from the calculation

$$\begin{aligned}
 [i(0)] \circ ([r] \circ [i(0)]) &= ([i(0)] \circ [r]) \circ [i(0)] \\
 &= [e] \circ [i(0)] \\
 &= [e] \circ ([e] \circ [i(-1)]) \\
 &= ([e] \circ [e]) \circ [i(-1)] \\
 &= [e] \circ [i(-1)] \\
 &= [i(0)].
 \end{aligned}$$

□

0420 **Corollary 8.5.8.5.** *Let $\mathcal{C}$ be an ∞ -category which is sequentially complete and cocomplete, and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. Then e is idempotent if and only if it is homotopy idempotent and the composite map*

$$\varprojlim(\cdots \rightarrow X \xrightarrow{e} X \rightarrow \cdots) \rightarrow X \rightarrow \varinjlim(\cdots \rightarrow X \xrightarrow{e} X \rightarrow \cdots)$$

is an isomorphism (see Definition 8.5.7.14).

Proof. This is a special case of Proposition 8.5.8.4, together with the observation that every idempotent in $\mathcal{C}$ is split (Proposition 8.5.7.12). □

Let us now present a sample application of Proposition 8.5.8.4.

0421 **Corollary 8.5.8.6.** *Let X be a connected Kan complex and let $x \in X$ be a vertex. Then every homotopy idempotent endomorphism $e : (X, x) \rightarrow (X, x)$ in the ∞ -category $\mathcal{S}_*$ is (split) idempotent.*

Proof. Without loss of generality, we may assume that the morphism e is obtained from a morphism $(X, x) \rightarrow (X, x)$ in the ordinary category of pointed Kan complexes (see Proposition 5.5.3.8). Then the diagram $T_e : \text{Spine}[\mathbf{Z}] \rightarrow \mathcal{S}_*$ of Notation 8.5.7.11 lifts to a functor of ordinary categories $\mathcal{F} : (\mathbf{Z}, \leq) \rightarrow \text{Kan}_*$, which we display as

$$\cdots \rightarrow (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \xrightarrow{e} (X, x) \rightarrow \cdots$$

Let us abuse notation by identifying $\mathcal{F}$ with its image in the category of Kan complexes Kan . Applying Variant 7.5.3.6, we can choose a levelwise homotopy equivalence $\alpha : \mathcal{F} \rightarrow \mathcal{G}$, where $\mathcal{G} : (\mathbf{Z}, \leq) \rightarrow \text{Kan}$ is an isofibrant diagram of Kan complexes. Note that we can also regard $\mathcal{G}$ as a diagram of pointed Kan complexes, by equipping each $\mathcal{G}(n)$ with the base point $y_n = \alpha(n)(x)$. Let us extend $\mathcal{G}$ to a functor $\mathcal{G}^\pm : (\mathbf{Z} \cup \{-\infty, \infty\}, \leq) \rightarrow \text{Kan}_*$ by setting $\mathcal{G}^\pm(-\infty) = \varprojlim(\mathcal{G})$ and $\mathcal{G}^\pm(\infty) = \varinjlim(\mathcal{G})$, where the limit and colimit are formed in the category of (pointed) simplicial sets; we denote the base points of $\mathcal{G}^\pm(-\infty)$ and $\mathcal{G}^\pm(\infty)$

by $y_{-\infty}$ and y_{∞} , respectively. Passing to nerves, the functor $\mathcal{G}^{\pm}$ determines a diagram $S : \{-\infty\} \star \text{Spine}[\mathbf{Z}] \star \{\infty\} \rightarrow \mathcal{S}_*$.

Let $U : \mathcal{S}_* \rightarrow \mathcal{S}$ be the forgetful functor (given on objects by $U(X, x) = X$). Since the diagram $\mathcal{G}$ is isofibrant and the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow N_{\bullet}(\mathbf{Z})$ is left cofinal (Remark 8.5.4.15), the restriction $(U \circ S)|_{\{-\infty\} \star \text{Spine}[\mathbf{Z}]}$ is a limit diagram in the ∞ -category $\mathcal{S}$ (Corollary 7.5.4.7). Applying Corollary 7.1.4.22, we see that $S|_{\{-\infty\} \star \text{Spine}[\mathbf{Z}]}$ is a limit diagram in the ∞ -category $\mathcal{S}_*$. Since the partially ordered set $(\mathbf{Z}, \geq)$ is directed and the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow N_{\bullet}(\mathbf{Z})$ is right cofinal, the restriction $(U \circ S)|_{\text{Spine}[\mathbf{Z}] \star \{\infty\}}$ is a colimit diagram in the ∞ -category $\mathcal{S}$ (Corollary 9.1.6.3). Since the spine $\text{Spine}[\mathbf{Z}]$ is weakly contractible (Remark 8.5.4.16), it follows that $S|_{\text{Spine}[\mathbf{Z}] \star \{\infty\}}$ is a colimit diagram in the ∞ -category $\mathcal{S}_*$. Moreover, the natural transformation α induces an isomorphism $T_e \rightarrow S|_{\text{Spine}[\mathbf{Z}]}$ in the ∞ -category $\text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{S}_*)$. It follows that the morphism e is idempotent if and only if the composition

$$\Delta^1 \simeq \{-\infty\} \star \{\infty\} \hookrightarrow \{-\infty\} \star \text{Spine}[\mathbf{Z}] \star \{\infty\} \xrightarrow{S} \mathcal{S}_*$$

is an isomorphism in $\mathcal{S}_*$: that is, if and only if the map of Kan complexes

$$\theta : \mathcal{G}^{\pm}(-\infty) = \varprojlim(\mathcal{G}) \rightarrow \varinjlim(\mathcal{G}) = \mathcal{G}^{\pm}(\infty)$$

is a homotopy equivalence of (pointed) Kan complexes (Corollary 8.5.8.6).

Since each $\mathcal{G}(n)$ is a connected Kan complex, it follows that the colimit $\varinjlim(\mathcal{G})$ is also connected. By virtue of Theorem 3.2.7.1, it will suffice to show that, for every integer $d \geq 0$, θ induces a bijection $\pi_d(\varprojlim(\mathcal{G}), y_{-\infty}) \rightarrow \pi_d(\varinjlim(\mathcal{G}), y_{\infty})$ (note that, in the case $d = 0$, this guarantees that the Kan complex $\varprojlim(\mathcal{G})$ is also connected, so that a similar conclusion holds for any choice of base point). Let $\overleftarrow{G}$ denote the diagram of sets

$$\cdots \rightarrow \pi_d(\mathcal{G}(-1), y_{-1}) \rightarrow \pi_d(\mathcal{G}(0), y_0) \rightarrow \pi_d(\mathcal{G}(1), y_1) \rightarrow \cdots$$

Note that α determines an isomorphism of $\overleftarrow{G}$ with the diagram

$$\cdots \rightarrow \pi_d(X, x) \xrightarrow{f_d} \pi_d(X, x) \xrightarrow{f_d} \pi_d(X, x) \rightarrow \cdots$$

where each of the transition maps is induced by e . Since e is homotopic to $e \circ e$ (in the homotopy category of pointed Kan complexes), it follows that $f_d = f_d \circ f_d$, so that the tautological map $v : \varprojlim(\overleftarrow{G}) \rightarrow \varinjlim(\overleftarrow{G})$ is a bijection. Unwinding the definition, we see that $\pi_d(\theta)$ factors as a composition

$$\pi_d(\varprojlim_n \mathcal{G}(n), y_{\infty}) \xrightarrow{u} \varprojlim_n \pi_d(\mathcal{G}(n), y_n) \xrightarrow{v} \varinjlim_n \pi_d(\mathcal{G}(n), y_n) \xrightarrow{w} \pi_d(\mathcal{G}(\infty), y_{\infty}),$$

where the map w is also bijective (Remark 3.2.2.16). It will therefore suffice to show that the map u is bijective. By virtue of the Milnor exact sequence (Proposition [?]), this is

equivalent to the assertion that the set

$$\varprojlim^1(\cdots \rightarrow \pi_{d+1}(\mathcal{G}(-2), y_{-2}) \rightarrow \pi_{d+1}(\mathcal{G}(-1), y_{-1}) \rightarrow \pi_{d+1}(\mathcal{G}(0), y_0))$$

has a single element. This is a special case of Proposition [?], since the inverse system of groups

$$\cdots \rightarrow \pi_{d+1}(X, x) \xrightarrow{f_{d+1}} \pi_{d+1}(X, x) \xrightarrow{f_{d+1}} \pi_{d+1}(X, x)$$

is Mittag-Leffler (since f_{d+1} is idempotent, its image coincides with the image of f_{d+1}^n for every integer $n > 0$). $\square$

0422 Corollary 8.5.8.7. *Let X be a connected Kan complex and let $e : X \rightarrow X$ be a homotopy idempotent endomorphism in the ∞ -category $\mathcal{S}$. Then e is idempotent if and only if it can be lifted to a homotopy endomorphism $\tilde{e} : (X, x) \rightarrow (X, x)$ in the ∞ -category $\mathcal{S}_*$.*

Proof. Let $\tilde{e} : (X, x) \rightarrow (X, x)$ be a lift of e to a morphism in the ∞ -category $\mathcal{S}_*$. If $\tilde{e}$ is homotopy idempotent, then it is idempotent (Corollary 8.5.8.6), so that e is also idempotent. For the converse, suppose that e is idempotent: that is, it can be extended to a functor $F : \mathbf{N}_\bullet(\text{Idem}) \rightarrow \mathcal{C}$. Since the ∞ -category $\mathcal{S}$ admits small colimits (Corollary 7.4.3.3), the idempotent F splits. Consequently, there is a retraction diagram

0423

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{\text{id}_Y} & Y \end{array} \quad (8.66)$$

in the ∞ -category of spaces $\mathcal{S}$, where e is homotopic to the composition $(i \circ r) : X \rightarrow X$. Fix vertices $x \in X$ and $y \in Y$. Since X is connected, we can lift i to a morphism $\tilde{i} : (Y, y) \rightarrow (X, x)$ in the ∞ -category $\mathcal{S}_*$ (see Example 5.5.3.4). Since the forgetful functor $\mathcal{S}_* \rightarrow \mathcal{S}$ is a left fibration, we can lift (8.66) to a retraction diagram

$$\begin{array}{ccc} & (X, x) & \\ \tilde{i} \nearrow & & \searrow \tilde{r} \\ (Y, y) & \xrightarrow{\text{id}} & (Y, y) \end{array}$$

in the ∞ -category $\mathcal{S}_*$. It follows that e can be lifted to a (split) homotopy idempotent in $\mathcal{S}_*$, given by any composition of $\tilde{r}$ with $\tilde{i}$. $\square$

Exercise 8.5.8.8. Let (X, x) be a pointed Kan complex and let $e : X \rightarrow X$ be a morphism from X to itself. Show that: 0424

- If X is connected, then e can be lifted to a morphism $\tilde{e} : (X, x) \rightarrow (X, x)$ in the ∞ -category $\mathcal{S}_*$.
- If X is simply connected, then e is homotopy idempotent (in the ∞ -category $\mathcal{S}$) if and only if $\tilde{e}$ is homotopy idempotent (in the ∞ -category $\mathcal{S}_*$).

In particular, if X is simply connected, then every homotopy idempotent $e : X \rightarrow X$ is (split) idempotent (Corollary 8.5.8.7).

In the situation of Exercise 8.5.8.8, the simple connectivity assumption on X cannot be omitted. That is, not every homotopy idempotent in the ∞ -category $\mathcal{S}$ is split. We present a counterexample, due originally to Freyd and Heller (see [23]).

Definition 8.5.8.9 (Dyadic Homeomorphisms). Recall that a *dyadic rational number* is a real number of the form $\frac{a}{2^n}$, where a and n are integers. Let $s, t \geq 0$ be dyadic rational numbers. We say that a homeomorphism $f : [0, s] \xrightarrow{\sim} [0, t]$ is *dyadic* if it satisfies the following conditions: 0425

- The function f is piecewise linear; in particular, it is differentiable away from finitely many points of the closed interval $[0, s]$.
- If $x \in [0, s]$ is a point where f is not differentiable, then x is a dyadic rational number.
- For every point $x \in [0, s]$ where f is differentiable, the derivative $f'(x)$ is equal to 2^n for some integer n .

Note that the third condition implies that the homeomorphism f is strictly increasing, so that $f(0) = 0$ and $f(s) = t$.

Exercise 8.5.8.10 (Inverses of Dyadic Homeomorphisms). Let $s, t \geq 0$ be dyadic rational numbers and let $f : [0, s] \xrightarrow{\sim} [0, t]$ be a dyadic homeomorphism. Show that the inverse homeomorphism $f^{-1} : [0, t] \xrightarrow{\sim} [0, s]$ is also dyadic. 0426

Exercise 8.5.8.11 (Composition of Dyadic Homeomorphisms). Let $s, t, u \geq 0$ be dyadic rational numbers and let $f : [0, s] \xrightarrow{\sim} [0, t]$ and $g : [0, t] \xrightarrow{\sim} [0, u]$ be dyadic homeomorphisms. Show that the composition $(g \circ f) : [0, s] \xrightarrow{\sim} [0, u]$ is also a dyadic homeomorphism. 0427

Definition 8.5.8.12 (The Thompson Group). Let $\text{Aut}_{\text{Dy}}([0, 1])$ denote the collection of all dyadic homeomorphisms from the unit interval $[0, 1]$ to itself. It follows from Exercises 8.5.8.10 and 8.5.8.11 that $\text{Aut}_{\text{Dy}}([0, 1])$ has the structure of a group (where the group law is given by composition of homeomorphisms). We will refer to $\text{Aut}_{\text{Dy}}([0, 1])$ as the *Thompson group*. 0428

0429 **Construction 8.5.8.13** (Speeding Up). Let $f : [0, 1] \rightarrow [0, 1]$ be an orientation-preserving homeomorphism. We define $\alpha(f) : [0, 1] \rightarrow [0, 1]$ by the formula

$$\alpha(f)(x) = \begin{cases} f(2x)/2 & \text{if } 0 \leq x \leq 1/2 \\ x & \text{if } 1/2 \leq x \leq 1. \end{cases}$$

Then $\alpha(f)$ is also an orientation-preserving homeomorphism of $[0, 1]$ with itself. Moreover, if f is dyadic, then $\alpha(f)$ is also dyadic. It follows that the construction $f \mapsto \alpha(f)$ determines a group homomorphism α from the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$ to itself.

042A **Proposition 8.5.8.14.** *Let $\text{Aut}_{\text{Dy}}([0, 1])$ be the Thompson group of Definition 8.5.8.12 and let $X = B_{\bullet} \text{Aut}_{\text{Dy}}([0, 1])$ denote its classifying simplicial set (Construction 1.3.2.5). Then the homomorphism α of Construction 8.5.8.13 induces a homotopy idempotent endomorphism $e : X \rightarrow X$ in the ∞ -category $\mathcal{S}$.*

Proof. We wish to show that the diagram of Kan complexes

$$\begin{array}{ccc} & X & \\ e \nearrow & & \searrow e \\ X & \xrightarrow{e} & X \end{array}$$

commutes up to homotopy. By virtue of Proposition 1.5.3.3, this is equivalent to the assertion that the homomorphisms $\alpha, \alpha^2 : \text{Aut}_{\text{Dy}}([0, 1]) \rightarrow \text{Aut}_{\text{Dy}}([0, 1])$ are conjugate: that is, there exists an element $g \in \text{Aut}_{\text{Dy}}([0, 1])$ satisfying the identity $\alpha(f) \circ g = g \circ \alpha^2(f)$ for every element $f \in \text{Aut}_{\text{Dy}}([0, 1])$. Concretely, we can take g to be any dyadic homeomorphism satisfying the identity $g(x) = 2x$ for $0 \leq x \leq 1/4$. $\square$

We now show that the homotopy idempotent of Proposition 8.5.8.14 cannot be refined to an idempotent in the ∞ -category $\mathcal{S}$.

042B **Proposition 8.5.8.15.** *Let $X = B_{\bullet} \text{Aut}_{\text{Dy}}([0, 1])$. Then homotopy idempotent endomorphism $e : X \rightarrow X$ of Proposition 8.5.8.14 is not idempotent.*

Proof. Let x denote the unique vertex of X . Suppose, for a contradiction, that e is idempotent. Then we can lift e to a homotopy idempotent morphism $\tilde{e} : (X, x) \rightarrow (X, x)$ in the ∞ -category $\mathcal{S}_*$ (Corollary 8.5.8.7). Passing to fundamental groups, we obtain an idempotent homomorphism β from the Thompson group $\text{Aut}_{\text{Dy}}([0, 1]) = \pi_1(X, x)$ to itself. Since the forgetful functor $\mathcal{S}_* \rightarrow \mathcal{S}$ carries $\tilde{e}$ to e , β is conjugate to the homomorphism α of Construction 8.5.8.13. Since α is a monomorphism, it follows that β is also a monomorphism. The equation $\beta^2 = \beta$ then implies that β is the identity map. This is a contradiction, since β is conjugate to the homomorphism α (which is not the identity morphism). $\square$

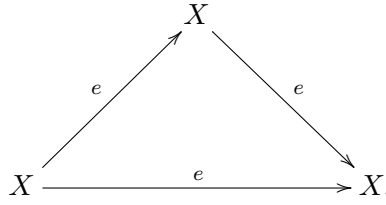

8.5.9 Partial Idempotents

Let Idem denote the category introduced in Construction 8.5.2.7. For each integer $n \geq 0$, we let $N_{\leq n}(\text{Idem})$ denote the n -skeleton of the simplicial set $N_{\bullet}(\text{Idem})$ (see Variant 1.3.1.6). If $\mathcal{C}$ is an ∞ -category, we will refer to a morphism $N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$ as a *partial idempotent* in $\mathcal{C}$. 042C

Example 8.5.9.1. The simplicial set $N_{\leq 0}(\text{Idem})$ is isomorphic to the standard simplex Δ^0 . Consequently, if $\mathcal{C}$ is an ∞ -category, then a morphism $N_{\leq 0}(\text{Idem}) \rightarrow \mathcal{C}$ can be identified with an object $X \in \mathcal{C}$. 042D

Example 8.5.9.2. The simplicial set $N_{\leq 1}(\text{Idem})$ can be identified with the simplicial circle $\Delta^1 / \partial \Delta^1$, obtained from the standard simplex Δ^1 by identifying its endpoints. Consequently, if $\mathcal{C}$ is an ∞ -category, then a morphism $N_{\leq 1}(\text{Idem}) \rightarrow \mathcal{C}$ can be identified with a pair (X, e) , where X is an object of $\mathcal{C}$ and e is an endomorphism of X . 042E

Example 8.5.9.3. Let $\mathcal{C}$ be an ∞ -category. Then a morphism $N_{\leq 2}(\text{Idem}) \rightarrow \mathcal{C}$ can be identified with a triple (X, e, σ) , where X is an object of $\mathcal{C}$, $e : X \rightarrow X$ is an endomorphism of X , and σ is a 2-simplex of $\mathcal{C}$ with boundary indicated in the diagram 042F

so that σ witnesses the identity $[e] = [e] \circ [e]$ in the homotopy category $\text{h}\mathcal{C}$.

Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$, which we identify with a morphism $F_{\leq 1} : N_{\leq 1}(\text{Idem}) \rightarrow \mathcal{C}$. The endomorphism e is homotopy idempotent (in the sense of Definition 8.5.8.1) if and only if $F_{\leq 1}$ admits an extension $F_{\leq 2} : N_{\leq 2}(\text{Idem}) \rightarrow \mathcal{C}$. Proposition 8.5.8.15 shows that this condition does not guarantee the existence of an idempotent $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ extending $F_{\leq 1}$. Our goal in this section is to show that a slightly stronger condition does suffice: namely, it is enough to assume that $F_{\leq 1}$ can be extended to a diagram $F_{\leq 3} : N_{\leq 3}(\text{Idem}) \rightarrow \mathcal{C}$. This is a consequence of the following:

Theorem 8.5.9.4. Let $n \geq 3$ be an integer. The inclusion map $N_{\leq n}(\text{Idem}) \hookrightarrow N_{\bullet}(\text{Idem})$ admits a factorization 042G

$$N_{\leq n}(\text{Idem}) \xrightarrow{\iota} \mathcal{E} \xrightarrow{U} N_{\bullet}(\text{Idem}),$$

where $\mathcal{E}$ is an ∞ -category, ι is an inner anodyne morphism which is bijective on simplices of dimension $< n$, and the functor U admits a right inverse $V : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{E}$.

042H **Remark 8.5.9.5.** In the situation of Theorem 8.5.9.5, we can regard ι and $V|_{N_{\leq n}(\text{Idem})}$ as morphisms from $N_{\leq n}(\text{Idem})$ to $\mathcal{E}$. By construction, these morphisms coincide after composing with the functor $U : \mathcal{E} \rightarrow N_{\bullet}(\text{Idem})$. Since U is bijective on simplices of dimensions $< n$, it follows that ι and $V|_{N_{\leq n}(\text{Idem})}$ coincide when on the $(n-1)$ -skeleton of $N_{\bullet}(\text{Idem})$. Beware that ι and V do *not* coincide on the nondegenerate n -simplex of $N_{\bullet}(\text{Idem})$. In fact, we claim that ι and $V|_{N_{\leq n}(\text{Idem})}$ are not even isomorphic when viewed as an object of the ∞ -category $\text{Fun}(N_{\leq n}(\text{Idem}), \mathcal{E})$. Assume, for a contradiction, that there exists an isomorphism α of $\iota = \text{id}_{\mathcal{E}} \circ \iota$ with $V|_{N_{\leq n}(\text{Idem})} = (V \circ U) \circ \iota$. Since ι is inner anodyne, we could then lift α to an isomorphism $\tilde{\alpha} : \text{id}_{\mathcal{E}} \rightarrow V \circ U$ in the ∞ -category $\text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C})$. It would follow that U is an equivalence of ∞ -categories (with homotopy inverse given by V). Then $(U \circ \iota) : N_{\leq n}(\text{Idem}) \rightarrow N_{\bullet}(\text{Idem})$ would be a categorical equivalence of simplicial sets, which contradicts Remark 8.5.4.19.

We will give the proof of Theorem 8.5.9.4 at the end of this section. First, let us record some consequences.

042J **Corollary 8.5.9.6.** *Let $n \geq 3$ be an integer, and let $\mathcal{C}$ be an ∞ -category equipped with a partial idempotent $F_{<n} : N_{\leq n-1}(\text{Idem}) \rightarrow \mathcal{C}$. The following conditions are equivalent:*

- (1) *The morphism $F_{<n}$ extends to an idempotent $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$.*
- (2) *The morphism $F_{<n}$ extends to a partial idempotent $F_{\leq n} : N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$.*

Proof. The implication (1) $\Rightarrow$ (2) is immediate. To prove the converse, suppose that $F_{\leq n} : N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$ is an extension of $F_{<n}$. Let $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$, $U : \mathcal{E} \rightarrow N_{\bullet}(\text{Idem})$, and $V : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{E}$ be as in Theorem 8.5.9.4. Since ι is inner anodyne, we can choose a functor $\overline{F} : \mathcal{E} \rightarrow \mathcal{C}$ satisfying $\overline{F} \circ \iota = F_{\leq n}$. Then $F = \overline{F} \circ V$ is a functor from $N_{\bullet}(\text{Idem})$ to $\mathcal{C}$, and Remark 8.5.9.5 shows that F coincides with $F_{<n}$ on the $(n-1)$ -skeleton of $N_{\bullet}(\text{Idem})$. $\square$

042K **Warning 8.5.9.7.** Let $\mathcal{C}$ be an ∞ -category and let $F_{\leq n} : N_{\leq n}(\text{Idem}) \rightarrow \mathcal{C}$ be a partial idempotent in $\mathcal{C}$. Corollary 8.5.9.6 asserts that, if $n \geq 3$, then we can choose an idempotent $F : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{C}$ such that F and $F_{\leq n}$ coincide on the $(n-1)$ -skeleton $N_{\bullet}(\text{Idem})$. Beware that we generally cannot arrange that $F|_{N_{\leq n}(\text{Idem})}$ coincides with $F_{\leq n}$. For example, this always fails in the (universal) case $F_{\leq n}$ is the inner anodyne morphism $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$ of Theorem 8.5.9.4 (see Remark 8.5.9.5).

042L **Corollary 8.5.9.8.** *Let $\mathcal{C}$ be an ∞ -category and let $e : X \rightarrow X$ be an endomorphism in $\mathcal{C}$. Then e is idempotent if and only if it can be extended to a diagram $N_{\leq 3}(\text{Idem}) \rightarrow \mathcal{C}$.*

042M **Corollary 8.5.9.9.** *Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category $\mathcal{I}$. Suppose that each $\mathcal{C}_i$ is an ∞ -category. Then the tautological map*

$$\theta : \varinjlim_{i \in \mathcal{I}} \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) \rightarrow \text{Fun}(N_{\bullet}(\text{Idem}), \varinjlim_{i \in \mathcal{I}} \mathcal{C}_i)$$

is an equivalence of ∞ -categories.

Proof. Choose any integer $n \geq 3$, and let $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$, $U : \mathcal{E} \rightarrow N_{\bullet}(\text{Idem})$, and $V : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{E}$ be as in Theorem 8.5.9.4. We then have a commutative diagram of ∞ -categories

$$\begin{array}{ccccc} \varinjlim \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) & \xrightarrow{\circ V} & \varinjlim \text{Fun}(\mathcal{E}, \mathcal{C}_i) & \xrightarrow{\circ U} & \varinjlim \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) \\ \downarrow \theta & & \downarrow \theta' & & \downarrow \theta \\ \text{Fun}(N_{\bullet}(\text{Idem}), \varinjlim \mathcal{C}_i) & \xrightarrow{\circ V} & \text{Fun}(\mathcal{E}, \varinjlim \mathcal{C}_i) & \xrightarrow{\circ U} & \text{Fun}(N_{\bullet}(\text{Idem}), \varinjlim \mathcal{C}_i), \end{array}$$

where the horizontal compositions are identity morphisms. Consequently, to show that θ is an equivalence of ∞ -categories, it will suffice to show that θ' is an equivalence of ∞ -categories (Proposition 8.5.1.7). The functor θ' fits into a commutative diagram

$$\begin{array}{ccc} \varinjlim \text{Fun}(\mathcal{E}, \mathcal{C}_i) & \xrightarrow{\circ \iota} & \varinjlim \text{Fun}(N_{\leq n}(\text{Idem}), \mathcal{C}_i) \\ \downarrow \theta' & & \downarrow \theta'' \\ \text{Fun}(\mathcal{E}, \varinjlim \mathcal{C}_i) & \xrightarrow{\circ \iota} & \text{Fun}(N_{\leq n}(\text{Idem}), \varinjlim (\mathcal{C}_i)). \end{array}$$

Since ι is inner anodyne, the horizontal maps are trivial Kan fibrations (Proposition 1.5.7.6). We conclude by observing that θ'' is an isomorphism of simplicial sets, since the simplicial set $N_{\leq n}(\text{Idem})$ is finite (Corollary 3.6.1.10). $\square$

Corollary 8.5.9.10. *Let $\{\mathcal{C}_i\}_{i \in \mathcal{I}}$ be a diagram of simplicial sets indexed by a filtered category $\mathcal{I}$. Suppose that each $\mathcal{C}_i$ is an idempotent-complete ∞ -category. Then the colimit $\mathcal{C} = \varinjlim_i \mathcal{C}_i$ is idempotent-complete.* 042N

Proof. For each object $i \in \mathcal{I}$, our assumption that $\mathcal{C}_i$ is idempotent-complete guarantees that the restriction functor $R_i : \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}_i) \rightarrow \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i)$ is an equivalence of ∞ -categories (Remark 8.5.4.10). Passing to filtered colimits, we deduce that the induced map $\varinjlim \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}_i) \rightarrow \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i)$ is also an equivalence of ∞ -categories (Corollary 4.5.7.2). This map fits into a commutative diagram

$$\begin{array}{ccc} \varinjlim \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}_i) & \longrightarrow & \text{Fun}(N_{\bullet}(\text{Ret}), \mathcal{C}) \\ \downarrow & & \downarrow R \\ \varinjlim \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}_i) & \longrightarrow & \text{Fun}(N_{\bullet}(\text{Idem}), \mathcal{C}), \end{array}$$

where the horizontal maps are equivalences of ∞ -categories (Corollaries 8.5.9.9 and 8.5.1.32). It follows that the restriction functor $R : \text{Fun}(\mathbf{N}_\bullet(\text{Ret}), \mathcal{C}) \rightarrow \text{Fun}(\mathbf{N}_\bullet(\text{Idem}), \mathcal{C})$ is also an equivalence of ∞ -categories, so that $\mathcal{C}$ is idempotent-complete (Remark 8.5.4.10). $\square$

We now turn to the proof of Theorem 8.5.9.4. The existence of an inner anodyne morphism $\iota : \mathbf{N}_{\leq n}(\text{Idem}) \rightarrow \mathcal{E}$ which is bijective on simplices of dimension $< n$ is essentially formal, by virtue of the following variant of Corollary 4.1.3.3:

042Q Lemma 8.5.9.11. *Let $n \geq 0$ be an integer and let K be a simplicial set which satisfies the following condition for $0 \leq m \leq n$:*

($\ast_m$) For every integer $0 < i < m$, every morphism of simplicial sets $\sigma : \Lambda_i^m \rightarrow K$ can be extended to an m -simplex of K .

Then there exists an inner anodyne morphism $\iota : K \hookrightarrow \mathcal{E}$, where $\mathcal{E}$ is an ∞ -category and ι is bijective on simplices of dimension $< n$.

Proof. We construct $\mathcal{E}$ as the colimit of a sequence of inner anodyne maps

$$K = K(0) \hookrightarrow K(1) \hookrightarrow K(2) \hookrightarrow K(3) \hookrightarrow \cdots$$

Assume that $K(t)$ has been constructed for some $t \geq 0$, and let S be the collection of all maps $\sigma : \Lambda_i^m \rightarrow K(t)$ where $0 < i < m$ and $m > n$. For every $\sigma \in S$, let us write C_σ for the simplicial set Λ_i^m which is the source of σ , and D_σ for the simplex Δ^m . We then construct a pushout diagram of simplicial sets

$$\begin{array}{ccc} \coprod_{\sigma \in S} C_\sigma & \longrightarrow & K(t) \\ \downarrow & & \downarrow \\ \coprod_{\sigma \in S} D_\sigma & \longrightarrow & K(t+1). \end{array}$$

By construction, the morphism $K(t) \rightarrow K(t+1)$ is inner anodyne and bijective on simplices of dimension $< n$. To complete the proof, it will suffice to show that the colimit $\mathcal{E} = \varinjlim_t K(t)$ is an ∞ -category. Fix a pair of integers $0 < i < m$ and a morphism $\sigma : \Lambda_i^m \rightarrow \mathcal{E}$; we wish to show that σ can be extended to an m -simplex of $\mathcal{E}$. Since Λ_i^m is a finite simplicial set, σ factors (uniquely) through $K(t)$ for some integer $t \gg 0$. By construction, if $m > n$ then σ can be extended to an m -simplex of $K(t+1)$. We may therefore assume that $m \leq n$. In this case, we can take $k = 0$, in which case the existence of the desired extension follows from assumption ($\ast_m$). $\square$

Example 8.5.9.12. Let $\mathcal{C}$ be an ∞ -category. For every integer $n \geq 0$, the skeleton $\mathrm{sk}_n(\mathcal{C})$ satisfies condition $(*_m)$ of Lemma 8.5.9.11 for $0 \leq m \leq n$. We can therefore choose an inner anodyne morphism $\iota : \mathrm{sk}_n(\mathcal{C}) \hookrightarrow \mathcal{E}$, where $\mathcal{E}$ is an ∞ -category and f is bijective on simplices of dimension $< n$. 042R

In what follows, we will write X for the unique object of the category Idem , and $e : X \rightarrow X$ for the unique non-identity morphism. The main content of Theorem 8.5.9.4 is contained in the following result:

Proposition 8.5.9.13. *Let $\mathcal{E}$ be an ∞ -category and let $\iota : N_{\leq 3}(\mathrm{Idem}) \rightarrow \mathcal{E}$ be a morphism of simplicial sets which is bijective on simplices of dimension ≤ 2 . Then $\iota(\tilde{e})$ is an idempotent morphism of $\mathcal{E}$.* 042S

Proof. Let us regard the linearly ordered set $\mathbf{Z} = \{\cdots < -2 < -1 < 0 < 1 < 2 < \cdots\}$ as a category. Let $X \in \mathrm{Fun}(\mathbf{Z}, \mathrm{Idem})$ denote the constant functor taking the value X , and let $Y \in \mathrm{Fun}(\mathbf{Z}, \mathrm{Idem})$ denote the functor which carries each non-identity morphism of $\mathbf{Z}$ to the morphism $\tilde{e}$ of Idem . We then have natural transformations

$$e_X : X \rightarrow X \quad i : Y \rightarrow X \quad r : X \rightarrow Y \quad e_Y : Y \rightarrow Y$$

which carry each element of $\mathbf{Z}$ to the morphism $\tilde{e}$. Note that the linearly ordered set $(\mathbf{Z}, \leq)$ can be identified with the homotopy category of the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ of Notation 8.5.4.13. Let $G : \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], N_{\leq 3}(\mathrm{Idem})) \rightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E})$ be the morphism of simplicial sets given by composition with ι . Since the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ is 1-dimensional, the inclusion map

$$\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], N_{\leq 3}(\mathrm{Idem})) \hookrightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], N_{\bullet}(\mathrm{Idem})) \simeq N_{\bullet}(\mathrm{Fun}(\mathbf{Z}, \mathrm{Idem}))$$

is bijective on simplices of dimension ≤ 2 , and therefore induces an equivalence of homotopy categories. It follows that G induces a functor of homotopy categories $hG : \mathrm{Fun}(\mathbf{Z}, \mathrm{Idem}) \rightarrow h\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E})$.

In what follows, we will identify the morphisms X and Y with vertices of the simplicial set $\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], N_{\leq 3}(\mathrm{Idem}))$, and the morphisms i, r, e_X , and e_Y with edges of the simplicial set $\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], N_{\leq 3}(\mathrm{Idem}))$. Let $\delta_{\mathcal{E}} : \mathcal{E} \rightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E})$ be the diagonal map, so that we have $G(X) = \delta_{\mathcal{C}}(\iota(\tilde{X}))$ and $G(e_X) = \delta_{\mathcal{C}}(\iota(\tilde{e}))$. We will deduce Proposition 8.5.9.13 from the following:

- (*) There exists an ∞ -category $\mathcal{C}$ and a functor $T : \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E}) \rightarrow \mathcal{C}$ such that $(T \circ \delta_{\mathcal{E}}) : \mathcal{E} \rightarrow \mathcal{C}$ is fully faithful and $(T \circ G)(e_Y)$ is an isomorphism in $\mathcal{C}$.

Let us first assume (*), and show that it implies Proposition 8.5.9.13. We wish to show that $\iota(\tilde{e})$ is an idempotent endomorphism in the ∞ -category $\mathcal{E}$. Since $T \circ \delta_{\mathcal{E}}$ is fully faithful,

this is equivalent to the statement that $(T \circ \delta_C)(\iota(\tilde{e})) = (T \circ G)(e_X)$ is an idempotent endomorphism in the ∞ -category $\mathcal{C}$. By virtue of Proposition 8.5.7.10, it will suffice to show that the homotopy class $[T(G(e_X))] = (\mathrm{h}T \circ \mathrm{h}G)(e_X)$ is a split idempotent in the homotopy category $\mathrm{h}\mathcal{C}$. By construction, the morphism e_X factors as a composition $i \circ r$ in the category $\mathrm{Fun}(\mathbf{Z}, \mathrm{Idem})$. It will therefore suffice to show that the functor $\mathrm{h}T \circ \mathrm{h}G$ carries the commutative diagram

$$\begin{array}{ccc} & X & \\ i \nearrow & & \searrow r \\ Y & \xrightarrow{e_Y} & Y \end{array}$$

to a retraction diagram in $\mathrm{h}\mathcal{C}$: that is, that $(\mathrm{h}T \circ \mathrm{h}G)(e_Y)$ is an identity morphism. This follows from Remark 8.5.2.2, since the morphism $(\mathrm{h}T \circ \mathrm{h}G)(e_Y)$ is both idempotent (since e_Y is an idempotent in the category $\mathrm{Fun}(\mathbf{Z}, \mathrm{Idem})$) and an isomorphism (by virtue of assumption (*)).

We now prove (*). Using Corollary 8.3.3.17, we can choose a fully faithful functor of ∞ -categories $H : \mathcal{E} \rightarrow \mathcal{C}$, where the ∞ -category $\mathcal{C}$ is sequentially cocomplete. Let $\mathcal{D}$ denote the full subcategory of $\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}]^\triangleright, \mathcal{C})$ spanned by the colimit diagrams. Our assumption that $\mathcal{C}$ is sequentially cocomplete guarantees that the restriction functor

$$\mathcal{D} \rightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) \quad U \mapsto U|_{\mathrm{Spine}[\mathbf{Z}]}$$

is a trivial Kan fibration of ∞ -categories (Corollary 7.3.6.15). Let $\delta_{\mathcal{C}} : \mathcal{C} \hookrightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C})$ and $\tilde{\delta}_{\mathcal{C}} : \mathcal{C} \hookrightarrow \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}]^\triangleright, \mathcal{C})$ be the diagonal embeddings. Since the simplicial set $\mathrm{Spine}[\mathbf{Z}]$ is weakly contractible, the morphism $\tilde{\delta}_{\mathcal{C}}$ factors through $\mathcal{D}$ (Corollary 7.2.3.5). Let $s : \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) \rightarrow \mathcal{D}$ be a solution to the lifting problem

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{\tilde{\delta}_{\mathcal{C}}} & \mathcal{D} \\ \downarrow \delta_{\mathcal{C}} & \nearrow s & \downarrow U \mapsto U|_{\mathrm{Spine}[\mathbf{Z}]} \\ \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) & \xrightarrow{\mathrm{id}} & \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}). \end{array}$$

Let $\mathrm{ev} : \mathcal{D} \rightarrow \mathcal{C}$ be the functor given by evaluation at the cone point of $\mathrm{Spine}[\mathbf{Z}]^\triangleright$. We let $T : \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E}) \rightarrow \mathcal{C}$ denote the functor given by the composition

$$\mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{E}) \xrightarrow{H \circ} \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}], \mathcal{C}) \xrightarrow{s} \mathrm{Fun}(\mathrm{Spine}[\mathbf{Z}]^\triangleright, \mathcal{C}) \xrightarrow{\mathrm{ev}} \mathcal{C}.$$

Stated more informally, the functor T carries a diagram

$$\cdots \rightarrow C_{-2} \rightarrow C_{-1} \rightarrow C_0 \rightarrow C_1 \rightarrow C_2 \rightarrow \cdots$$

in the ∞ -category $\mathcal{E}$ to a colimit of the diagram

$$\cdots \rightarrow H(C_{-2}) \rightarrow H(C_{-1}) \rightarrow H(C_0) \rightarrow H(C_1) \rightarrow H(C_2) \rightarrow \cdots$$

in the ∞ -category $\mathcal{C}$. By construction, $T \circ \delta_{\mathcal{E}}$ coincides with the fully faithful functor H .

We now complete the proof by showing that the functor T carries $G(e_Y)$ to an isomorphism in $\mathcal{C}$. Let us regard $G(\tilde{Y})$ as a diagram $\text{Spine}[\mathbf{Z}] \rightarrow \mathcal{E}$. Since the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow \mathbf{N}_{\bullet}(\mathbf{Z})$ is inner anodyne (Remark 8.5.4.15), we can extend $G(Y)$ to a functor $C : \mathbf{N}_{\bullet}(\mathbf{Z}) \rightarrow \mathcal{E}$. Let $a : \{0 < 1\} \times \mathbf{Z} \rightarrow \mathbf{Z}$ be the morphism of partially ordered sets given by $a(i, n) = i + n$. Passing to nerves, we obtain a morphism of simplicial sets $A : \Delta^1 \times \mathbf{N}_{\bullet}(\mathbf{Z}) \rightarrow \mathbf{N}_{\bullet}(\mathbf{Z})$. The composition $M = C \circ A$ then corresponds to a diagram in $\mathcal{E}$ which we display informally as

$$\begin{array}{ccccccc} \cdots & \longrightarrow & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) \xrightarrow{\iota(\tilde{e})} \cdots \\ & & \downarrow \iota(\tilde{e}) & & \downarrow \iota(\tilde{e}) & & \downarrow \iota(\tilde{e}) \\ \cdots & \longrightarrow & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) & \xrightarrow{\iota(\tilde{e})} & \iota(\tilde{X}) \xrightarrow{\iota(\tilde{e})} \cdots \end{array}$$

Let f denote the restriction $M|_{\Delta^1 \times \text{Spine}[\mathbf{Z}]}$, which we regard as a morphism in the ∞ -category $\text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{E})$. Since ι is bijective on simplices of dimension ≤ 2 and the simplicial set $\text{Spine}[\mathbf{Z}]$ has dimension ≤ 1 , the morphism G is bijective on simplices of dimension ≤ 1 . We can therefore write $f = G(f_0)$ for a unique edge f_0 of $\text{Fun}(\text{Spine}[\mathbf{Z}], \mathbf{N}_{\leq 3}(\text{Idem}))$. It follows by inspection that f_0 must coincide with $e_{\tilde{Y}}$. We are therefore reduced to showing that $T(f)$ is an isomorphism in the ∞ -category $\mathcal{C}$.

Since the ∞ -category $\mathcal{C}$ is sequentially cocomplete, we can extend $(H \circ C) : \mathbf{N}_{\bullet}(\mathbf{Z}) \rightarrow \mathcal{C}$ to a colimit diagram $\bar{C} : \mathbf{N}_{\bullet}(\mathbf{Z})^{\triangleright} \rightarrow \mathcal{C}$. Note that A extends uniquely to a morphism of simplicial sets $\bar{A} : \Delta^1 \times \mathbf{N}_{\bullet}(\mathbf{Z})^{\triangleright} \rightarrow \mathbf{N}_{\bullet}(\mathbf{Z})^{\triangleright}$ (given on vertices by $\bar{A}(i, v) = v$, where v is the cone point of $\mathbf{N}_{\bullet}(\mathbf{Z})^{\triangleright}$). Let us identify the restriction $(\bar{C} \circ \bar{A})|_{\Delta^1 \times \text{Spine}[\mathbf{Z}]^{\triangleright}}$ with a morphism $\bar{f} : D \rightarrow D'$ in the ∞ -category $\text{Fun}(\text{Spine}[\mathbf{Z}]^{\triangleright}, \mathcal{C})$. Since the inclusion $\text{Spine}[\mathbf{Z}] \hookrightarrow \mathbf{N}_{\bullet}(\mathbf{Z})$ is right cofinal (Proposition 7.2.1.3), both D and D' are colimit diagrams in $\mathcal{D}$ (Corollary 7.2.2.3). Consequently, we can view $\bar{f}$ as a morphism in the ∞ -category $\mathcal{D}$. By construction, the restriction functor $\mathcal{D} \rightarrow \text{Fun}(\text{Spine}[\mathbf{Z}], \mathcal{C})$ carries $\bar{f}$ to $H(f)$. It follows that $T(f) = (\text{ev} \circ s \circ H)(f)$ is isomorphic to $\text{ev}(\bar{f})$ as an object of the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$. We are therefore reduced to showing that $\text{ev}(\bar{f})$ is an isomorphism in $\mathcal{C}$. This is clear: the morphism $\text{ev}(\bar{f})$ is an identity morphism in $\mathcal{C}$, since the functor $\bar{A}$ carries $\Delta^1 \times \{v\}$ to a degenerate edge of $\mathbf{N}_{\bullet}(\mathbf{Z})^{\triangleright}$. $\square$

Proof of Theorem 8.5.9.4. Fix an integer $n \geq 0$. Using Example 8.5.9.12, we can choose an ∞ -category $\mathcal{E}$ and an inner anodyne morphism $\iota : N_{\leq n}(\text{Idem}) \hookrightarrow \mathcal{E}$ which is bijective on simplices of dimension $< n$. Since ι is inner anodyne, there is a unique functor $U : \mathcal{E} \rightarrow N_{\bullet}(\text{Idem})$ for which $U \circ \iota$ coincides with the inclusion map $N_{\leq n}(\text{Idem}) \hookrightarrow N_{\bullet}(\text{Idem})$. If $n \geq 3$, then Proposition 8.5.9.13 guarantees that $\iota(\tilde{e})$ is an idempotent endomorphism in $\mathcal{E}$: that is, there exists a functor $V : N_{\bullet}(\text{Idem}) \rightarrow \mathcal{E}$ satisfying $V(\tilde{e}) = \iota(\tilde{e})$. To complete the proof, it will suffice to show that the composition $N_{\bullet}(\text{Idem}) \xrightarrow{V} \mathcal{E} \xrightarrow{U} N_{\bullet}(\text{Idem})$ is the identity functor. This follows from the universal property of Remark 8.5.2.8 (together with Proposition 1.3.3.1), it since the functor $U \circ V$ carries the morphism e to itself. $\square$

8.5.10 The Thompson Groupoid

042T In §8.5.8, we constructed an example of a homotopy idempotent endomorphism $e : X \rightarrow X$ which is not idempotent. Our construction (following Heller and Freyd) involved the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$. Our goal in this section is to show that this is no coincidence: there is a universal example of an ∞ -category $\mathcal{C}$ containing a homotopy idempotent endomorphism, whose structure can be described explicitly in terms of $\text{Aut}_{\text{Dy}}([0, 1])$. We begin with a variant of Definition 8.5.8.12.

042U **Definition 8.5.10.1** (The Thompson Groupoid). We define a category Dy as follows:

- The objects of Dy are closed intervals of the form $[0, s]$, where $s \geq 0$ is a dyadic rational number.
- If $s, t \geq 0$ are dyadic rational numbers, then a morphism from $[0, s]$ to $[0, t]$ in the category Dy is a dyadic homeomorphism $[0, s] \xrightarrow{\sim} [0, t]$ (see Definition 8.5.8.9).
- The composition law on Dy is given by composition of dyadic homeomorphisms (which is well-defined by virtue of Exercise 8.5.8.11).

It follows from Exercise 8.5.8.10 that the category Dy is a groupoid. We will refer to Dy as the *Thompson groupoid*.

042V **Remark 8.5.10.2.** The Thompson groupoid Dy contains exactly two isomorphism classes:

- The isomorphism class of the degenerate interval $[0, 0] = \{0\}$, whose automorphism group is the trivial group.
- The isomorphism class of the unit interval $[0, 1]$, whose automorphism group is the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$ of Definition 8.5.8.12.

By virtue of Remark 8.5.10.2, the Thompson groupoid Dy is equivalent to the full subcategory spanned by the objects $\{0\}$ and $[0, 1]$, which can be described explicitly in terms

of the Thompson group $\text{Aut}_{\text{Dy}}([0, 1])$. However, allowing a larger class of intervals in the definition reveals some additional structure.

Construction 8.5.10.3 (Concatenation). Let Dy denote the Thompson groupoid. We 042W define a functor $\otimes : \text{Dy} \times \text{Dy} \rightarrow \text{Dy}$ as follows:

- On objects, the functor $\otimes$ is given by the formula

$$[0, s] \otimes [0, t] = [0, s + t].$$

- On morphisms, the functor $\otimes$ is given by the formula

$$(f \otimes g)(x) = \begin{cases} g(x) & \text{if } 0 \leq x \leq t \\ f(x - t) + s & \text{if } t \leq x \leq s + t. \end{cases}$$

We will refer to $\otimes : \text{Dy} \times \text{Dy} \rightarrow \text{Dy}$ as the *concatenation functor* on the Thompson groupoid Dy . Note that the operation $\otimes$ is strictly associative, and admits a (strict) unit given by the degenerate interval $\{0\} = [0, 0]$. Consequently, $\otimes$ determines a strict monoidal structure on the category Dy (in the sense of Definition 2.1.2.1).

Notation 8.5.10.4. Let $B\text{Dy}$ denote the (strict) 2-category obtained by delooping Dy (see 042X Example 2.2.0.8). Since Dy is a groupoid, $B\text{Dy}$ is a $(2, 1)$ -category. It follows that the Duskin nerve $N_{\bullet}^{\text{D}}(B\text{Dy})$ is an ∞ -category (Theorem 2.3.2.1). We can describe the low-dimensional simplices of $N_{\bullet}^{\text{D}}(B\text{Dy})$ explicitly as follows:

- The ∞ -category $N_{\bullet}^{\text{D}}(B\text{Dy})$ has a unique object, which we will denote by $\overline{X}$.
- Morphisms from $\overline{X}$ to itself in the ∞ -category $N_{\bullet}^{\text{D}}(B\text{Dy})$ can be identified with nonnegative dyadic rational numbers s (corresponding to the closed interval $[0, s]$, regarded as an object of the Thompson groupoid Dy).
- Suppose we are given dyadic rational numbers $s, t, u \geq 0$. Then 2-simplices of $N_{\bullet}^{\text{D}}(B\text{Dy})$ with boundary indicated in the diagram

$$\begin{array}{ccc} & \overline{X} & \\ t \nearrow & & \searrow s \\ \overline{X} & \xrightarrow{u} & \overline{X} \end{array}$$

can be identified with dyadic homeomorphisms $[0, s + t] \xrightarrow{\sim} [0, u]$.

Let $\bar{e} : \bar{X} \rightarrow \bar{X}$ denote the morphism in $N_{\bullet}^D(BDy)$ corresponding to the object $[0, 1] \in Dy$, and let $\bar{\sigma}$ be the 2-simplex of $N_{\bullet}^D(BDy)$ corresponding to the dyadic homeomorphism

$$[0, 1] \otimes [0, 1] = [0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2.$$

Then the triple $(\bar{X}, \bar{e}, \bar{\sigma})$ can then be viewed as a partial idempotent $\iota : N_{\leq 2}(Idem) \rightarrow N_{\bullet}^D(BDy)$ (see Example 8.5.9.3).

We can now formulate our main result:

042Y **Theorem 8.5.10.5.** *The partial idempotent $\iota : N_{\leq 2}(Idem) \rightarrow N_{\bullet}^D(BDy)$ of Notation 8.5.10.4 is a categorical equivalence of simplicial sets.*

042Z **Corollary 8.5.10.6.** *Let $\mathcal{C}$ be an ∞ -category. Then composition with the partial idempotent ι of Notation 8.5.10.4 induces a trivial Kan fibration of ∞ -categories*

$$\text{Fun}(N_{\bullet}^D(BDy), \mathcal{C}) \rightarrow \text{Fun}(N_{\leq 2}(Idem), \mathcal{C}).$$

Proof. Combine Theorem 8.5.10.5 with Corollary 4.5.5.19 (noting that ι is a monomorphism of simplicial sets). $\square$

0430 **Corollary 8.5.10.7.** *Let $\mathcal{C}$ be an ∞ -category containing an endomorphism $e : X \rightarrow X$. Then e is homotopy idempotent if and only if there is a functor of ∞ -categories $F : N_{\bullet}^D(BDy) \rightarrow \mathcal{C}$ satisfying $F(\bar{e}) = e$.*

0431 **Example 8.5.10.8.** Let $Dy_{>0}$ denote the full subcategory of the Thompson groupoid Dy spanned by the intervals $[0, s]$ where $s > 0$. Note that the action of Dy on itself (via concatenation) restricts to an action of Dy on the groupoid $Dy_{>0}$, and therefore determines a (strict) functor of 2-categories

$$BDy \rightarrow \{\text{Groupoids}\} \quad X \mapsto Dy_{>0}.$$

Passing to nerves, we obtain a functor of ∞ -categories

$$N_{\bullet}^D(BDy) \rightarrow \mathcal{S} \quad X \mapsto N_{\bullet}(Dy_{>0}),$$

which carries the 1-morphism $\bar{e}$ of BDy to the homotopy idempotent endomorphism

$$N_{\bullet}(Dy_{>0}) \rightarrow N_{\bullet}(Dy_{>0}) \quad [0, s] \mapsto [0, 1] \otimes [0, s] = [0, 1 + s].$$

Note that, up to isomorphism, this coincides with the homotopy idempotent endomorphism constructed in Proposition 8.5.8.14; this follows from the observation that the diagram of

categories

$$\begin{array}{ccc}
 B \operatorname{Aut}_{\operatorname{Dy}}([0, 1]) & \xrightarrow{\alpha} & B \operatorname{Aut}_{\operatorname{Dy}}([0, 1]) \\
 \downarrow \sim & & \downarrow \sim \\
 \operatorname{Dy}_{>0} & \xrightarrow{[0, 1] \otimes} & \operatorname{Dy}_{>0}
 \end{array}$$

commutes up to isomorphism (where the vertical maps are the inclusion functors and α is the homomorphism of Construction 8.5.8.13).

Our first goal is to reduce Theorem 8.5.10.5 to a more concrete statement about simplicial monoids.

Notation 8.5.10.9. Let $N_{\leq 2}(\operatorname{Idem})$ denote the simplicial set described in Example 8.5.9.3. 0432 By virtue of Proposition 2.4.4.3, we can choose a simplicial category $\mathcal{C}$ and a morphism of simplicial sets $u : N_{\leq 2}(\operatorname{Idem}) \rightarrow N_{\bullet}^{\operatorname{hc}}(\mathcal{C})$ which exhibits $\mathcal{C}$ as a simplicial path category for $N_{\leq 2}(\operatorname{Idem})$. The morphism u carries the unique vertex $\tilde{X}$ of $N_{\leq 2}(\operatorname{Idem})$ to an object $X \in \mathcal{C}$. Set $E_{\bullet} = \operatorname{Hom}_{\mathcal{C}}(X, X)_{\bullet}$, which we regard as a simplicial monoid. Evaluating the morphism u on the nondegenerate edge $\tilde{e}$ of $N_{\leq 2}(\operatorname{Idem})$, we obtain a morphism $e : X \rightarrow X$ in the category $\mathcal{C}$, which we can view as a vertex of the simplicial set $E_{\bullet}$. Evaluating the morphism u on the nondegenerate 2-simplex of $N_{\leq 2}(\operatorname{Idem})$, we obtain an edge $h : e^2 \rightarrow e$ in the simplicial monoid $E_{\bullet}$.

Let $N_{\bullet}(\operatorname{Dy})$ denote the nerve of the Thompson groupoid. The concatenation functor of Notation 8.5.10.4 endows $N_{\bullet}(\operatorname{Dy})$ with the structure of a simplicial monoid. We let $B N_{\bullet}(\operatorname{Dy})$ denote the simplicial category given by delooping $N_{\bullet}(\operatorname{Dy})$ (Example 2.4.2.3), so that the homotopy coherent nerve of $B N_{\bullet}(\operatorname{Dy})$ can be identified with the Duskin nerve of the strict 2-category $B \operatorname{Dy}$ (see Example 2.4.3.11). It follows that the partial idempotent ι of Notation 8.5.10.4 can be identified with a morphism from $N_{\leq 2}(\operatorname{Idem})$ to $N_{\bullet}^{\operatorname{hc}}(B N_{\bullet}(\operatorname{Dy}))$, which factors unique as a composition

$$N_{\leq 2}(\operatorname{Idem}) \xrightarrow{u} N_{\bullet}^{\operatorname{hc}}(\mathcal{C}) \xrightarrow{N_{\bullet}^{\operatorname{hc}}(F)} N_{\bullet}^{\operatorname{hc}}(B N_{\bullet}(\operatorname{Dy}))$$

for some simplicial functor $F : \mathcal{C} \rightarrow B N_{\bullet}(\operatorname{Dy})$, which we can identify with a homomorphism of simplicial monoids

$$\varphi : E_{\bullet} = \operatorname{Hom}_{\mathcal{C}}(X, X)_{\bullet} \xrightarrow{F} \operatorname{Hom}_{B N_{\bullet}(\operatorname{Dy})}(F(X), F(X))_{\bullet} = N_{\bullet}(\operatorname{Dy}).$$

By construction, the homomorphism φ carries the vertex e to the object $[0, 1] \in \operatorname{Dy}$, and the edge $h : e^2 \rightarrow e$ to the dyadic homeomorphism

$$[0, 1] \otimes [0, 1] = [0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2.$$

0433 **Remark 8.5.10.10.** From the universal property of the category $\mathcal{C} = \text{Path}[\mathbf{N}_{\leq 2}(\text{Idem})]_{\bullet}$, it is not difficult to see that $E_{\bullet}$ is freely generated (as a simplicial monoid) by the vertex e and the edge $h : e^2 \rightarrow e$. In particular, the homomorphism of simplicial monoids $\varphi : E_{\bullet} \rightarrow \mathbf{N}_{\bullet}(\text{Dy})$ is uniquely determined by the requirement that it carries e to the unit interval $[0, 1] \in \text{Dy}$ and h to the dyadic homeomorphism $x \mapsto x/2$.

We will deduce Theorem 8.5.10.5 from the following:

0434 **Proposition 8.5.10.11.** *The homomorphism $\varphi : E_{\bullet} \rightarrow \mathbf{N}_{\bullet}(\text{Dy})$ is a weak homotopy equivalence of simplicial sets.*

Proof of Theorem 8.5.10.5 from Proposition 8.5.10.11. We wish to show that the partial idempotent

$$\iota : \mathbf{N}_{\leq 2}(\text{Idem}) \rightarrow \mathbf{N}_{\bullet}^{\text{D}}(\text{BDy}) \simeq \mathbf{N}_{\bullet}^{\text{hc}}(B\mathbf{N}_{\bullet}(\text{Dy}))$$

is a categorical equivalence of simplicial sets. Since the category Dy is a groupoid, the simplicial monoid $\mathbf{N}_{\bullet}(\text{Dy})$ is a Kan complex (Proposition 1.3.5.2). It follows that the simplicial category $B\mathbf{N}_{\bullet}(\text{Dy})$ is locally Kan. Invoking Theorem [?], we are reduced to showing that ι induces a weak equivalence of simplicial categories $F : \text{Path}[\mathbf{N}_{\leq 2}(\text{Idem})]_{\bullet} \rightarrow B\mathbf{N}_{\bullet}(\text{Dy})$, in the sense of Definition 4.6.8.7. Write X for the unique object of the path category $\text{Path}[\mathbf{N}_{\leq 2}(\text{Idem})]_{\bullet}$, so that $F(X)$ is the unique object of $B\mathbf{N}_{\bullet}(\text{Dy})$. We are then reduced to showing that F induces a weak homotopy equivalence of simplicial monoids

$$\varphi : E_{\bullet} = \text{Hom}_{\text{Path}[\mathbf{N}_{\leq 2}(\text{Idem})]}(X, X)_{\bullet} \rightarrow \text{Hom}_{B\mathbf{N}_{\bullet}(\text{Dy})}(F(X), F(X)) = \mathbf{N}_{\bullet}(\text{Dy}),$$

which follows from Proposition 8.5.10.11. □

We will deduce Proposition 8.5.10.11 from a more refined result, which characterizes the simplicial monoid $E_{\bullet}$ up to categorical equivalence (rather than merely up to weak homotopy equivalence).

0435 **Notation 8.5.10.12.** Let m and n be nonnegative integers. We will say that a homeomorphism $f : [0, m] \xrightarrow{\sim} [0, n]$ is a *dyadic contraction* if, for every integer $0 \leq k < m$, the restriction of f to the closed interval $[k, k+1]$ is given by the formula $f(x) = (x+a)/2^b$ for some integers a and b with $b \geq 0$.

We let Dy_+ denote the subcategory of the Thompson groupoid Dy whose objects are intervals of the form $[0, m]$, where m is a nonnegative integer, and whose morphisms are dyadic contractions.

0436 **Exercise 8.5.10.13.** Show that the subcategory $\text{Dy}_+ \subset \text{Dy}$ is well-defined: that is, the collection of dyadic contractions is closed under composition.

0437 **Warning 8.5.10.14.** The category Dy_+ of Notation 8.5.10.12 is not a groupoid. In fact, every isomorphism in the category Dy_+ is an identity morphism.

Proposition 8.5.10.15. *The homomorphism $\varphi : E_\bullet \rightarrow N_\bullet(\text{Dy})$ factors as a composition* 0438

$$E_\bullet \xrightarrow{\varphi_+} N_\bullet(\text{Dy}_+) \subset N_\bullet(\text{Dy}),$$

where φ_+ is inner anodyne.

Proof of Proposition 8.5.10.11 from Proposition 8.5.10.15. By Proposition 8.5.10.15, it will suffice to show that the inclusion of categories $\text{Dy}_+ \hookrightarrow \text{Dy}$ induces a weak homotopy equivalence of simplicial sets $U : N_\bullet(\text{Dy}_+) \hookrightarrow N_\bullet(\text{Dy})$. Using Quillen's Theorem A (Example 7.2.3.3), we are reduced to proving the following: for every object $[0, s] \in \text{Dy}$, the category $\mathcal{A} = \text{Dy}_+ \times_{\text{Dy}} \text{Dy}_{[0, s]}$ has weakly contractible nerve. We can describe the category $\mathcal{A}$ more concretely as follows:

- The objects of $\mathcal{A}$ are dyadic homeomorphisms $f : [0, s] \xrightarrow{\sim} [0, m]$, where m is an integer.
- Let $f : [0, s] \xrightarrow{\sim} [0, m]$ and $g : [0, s] \xrightarrow{\sim} [0, n]$ be dyadic homeomorphisms. Then there is a morphism from f to g (in the category $\mathcal{A}$) if and only if the homeomorphism $(g \circ f^{-1}) : [0, m] \rightarrow [0, n]$ is a dyadic contraction. If this condition is satisfied, then the morphism is unique.

It follows that the category $\mathcal{A}$ can be viewed as a partially ordered set. Moreover, every finite subset of $\mathcal{A}$ has a lower bound, given by the dyadic homeomorphism

$$[0, s] \xrightarrow{\sim} [0, 2^k s] \quad x \mapsto 2^k x$$

for some integer $k \gg 0$. Consequently, the simplicial set $N_\bullet(\mathcal{A}^{\text{op}})$ is a filtered ∞ -category (Definition 9.1.1.1 and Example 9.1.1.2), and therefore weakly contractible (see Proposition 9.1.1.17). $\square$

The proof of Proposition 8.5.10.15 will require some preliminaries.

Notation 8.5.10.16. Let $n \geq 0$ be an integer and let J be a subset of $\{1, 2, \dots, n\}$. We 0439 let $b_J : [0, n] \xrightarrow{\sim} [0, n + |J|]$ be the dyadic homeomorphism which is characterized by the following requirement: for every integer $1 \leq j \leq n$, the function b_J is differentiable at every point $x \in (j - 1, j)$, with derivative given by the formula

$$b_J'(x) = \begin{cases} 1 & \text{if } j \notin J \\ 2 & \text{if } j \in J. \end{cases}$$

Note that, if this condition is satisfied, then the inverse homeomorphism $b_J^{-1} : [0, n + |J|] \xrightarrow{\sim} [0, n]$ is a dyadic contraction. We say that a dyadic contraction is *elementary* if it has the form b_J^{-1} , for some integer $n \geq 0$ and some subset $J \subseteq \{1, 2, \dots, n\}$.

043A **Remark 8.5.10.17.** Let $f : [0, m] \xrightarrow{\sim} [0, n]$ be a dyadic contraction. The following conditions are equivalent:

- The dyadic contraction f is elementary, in the sense of Notation 8.5.10.16.
- For every point $x \in [0, m]$ where f is differentiable, the derivative $f'(x)$ is either 1 or $1/2$.
- The dyadic contraction f can be written as a concatenation $f_1 \otimes f_2 \otimes \cdots \otimes f_n$, where each f_i is either the identity function $\text{id} : [0, 1] \xrightarrow{\sim} [0, 1]$ or the homeomorphism

$$H : [0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2.$$

043B **Lemma 8.5.10.18.** *The collection of elementary dyadic contractions is a class of short morphisms for the ∞ -category $\mathbf{N}_\bullet(\mathbf{Dy}_+)$, in the sense of Definition 6.2.7.4.*

Proof. Let S denote the collection of all elementary dyadic contractions. We verify that S satisfies conditions (1) through (4) of Definition 6.2.7.4:

- (1) For every integer $n \geq 0$, the identity morphism $\text{id} : [0, n] \xrightarrow{\sim} [0, n]$ is an elementary dyadic contraction. This is immediately from the definitions.
- (2) Suppose we are given a commutative diagram of dyadic contractions

$$\begin{array}{ccc} & [0, m] & \\ f \nearrow & & \searrow g \\ [0, k] & \xrightarrow{h} & [0, n]. \end{array}$$

Assume that g and h are elementary; we wish to show that f is also elementary (in fact, the assumption that g is elementary will not be needed). Choose a point $x \in [0, k]$ at which f is differentiable; we wish to show that $f'(x) \geq 1/2$ (see Remark 8.5.10.17). Replacing x by a nearby point if necessary, we may assume that g is differentiable at the point $y = f(x)$. Since g is a dyadic contraction and h is an elementary dyadic contraction, we have $g'(y) \leq 1$ and $h'(x) \geq 1/2$. Applying the chain rule, we obtain inequalities $f'(x) \geq f'(x) \cdot g'(y) = h'(x) \geq 1/2$.

- (3) Let $f : [0, m] \xrightarrow{\sim} [0, n]$ be a dyadic contraction. We wish to show that f admits an S -optimal factorization (in the sense of Definition 6.2.7.1). Let P denote the collection of all subsets $\{1, 2, \dots, n\}$ having the property that the composition $(b_J \circ f) : [0, m] \rightarrow [0, n + |J|]$ is a dyadic contraction; here b_J denotes the dyadic homeomorphism

introduced in Notation 8.5.10.16. Unwinding the definitions, we can identify P with the set of factorizations $f = s \circ g$, where g is a dyadic contraction and s is an elementary dyadic contraction (the identification carries a set $J \in P$ to the pair $(s, g) = (b_J^{-1}, b_J \circ f)$). Under this identification, a factorization $f = s \circ g$ is S -optimal if and only if J is a largest element of P . We conclude by observing that P has a largest element $J_{\max}$, given by the collection of those integers $j \in \{1, 2, \dots, n\}$ having the property that the inverse homeomorphism f^{-1} has derivative ≥ 2 at every point $x \in [j-1, j]$ where f^{-1} is differentiable (alternatively, $J_{\max}$ can be described as the set of integers $1 \leq j \leq n$ which satisfy $f^{-1}(j) > f^{-1}(j-1) + 1$).

- (4) Let $f : [0, m] \rightarrow \sim[0, n]$ be a dyadic contraction. Let us define the *length* of f to be the smallest nonnegative integer k such that $f'(x) \geq 1/2^k$ for every point $x \in [0, m]$ where f is differentiable. We claim that, if this condition is satisfied, then f can be written as a composition $s_1 \circ s_2 \circ \dots \circ s_k$, where each s_i is an elementary dyadic contraction. Our proof proceeds by induction on k . If $k = 0$, then f is an identity morphism and there is nothing to prove. Let us therefore assume that $k > 0$, and let $f = s_1 \circ g$ be an S -optimal factorization of f . We claim that g can be written as a composition of elementary contractions $s_2 \circ \dots \circ s_k$. By virtue of our inductive hypothesis, it will suffice to show that g has length $k-1$, which follows from the proof of (3).

□

Proof of Proposition 8.5.10.15. Let $N_{\bullet}(\text{Dy}_+)^{\text{short}}$ denote the simplicial subset of $N_{\bullet}(\text{Dy}_+)$ whose m -simplices are diagrams of dyadic contractions σ :

$$[0, n_0] \xrightarrow{\sim} [0, n_1] \xrightarrow{\sim} \dots \xrightarrow{\sim} [0, n_m]$$

for which the composite map $[0, n_0] \xrightarrow{\sim} [0, n_m]$ is an elementary dyadic contraction (note that this guarantees that each intermediate composition $[0, n_i] \xrightarrow{\sim} [0, n_j]$ is also elementary). It follows from Lemma 8.5.10.18 and Theorem 6.2.7.10 that the inclusion map $N_{\bullet}(\text{Dy}_+)^{\text{short}} \hookrightarrow N_{\bullet}(\text{Dy}_+)$ is inner anodyne. We will complete the proof by showing that the morphism $\varphi : E_{\bullet} \rightarrow N_{\bullet}(\text{Dy})$ induces of Notation 8.5.10.9 induces an isomorphism of $E_{\bullet}$ with the simplicial subset $N_{\bullet}(\text{Dy}_+)^{\text{short}} \subseteq N_{\bullet}(\text{Dy})$.

Fix an integer $m \geq 0$, so that φ induces a monoid homomorphism $\varphi_m : E_m \rightarrow N_m(\text{Dy})$. We wish to show that φ_m is a monomorphism, whose image is the subset $N_m(\text{Dy}_+)^{\text{short}} \subseteq N_m(\text{Dy})$. Note that $N_m(\text{Dy}_+)^{\text{short}}$ is closed under concatenation, and therefore inherits the structure of a monoid. Let us say that an m -simplex σ of $N_{\bullet}(\text{Dy}_+)^{\text{short}}$ is *indecomposable* if it corresponds to a diagram of dyadic contractions

$$[0, n_0] \xrightarrow{\sim} [0, n_1] \xrightarrow{\sim} \dots \xrightarrow{\sim} [0, n_m]$$

with $n_m = 1$. In this case, we define the *index* of σ to be the smallest integer k such that $n_k = 1$. For every integer $0 \leq k \leq m$, the simplicial set $N_\bullet(\text{Dy}_+)^{\text{short}}$ has a unique indecomposable m -simplex σ_k of index k , which can be described explicitly as follows:

- If $k = 0$, then σ_k is the diagram of identity morphisms

$$[0, 1] \xrightarrow{\text{id}} [0, 1] \xrightarrow{\text{id}} [0, 1] \xrightarrow{\text{id}} \cdots \xrightarrow{\text{id}} [0, 1].$$

- If $k > 0$, then the diagram σ_k has the form

$$[0, 2] \xrightarrow{\text{id}} \cdots \xrightarrow{\text{id}} [0, 2] \xrightarrow{x \mapsto x/2} [0, 1] \xrightarrow{\text{id}} \cdots \xrightarrow{\text{id}} [0, 1].$$

Moreover, every m -simplex of $N_\bullet(\text{Dy}_+)^{\text{short}}$ can be written uniquely as a concatenation of indecomposable m -simplices of $N_\bullet(\text{Dy}_+)^{\text{short}}$: that is, $N_m(\text{Dy}_+)^{\text{short}}$ can be identified with the free monoid generated by the set $\{\sigma_0, \sigma_1, \dots, \sigma_m\}$.

Let $\mathcal{C}_\bullet = \text{Path}[N_{\leq 2}(\text{Idem})]_\bullet$ denote the simplicial path category of $N_{\leq 2}(\text{Idem})$. Theorem 2.4.4.10 supplies an identification of $\mathcal{C}_m$ with the path category $\text{Path}[G]$, where G is a directed graph having a single vertex X (corresponding to the unique vertex of the simplicial set $N_{\leq 2}(\text{Idem})$). It follows that $E_m = \text{Hom}_{\mathcal{C}_m}(X, X)$ can be identified with the free monoid generated by the set of edges $\text{Edge}(G)$ (Example 1.3.7.3). It will therefore suffice to prove the following:

- ($*_m$) The monoid homomorphism φ_m induces a bijection from the set $\text{Edge}(G)$ to the collection $\{\sigma_0, \sigma_1, \dots, \sigma_m\}$ of indecomposable m -simplices of $N_\bullet(\text{Dy}_+)^{\text{short}}$.

To prove ($*_m$), we recall that $\text{Edge}(G)$ can be identified with the set of pairs $(\tau, \vec{I})$, where τ is a nondegenerate simplex of $N_{\leq 2}(\text{Idem})$ of dimension $n > 0$ and $\vec{I} = (I_0 \supseteq I_1 \supseteq \cdots \supseteq I_{m-1} \supseteq I_m)$ is a chain of subsets of $[n] = \{0 < 1 < \cdots < n\}$ satisfying $I_0 = [n]$ and $I_m = \{0, n\}$. We consider two possibilities:

- The simplex τ has dimension $n = 1$. In this case, both τ and $\vec{I}$ are uniquely determined. We claim that the homomorphism φ_m carries $(\tau, \vec{I})$ to the indecomposable m -simplex σ_0 . To prove this, we can invoke our assumption that φ is a morphism of simplicial monoids to reduce to the case $m = 0$, in which case it reduces to the identity $\varphi(e) = [0, 1]$ of Remark 8.5.10.10.
- The simplex τ has dimension $n = 2$. In this case, τ is again uniquely determined, and the chain $\vec{I}$ is determined by a single integer $1 \leq k \leq m$, given by the formula $k = \min\{j : I_j = \{0, 2\}\}$. We claim that the homomorphism φ_m carries $(\tau, \vec{I})$ to the indecomposable m -simplex σ_k . To prove this, we can again invoke our assumption that φ is a morphism of simplicial monoids to reduce to the case $m = 1$, in which

case it reduces to the assertion that φ carries the edge $h : e^2 \rightarrow e$ of $E_\bullet$ to the dyadic contraction

$$[0, 2] \xrightarrow{\sim} [0, 1] \quad x \mapsto x/2;$$

see Remark 8.5.10.10.

□

8.6 Conjugate and Dual Fibrations

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. For each object $C \in \mathcal{C}$, we let $\mathcal{E}_C$ denote the fiber $U^{-1}\{C\} = \{C\} \times_{\mathcal{C}} \mathcal{E}$. In §5.2.5, we showed that this construction determines a functor

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat} \quad C \mapsto \mathcal{E}_C,$$

which we refer to as the *(covariant) homotopy transport representation* of the cocartesian fibration U (Construction 5.2.5.2). Similarly, if $U' : \mathcal{E}' \rightarrow \mathcal{C}'$ is a cartesian fibration of ∞ -categories, then the assignment $C \mapsto \mathcal{E}'_C$ determines a functor

$$\mathrm{hTr}_{\mathcal{E}'/\mathcal{C}'} : \mathrm{h}\mathcal{C}'^{\mathrm{op}} \rightarrow \mathrm{hQCat} \quad C \mapsto \mathcal{E}'_C$$

which we refer to as the *(contravariant) homotopy transport representation* of the cartesian fibration U (Construction 5.2.5.7). There is an obvious relationship between these constructions. If $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration, then the opposite map $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ is a cartesian fibration, and the homotopy transport representations $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}$ and $\mathrm{hTr}_{\mathcal{E}^{\mathrm{op}}/\mathcal{C}^{\mathrm{op}}}$ are interchanged by composing with the automorphism

$$\sigma : \mathrm{hQCat} \rightarrow \mathrm{hQCat} \quad \mathcal{A} \mapsto \mathcal{A}^{\mathrm{op}}.$$

In this section, we show that the passage from a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ to the opposite cartesian fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ can be broken into two steps:

- To every cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, we will associate another cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ which we refer to as the *cocartesian dual of U* , whose (covariant) homotopy transport representation is given (up to isomorphism) by the construction

$$\mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat} \quad C \mapsto \mathcal{E}_C^{\mathrm{op}}.$$

In particular, each fiber of $U^\vee$ is equivalent to the *opposite* of the corresponding fiber of U .

- To every cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, we will associate a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ which we refer to as the *cartesian conjugate* of U , whose (contravariant) homotopy transport representation is given (up to isomorphism) by the construction

$$\text{hTr}_{\mathcal{E}^\dagger / \mathcal{C}^{\text{op}}} : \text{h}\mathcal{C} \rightarrow \text{hQCat} \quad C \mapsto \mathcal{E}_C.$$

In particular, each fiber of $U^\dagger$ is equivalent to the corresponding fiber of U .

For a fixed ∞ -category (or simplicial set) $\mathcal{C}$, the relationships between these constructions is summarized by the following diagram:

$$\begin{array}{ccc}
 \{ \text{Cocartesian fibrations } U : \mathcal{E} \rightarrow \mathcal{C} \} & \xleftrightarrow{U \longleftrightarrow U^{\text{op}}} & \{ \text{Cartesian fibrations } U' : \mathcal{E} \rightarrow \mathcal{C}^{\text{op}} \} \\
 \uparrow \scriptstyle U \longleftrightarrow U^\dagger & \nwarrow \scriptstyle U \longleftrightarrow U^\vee & \uparrow \scriptstyle V^\dagger \longleftrightarrow V \\
 \{ \text{Cartesian fibrations } V' : \mathcal{E} \rightarrow \mathcal{C}^{\text{op}} \} & \xleftrightarrow{V^{\text{op}} \longleftrightarrow V} & \{ \text{Cocartesian fibrations } V : \mathcal{E} \rightarrow \mathcal{C} \}
 \end{array} \tag{8.67}$$

If $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration of ∞ -categories, then the opposite fibration $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is easy to describe at the level of simplicial sets (see §1.4.2). For the dual and conjugate fibrations $U^\vee$ and $U^\dagger$, this is somewhat more subtle. For example, the passage from a simplicial set $\mathcal{E}$ to its opposite $\mathcal{E}^{\text{op}}$ is involutive, in the sense that there is a canonical isomorphism $\mathcal{E} \simeq (\mathcal{E}^{\text{op}})^{\text{op}}$ (in fact, if we adhere strictly to the convention of Construction 1.4.2.2, then the simplicial sets $\mathcal{E}$ and $(\mathcal{E}^{\text{op}})^{\text{op}}$ are *identical*). It is therefore natural to hope for the passage from a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ to its dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ to have a similar property: heuristically, $\mathcal{E}^\vee$ is obtained from $\mathcal{E}$ by applying the preceding construction to each fiber of U . Unfortunately, it does not seem possible to give a construction where this property is visible at the level of simplicial sets: the best we can expect is that cocartesian duality is involutive *up to equivalence*, in the sense that the double dual $(U^\vee)^\vee : (\mathcal{E}^\vee)^\vee \rightarrow \mathcal{C}$ is equivalent to the original cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ in some natural way. To address this point, it will be convenient to view duality as a *relationship* which can exist between cocartesian fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ over the same base, rather than as an *operation* which takes U as input and produces $U^\vee$ as an output. Similarly, we will view conjugacy as a relationship which can exist between a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ and a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ over the opposite base. Our first goal will be to describe these relationships more precisely:

- Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. We will say that a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ is a *cartesian conjugate* of U if there exists a commutative diagram

$$\begin{array}{ccc}
 \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\
 \downarrow & & \downarrow U \\
 \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C}
 \end{array}$$

satisfying two axioms (Definition 8.6.1.1), one of which requires that T restricts to an equivalence of ∞ -categories $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$ for each vertex $C \in \mathcal{C}$. In §8.6.1, we develop the properties of this definition and give some examples.

- Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. We say that a cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is a *cocartesian dual* of U if there exists a left fibration of simplicial sets $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ satisfying two axioms (Definition 8.6.4.1), one of which requires that for each vertex $C \in \mathcal{C}$, the induced map $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$ is a balanced coupling of ∞ -categories (Definition 8.2.6.1). This guarantees in particular that $\mathcal{E}_C^\vee$ is equivalent to the opposite ∞ -category $\mathcal{E}_C^{\text{op}}$ (Corollary 8.2.6.7). In §8.6.4, we develop the properties of this definition and give some examples.

Our next goal is to show that, if $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cocartesian fibration of simplicial sets, then it admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ and a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, which are uniquely determined up to equivalence. In each case, we will prove existence (and ultimately uniqueness) using explicit constructions at the level of simplicial sets. To fix ideas, let us first assume that $\mathcal{C} = \Delta^0$. In this case, constructing the dual of cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is tantamount to constructing an ∞ -category $\mathcal{E}^\vee$ which is equivalent to the opposite of $\mathcal{E}$. We consider three different solutions to this problem:

- (a) We can take $\mathcal{E}^\vee$ to be the opposite ∞ -category $\mathcal{E}^{\text{op}}$ itself, given concretely by Construction 1.4.2.2.
- (b) We can take $\mathcal{E}^\vee$ to be the ∞ -category $\text{Cospan}^{\text{iso,all}}(\mathcal{E})$ of Variant 8.1.7.14, whose morphisms are given by cospans $X \xrightarrow{f} B \xleftarrow{g} Y$ in the ∞ -category $\mathcal{E}$ where f is an isomorphism. By virtue of Proposition 8.1.7.6, this is equivalent to the ∞ -category $\mathcal{E}^{\text{op}}$.
- (c) We can take $\mathcal{E}^\vee$ to be the ∞ -category of corepresentable functors $\text{Fun}^{\text{corep}}(\mathcal{E}, \mathcal{S})$. This is equivalent to $\mathcal{E}^{\text{op}}$ by virtue of the ∞ -categorical version of Yoneda's lemma (Theorem 8.3.3.13), at least if $\mathcal{E}$ is locally small.

Each of these approaches can be adapted to more general situations. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets.

- Assume that $\mathcal{C}$ is an ∞ -category. In §8.6.2, we define a fibration

$$\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\mathrm{op}}$$

and show that it is a cartesian conjugate of U (Proposition 8.6.2.3). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the original ∞ -category $\mathcal{E}$; consequently, after passing to opposite fibrations, it can be viewed as a relative version of construction (a).

- Let $\mathrm{Cospan}^\dagger(\mathcal{E}/\mathcal{C})$ denote the fiber product $\mathrm{Cospan}^{\mathrm{all}, R}(\mathcal{E}) \times_{\mathrm{Cospan}(\mathcal{C})} \mathcal{C}^{\mathrm{op}}$, where R denotes the collection of all U -cocartesian edges of $\mathcal{E}$. In §8.6.3, we show that projection onto the second factor determines a cartesian fibration $\mathrm{Cospan}^\dagger(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}}$ which is conjugate to U (Proposition 8.6.3.5). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the ∞ -category $\mathrm{Cospan}^{\mathrm{all}, \mathrm{iso}}(\mathcal{C})$. Consequently, after passing to opposite fibrations, it can be viewed as a relative version of construction (b).
- Assume that, for each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C$ is locally small. In §8.6.5, we define a fibration $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}) \rightarrow \mathcal{C}$ and show that it is a cocartesian dual of U (Proposition 8.6.5.8). In the special case $\mathcal{C} = \Delta^0$, this definition reproduces the ∞ -category of corepresentable functors $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}, \mathcal{S})$; consequently, it can be viewed as a relative version of construction (c).

04C2 Remark 8.6.0.1. Ultimately, each of the constructions described above gives rise to essentially the same object. However, it will be useful to consider all three, since each reveals different facets of the overall picture. Fix a cocartesian fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$.

- The construction of §8.6.2 can be used to show that U admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\mathrm{op}}$ (Corollary 8.6.2.4). However, from this point of view, it is not obvious that the cartesian fibration $U^\dagger$ is unique (unless $\mathcal{C}$ is assumed to be an ∞ -category), or that every cartesian fibration can be obtained in this way.
- The construction of §8.6.3 produces a cartesian fibration $V : \mathrm{Cospan}^\dagger(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}}$ having the property that *every* cartesian conjugate of U is equivalent to V (Proposition 8.6.3.11). This guarantees that the cartesian conjugate of U is unique up to equivalence. However, it does not by itself prove existence (see Warning 8.6.3.13).
- The construction of §8.6.5 can be used to show that U admits a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, which is uniquely determined up to equivalence (Theorem 8.6.5.1). In §8.6.6, we show that the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ can be realized as a

cartesian conjugate of $U^\vee$ (Proposition 8.6.6.1). It follows that every cartesian fibration can be realized as the conjugate of a cocartesian fibration. However, from this point of view, it is not obvious that this realization is unique.

Remark 8.6.0.2 (Duality via Transport Representations). Let $\mathcal{QC}$ denote the ∞ -category of small ∞ -categories (Construction 5.5.4.1). Then $\mathcal{QC}$ admits an autoequivalence $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$, given on objects by the formula $\sigma(\mathcal{A}) = \mathcal{A}^{\text{op}}$ (see Construction 8.6.7.6). Recall that an (essentially small) cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is determined, up to equivalence, by a functor $\text{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{QC}$, which we refer to as the *covariant transport representation* of U (Definition 5.6.5.1). In §8.6.7, we show that a cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is a cocartesian dual of U if and only if its covariant transport representation is isomorphic to the composition $\mathcal{C} \xrightarrow{\text{Tr}_{\mathcal{E}/\mathcal{C}}} \mathcal{QC} \xrightarrow{\sigma} \mathcal{QC}$ (Proposition 8.6.7.12). This gives another construction of the cocartesian dual of U (albeit one which is cumbersome to work with). 04C3

Remark 8.6.0.3. The commutativity of the diagram (8.67) is not immediately obvious: the notions of cartesian conjugacy and cocartesian duality have separate definitions that are *a priori* unrelated to one another. We will maintain this separation in our exposition: the portions of this section which discuss conjugate fibrations (§8.6.1, §8.6.2, and §8.6.3) can be read independently of those which discuss dual fibrations (§8.6.4, §8.6.5, and §8.6.7). Only in §8.6.6 will we consider both notions simultaneously. 04C4

Remark 8.6.0.4. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. The construction of the conjugate fibration $\text{Cospan}^\dagger(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ studied in §8.6.3 appears in work of Barwick-Glasman-Nardin; see [4]. 04C5

8.6.1 Conjugate Fibrations

Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Our goal in this section is to formalize the requirement that U and $U^\dagger$ have “the same fibers”: that is, that there exists a family of equivalences $\{T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C\}_{C \in \mathcal{C}}$ which in some sense depend functorially on the vertex $C \in \mathcal{C}$. 04C6

Definition 8.6.1.1 (Conjugate Fibrations). Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Let $\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ and $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ be the projection maps of Notation 8.1.1.6. We say that a morphism of simplicial sets $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ exhibits $U^\dagger$ as a cartesian conjugate of U if the following conditions are satisfied: 04C7

(0) The diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \xrightarrow{\lambda_+} & \mathcal{C} \end{array}$$

is commutative.

- (1) For every vertex $C \in \mathcal{C}$, restricting T to the inverse image of the vertex $\text{id}_C \in \text{Tw}(\mathcal{C})$ determines an equivalence of ∞ -categories $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$.
- (2) Let e be an edge of the simplicial set $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. If the image of e in $\mathcal{E}^\dagger$ is $U^\dagger$ -cartesian, then $T(e)$ is a U -cocartesian edge of $\mathcal{E}$.

We say that $U^\dagger$ is a *cartesian conjugate* of U if there exists a morphism $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ which exhibits $U^\dagger$ as a cartesian conjugate of U .

04C8 Warning 8.6.1.2 (Symmetry). Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. In §8.6.6, we will show that $U^\dagger$ is a cartesian conjugate of U if and only if U^{op} is a cocartesian conjugate of $U^{\dagger, \text{op}}$ (Corollary 8.6.6.2). Beware that this is not obvious from Definition 8.6.1.1.

04C9 Example 8.6.1.3. Let $\mathcal{E}$ and $\mathcal{E}^\dagger$ be ∞ -categories. Set $\mathcal{C} = \Delta^0$ and let $U : \mathcal{E} \rightarrow \mathcal{C}^{\text{op}}$ and $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}$ denote the projection maps. Then a functor

$$T : \mathcal{E}^\dagger \simeq \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

exhibits $U^\dagger$ as a cartesian conjugate of U if and only if it is an equivalence of ∞ -categories. In particular, $U^\dagger$ is a cartesian conjugate of U if and only if the ∞ -category $\mathcal{E}^\dagger$ is equivalent to $\mathcal{E}$.

04CA Remark 8.6.1.4 (Base Change). Let $F : \mathcal{C}' \rightarrow \mathcal{C}$ be a morphism of simplicial sets. Suppose we are given pullback squares

$$\begin{array}{ccc} \mathcal{E}'^\dagger & \xrightarrow{U'^\dagger} & \mathcal{C}'^{\text{op}} \\ \downarrow & & \downarrow F^{\text{op}} \\ \mathcal{E}^\dagger & \xrightarrow{U^\dagger} & \mathcal{C}^{\text{op}} \end{array} \quad \begin{array}{ccc} \mathcal{E}' & \xrightarrow{U'} & \mathcal{C}' \\ \downarrow & & \downarrow F \\ \mathcal{E} & \xrightarrow{U} & \mathcal{C}, \end{array}$$

where $U^\dagger$ is a cartesian fibration and U is a cocartesian fibration. If $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ is a morphism which exhibits $U^\dagger$ as a cartesian conjugate of U , then the induced map $T' : \mathcal{E}'^\dagger \times_{\mathcal{C}'^{\text{op}}} \text{Tw}(\mathcal{C}') \rightarrow \mathcal{E}'$ exhibits $U'^\dagger$ as a cartesian conjugate of U' .

In the situation of Definition 8.6.1.1, we can regard condition (2) as a formulation of the requirement that the functor $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$ depends functorially on the vertex $C \in \mathcal{C}$. This heuristic can be articulated more precisely as follows:

Proposition 8.6.1.5. *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Let $e : C \rightarrow C'$ be an edge of $\mathcal{C}$, and let*

$$e^* : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_{C'}^\dagger \quad e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$$

be functors given by contravariant and covariant transport along e for the fibrations $U^\dagger$ and U , respectively. If $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ is a morphism which satisfies conditions (0) and (2) of Definition 8.6.1.1, then the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E}_C^\dagger & \xrightarrow{e^*} & \mathcal{E}_{C'}^\dagger \\ \downarrow T_C & & \downarrow T_{C'} \\ \mathcal{E}_C & \xrightarrow{e_!} & \mathcal{E}_{C'} \end{array}$$

commutes up to isomorphism.

Proof. The restriction of T to the inverse image of the vertex $\{e\} \subseteq \text{Tw}(\mathcal{C})$ determines a functor of ∞ -categories $T_e : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_{C'}$. To complete the proof, it will suffice to verify the following pair of assertions:

- (a) The functor T_e is isomorphic to the composition $T_{C'} \circ e^*$.
- (b) The functor T_e is isomorphic to the composition $e_! \circ T_C$.

We begin by proving (a). Choose a diagram

$$\begin{array}{ccc} \mathcal{E}_C^\dagger \times \Delta^1 & \xrightarrow{H} & \mathcal{E}^\dagger \\ \downarrow & & \downarrow U^\dagger \\ \Delta^1 & \xrightarrow{e} & \mathcal{C}^{\text{op}} \end{array}$$

which witnesses $e^* = H_{\mathcal{E}_C^\dagger \times \{0\}}$ as given by contravariant transport along e (see Definition 5.2.2.15). Let $e_L : \text{id}_C \rightarrow e$ and $e_R : \text{id}_{C'} \rightarrow e$ denote the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6, and let $\tilde{H}$ denote the product morphism

$$\mathcal{E}_C^\dagger \times \Delta^1 \xrightarrow{H \times e_R} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}).$$

Then the composition $T \circ \tilde{H}$ can be regarded as a natural transformation from the functor $T_{C'} \circ e^*$ to T_e . For each object X of the ∞ -category $\mathcal{E}_C^\dagger$, the restriction $H|_{\{X\} \times \Delta^1}$ is a $U^\dagger$ -cartesian edge of $\mathcal{E}^\dagger$. Using condition (2) of Definition 8.6.1.1, we conclude that $(T \circ \tilde{H})|_{\{X\} \times \Delta^1}$ is a U -cocartesian edge of $\mathcal{E}$ lying over the degenerate edge $\text{id}_{C'}$ of $\mathcal{C}$, and is therefore an isomorphism in the ∞ -category $\mathcal{E}_{C'}$ (Proposition 5.1.4.12). Applying Theorem 4.4.4.4, we conclude that $T \circ \tilde{H}$ is an isomorphism of functors from $T_{C'} \circ e^*$ to T_e .

We now prove (b). Let H' denote the composite map

$$\mathcal{E}_C^\dagger \times \Delta^1 \xrightarrow{\text{id} \times e_L} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \xrightarrow{T} \mathcal{E},$$

We then have a commutative diagram

$$\begin{array}{ccc} \mathcal{E}_C^\dagger \times \Delta^1 & \xrightarrow{H'} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \Delta^1 & \xrightarrow{e} & \mathcal{C}. \end{array}$$

Condition (2) of Definition 8.6.1.1 guarantees that, for each object $X \in \mathcal{E}_C^\dagger$, the restriction $H'|_{\{X\} \times \Delta^1}$ is a U -cocartesian edge of $\mathcal{E}$. It follows that H' determines an isomorphism of $T_e = H'|_{\mathcal{E}_C^\dagger \times \{1\}}$ with the composition $e_! \circ (H'|_{\mathcal{E}_C^\dagger \times \{0\}}) = e_! \circ T_C$. $\square$

04CC Corollary 8.6.1.6. *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration having homotopy transport representation $\text{hTr}_{\mathcal{E}/\mathcal{C}} : \text{h}\mathcal{C} \rightarrow \text{hQCat}$ (Construction 5.2.5.2), and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration having homotopy transport representation $\text{hTr}_{\mathcal{E}^\dagger/\mathcal{C}^{\text{op}}} : \text{h}\mathcal{C} \rightarrow \text{hQCat}$ (Construction 5.2.5.7). If $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ exhibits $U^\dagger$ as a cartesian conjugate of U , then T induces an isomorphism of functors $\text{hTr}_{\mathcal{E}^\dagger/\mathcal{C}^{\text{op}}} \xrightarrow{\sim} \text{hTr}_{\mathcal{E}/\mathcal{C}}$, carrying each vertex $C \in \mathcal{C}$ to (the isomorphism class of) the equivalence $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$.*

04CD Corollary 8.6.1.7. *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. If $U^\dagger$ is a cartesian conjugate of U , then the homotopy transport representations*

$$\text{hTr}_{\mathcal{E}^\dagger/\mathcal{C}^{\text{op}}}, \text{hTr}_{\mathcal{E}/\mathcal{C}} : \text{h}\mathcal{C} \rightarrow \text{hQCat}$$

are isomorphic.

We now give some concrete examples of conjugate fibrations.

04CE Proposition 8.6.1.8 (Conjugates of Left Fibrations). *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets. Then:*

- (a) The map $H : \mathrm{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ is a trivial Kan fibration of simplicial sets.
- (b) Let T_0 be a section of H , and let $T : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ be the composition of T_0 with the projection map $\mathrm{Tw}(\mathcal{E}) \rightarrow \mathcal{E}$. Then T exhibits the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ as a cartesian conjugate of U .

Proof. Note that the morphism H factors as a composition

$$\mathrm{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}),$$

where the map on the left is a left fibration by virtue of Proposition 8.1.1.15, and the map on the right is pullback of U (and is therefore also a left fibration). It follows that H is a left fibration (Remark 4.2.1.11). To prove (a), it will suffice to show that every fiber of H is a contractible Kan complex (Proposition 4.4.2.14). For this, we may assume without loss of generality that $\mathcal{C} = \Delta^0$. In this case, $\mathcal{E}$ is a Kan complex (Proposition 4.4.2.1) and we can identify H with the projection map $\mathrm{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\mathrm{op}}$, which is a trivial Kan fibration by virtue of Corollary 8.1.2.3.

Let $T : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ be as in (b); we wish to show that T satisfies conditions (0), (1), and (2) of Definition 8.6.1.1. Condition (0) follows from the commutativity of the diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{E}) & \xrightarrow{\quad} & \mathcal{E} \\ \downarrow H & & \downarrow U \\ \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) & \xrightarrow{\quad} \mathrm{Tw}(\mathcal{C}) \xrightarrow{\quad} & \mathcal{C} \end{array}$$

and condition (2) is vacuous (our assumption that U is a left fibration guarantees that every edge of $\mathcal{E}$ is U -cocartesian; see Example 5.1.1.3). To verify condition (1), we may again assume that $\mathcal{C} = \Delta^0$, in which case the desired result follows from the observation that the projection maps $\mathcal{E}^{\mathrm{op}} \leftarrow \mathrm{Tw}(\mathcal{E}) \rightarrow \mathcal{E}$ are homotopy equivalences of Kan complexes (see Corollary 8.1.2.3). $\square$

Construction 8.6.1.9 (Conjugacy for Categories of Elements). Let $\mathcal{C}$ be a category, let $\mathbf{Cat}$ denote the 2-category of (small) categories, and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories. Let 04CF

$$\int^{\mathcal{C}^{\mathrm{op}}} \mathcal{F} \quad \int_{\mathcal{C}} \mathcal{F}$$

denote the contravariant and covariant categories of elements of $\mathcal{F}$, respectively (see Definitions 5.6.1.4 and 5.6.1.1). Recall that objects of either category can be identified with pairs (C, X) , where C is an object of $\mathcal{C}$ and X is an object of the category $\mathcal{F}(C)$. However, morphisms are defined differently:

- A morphism from (C, X) to (D, Y) in the category $\int_{\mathcal{C}} \mathcal{F}$ is a pair (f, u) where $f : C \rightarrow D$ is a morphism in the category $\mathcal{C}$ and $u : \mathcal{F}(f)(X) \rightarrow Y$ is a morphism in the category $\mathcal{F}(D)$.
- A morphism from (C, X) to (D, Y) in the category $\int^{\mathcal{C}^{\text{op}}} \mathcal{F}$ is a pair (g, v) , where $g : D \rightarrow C$ is a morphism in the category $\mathcal{C}$, and $v : X \rightarrow \mathcal{F}(g)(Y)$ is a morphism in the category $\mathcal{F}(C)$.

Let us identify the objects of the fiber product $(\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ with pairs $(s : C' \rightarrow C, X)$, where $s : C' \rightarrow C$ is a morphism in $\mathcal{C}$ and X is an object of the category $\mathcal{F}(C')$. We define a functor We define a functor

$$T : (\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \int_{\mathcal{C}} \mathcal{F}$$

as follows:

- On objects, T is given by the formula $T(s : C' \rightarrow C, X) = (C, \mathcal{F}(s)(X))$.
- Let $(s : C' \rightarrow C, X)$ and $(t : D' \rightarrow D, Y)$ be objects of the category $(\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. Unwinding the definitions, we see that a morphism from $(s : C' \rightarrow C, X)$ to $(t : D' \rightarrow D, Y)$ can be identified with triples (f, f', u) , where $f : C \rightarrow D$ and $f' : D' \rightarrow C'$ are morphisms in $\mathcal{C}$ satisfying $t = f \circ s \circ f'$, and $u : X \rightarrow \mathcal{F}(f')(Y)$ is a morphism in the category $\mathcal{F}(C')$. In this case, we define $T(f, f', u)$ to be the morphism $(f, v) : (C, \mathcal{F}(s)(X)) \rightarrow (D, \mathcal{F}(t)(Y))$, where v is the morphism in $\mathcal{F}(D)$ given by the composition

$$\begin{aligned} (\mathcal{F}(f) \circ \mathcal{F}(s))(X) &\xrightarrow{(\mathcal{F}(f) \circ \mathcal{F}(s))(u)} (\mathcal{F}(f) \circ \mathcal{F}(s) \circ \mathcal{F}(f'))(Y) \\ &\simeq \mathcal{F}(f \circ s \circ f')(Y) \\ &= \mathcal{F}(t)(Y), \end{aligned}$$

where the unlabeled isomorphism is supplied by the composition constraints for the functor $\mathcal{F}$.

04CG Proposition 8.6.1.10. *Let $\mathcal{C}$ be a category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor. Then, after passing to nerves, the functor*

$$T : (\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \int_{\mathcal{C}} \mathcal{F}$$

of Construction 8.6.1.9 exhibits the forgetful functor $U^\dagger : \int^{\mathcal{C}^{\text{op}}} \mathcal{F} \rightarrow \mathcal{C}^{\text{op}}$ as a cartesian conjugate of the forgetful functor $U : \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}$.

Proof. Condition (0) of Definition 8.6.1.1 follows immediately from the construction. To verify condition (1), we observe that for each object $C \in \mathcal{C}$, the functor

$$T_C : (\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \{C\} \rightarrow \{C\} \times_{\mathcal{C}} (\int_{\mathcal{C}} \mathcal{F})$$

can be identified with the functor $\mathcal{F}(\text{id}_C) : \mathcal{F}(C) \rightarrow \mathcal{F}(C)$. The identity constraint of $\mathcal{F}$ supplies an isomorphism of functors $\text{id}_{\mathcal{F}(C)} \xrightarrow{\sim} T_C$, so that T_C is an equivalence of categories. To verify condition (2), suppose we are given a morphism e in the category $(\int^{\mathcal{C}^{\text{op}}} \mathcal{F}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. We wish to show that, if the image of e in the category $\int^{\mathcal{C}^{\text{op}}} \mathcal{F}$ is $U^\dagger$ -cartesian, then $T(e)$ is a U -cocartesian morphism in the category $\int_{\mathcal{C}} \mathcal{F}$. Writing $e = (f, f', u)$ and $T(e) = (f, v)$ as in Construction 8.6.1.9, we are reduced to showing that if u is an isomorphism, then v is also an isomorphism (Proposition 5.6.1.15), which is immediate from the construction. $\square$

Construction 8.6.1.11 (Conjugacy for Weighted Nerves). Let $\mathbf{QCat}$ denote the category 04CH of ∞ -categories (which we regard as a full subcategory of the category of simplicial sets). Let $\mathcal{C}$ be a category equipped with a functor $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$, and let $\mathcal{E} = \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C})$ denote the weighted nerve of Definition 5.3.3.1. We will identify n -simplices of $\mathcal{E}$ with pairs (σ_+, τ_+) , where $\sigma_+ = (C_0 \rightarrow C_1 \rightarrow \cdots \rightarrow C_n)$ is an n -simplex of the simplicial set $\mathbf{N}_\bullet(\mathcal{C})$ and $\tau_+ = (\tau_0, \tau_1, \dots, \tau_n)$ is the datum of a commutative diagram

$$\begin{array}{ccccccc} \Delta^0 \hookrightarrow & \Delta^1 \hookrightarrow & \Delta^2 \hookrightarrow & \cdots \hookrightarrow & \Delta^n \\ \tau_0 \downarrow & \tau_1 \downarrow & \tau_2 \downarrow & \downarrow & \tau_n \downarrow \\ \mathcal{F}(C_0) \longrightarrow & \mathcal{F}(C_1) \longrightarrow & \mathcal{F}(C_2) \longrightarrow & \cdots \longrightarrow & \mathcal{F}(C_n). \end{array}$$

Let $U : \mathcal{E} \rightarrow \mathbf{N}_\bullet(\mathcal{C})$ be the cocartesian fibration of Corollary 5.3.3.16, given on n -simplices by the formula $U(\sigma_+, \tau_+) = \sigma_+$.

Let $\mathcal{F}^{\text{op}} : \mathcal{C} \rightarrow \mathbf{QCat}$ denote the functor given by the formula $\mathcal{F}^{\text{op}}(C) = \mathcal{F}(C)^{\text{op}}$, and let $\mathcal{E}^\dagger$ denote the ∞ -category $\mathbf{N}_\bullet^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}}$. Unwinding the definitions, we see that n -simplices of $\mathcal{E}^\dagger$ can be identified with pairs (σ_-, τ_-) , where $\sigma_- = (C'_n \rightarrow C'_{n-1} \rightarrow \cdots \rightarrow C'_0)$ is an n -simplex of the simplicial set $\mathbf{N}_\bullet(\mathcal{C})^{\text{op}}$ and $\tau_- = (\tau'_n, \tau'_{n-1}, \dots, \tau'_0)$ is the datum of a commutative diagram

$$\begin{array}{ccccccc} \{n\} \hookrightarrow & \mathbf{N}_\bullet(\{n-1 < n\}) \hookrightarrow & \cdots \hookrightarrow & \Delta^n \\ \tau'_n \downarrow & \tau'_{n-1} \downarrow & & \tau'_0 \downarrow \\ \mathcal{F}(C'_n) \longrightarrow & \mathcal{F}(C'_{n-1}) \longrightarrow & \cdots \longrightarrow & \mathcal{F}(C'_0). \end{array}$$

Corollary 5.3.3.16 supplies a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathbf{N}_\bullet(\mathcal{C})^{\text{op}}$, given on n -simplices by the formula $U^\dagger(\sigma_-, \tau_-) = \sigma_-$.

Let us identify n -simplices of the fiber product $\mathcal{E}^\dagger \times_{\mathbf{N}_\bullet(\mathcal{C})^{\text{op}}} \text{Tw}(\mathbf{N}_\bullet(\mathcal{C}))$ with quadruples $(\sigma_-, \tau_-, \sigma_+, e)$, where $\sigma_- = (C'_n \rightarrow \cdots \rightarrow C'_0)$ is an n -simplex of $\mathbf{N}_\bullet(\mathcal{C})^{\text{op}}$, $\tau_- = (\tau'_n, \cdots, \tau'_0)$ is as above, $\sigma_+ = (C_0 \rightarrow \cdots \rightarrow C_n)$ is an n -simplex of $\mathbf{N}_\bullet(\mathcal{C})$, and $e : C'_0 \rightarrow C_0$ is a morphism in the category $\mathcal{C}$. For $0 \leq i \leq n$, we let τ_i denote the i -simplex of $\mathcal{F}(C_i)$ given by the composition

$$\Delta^i \hookrightarrow \Delta^n \xrightarrow{\tau'_0} \mathcal{F}(C'_0) \xrightarrow{\mathcal{F}(e)} \mathcal{F}(C_0) \rightarrow \mathcal{F}(C_i).$$

Set $\tau_+ = (\tau_0, \cdots, \tau_n)$, so that the pair (σ_+, τ_+) determines an n -simplex of the simplicial set $\mathcal{E}$. The construction $(\sigma_-, \tau_-, \sigma_+, e) \mapsto (\sigma_+, \tau_+)$ is compatible with face and degeneracy operators, and therefore determines a functor of ∞ -categories

$$T : \mathcal{E}^\dagger \times_{\mathbf{N}_\bullet(\mathcal{C})^{\text{op}}} \text{Tw}(\mathbf{N}_\bullet(\mathcal{C})) \rightarrow \mathcal{E}.$$

04CJ Proposition 8.6.1.12. *Let $\mathcal{C}$ be a category equipped with a functor $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$, let $U : \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C}) \rightarrow \mathbf{N}_\bullet(\mathcal{C})$ denote the cocartesian fibration of Corollary 5.3.3.16, and define $U^\dagger : \mathbf{N}_\bullet^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}} \rightarrow \mathbf{N}_\bullet(\mathcal{C})^{\text{op}}$ similarly. Then the functor*

$$T : \mathbf{N}_\bullet^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}} \times_{\mathbf{N}_\bullet(\mathcal{C})^{\text{op}}} \text{Tw}(\mathbf{N}_\bullet(\mathcal{C})) \rightarrow \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C})$$

of Construction 8.6.1.11 exhibits $U^\dagger$ as a cartesian conjugate of U .

Proof. Condition (0) of Definition 8.6.1.1 follows immediately from the construction. Condition (1) follows from the observation that, for each object $C \in \mathcal{C}$, the induced map

$$T_C : \mathbf{N}_\bullet^{\mathcal{F}^{\text{op}}}(\mathcal{C})^{\text{op}} \times_{\mathbf{N}_\bullet(\mathcal{C})^{\text{op}}} \{C\} \rightarrow \{C\} \times_{\mathbf{N}_\bullet(\mathcal{C})} \mathbf{N}_\bullet^{\mathcal{F}}(\mathcal{C})$$

is an isomorphism of simplicial sets (under the identifications supplied by Example 5.3.3.8, it corresponds to the identity functor from the ∞ -category $\mathcal{F}(C)$ to itself). Condition (2) follows from the characterization of U -cocartesian and $U^{\dagger, \text{op}}$ -cocartesian morphisms given in Corollary 5.3.3.16. $\square$

We close this section with a technical result, which will be convenient for verifying hypothesis (2) of Definition 8.6.1.1. If $\mathcal{C}$ is a simplicial set and $e : C \rightarrow D$ is an edge of $\mathcal{C}$, we write $e_L : \text{id}_C \rightarrow e$ and $e_R : \text{id}_D \rightarrow e$ for the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6.

04CK Proposition 8.6.1.13. *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration, and suppose we are given a commutative*

diagram

$$\begin{array}{ccc}
 \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\
 \downarrow & & \downarrow U \\
 \text{Tw}(\mathcal{C}) & \xrightarrow{\lambda_+} & \mathcal{C}.
 \end{array}$$

Then T satisfies condition (2) of Definition 8.6.1.1 if and only if it satisfies both of the following conditions:

- (2') For every object $Y \in \mathcal{E}^\dagger$ having image $\bar{Y} = U^\dagger(Y)$ and every edge $e : \bar{Y} \rightarrow \bar{X}$ of $\mathcal{C}$, the morphism T carries $(\text{id}_Y, e_L) : (Y, \text{id}_{\bar{Y}}) \rightarrow (Y, e)$ to a U -cocartesian edge of $\mathcal{E}$.
- (2'') Let $f : X \rightarrow Y$ be a $U^\dagger$ -cartesian edge of $\mathcal{E}^\dagger$. Set $\bar{X} = U^\dagger(X)$ and $\bar{Y} = U^\dagger(Y)$, so that $U^\dagger(f)$ can be identified with an edge $e : \bar{Y} \rightarrow \bar{X}$ of the simplicial set $\mathcal{C}$. Then T carries $(f, e_R) : (X, \text{id}_{\bar{X}}) \rightarrow (Y, e)$ to an isomorphism in the ∞ -category $\mathcal{E}_{\bar{Y}}$.

Proof. The implication (2) $\Rightarrow$ (2') is immediate from the definitions, and the implication (2) $\Rightarrow$ (2'') follows from Proposition 5.1.4.12. For the converse, suppose that conditions (2') and (2'') are satisfied. Let $f : X \rightarrow Y$ be a $U^\dagger$ -cartesian edge of $\mathcal{E}^\dagger$, and let us identify $U^\dagger(f)$ with an edge $e : \bar{Y} \rightarrow \bar{X}$ of the simplicial set $\mathcal{C}$. Suppose we are given a lift of e to an edge $\tilde{e} : u \rightarrow v$ of $\text{Tw}(\mathcal{C})$, which we identify with a 3-simplex $\sigma : \Delta^3 \rightarrow \mathcal{C}$ depicted in the diagram

$$\begin{array}{ccc}
 \bar{X} & \xleftarrow{e} & \bar{Y} \\
 \downarrow u & & \downarrow v \\
 \bar{X}' & \longrightarrow & \bar{Y}'.
 \end{array}$$

We wish to show that $T(f, \tilde{e})$ is a U -cocartesian edge of $\mathcal{E}$.

Let σ' denote the degenerate 5-simplex of $\mathcal{C}$ given by $\gamma^*(\sigma)$, where $\gamma : [5] \rightarrow [3]$ is given by $\gamma(0) = 0$, $\gamma(1) = \gamma(2) = \gamma(3) = 1$, $\gamma(4) = 2$, and $\gamma(5) = 3$. Let us abuse notation by identifying σ' with the 2-simplex of $\text{Tw}(\mathcal{C})$ depicted in the diagram

$$\begin{array}{ccccc}
 \bar{X} & \xleftarrow{\text{id}} & \bar{X} & \xleftarrow{e} & \bar{Y} \\
 \downarrow \text{id} & & \downarrow u & & \downarrow v \\
 \bar{X} & \xrightarrow{u} & \bar{X}' & \longrightarrow & \bar{Y}'.
 \end{array}$$

04CL

(8.68)

Evaluating T on the pair $(s_0^1(f), \sigma')$, we obtain a 2-simplex of $\mathcal{E}$ depicted in the diagram

$$\begin{array}{ccc}
 & T(X, u) & \\
 T(\text{id}_X, u_L) \nearrow & & \searrow T(f, \tilde{e}) \\
 T(X, \text{id}_X) & \xrightarrow{\quad\quad\quad} & T(Y, v),
 \end{array}$$

where the left diagonal map is U -cocartesian by virtue of assumption (2'). Consequently, to show that the $T(f, \tilde{e})$ is U -cocartesian, it will suffice to show that the horizontal edge is U -cocartesian (Proposition 5.1.4.13). Note that, in the special case where $\sigma = s_0^2(\sigma_0)$ for some 2-simplex σ_0 of $\mathcal{C}$, the horizontal edge coincides with $T(\text{id}_X, v_L)$, which is also U -cocartesian by virtue of (2').

To handle the general case, we can replace σ by the 3-simplex of $\mathcal{C}$ given by the outer rectangle of the diagram (8.68) (that is, by the 3-simplex $\sigma'|_{N_\bullet(\{0 < 2 < 3 < 5\})}$, and thereby reduce to the special case where $\sigma = s_1^2(\sigma_1)$, for some 2-simplex σ_1 of $\mathcal{C}$ (so that $\bar{X} = \bar{X}'$ and u is a degenerate edge of $\mathcal{C}$). In this case, we let σ'' denote the 5-simplex of $\mathcal{C}$ given by $\beta^*(\sigma_1)$, where $\beta : [5] \rightarrow [2]$ is given by $\beta(0) = \beta(1) = 0$, $\beta(2) = \beta(3) = \beta(4) = 1$, and $\beta(5) = 2$. Let us view σ'' as a 2-simplex of $\text{Tw}(\mathcal{C})$ depicted in the diagram

$$\begin{array}{ccccc}
 \bar{X} & \xleftarrow{e} & \bar{Y} & \xleftarrow{\text{id}} & \bar{Y} \\
 \downarrow u & & & & \\
 \bar{X}' & \xrightarrow{\text{id}} & \bar{X}' & \longrightarrow & \bar{Y}'.
 \end{array}$$

Evaluating T on the pair $(s_1^1(f), \sigma'')$, we obtain a 2-simplex of $\mathcal{E}$ depicted in the diagram

$$\begin{array}{ccc}
 & T(Y, e) & \\
 T(f, e_R) \nearrow & & \searrow \\
 T(X, u) & \xrightarrow{\quad T(f, \tilde{e}) \quad} & T(Y, v).
 \end{array}$$

Here the left diagonal edge is U -cocartesian by virtue of assumption (2'') and the right diagonal edge is U -cocartesian by virtue of the special case treated above. Applying Proposition 5.1.4.13, we conclude that $T(f, \tilde{e})$ is also U -cocartesian. $\square$

05JF Remark 8.6.1.14. In the situation of Proposition 8.6.1.13, suppose that T exhibits $U^\dagger$ as a cartesian conjugate of U . Then we have the following stronger version condition of (2''):

- (*) Let $f : X \rightarrow Y$ be an edge of $\mathcal{E}^\dagger$. Set $\overline{X} = U^\dagger(X)$ and $\overline{Y} = U^\dagger(Y)$, so that $U^\dagger(f)$ can be identified with an edge $e : \overline{Y} \rightarrow \overline{X}$ of the simplicial set $\mathcal{C}$. Then f is $U^\dagger$ -cartesian if and only if $T(f, e_R)$ is an isomorphism in the ∞ -category $\mathcal{E}_{\overline{Y}}$.

The “only if” direction follows from Proposition 8.6.1.13. To prove the converse, choose a 2-simplex σ of $\mathcal{E}^\dagger$ corresponding to a diagram

$$\begin{array}{ccc} & X' & \\ u \nearrow & & \searrow f' \\ X & \xrightarrow{f} & Y \end{array}$$

of the simplicial set $\mathcal{E}^\dagger$, where $U^\dagger(\sigma)$ is a left-degenerate 2-simplex of $\mathcal{C}^{\text{op}}$ and f' is $U^\dagger$ -cartesian. We then obtain a 2-simplex

$$\begin{array}{ccc} & T(X', f) & \\ T_{\overline{Y}}(u) \nearrow & & \searrow T(f', e_R) \\ T(X, f) & \xrightarrow{T(f, e_R)} & T(Y, \text{id}_Y) \end{array}$$

in the ∞ -category $\mathcal{E}_{\overline{Y}}$. If both $T(f, e_R)$ and $T(f', e_R)$ are isomorphisms, then $T_{\overline{Y}}(u)$ is an isomorphism as well. Since the functor $T_{\overline{Y}} : \mathcal{E}_{\overline{Y}}^\dagger \rightarrow \mathcal{E}_{\overline{Y}}$ is an equivalence of ∞ -categories, we conclude that u is an isomorphism in the ∞ -category $\mathcal{E}_{\overline{Y}}^\dagger$, so that f is also $U^\dagger$ -cartesian (see Remark 5.1.3.8).

8.6.2 Existence of Conjugate Fibrations

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Our goal in this section is 04CM to show that U admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ (Corollary 8.6.2.4). For this purpose, we will need to construct a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{\quad} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \xrightarrow{\quad} & \mathcal{C} . \end{array}$$

We begin by considering the universal example of such a diagram.

04CN **Notation 8.6.2.1.** Let $\mathcal{D}$ be a simplicial set equipped with a morphism $\lambda = (\lambda_-, \lambda_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\text{op}} \times \mathcal{D}_+$. For every simplicial set $\mathcal{E}$, we let $\text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ denote the relative exponential of Construction 4.5.9.1. For $n \geq 0$, we will identify n -simplices of $\text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ with pairs (σ, f) , where σ is an n -simplex of $\mathcal{D}_-^{\text{op}}$ and $f : \Delta^n \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} \rightarrow \mathcal{E}$ is a morphism of simplicial sets. Suppose that we are also given a morphism of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{D}_+$. In this case, we let $\text{Fun}_{/\mathcal{D}_+}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ denote the simplicial subset of $\text{Fun}(\mathcal{D} / \mathcal{D}_-^{\text{op}}, \mathcal{E})$ whose n -simplices are pairs (σ, f) which satisfy the additional condition that the diagram

$$\begin{array}{ccc} \Delta^n \times_{\mathcal{D}_-^{\text{op}}} \mathcal{D} & \xrightarrow{f} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \mathcal{D} & \xrightarrow{\lambda_+} & \mathcal{D}_+ \end{array}$$

is commutative.

04CP **Construction 8.6.2.2.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ be the simplicial set given in Notation 8.6.2.1. Unwinding the definitions, we see that vertices of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ can be identified with pairs (C, f_C) , where C is an object of $\mathcal{C}$ and f_C is a morphism which fits into a commutative diagram

$$\begin{array}{ccc} \{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{f_C} & \mathcal{E} \\ & \searrow & \swarrow U \\ & \mathcal{C} & \end{array}$$

We let $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ denote the full simplicial subset of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$, spanned by those pairs (C, f_C) where the morphism f_C carries each edge of $\{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ to a U -cocartesian edge of $\mathcal{E}$. By construction, the simplicial set $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E})$ is equipped with a projection map $V : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$ and an evaluation map $\text{ev} : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$, given on vertices by the construction $(C, f_C, u : C \rightarrow C') \mapsto f_C(u)$.

We can now formulate the main result of this section:

04CQ **Proposition 8.6.2.3.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Then the projection map $V : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$ of Construction 8.6.2.2 is a cartesian fibration of ∞ -categories, and the evaluation functor*

$$\text{ev} : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E} \quad (C, f_C, u : C \rightarrow C') \mapsto f_C(u)$$

exhibits V as a cartesian conjugate of U .

Corollary 8.6.2.4. *Every cocartesian fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$ admits a cartesian conjugate.* 04CR

Proof. Using Corollary 5.6.7.3, we can choose a pullback diagram

$$\begin{array}{ccc} \mathcal{E} & \longrightarrow & \mathcal{E}' \\ \downarrow U & & \downarrow U' \\ \mathcal{C} & \longrightarrow & \mathcal{C}', \end{array}$$

where U' is a cocartesian fibration of ∞ -categories. By virtue of Remark 8.6.1.4, it will suffice to show that U' admits a cartesian conjugate, which follows from Proposition 8.6.2.3. $\square$

Warning 8.6.2.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. If $\mathcal{C}$ is not an ∞ -category, then the morphism $V : \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C})/\mathcal{C}^{\mathrm{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\mathrm{op}}$ given by Construction 8.6.2.2 need not be a cartesian conjugate of U . In §8.6.3, we will give an alternative construction of a cartesian conjugate which works in complete generality (Proposition 8.6.3.5). 04CS

The proof of Proposition 8.6.2.3 will require some preliminaries.

Lemma 8.6.2.6. *Let $\lambda = (\lambda_-, \lambda_+) : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}} \times \mathcal{D}_+$ be a coupling of ∞ -categories and let $U : \mathcal{E} \rightarrow \mathcal{D}_+$ be an isofibration. Then:* 04CT

- (1) *The projection map $\bar{V} : \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E}) \rightarrow \mathcal{D}_-^{\mathrm{op}}$ is a cartesian fibration of ∞ -categories.*
- (2) *Let $\tilde{e}$ be a morphism in the ∞ -category $\mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$, corresponding to a morphism e of $\mathcal{D}_-^{\mathrm{op}}$ and a functor $f_e : \Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \rightarrow \mathcal{E}$. Then $\tilde{e}$ is $\bar{V}$ -cartesian if and only if, for every morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ whose image in $\mathcal{D}_+$ is an isomorphism, the image $f_e(u)$ is an isomorphism in $\mathcal{E}$.*

Proof. Unwinding the definitions, we have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathrm{Fun}_{/\mathcal{D}_+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E}) & \longrightarrow & \mathrm{Fun}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E}) \\ \downarrow \bar{V} & & \downarrow \bar{V}' \\ \mathcal{D}_-^{\mathrm{op}} & \longrightarrow & \mathrm{Fun}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{D}_+), \end{array}$$

where the lower horizontal map classifies the morphism $\lambda_+ : \mathcal{D} \rightarrow \mathcal{D}_+$ and $\bar{V}'$ is given by composition with U . The functor $\lambda_- : \mathcal{D} \rightarrow \mathcal{D}_-^{\mathrm{op}}$ is a cocartesian fibration (Proposition

8.2.1.7) and therefore exponentiable (Proposition 5.3.6.1). It follows from Proposition 4.5.9.18 guarantees that $\bar{V}'$ is an isofibration, so that $\bar{V}$ is also an isofibration.

Let us say that a morphism $\tilde{e}$ in the ∞ -category $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ is *special* if it satisfies the condition described in (2). Let us identify $\tilde{e}$ with a pair (e, f_e) , where $e : D' \rightarrow D$ is a morphism in the ∞ -category $\mathcal{D}_-^{\mathrm{op}}$ and $f_e : \Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \rightarrow \mathcal{E}$ is a functor of ∞ -categories. Let $\pi : \Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} \rightarrow \Delta^1$ be given by the projection map onto the first factor. Then π is a cocartesian fibration, and a morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ is π -cocartesian if and only if its image in $\mathcal{D}_+$ is an isomorphism (see Proposition 8.2.1.7). If this condition is satisfied, the assumption that $\tilde{e}$ is special guarantees that $f_e(u)$ is an isomorphism in the ∞ -category $\mathcal{E}$, and is therefore U -cartesian (Proposition 5.1.1.9). Applying Lemma 5.3.6.11, we deduce that $\tilde{e}$ is $\bar{V}'$ -cartesian when regarded as a morphism of $\mathrm{Fun}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$, and therefore also $\bar{V}$ -cartesian when regarded as a morphism of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$.

To show that $\bar{V}$ is a cartesian fibration, it will suffice to show that if (D, f_D) is an object of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$, then every morphism $e : C \rightarrow D$ in the ∞ -category $\mathcal{D}_-^{\mathrm{op}}$ can be lifted to a special morphism $\tilde{e} : (C, f_C) \rightarrow (D, f_D)$ in $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$. We first claim that the lifting problem

$$\begin{array}{ccc} \{D\} \times_{\mathcal{C}_-^{\mathrm{op}}} \mathcal{C} & \xrightarrow{f_D} & \mathcal{E} \\ \downarrow & \nearrow f_e & \downarrow U \\ \Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D} & \longrightarrow & \mathcal{D}_+ \end{array}$$

admits a solution f_e which is U -right Kan extended from $\{D\} \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$. Using the criterion of Corollary 7.3.5.9, we are reduced to showing that if $u : X' \rightarrow X$ is a π -cocartesian morphism of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ lying over the nondegenerate edge of Δ^1 , then its image in $\mathcal{D}_+$ can be lifted to a U -cartesian morphism $E \rightarrow f_D(X)$ in $\mathcal{E}$. Since the image of u in $\mathcal{D}_+$ is an isomorphism (Proposition 8.2.1.7), this follows from our assumption that U is an isofibration. Note that the functor f_e carries *every* π -cocartesian morphism u of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ to an isomorphism in $\mathcal{D}$ (if the image of u in Δ^1 is degenerate, then u is an isomorphism and this condition is automatically satisfied), so that $\tilde{e} = (e, f_e)$ is a special morphism of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ having target (D, f_D) . This completes the proof of (1).

To complete the proof of (2), it will suffice to show that every $\bar{V}$ -cartesian morphism $\tilde{e} = (C, f_C) \rightarrow (D, f_D)$ of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$ is special. Let $e : C \rightarrow D$ denote the image of $\tilde{e}$ in the ∞ -category $\mathcal{D}_-^{\mathrm{op}}$. Using the preceding argument, we can lift e to a special morphism $\tilde{e}' : (C, f'_C) \rightarrow (D, f_D)$ of $\mathrm{Fun}_{/\mathcal{D}^+}(\mathcal{D}/\mathcal{D}_-^{\mathrm{op}}, \mathcal{E})$. Write $\tilde{e} = (e, f_e)$ and $\tilde{e}' = (e, f'_e)$. Since $\tilde{e}'$ is also $\bar{V}$ -cartesian, Remark 5.1.3.8 guarantees that the functors f_e and f'_e are isomorphic. In particular, if u is a morphism of $\Delta^1 \times_{\mathcal{D}_-^{\mathrm{op}}} \mathcal{D}$ such that $f'_e(u)$ is an isomorphism in $\mathcal{E}$, then $f_e(u)$ is also an isomorphism in $\mathcal{E}$. It follows that the morphism $\tilde{e}$ is also special, as

desired. $\square$

Lemma 8.6.2.7. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories and let $\bar{V} : \text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$ be the cartesian fibration of Lemma 8.6.2.6. Then:*

(1) *Let $\tilde{e} : (C, f_C) \rightarrow (D, f_D)$ be a $\bar{V}$ -cartesian morphism of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$. If (D, f_D) belongs to the simplicial subset $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$ of Construction 8.6.2.2, then (C, f_C) also belongs to $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$.*

(2) *The morphism $\bar{V}$ restricts to a cartesian fibration of ∞ -categories*

$$V : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}.$$

(3) *A morphism in the ∞ -category $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$ is V -cartesian if and only if it is $\bar{V}$ -cartesian when regarded as a morphism of $\text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$.*

Proof. We will prove assertion (1); assertions (2) and (3) then follow as formal consequences (see Proposition 5.1.4.17). Let us identify $\tilde{e}$ with a pair (e, f_e) , where $e : C \rightarrow D$ is a morphism in the ∞ -category $\mathcal{C}^{\text{op}}$ and $f_e : \Delta^1 \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ is a functor. Let $u : \tilde{C} \rightarrow \tilde{C}'$ be a morphism in the fiber $\{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$; we wish to show that $f_C(u)$ is a U -cocartesian morphism of $\mathcal{E}$. Since the projection map $\Delta^1 \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \Delta^1$ is a cocartesian fibration, we can choose a diagram

$$\begin{array}{ccc} \tilde{C} & \longrightarrow & \tilde{D} \\ \downarrow u & & \downarrow v \\ \tilde{C}' & \longrightarrow & \tilde{D}' \end{array}$$

in the ∞ -category $\Delta^1 \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$, where v is a morphism of $\{D\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ and the horizontal maps are π -cocartesian. Applying the functor f_e , we obtain a diagram

$$\begin{array}{ccc} f_C(\tilde{C}) & \longrightarrow & f_D(\tilde{D}) \\ \downarrow f_C(u) & & \downarrow f_D(v) \\ f_C(\tilde{C}') & \longrightarrow & f_D(\tilde{D}') \end{array}$$

in the ∞ -category $\mathcal{E}$, where the horizontal maps are isomorphisms (by virtue of our assumption that $\tilde{e}$ is $\bar{V}$ -cartesian; see Lemma 8.6.2.6). It will therefore suffice to show that $f_D(v)$ is U -cocartesian (Corollary 5.1.2.5), which follows from our assumption that (D, f_D) is an object of $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$. $\square$

We will deduce Proposition 8.6.2.3 from the following more precise result:

04CV **Proposition 8.6.2.8.** *Let $\mathcal{C}$ be an ∞ -category, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ & \searrow & \swarrow U \\ & \mathcal{C}, & \end{array}$$

which we identify with a functor $F : \mathcal{E}^\dagger \rightarrow \text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$. The following conditions are equivalent:

- (a) The functor T exhibits $U^\dagger$ as a cartesian conjugate of U (in the sense of Definition 8.6.1.1).
- (b) The functor F restricts to an equivalence of $\mathcal{E}^\dagger$ with the full subcategory

$$\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \subseteq \text{Fun}_{/\mathcal{C}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$$

introduced in Construction 8.6.2.2.

Proof. Let $\lambda = (\lambda_-, \lambda_+) : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \times \mathcal{C}$ denote the twisted arrow fibration of Example 8.2.0.2. Recall that (a) is equivalent to the following pair of conditions:

- (a₁) For every object $C \in \mathcal{C}$, the restriction of T to the fiber over the vertex $\{\text{id}_C\} \subseteq \text{Tw}(\mathcal{C})$ determines an equivalence of ∞ -categories $T_C : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \{C\} \rightarrow \{C\} \times_{\mathcal{C}} \mathcal{E}$.
- (a₂) Let (e', e) be an edge of the fiber product $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. If e' is a $U^\dagger$ -cartesian morphism of $\mathcal{E}^\dagger$, then $T(e', e)$ is a U -cocartesian morphism of $\mathcal{E}$.

Unwinding the definitions, we see that F factors through $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$ if and only if T satisfies the following weaker version of (a₂):

- (b₀) Let (e', e) be an edge of the fiber product $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. If e' is a degenerate edge of $\mathcal{E}^\dagger$, then $T(e', e)$ is a U -cocartesian morphism of $\mathcal{E}$.

If this condition is satisfied, then we have a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger & \xrightarrow{F} & \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \\ & \searrow U^\dagger & \swarrow V \\ & \mathcal{C}^{\text{op}}, & \end{array}$$

where the vertical maps are cartesian fibrations (Lemma 8.6.2.7). Using Theorem 5.1.6.1, we see that F is an equivalence if and only if it satisfies the following further conditions:

(b_1) For each object $C \in \mathcal{C}$, the functor F restricts to an equivalence of ∞ -categories

$$F_C : \mathcal{E}_C^\dagger = \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \{C\} \rightarrow \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \times_{\mathcal{C}^{\text{op}}} \{C\}.$$

(b_2) The functor F carries $U^\dagger$ -cartesian morphisms of $\mathcal{E}^\dagger$ to V -cartesian morphisms of $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$.

Let C be an object of $\mathcal{C}$. Unwinding the definitions, we can identify the fiber

$$\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \times_{\mathcal{C}^{\text{op}}} \{C\}$$

with the ∞ -category $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}), \mathcal{E})$. Since id_C is initial when viewed as an object of the ∞ -category $\{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ (Proposition 8.1.2.1), Proposition 5.3.1.21 guarantees that the evaluation map

$$\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\{C\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}), \mathcal{E}) \rightarrow \{C\} \times_{\mathcal{C}} \mathcal{E}$$

is a trivial Kan fibration. Moreover, the composition of this evaluation map with the functor F_C coincides with the functor T_C appearing in condition (a_1). It follows that conditions (a_1) and (b_1) are equivalent.

Using the characterization of V -cartesian morphisms supplied by Lemmas 8.6.2.6 and 8.6.2.7, we can reformulate (b_2) more concretely as follows:

(b'_2) Let (e', e) be an edge of the fiber product $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. If e' is a $U^\dagger$ -cartesian morphism of $\mathcal{E}^\dagger$ and $\lambda_+(e)$ is an isomorphism in $\mathcal{C}$, then $T(e', e)$ is an isomorphism in the ∞ -category $\mathcal{E}$.

To complete the proof, it will suffice to show that the functor T satisfies (a_2) if and only if it satisfies both (b_0) and (b'_2). The implication (a_2) $\Rightarrow$ (b_0) is immediate, and the implication (a_2) $\Rightarrow$ (b'_2) follows from Corollary 5.1.1.9. The reverse implication follows from Proposition 8.6.1.13. $\square$

Proof of Proposition 8.6.2.3. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. It follows from Lemma 8.6.2.7 that the projection map $V : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian fibration. We wish to show that the evaluation map

$$\text{ev} : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

exhibits V as a cartesian conjugate of U . This follows from Proposition 8.6.2.8, since the identity automorphism of $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E})$ is an equivalence of ∞ -categories. $\square$

It follows from Proposition 8.6.2.8 that conjugate fibrations can be characterized by a universal mapping property:

05JG **Corollary 8.6.2.9.** *Let $\mathcal{C}$ be an ∞ -category, let $V : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $V^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ & \searrow & \swarrow V \\ & \mathcal{C} & \end{array}$$

which exhibits $V^\dagger$ as a cartesian conjugate of V . Then, for every morphism of simplicial sets $U^\dagger : \mathcal{D}^\dagger \rightarrow \mathcal{C}^{\text{op}}$, composition with T induces a fully faithful functor

$$\text{Fun}_{/\mathcal{C}^{\text{op}}}(\mathcal{D}^\dagger, \mathcal{E}^\dagger) \rightarrow \text{Fun}_{/\mathcal{C}}(\mathcal{D}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}), \mathcal{E}).$$

The essential image is spanned by those diagrams $Q : \mathcal{D}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ having the property that, for every vertex $D \in \mathcal{D}^\dagger$, Q carries every edge of $\{D\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ to a V -cocartesian edge of $\mathcal{E}$.

Let $\mathcal{C}$ be an ∞ -category, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. It follows from Proposition 8.6.2.8 that if there exists a functor

$$T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

which exhibits $U^\dagger$ as a cartesian conjugate of U , then $U^\dagger$ can be recovered from U up to equivalence. In this situation, we can also recover U from the cartesian fibration $U^\dagger$.

04CY **Proposition 8.6.2.10.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration of ∞ -categories, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array}$$

which exhibits $U^\dagger$ as a cartesian conjugate of U . Then T also exhibits $\mathcal{E}$ as a localization of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ with respect to W , where W is the collection of all morphisms $w = (w', w'')$ where w' is a U' -cartesian morphism of $\mathcal{E}^\dagger$ and w'' is a morphism of $\text{Tw}(\mathcal{C})$ whose image in $\mathcal{C}$ is degenerate.

Remark 8.6.2.11. The converse of Proposition 8.6.2.10 is also true; see Corollary 8.6.6.7. 04CZ

Proof of Proposition 8.6.2.10. Let $\lambda = (\lambda_-, \lambda_+) : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ denote the twisted arrow coupling of Example 8.2.0.2, and let $V : \mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ denote the composition of λ_+ with projection onto the second factor. Note that V factors as a composition

$$\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \xrightarrow{\mathrm{id} \times \lambda} \mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} (\mathcal{C}^{\mathrm{op}} \times \mathcal{C}) \simeq \mathcal{E}^\dagger \times \mathcal{C} \rightarrow \mathcal{C},$$

where the first map is a left fibration (since it is a pullback of λ , which is a left fibration by virtue of Proposition 8.1.1.15), and the last map is a cocartesian fibration (since it is a pullback of the projection map $\mathcal{E}^\dagger \rightarrow \Delta^0$). It follows that V is a cocartesian fibration, and that a morphism of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ is V -cocartesian if and only if its image in $\mathcal{E}^\dagger$ is an isomorphism. In particular, our hypotheses on T guarantees that it carries V -cocartesian morphisms of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ to U -cocartesian morphisms of $\mathcal{E}$.

Fix an object $C \in \mathcal{C}$. Let $\mathcal{E}^\dagger(C)$ denote the fiber $V^{-1}\{C\} = \mathcal{E}' \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{C\}$, so that projection onto the middle factor gives a map $U_C^\dagger : \mathcal{E}^\dagger(C) \rightarrow \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \{C\}$. Note that $U_C^\dagger$ is a pullback of $U^\dagger$. It follows that $U_C^\dagger$ is a cartesian fibration, and that a morphism of $\mathcal{E}^\dagger(C)$ is $U_C^\dagger$ -cartesian if and only if its image in $\mathcal{E}^\dagger$ is $U^\dagger$ -cartesian (Remark 5.1.4.6). Let W_C denote the collection of morphisms of $\mathcal{E}^\dagger(C)$ which satisfy this condition, so that $W = \bigcup_{C \in \mathcal{C}} W_C$. Note that T restricts to a functor $T^C : \mathcal{E}^\dagger(C) \rightarrow \mathcal{E}_C$. By virtue of Proposition 6.3.4.2, it will suffice to verify the following (for each object $C \in \mathcal{C}$):

($*_C$) The functor T^C exhibits the ∞ -category $\mathcal{E}_C$ as a localization of $\mathcal{E}^\dagger(C)$ with respect to W_C .

Let $\mathcal{K}$ denote the full subcategory of $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ whose objects are isomorphisms $D \rightarrow C$. By virtue of Proposition 8.1.2.1, $\mathcal{K}$ can also be described as the full subcategory of $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ spanned by its initial objects. It follows that $\mathcal{K}$ is a coreflective subcategory of $\mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ (Example 6.2.2.10). Let $\mathcal{E}_0^\dagger(C) \subseteq \mathcal{E}^\dagger(C)$ denote the inverse image of $\mathcal{K}$ under $U_C^\dagger$, so that $\mathcal{E}_0^\dagger(C)$ is a coreflective subcategory of $\mathcal{E}^\dagger(C)$ (Proposition 6.2.4.1). Using Lemma 6.2.2.22, we can choose a functor $L : \mathcal{E}^\dagger(C) \rightarrow \mathcal{E}_0^\dagger(C)$ and a natural transformation $\epsilon : L \rightarrow \mathrm{id}_{\mathcal{E}^\dagger(C)}$ which exhibits L as a $\mathcal{E}_0^\dagger(C)$ -coreflection functor. Our assumption on T guarantees that the functor T^C carries each element of W_C to an isomorphism in $\mathcal{E}_0^\dagger(C)$, so that ϵ induces an isomorphism of functors $(T^C|_{\mathcal{E}_0^\dagger(C)} \circ L) \rightarrow T^C$. Since the Kan complex $\mathcal{K}$ is contractible (Corollary 4.6.7.15), the inclusion map $\{\mathrm{id}_C\} \hookrightarrow \mathcal{K}$ is a homotopy equivalence of Kan complexes, and therefore induces an equivalence of ∞ -categories $\mathcal{E}^\dagger(C) \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \simeq \mathcal{E}_0^\dagger(C)$ (Corollary 4.5.2.30). Since the composition

$$\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \{C\} \hookrightarrow \mathcal{E}_0^\dagger(C) \xrightarrow{T^C} \mathcal{E}_C$$

is an equivalence of ∞ -categories, we conclude that the functor $T^C|_{\mathcal{E}_0^\dagger(C)}$ is also an equivalence of ∞ -categories. To complete the proof of (2_C), it will suffice to show that the functor L

exhibits $\mathcal{E}_0^\dagger(C)$ as a localization of $\mathcal{E}^\dagger(C)$ with respect to W_C (see Remark 6.3.1.20). Let W_C^+ denote the collection of morphisms v of $\mathcal{E}^\dagger(C)$ such that $L(v)$ is an isomorphism in $\mathcal{E}_0^\dagger(C)$. By virtue of the preceding arguments, this is equivalent to the requirement that $T(v)$ is an isomorphism in the ∞ -category $\mathcal{E}_C$; in particular, assumption (1) guarantees that W_C is contained in W_C^+ . Conversely, if $u : Y \rightarrow Z$ is a morphism of $\mathcal{E}^\dagger(C)$ which belongs to W_C^+ , then we can choose a commutative diagram

$$\begin{array}{ccc} & Y & \\ u \nearrow & & \searrow v \\ X & \xrightarrow{w} & Z \end{array}$$

where u and w exhibit X as $\mathcal{E}_0^\dagger(C)$ -coreflections of the objects Y and Z , respectively, and therefore belong to W_C . We are therefore reduced to showing that the functor L exhibits $\mathcal{E}_0^\dagger(C)$ as a localization of $\mathcal{E}^\dagger(C)$ with respect to W_C^+ , which is a special case of Example 6.3.3.10. $\square$

05WC Corollary 8.6.2.12. *Let $\mathcal{C}$ be an ∞ -category. Suppose we are given cocartesian fibrations $U : \mathcal{D} \rightarrow \mathcal{C}$ and $V : \mathcal{E} \rightarrow \mathcal{C}$, a pair of cartesian fibrations $U^\dagger : \mathcal{D}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ and $V^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$, together with functors*

$$T_0 : \mathcal{D}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{D} \quad T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

which exhibit $U^\dagger$ and $V^\dagger$ as cartesian conjugates of U and V , respectively. Then:

(1) *Precomposition with T_0 and postcomposition with T induce fully faithful functors*

$$\text{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}) \xrightarrow{Q} \text{Fun}_{/\mathcal{C}}(\mathcal{D}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}), \mathcal{E}) \xleftarrow{Q^\dagger} \text{Fun}_{/\mathcal{C}^{\text{op}}}(\mathcal{D}^\dagger, \mathcal{E}^\dagger).$$

(2) *Let F be an object of $\text{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E})$. Then $Q(F)$ belongs to the essential image of $Q^\dagger$ if and only if F belongs to the full subcategory $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\mathcal{D}, \mathcal{E})$ introduced in Notation 5.3.1.10 (that is, if and only if F carries U -cocartesian morphisms of $\mathcal{D}$ to V -cocartesian morphisms of $\mathcal{E}$).*

(3) *Let $F^\dagger$ be an object of $\text{Fun}_{/\mathcal{C}^{\text{op}}}(\mathcal{D}^\dagger, \mathcal{E}^\dagger)$. Then $Q^\dagger(F^\dagger)$ belongs to the essential image of Q if and only if $F^\dagger$ belongs to the full subcategory $\text{Fun}_{/\mathcal{C}^{\text{op}}}^{\text{Cart}}(\mathcal{D}^\dagger, \mathcal{E}^\dagger)$ of Variant 5.3.1.11 (that is, if and only if $F^\dagger$ carries $U^\dagger$ -cartesian morphisms of $\mathcal{D}^\dagger$ to $V^\dagger$ -cartesian morphisms of $\mathcal{E}^\dagger$).*

- (4) *There is a canonical equivalence of ∞ -categories $\Psi : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{D}, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{Cart}}(\mathcal{D}^\dagger, \mathcal{E}^\dagger)$, which is characterized (up to isomorphism) by the requirement that the diagram*

$$\begin{array}{ccc}
 \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{D}, \mathcal{E}) & \xrightarrow{\Psi} & \mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{Cart}}(\mathcal{D}^\dagger, \mathcal{E}^\dagger) \\
 & \searrow \circ T_0 & \swarrow T \circ \\
 & \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E}) &
 \end{array}$$

commutes up to isomorphism.

Proof. We will prove assertions (1), (2), and (3); assertion (4) is then a formal consequence. Applying Proposition 8.6.2.10 to T_0 we deduce that the functor Q is fully faithful, and that its essential image is spanned by those objects $G \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E})$ which satisfy the following condition:

- (*) Let $w = (w', w'')$ be a morphism of $\mathcal{D}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If w' is $U^\dagger$ -cartesian and w'' has degenerate image in $\mathcal{C}$, then $G(w)$ is an isomorphism in $\mathcal{E}$.

Applying Proposition 8.6.2.8 we see that $Q^\dagger$ is also fully faithful, and that its essential image consists of those G which satisfy the following:

- (*)[†] Let $w = (w', w'')$ be a morphism of $\mathcal{D}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. If w' is a degenerate edge of $\mathcal{D}^\dagger$, then $G(w)$ is a V -cocartesian morphism of $\mathcal{E}$.

This proves assertion (1).

To prove (2), we must show that an object $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E})$ carries U -cocartesian morphisms of $\mathcal{D}$ to V -cocartesian morphisms of $\mathcal{E}$ if and only if the induced map

$$\mathcal{D}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \xrightarrow{T_0} \mathcal{D} \xrightarrow{F} \mathcal{E}$$

satisfies condition (*[†]). The “only if” direction follows from our assumption that T_0 exhibits $U^\dagger$ as a cartesian conjugate of U . For the converse, assume that $Q(F) = F \circ T_0$ satisfies condition (*[†]) and let $f : X \rightarrow Y$ be a U -cocartesian morphism of $\mathcal{D}$, having image $e : C \rightarrow D$ in $\mathcal{C}$. Choose an object $X' \in \mathcal{D}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \{C\}$ such that $T_0(X')$ is isomorphic to X as an object of the ∞ -category $\{C\} \times_{\mathcal{C}} \mathcal{D}$. Let $e_L : \mathrm{id}_C \rightarrow e$ be the morphism in $\mathrm{Tw}(\mathcal{C})$ introduced in Example 8.1.3.6, and regard $w = (\mathrm{id}_{X'}, e_L)$ as an edge of $\mathcal{D}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$. Our assumption on T_0 guarantees that $T_0(w)$ is a U -cocartesian edge of $\mathcal{D}$ lying over e , and is therefore isomorphic to f (as an object of $\mathrm{Fun}(\Delta^1, \mathcal{D})$). It will therefore suffice to show that $(F \circ T_0)(w)$ is a V -cocartesian edge of $\mathcal{E}$, which follows from condition (*[†]).

To prove (3), we must show that an object $F^\dagger \in \text{Fun}/_{\mathcal{C}^{\text{op}}}(\mathcal{D}^\dagger, \mathcal{E}^\dagger)$ carries $U^\dagger$ -cartesian morphisms of $\mathcal{D}^\dagger$ to $V^\dagger$ -cartesian morphisms of $\mathcal{E}^\dagger$ if and only if the induced map

$$\mathcal{D}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \xrightarrow{F^\dagger \times \text{id}} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \xrightarrow{T} \mathcal{E}.$$

satisfies condition $(*)^\dagger$. The “only if” direction follows immediately from our assumption that T exhibits $V^\dagger$ as a cartesian conjugate of V , and the reverse implication follows from the criterion of Remark 8.6.1.14. $\square$

05JH **Example 8.6.2.13** (Functoriality). In the situation of Corollary 8.6.2.12, suppose we are given a commutative diagram

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{F} & \mathcal{E} \\ & \searrow U & \swarrow V \\ & \mathcal{C} & \end{array}$$

where U and V are cocartesian fibrations, where F carries U -cocartesian morphisms of $\mathcal{D}$ to V -cocartesian morphisms of $\mathcal{E}$. Then there is an essentially unique functor $F^\dagger : \mathcal{D}^\dagger \rightarrow \mathcal{E}^\dagger$ satisfying $V^\dagger \circ F^\dagger = U^\dagger$ for which the diagram

$$\begin{array}{ccc} \mathcal{D}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T_0} & \mathcal{D} \\ \downarrow F^\dagger \times \text{id} & & \downarrow F \\ \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \end{array}$$

commutes up to isomorphism (over $\mathcal{C}$). Moreover, $F^\dagger$ automatically carries $U^\dagger$ -cartesian morphisms of $\mathcal{D}^\dagger$ to $V^\dagger$ -cartesian morphisms of $\mathcal{E}^\dagger$.

8.6.3 Uniqueness of Conjugate Fibrations

04EC Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. It follows from Corollary 8.6.2.4 that U admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$. When $\mathcal{C}$ is an ∞ -category, Proposition 8.6.2.8 guarantees that $U^\dagger$ is unique up to equivalence: any cartesian conjugate of U is equivalent to the cartesian fibration

$$V : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \mathcal{C}^{\text{op}}$$

of Construction 8.6.2.2. In this section, we will establish a more general uniqueness result, which applies even when $\mathcal{C}$ is not an ∞ -category. Our proof will use an alternative construction

of the conjugate fibration due to Barwick-Glasman-Nardin ([4]), which involves the restricted cospan construction of §8.1.6.

Notation 8.6.3.1. Let $\mathcal{C}$ be a simplicial set and let $\rho_- : \mathcal{C}^{\text{op}} \rightarrow \text{Cospan}(\mathcal{C})$ be the comparison map of Variant 8.1.7.14. For every cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$, we let $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$ denote the fiber product $\text{Cospan}(\mathcal{E})^{\text{all}, R}(\mathcal{E}) \times_{\text{Cospan}(\mathcal{C})} \mathcal{C}^{\text{op}}$, where R is the collection of all U -cocartesian edges of $\mathcal{E}$ (see Definition 8.1.6.1). 04ED

Remark 8.6.3.2. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Low-dimensional simplices of the simplicial set $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$ can be described as follows: 04EE

- Vertices of the simplicial set $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$ can be identified with vertices of the simplicial set $\mathcal{E}$.
- Let X and Y be vertices of $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$. Then edges $e : X \rightarrow Y$ of $\text{Cospan}(\mathcal{E} / \mathcal{C})$ can be identified with pairs of edges $X \xrightarrow{f} B \xleftarrow{g} Y$ in the simplicial set $\mathcal{E}$ having the property that g is U -cocartesian and $U(f)$ is a degenerate edge of $\mathcal{C}$.

Example 8.6.3.3. Let $\mathcal{E}$ be an ∞ -category, so the projection map $\mathcal{E} \rightarrow \Delta^0$ is a cocartesian fibration of simplicial sets. Then the simplicial set $\text{Cospan}^\dagger(\mathcal{E} / \Delta^0)$ of Notation 8.6.3.1 can be identified with the simplicial set $\text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E})$ of Construction 8.1.7.2. In particular, $\text{Cospan}^\dagger(\mathcal{E} / \Delta^0)$ is an ∞ -category (Proposition 8.1.7.5), and Proposition 8.1.7.6 supplies an equivalence of ∞ -categories $\rho_+ : \mathcal{E} \rightarrow \text{Cospan}^\dagger(\mathcal{E} / \Delta^0)$. 04EF

Remark 8.6.3.4 (Base Change). Suppose we are given a pullback diagram of simplicial sets 04EG

$$\begin{array}{ccc} \mathcal{E}' & \longrightarrow & \mathcal{E} \\ \downarrow U' & & \downarrow U \\ \mathcal{C}' & \xrightarrow{F} & \mathcal{C}, \end{array}$$

where U and U' are cocartesian fibrations. Then we have a canonical isomorphism of simplicial sets

$$\text{Cospan}^\dagger(\mathcal{E}' / \mathcal{C}') \simeq \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \mathcal{C}'^{\text{op}}.$$

In particular, for each vertex $C \in \mathcal{C}$, the fiber $\text{Cospan}_\dagger(\mathcal{E} / \mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \{C\}$ is isomorphic to the ∞ -category $\text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E}_C)$, which is equivalent to the ∞ -category $\mathcal{E}_C$.

We can now state a preliminary version of our main result:

Proposition 8.6.3.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then the projection map $V : \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian fibration, which is a cartesian conjugate of U . 05JK

The proof of Proposition 8.6.3.5 will require some preliminaries. Our first step is to show that the projection map V is a cartesian fibration.

04EL Lemma 8.6.3.6. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let R denote the collection of all U -cocartesian morphisms of $\mathcal{E}$, and let L denote the collection of all morphisms $e : X \rightarrow Y$ of $\mathcal{E}$ such that $U(e)$ is an isomorphism in $\mathcal{C}$. Then $\text{Cospan}(U) : \text{Cospan}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$ restricts to a cartesian fibration of ∞ -categories $V : \text{Cospan}^{L,R}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{iso},\text{all}}(\mathcal{C})$. Moreover, an edge $e : X \rightarrow Y$ of $\text{Cospan}^{L,R}(\mathcal{E})$ is V -ccartesian if and only if it satisfies the following condition:*

(*) *The edge e corresponds to a cospan $X \xrightarrow{\ell} B \xleftarrow{r} Y$ in $\mathcal{E}$, where ℓ is an isomorphism and r is U -cocartesian.*

Proof. Let L_0 be the collection of all isomorphisms in $\mathcal{C}$, and let R_0 be the collection of all morphisms of $\mathcal{C}$. Then L_0 and R_0 are pushout-compatible, in the sense of Definition 8.1.6.5 (Example 8.1.6.6). Moreover, U is a Beck-Chevalley fibration relative to (R_0, L_0) (Example 8.1.10.8). Since $\text{Cospan}^{L_0, R_0}(\mathcal{C}) = \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C})$ is an ∞ -category, the desired result follows from Theorem 8.1.10.9 and Remark 8.1.10.11. $\square$

04EM Remark 8.6.3.7. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let R denote the collection of all U -cocartesian morphisms of $\mathcal{E}$, and let L denote the collection of all morphisms g of $\mathcal{E}$ such that $U(g)$ is an isomorphism in $\mathcal{C}$. We then have a commutative diagram of pullback squares

$$\begin{array}{ccccc} \text{Cospan}^\dagger(\mathcal{E}/\mathcal{C}) & \longrightarrow & \text{Cospan}^{L,R}(\mathcal{E}) & \longrightarrow & \text{Cospan}^{\text{all},R}(\mathcal{E}) \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{C}^{\text{op}} & \xrightarrow{\rho_-} & \text{Cospan}^{\text{iso},\text{all}}(\mathcal{C}) & \longrightarrow & \text{Cospan}(\mathcal{C}), \end{array}$$

where the vertical map in the middle is a cartesian fibration (Lemma 8.6.3.6), and the horizontal map on the lower left is an equivalence of ∞ -categories (Proposition 8.1.7.6). It follows that the projection map $\text{Cospan}^\dagger(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian fibration of ∞ -categories. Moreover, Corollary 4.5.2.30 implies that the inclusion $\text{Cospan}^\dagger(\mathcal{E}/\mathcal{C}) \hookrightarrow \text{Cospan}^{L,R}(\mathcal{E})$ is an equivalence of ∞ -categories.

04EN Lemma 8.6.3.8. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then the projection map $V : \text{Cospan}^\dagger(\mathcal{E}/\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ is also a cartesian fibration. Moreover, an edge $X \rightarrow Y$ of $\text{Cospan}^\dagger(\mathcal{E}/\mathcal{C})$ is V -cartesian if and only if it corresponds to a cospan $X \xrightarrow{\ell} B \xleftarrow{r} Y$ in $\mathcal{E}$, where r is U -cocartesian and ℓ is an isomorphism in the ∞ -category $\{U(X)\} \times_{\mathcal{C}} \mathcal{E}$.*

Proof. Using Proposition 5.1.4.8 and Remark 8.6.3.4, we can reduce to the case where $\mathcal{C} = \Delta^n$ is a standard simplex. In particular, $\mathcal{C}$ is an ∞ -category. In this case, the desired result follows by combining Remark 8.6.3.7 with Lemma 8.6.3.6. $\square$

Construction 8.6.3.9. Let $\mathcal{C}$ be a simplicial set, and suppose we are given a pair of morphisms $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$. Let $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ be a morphism of simplicial sets for which the diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array} \quad \begin{array}{l} \text{04EY} \\ (8.69) \end{array}$$

is commutative. Let $\lambda_+ : \text{Tw}(\mathcal{E}^\dagger) \rightarrow \mathcal{E}^\dagger$ be the projection map of Notation 8.1.1.6 and let $\iota : \text{Tw}(\mathcal{C}^{\text{op}}) \xrightarrow{\sim} \text{Tw}(\mathcal{C})$ be the isomorphism described in Remark 8.1.1.7. Then we can extend (8.69) to a commutative diagram

$$\begin{array}{ccccc} \text{Tw}(\mathcal{E}^\dagger) & \xrightarrow{(\lambda_+, \iota \circ \text{Tw}(U^\dagger))} & \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow \text{Tw}(U^\dagger) & & \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}^{\text{op}}) & \xrightarrow{\iota} & \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array} \quad \begin{array}{l} \text{04EZ} \\ (8.70) \end{array}$$

Using Proposition 8.1.3.7, we can identify the outer rectangle with a diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger & \longrightarrow & \text{Cospan}(\mathcal{E}) \\ \downarrow U^\dagger & & \downarrow \text{Cospan}(U) \\ \mathcal{C}^{\text{op}} & \xrightarrow{\rho_-} & \text{Cospan}(\mathcal{C}), \end{array} \quad \begin{array}{l} \text{04F0} \\ (8.71) \end{array}$$

which we can identify with a comparison map $\Psi : \mathcal{E}^\dagger \rightarrow \text{Cospan}(\mathcal{E}) \times_{\text{Cospan}(\mathcal{C})} \mathcal{C}^{\text{op}}$.

Remark 8.6.3.10. In the situation of Construction 8.6.3.9, the morphism Ψ can be described explicitly on low-dimensional simplices as follows: 04F1

- If X is a vertex of $\mathcal{E}^\dagger$ having image $C = U^\dagger(X)$, then $\Psi(X)$ is the vertex of $\text{Cospan}(\mathcal{E})$ corresponding to the vertex $T(X, \text{id}_C) \in \mathcal{E}$.

- Let X and Y be vertices of $\mathcal{E}^\dagger$, having images $C = U^\dagger(X)$ and $D = U^\dagger(Y)$. Let $f : X \rightarrow Y$ be an edge of $\mathcal{E}^\dagger$, and let us identify $U^\dagger(f)$ with an edge $e : D \rightarrow C$ in the simplicial set $\mathcal{C}$. Then $\Psi(f) : \Psi(X) \rightarrow \Psi(Y)$ is the edge of $\text{Cospan}(\mathcal{E})$ corresponding to the pair of edges $T(X, \text{id}_C) \xrightarrow{T(f, e_R)} T(Y, e) \xleftarrow{T(\text{id}_Y, e_L)} T(Y, \text{id}_D)$ in $\mathcal{E}$; here $e_L : \text{id}_D \rightarrow e$ and $e_R : \text{id}_C \rightarrow e$ denote the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6.

We will deduce Proposition 8.6.3.5 from the following more precise result:

04F2 **Proposition 8.6.3.11.** *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration. Suppose we are given a morphism $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ for which the diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array}$$

is commutative. The following conditions are equivalent:

- The morphism T exhibits $U^\dagger$ as a cartesian conjugate of U , in the sense of Definition 8.6.1.1.
- The comparison map Ψ of Construction 8.6.3.9 factors through the simplicial set $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$ of Notation 8.6.3.1, and the map $\mathcal{E}^\dagger \rightarrow \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$ is an equivalence of cartesian fibrations over $\mathcal{C}$.

Proof. Using Proposition 5.1.7.15, we see that (b) is equivalent to the following three conditions:

- The map Ψ factors through the simplicial subset $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \subseteq \text{Cospan}(\mathcal{E}) \times_{\text{Cospan}(\mathcal{C})} \mathcal{C}^{\text{op}}$.
- Let $V : \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ be the cartesian fibration of Lemma 8.6.3.8. Then Ψ carries $U^\dagger$ -cartesian edges of $\mathcal{E}^\dagger$ to V -cartesian edges of $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$.
- For each vertex $C \in \mathcal{C}$, the morphism Ψ restricts to an equivalence of ∞ -categories

$$\Psi_C : \mathcal{E}_C^\dagger \rightarrow \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \{C\} = \text{Cospan}^{\text{all, iso}}(\mathcal{E}_C).$$

For every edge $e : D \rightarrow C$ of $\mathcal{C}$, let $e_L : \text{id}_D \rightarrow e$ and $e_R : \text{id}_C \rightarrow e$ denote the edges of $\text{Tw}(\mathcal{C})$ described in Example 8.1.3.6. Using Remark 8.6.3.10, we can rewrite condition (b₀) as follows:

(b'_0) Let Y be a vertex of $\mathcal{E}^\dagger$ having image $D = U^\dagger(Y)$ in $\mathcal{C}$, and let $e : C \rightarrow D$ be an edge of $\mathcal{C}$. Then $T(\text{id}_Y, e_L) : T(Y, \text{id}_D) \rightarrow T(Y, e)$ is a U -cocartesian edge of $\mathcal{E}$.

Similarly, by combining Remark 8.6.3.10 with the characterization of V -cartesian edges supplied by Lemma 8.6.3.8, we can rewrite condition (b_1) as follows:

(b'_1) Let $f : X \rightarrow Y$ be a $U^\dagger$ -cartesian edge of $\mathcal{E}^\dagger$, and let us identify $U^\dagger(f)$ with an edge $e : D \rightarrow C$ of $\mathcal{C}$. Then $T(f, e_R) : T(X, \text{id}_C) \rightarrow T(Y, e)$ is an isomorphism in the ∞ -category $\mathcal{E}_C$.

Unwinding the definitions, we observe that for each vertex $C \in \mathcal{C}$, the functor Ψ_C factors as a composition

$$\mathcal{E}_C^\dagger \xrightarrow{T_C} \mathcal{E}_C \hookrightarrow \text{Cospan}^{\text{all, iso}}(\mathcal{E}_C) \simeq \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \{C\},$$

where the second map is the equivalence of Proposition 8.1.7.6. We can therefore rewrite (b_2) as follows:

(b'_2) For each vertex $C \in \mathcal{C}$, the morphism T restricts to an equivalence of ∞ -categories $T_C : \mathcal{E}_C^\dagger \rightarrow \mathcal{E}_C$.

The equivalence of (a) and (b) now follows from Proposition 8.6.1.13. $\square$

Example 8.6.3.12. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories. Applying Construction 8.6.3.9 to the evaluation functor

$$\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E} \quad (C, f_C, u : C \rightarrow C') \mapsto f_C(u),$$

we obtain a comparison functor

$$\Psi : \text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}).$$

It follows from Propositions 8.6.3.11 and 8.6.2.3 that this functor is an equivalence of ∞ -categories.

Proof of Proposition 8.6.3.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Using Corollary 8.6.2.4, we can choose a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ and a morphism $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ which exhibits $U^\dagger$ as a cartesian conjugate of U . Applying Proposition 8.6.3.11, we see that Construction 8.6.3.9 supplies a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger & \xrightarrow{\Psi} & \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \\ & \searrow U^\dagger & \swarrow V \\ & \mathcal{C}^{\text{op}}, & \end{array}$$

where the horizontal map is an equivalence of cartesian fibrations over $\mathcal{C}^{\text{op}}$. It follows that V is also a cartesian conjugate of U . $\square$

04F6 Warning 8.6.3.13. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Proposition 8.6.3.5 guarantees the existence of a morphism

$$T : \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$$

which exhibits the projection map $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ as a cartesian conjugate of U . Beware that the construction of T requires making some auxiliary choices. For example, if $\mathcal{C}$ is an ∞ -category, then we can construct the datum T by choosing a homotopy inverse to the equivalence $\text{Fun}_{/\mathcal{C}}^{\text{CCart}}(\text{Tw}(\mathcal{C}) / \mathcal{C}^{\text{op}}, \mathcal{E}) \rightarrow \text{Cospan}^\dagger(\mathcal{E} / \mathcal{C})$ of Example 8.6.3.12.

04F4 Corollary 8.6.3.14 (Uniqueness). *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then U admits a cartesian conjugate, which is uniquely determined up equivalence.*

Proof. Combining Propositions 8.6.3.11 and 8.6.3.5, we see that a cartesian fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ is conjugate to U if and only if it is equivalent to the projection map $\text{Cospan}^\dagger(\mathcal{E} / \mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$. $\square$

We close this section with a simple application of Proposition 8.6.3.5.

05JL Construction 8.6.3.15. Let e denote the nondegenerate edge of Δ^1 , viewed as an object of the ∞ -category $\text{Tw}(\Delta^1)$. For every simplicial set $\mathcal{C}$, we let

$$\Xi : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \text{Cospan}(\text{Tw}(\mathcal{C}))$$

denote the morphism of simplicial sets which corresponds, under the bijection of Proposition 8.1.3.7, to the composite map

$$\begin{aligned} \text{Tw}(\text{Fun}(\Delta^1, \mathcal{C})) &\simeq \{e\} \times \text{Tw}(\text{Fun}(\Delta^1, \mathcal{C})) \\ &\hookrightarrow \text{Tw}(\Delta^1) \times \text{Tw}(\text{Fun}(\Delta^1, \mathcal{C})) \\ &\simeq \text{Tw}(\Delta^1 \times \text{Fun}(\Delta^1, \mathcal{C})) \\ &\xrightarrow{\text{Tw}(\text{ev})} \text{Tw}(\mathcal{C}). \end{aligned}$$

05JM Remark 8.6.3.16. Let $\mathcal{C}$ be a simplicial set and let

$$\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}} \quad \lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$$

be the projection maps of Notation 8.1.1.6. Then the morphism Ξ of Construction 8.6.3.15 fits into a commutative diagram

$$\begin{array}{ccccc}
 \mathcal{C} & \xleftarrow{\text{ev}_0} & \text{Fun}(\Delta^1, \mathcal{C}) & \xrightarrow{\text{ev}_1} & \mathcal{C} \\
 \downarrow \rho_- & & \downarrow \Xi & & \downarrow \rho_+ \\
 \text{Cospan}(\mathcal{C}^{\text{op}}) & \xleftarrow{\text{Cospan}(\lambda_-)} & \text{Cospan}(\text{Tw}(\mathcal{C})) & \xrightarrow{\text{Cospan}(\lambda_+)} & \text{Cospan}(\mathcal{C}),
 \end{array} \tag{8.72}$$

where ρ_+ and ρ_- are the embeddings of Construction 8.1.7.1 and Variant 8.1.7.14. Moreover, the composition of Ξ with the diagonal map $\mathcal{C} \hookrightarrow \text{Fun}(\Delta^1, \mathcal{C})$ is the unit map $\mathcal{C} \rightarrow \text{Cospan}(\text{Tw}(\mathcal{C}))$ of Construction 8.1.3.5.

In the situation of Remark 8.6.3.16, suppose that the simplicial set $\mathcal{C}$ is an ∞ -category. Then the projection map $\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$ is a cocartesian fibration of ∞ -categories, and a morphism u of $\text{Tw}(\mathcal{C})$ is λ_- -cocartesian if and only if $\lambda_+(u)$ is an isomorphism in $\mathcal{C}$ (Corollary 8.1.1.14). Using the commutativity of the diagram (8.72), we see that the morphism Ξ factors through the simplicial subset $\text{Cospan}^\dagger(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}) \subseteq \text{Cospan}(\text{Tw}(\mathcal{C}))$ of Notation 8.6.3.1. In this case, we have the following:

Proposition 8.6.3.17. *Let $\mathcal{C}$ be an ∞ -category. Then the morphism $\Xi : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \text{Cospan}^\dagger(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}})$ is an equivalence of ∞ -categories.* 05JP

Proof. Let $V : \text{Cospan}^\dagger(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}) \rightarrow \mathcal{C}$ be the projection map. It follows from Lemma 8.6.3.8 (and Corollary 8.1.1.14) that V is a cartesian fibration, and that a morphism in $\text{Cospan}^\dagger(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}})$ is V -cartesian if and only if its image under the composite map

$$\text{Cospan}^\dagger(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}) \hookrightarrow \text{Cospan}(\text{Tw}(\mathcal{C})) \xrightarrow{\text{Cospan}(\lambda_+)} \text{Cospan}(\mathcal{C})$$

is contained in $\text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C})$. Recall that the evaluation functor $\text{ev}_0 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is also a cartesian fibration, and that a morphism f of $\text{Fun}(\Delta^1, \mathcal{C})$ is ev_0 -cartesian if and only if $\text{ev}_1(f)$ is an isomorphism in $\mathcal{C}$ (Corollary 5.3.7.3). Invoking Remark 8.6.3.16, we obtain a commutative diagram

$$\begin{array}{ccc}
 \text{Fun}(\Delta^1, \mathcal{C}) & \xrightarrow{\Xi} & \text{Cospan}^\dagger(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}) \\
 \searrow \text{ev}_0 & & \swarrow V \\
 & \mathcal{C}, &
 \end{array}$$

where Ξ carries ev_0 -cartesian morphisms of the ∞ -category $\text{Fun}(\Delta^1, \mathcal{C})$ to V -cartesian morphisms of the ∞ -category $\text{Cospan}^\dagger(\text{Tw}(\mathcal{C}), \mathcal{C}^{\text{op}})$. By virtue of Proposition 5.1.7.15, it will suffice to show that for each object $X \in \mathcal{C}$, the functor Ξ restricts to an equivalence of fibers

$$\Xi_X : \{X\} \tilde{\times}_{\mathcal{C}} \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \{X\} \times_{\mathcal{C}} \text{Cospan}^\dagger(\text{Tw}(\mathcal{C})/\mathcal{C}^{\text{op}}) \simeq \text{Cospan}^{\text{all, iso}}(\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})).$$

We conclude by observing that Ξ_X fits into a commutative diagram

$$\begin{array}{ccc} \mathcal{C}_{X/} & \xrightarrow{\quad} & \{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \\ \downarrow & & \downarrow \rho_+ \\ \{X\} \times_{\mathcal{C}} \text{Fun}(\Delta^1, \mathcal{C}) & \xrightarrow{\Xi_X} & \text{Cospan}^{\text{all, iso}}(\{X\} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})) \end{array}$$

where the left vertical map is the equivalence of Corollary 4.6.4.20, the right vertical map is the equivalence of Proposition 8.1.7.6, and the upper horizontal map is the equivalence of Proposition 8.1.2.9. $\square$

05JQ **Corollary 8.6.3.18.** *Let $\mathcal{C}$ be an ∞ -category. Then the evaluation map $\text{ev}_0 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is a cartesian conjugate of the cocartesian fibration $\lambda_- : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\text{op}}$.*

Proof. Combine Propositions 8.6.3.17 and 8.6.3.5. $\square$

8.6.4 Dual Fibrations

04D0 Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Corollary 8.6.3.14 asserts that U admits a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$, which is uniquely determined up to equivalence. Setting $\mathcal{E}^\vee = \mathcal{E}^{\dagger, \text{op}}$ and $U^\vee = U^{\dagger, \text{op}}$, we obtain another cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$. Our goal in this section is to give a direct characterization of the relationship between U and $U^\vee$, which does not rely on the theory of conjugate fibrations developed in §8.6.1 and §8.6.2. To fix ideas, let us begin by considering the case $\mathcal{C} = \Delta^0$. In this case, the conjugate fibration $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ is characterized by the requirement that the ∞ -category $\mathcal{E}^\dagger$ is equivalent to $\mathcal{E}$. Consequently, the cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is characterized by the requirement that $\mathcal{E}^\vee$ is equivalent to the opposite ∞ -category $\mathcal{E}^{\text{op}}$. By virtue of Corollary 8.2.6.7, this is equivalent to the existence of a *balanced coupling* $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times \mathcal{E}$: that is, a left fibration which satisfies the following addition conditions:

- For every object $X \in \mathcal{E}$, there exists an object $\tilde{X} \in \tilde{\mathcal{E}}$ satisfying $\lambda_+(\tilde{X}) = X$ which is *universal*: that is, it is an initial object of the ∞ -category $\tilde{\mathcal{E}} \times_{\mathcal{E}} \{X\}$.
- For every object $X^\vee \in \mathcal{E}^\vee$, there exists an object $\tilde{X} \in \tilde{\mathcal{E}}$ satisfying $\lambda_-(\tilde{X}) = X^\vee$ which is *couniversal*: that is, it is an initial object of the ∞ -category $\{X^\vee\} \times_{\mathcal{E}^\vee} \tilde{\mathcal{E}}$.

- An object of $\tilde{\mathcal{E}}$ is universal if and only if it is couniversal.

We now extend the notion of balanced coupling to the relative setting.

Definition 8.6.4.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, and let $\lambda = (\lambda_-, \lambda_+) : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration of simplicial sets. We will say that λ *exhibits $U^\vee$ as a cocartesian dual of U* if the following conditions are satisfied: 04D1

- (a) For every vertex $C \in \mathcal{C}$, the left fibration

$$\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$$

is a balanced coupling of ∞ -categories.

- (b) Let $\tilde{U} : \tilde{\mathcal{E}} \rightarrow \mathcal{C}$ denote the projection map $U^\vee \circ \lambda_- = U \circ \lambda_+$, $f : \tilde{X} \rightarrow \tilde{X}'$ be a $\tilde{U}$ -cocartesian edge of $\tilde{\mathcal{E}}$, and let $e : C \rightarrow C'$ be its image $\tilde{U}(f)$ in the simplicial set $\mathcal{C}$. If the object $\tilde{X} \in \tilde{\mathcal{E}}_C$ is universal for the coupling λ_C , then the object $\tilde{X}' \in \tilde{\mathcal{E}}_{C'}$ is universal for the coupling $\lambda_{C'}$.

We say that $U^\vee$ *is a cocartesian dual of U* if there exists a left fibration $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ which exhibits $U^\vee$ as a cocartesian dual of U .

Example 8.6.4.2. Let $\mathcal{E}$ and $\mathcal{E}^\vee$ be ∞ -categories, and let $U : \mathcal{E} \rightarrow \Delta^0$ and $U^\vee : \mathcal{E}^\vee \rightarrow \Delta^0$ 04D2 denote the projection maps. Then a left fibration $\tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\Delta^0} \mathcal{E} = \mathcal{E}^\vee \times \mathcal{E}$ exhibits $U^\vee$ as a cocartesian dual of U if and only if it is a balanced coupling. In particular, $U^\vee$ is a cocartesian dual of U if and only if $\mathcal{E}^\vee$ is equivalent to the opposite ∞ -category $\mathcal{E}^{\text{op}}$ (Corollary 8.2.6.7).

Remark 8.6.4.3 (Symmetry). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of 04D3 simplicial sets. Then a left fibration $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ exhibits $U^\vee$ as a cocartesian dual of U if and only if it exhibits U as a cocartesian dual of $U^\vee$, after identifying $\mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ with $\mathcal{E} \times_{\mathcal{C}} \mathcal{E}^\vee$. In particular, $U^\vee$ is a cocartesian dual of U if and only if U is a cocartesian dual of $U^\vee$.

Remark 8.6.4.4 (Base Change). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations 04D4 of simplicial sets and $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration. The following conditions are equivalent:

- (a) The left fibration λ exhibits $U^\vee$ as a cocartesian dual of U (in the sense of Definition 8.6.4.1).

(b) For every morphism of simplicial sets $\mathcal{C}_0 \rightarrow \mathcal{C}$, form a diagram of pullback squares

$$\begin{array}{ccccc} \mathcal{E}_0^\vee & \xrightarrow{U_0^\vee} & \mathcal{C}' & \xleftarrow{U_0} & \mathcal{E}_0 \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{E} & \xrightarrow{U^\vee} & \mathcal{C} & \xleftarrow{U} & \mathcal{E} \end{array}$$

Then the induced map

$$\lambda_0 : (\mathcal{C}_0 \times_{\mathcal{C}} \tilde{\mathcal{E}}) \rightarrow \mathcal{E}_0^\vee \times_{\mathcal{C}_0} \mathcal{E}_0$$

exhibits $U_0^\vee$ as a cocartesian dual of U_0 .

Moreover, it suffices to verify condition (b) in the special case where $\mathcal{C}_0 = \Delta^1$ is the standard 1-simplex.

04D5 Remark 8.6.4.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be a cocartesian dual of U . Then, for every morphism of simplicial sets $\mathcal{C}_0 \rightarrow \mathcal{C}$, the projection map $U_0^\vee : \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E}^\vee \rightarrow \mathcal{C}_0$ is a cocartesian dual of the projection map $U_0 : \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{C}_0$. In particular, for every object $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C^\vee = \{C\} \times_{\mathcal{C}} \mathcal{E}^\vee$ is equivalent to the opposite of the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ (Example 8.6.4.2).

04D6 Remark 8.6.4.6. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$. In §8.6.6, we will show that $U^\vee$ is a cocartesian dual of U (in the sense of Definition 8.6.4.1) if and only if the opposite fibration $U^{\vee, \text{op}} : \mathcal{E}^{\vee, \text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian conjugate of U (in the sense of Definition 8.6.1.1). See Proposition 8.6.6.1.

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, and let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration. Condition (a) of Definition 8.6.4.1 guarantees that, for each vertex $C \in \mathcal{C}$, the coupling $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times_{\mathcal{C}} \mathcal{E}_C$ is representable by an equivalence of ∞ -categories $G_C : \mathcal{E}_C \rightarrow (\mathcal{E}_C^\vee)^{\text{op}}$ (Theorem 8.2.6.6). Heuristically, one can think of condition (b) as requiring that the equivalence G_C depends functorially on C . We can articulate this heuristic more precisely as follows:

04D7 Proposition 8.6.4.7. Let $U : \mathcal{E} \rightarrow \Delta^1$ and $U^\vee : \mathcal{E}^\vee \rightarrow \Delta^1$ be cocartesian fibrations of ∞ -categories, and let $F : \mathcal{E}_0 \rightarrow \mathcal{E}_1$ and $F^\vee : \mathcal{E}_0^\vee \rightarrow \mathcal{E}_1^\vee$ be functors given by covariant transport along the nondegenerate edge of Δ^1 . Let $\lambda = (\lambda_-, \lambda_+) : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\Delta^1} \mathcal{E}$ be a left fibration, and suppose that the associated couplings

$$\lambda_0 : \tilde{\mathcal{E}}_0 \rightarrow \mathcal{E}_0^\vee \times \mathcal{E}_0 \quad \lambda_1 : \tilde{\mathcal{E}}_1 \rightarrow \mathcal{E}_1^\vee \times \mathcal{E}_1$$

are representable by functors $G_0 : \mathcal{E}_0 \rightarrow (\mathcal{E}_0^\vee)^{\text{op}}$ and $G_1 : \mathcal{E}_1 \rightarrow (\mathcal{E}_1^\vee)^{\text{op}}$, respectively. If λ satisfies condition (b) of Definition 8.6.4.1, then the diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E}_0 & \xrightarrow{F} & \mathcal{E}_1 \\ \downarrow G_0 & & \downarrow G_1 \\ (\mathcal{E}_0^\vee)^{\text{op}} & \xrightarrow{(F^\vee)^{\text{op}}} & (\mathcal{E}_1^\vee)^{\text{op}} \end{array} \quad \begin{array}{l} \text{04D8} \\ (8.73) \end{array}$$

commutes up to isomorphism.

Proof. Let $\tilde{U}$ denote the composite map

$$\tilde{\mathcal{E}} \xrightarrow{\lambda} \mathcal{E}^\vee \times_{\Delta^1} \mathcal{E} \rightarrow \Delta^1.$$

Using Proposition 5.1.4.14, we see that λ is a cocartesian fibration, and that an edge e of $\tilde{\mathcal{E}}$ is $\tilde{U}$ -cocartesian if and only if $\lambda_+(e)$ is a U -cocartesian edge of $\mathcal{E}$ and $\lambda_-(e)$ is a $U^\vee$ -cocartesian edge of $\mathcal{E}^\vee$. Let $\tilde{F} : \tilde{\mathcal{E}}_0 \rightarrow \tilde{\mathcal{E}}_1$ be given by covariant transport along the nondegenerate edge of Δ^1 . Using Remark 5.2.8.5, we see that the diagram of ∞ -categories

$$\begin{array}{ccc} \tilde{\mathcal{E}}_0 & \xrightarrow{\tilde{F}} & \tilde{\mathcal{E}}_1 \\ \downarrow \lambda_0 & & \downarrow \lambda_1 \\ \mathcal{E}_0^\vee \times \mathcal{E}_0 & \xrightarrow{F^\vee \times F} & \mathcal{E}_1^\vee \times \mathcal{E}_1 \end{array} \quad \begin{array}{l} \text{04D9} \\ (8.74) \end{array}$$

commutes up to isomorphism. Since λ_1 is an isofibration, we can replace $\tilde{F}$ by an isomorphic functor to arrange that the diagram (8.74) is strictly commutative (see Corollary 4.4.5.6). Condition (b) of Definition 8.6.4.1 guarantees that the functor $\tilde{F}$ carries universal objects of $\tilde{\mathcal{E}}_0$ (for the coupling λ_0) to universal objects of $\tilde{\mathcal{E}}_1$ (for the coupling λ_1). The commutativity of the diagram (8.73) now follows from Corollary 8.2.4.4. $\square$

Corollary 8.6.4.8. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations* 04DA

$$\text{hTr}_{\mathcal{E}/\mathcal{C}}, \text{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \text{h}\mathcal{C} \rightarrow \text{hQCat},$$

and let $\text{hTr}_{\mathcal{E}^\vee/\mathcal{C}}^{\text{op}}$ denote the functor $C \mapsto \text{hTr}_{\mathcal{E}^\vee/\mathcal{C}}(C)^{\text{op}} = (\mathcal{E}_C^\vee)^{\text{op}}$. Let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration such that, for each vertex $C \in \mathcal{C}$, the coupling $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$ is representable by a functor $G_C : \mathcal{E}_C \rightarrow (\mathcal{E}_C^\vee)^{\text{op}}$. If λ satisfies condition (b) of Definition 8.6.4.1, then the construction $C \mapsto [G_C]$ determines a natural transformation of functors $\text{hTr}_{\mathcal{E}/\mathcal{C}} \rightarrow \text{hTr}_{\mathcal{E}^\vee/\mathcal{C}}^{\text{op}}$.

04DB **Corollary 8.6.4.9.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations*

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat}.$$

Let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration which exhibits $U^\vee$ as a cocartesian dual of U . Then λ induces an isomorphism of functors $\mathrm{hTr}_{\mathcal{E}/\mathcal{C}} \xrightarrow{\sim} \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}^{\mathrm{op}}$, which carries each vertex $C \in \mathcal{C}$ to (the isomorphism class of) a functor which represents the balanced coupling $\lambda_C : \tilde{\mathcal{E}}_C \rightarrow \mathcal{E}_C^\vee \times \mathcal{E}_C$.

Proof. Combine Corollary 8.6.4.8 with Theorem 8.2.6.6. □

04DC **Corollary 8.6.4.10.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having homotopy transport representations*

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}, \mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat}.$$

If $U^\vee$ is a cocartesian dual of U , then $\mathrm{hTr}_{\mathcal{E}^\vee/\mathcal{C}}$ is isomorphic to the functor

$$\mathrm{hTr}_{\mathcal{E}/\mathcal{C}}^{\mathrm{op}} : \mathrm{h}\mathcal{C} \rightarrow \mathrm{hQCat} \quad C \mapsto \mathcal{E}_C^{\mathrm{op}}.$$

04DD **Remark 8.6.4.11.** In §8.6.7, we will prove a stronger version of Corollary 8.6.4.10, which gives a reformulation of cocartesian duality in the language of transport representations (see Proposition 8.6.7.12).

For some applications, it will be convenient to work with a reformulation of Definition 8.6.4.1.

04DE **Definition 8.6.4.12.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets. We say that a morphism of simplicial sets $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}$ exhibits $U^\vee$ as a cocartesian dual of U if the following conditions are satisfied:

- (a) For each vertex $C \in \mathcal{C}$, the induced map $\mathcal{K}_C : \mathcal{E}_C^\vee \times \mathcal{E}_C \rightarrow \mathcal{S}$ is a balanced profunctor (see Definition 8.3.2.18).
- (b) Let $f : X \rightarrow Y$ be a U -cocartesian edge of $\mathcal{E}$ and let $f^\vee : X^\vee \rightarrow Y^\vee$ be a $U^\vee$ -cocartesian edge of $\mathcal{E}^\vee$ having the same image $e : C \rightarrow D$ in $\mathcal{C}$. Then the map of Kan complexes

$$\mathcal{K}(f^\vee, f) : \mathcal{K}_C(X^\vee, X) \rightarrow \mathcal{K}_D(Y^\vee, Y)$$

carries universal vertices of $\mathcal{K}_C(X^\vee, X)$ to universal vertices of $\mathcal{K}_D(Y^\vee, Y)$ (see Definition 8.3.2.7).

Variant 8.6.4.13. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets. In the formulation of Definition 8.6.4.12, we have implicitly assumed that for each vertex $C \in \mathcal{C}$, the ∞ -categories $\mathcal{E}_C$ and $\mathcal{C}_C^\vee$ are locally small (if this condition is not satisfied, then a balanced profunctor $\mathcal{K}_C : \mathcal{E}_C^\vee \times \mathcal{E}_C \rightarrow \mathcal{S}$ cannot exist). However, we will sometimes apply the theory of cocartesian duality in situations where this condition is not satisfied. If κ is an uncountable cardinal (not necessarily small), we will say that a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ exhibits $U^\vee$ as a cocartesian dual of U if it satisfies conditions (a) and (b) of Definition 8.6.4.12. In this case, we can take κ to be any uncountable cardinal having the property that, for each vertex $C \in \mathcal{C}$, the ∞ -categories $\mathcal{E}_C$ and $\mathcal{E}_C^\vee$ are locally κ -small. 04DF

Remark 8.6.4.14. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, let $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E}$ be a left fibration, and let $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ be a covariant transport representation for λ . Then λ exhibits $U^\vee$ as a cocartesian dual of U (in the sense of Definition 8.6.4.1) if and only if $\mathcal{K}$ exhibits $U^\vee$ as a cocartesian dual of U (in the sense of Variant 8.6.4.13). See Remarks 8.3.2.19 and 8.3.2.8. 04DG

Combining Remark 8.6.4.14 with the classification of left fibrations (Corollary 5.6.0.6), we obtain the following:

Proposition 8.6.4.15. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of ∞ -categories. Let κ be an uncountable cardinal with the property that, for each vertex $C \in \mathcal{C}$, the ∞ -categories $\mathcal{E}_C$ and $\mathcal{E}_C^\vee$ are locally κ -small. Then $U^\vee$ is a cocartesian dual of U if and only if there exists a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$ which exhibits $U^\vee$ as a cocartesian dual of U , in the sense of Definition 8.6.4.12. 04DH

We now give some examples of cocartesian duality.

Proposition 8.6.4.16. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets, and set $\tilde{\mathcal{E}} = \mathcal{C} \times_{\text{Fun}(\Delta^1, \mathcal{E})} \text{Fun}(\Delta^1, \mathcal{E})$. Then the evaluation maps $\text{ev}_0, \text{ev}_1 : \tilde{\mathcal{E}} \rightarrow \mathcal{E}$ determine a left fibration $\lambda : \tilde{\mathcal{E}} \rightarrow \mathcal{E} \times_{\mathcal{C}} \mathcal{E}$ which exhibits U as a cocartesian dual of itself. 04DJ

Proof. The morphism λ is a pullback of the restriction map

$$\text{Fun}(\Delta^1, \mathcal{E}) \rightarrow \text{Fun}(\partial\Delta^1, \mathcal{E}) \times_{\text{Fun}(\partial\Delta^1, \mathcal{C})} \text{Fun}(\Delta^1, \mathcal{C}),$$

and is therefore a left fibration by virtue of Proposition 4.2.5.1. For every vertex $C \in \mathcal{C}$, we can identify λ_C with the coupling

$$\text{Fun}(\Delta^1, \mathcal{E}_C) \rightarrow \text{Fun}(\{0\}, \mathcal{E}_C) \times \text{Fun}(\{1\}, \mathcal{E}_C).$$

It follows from Example 8.2.6.3 that each λ_C is a balanced coupling, so that λ satisfies condition (a) of Definition 8.6.4.1. Moreover, every object of $\text{Fun}(\Delta^1, \mathcal{E}_C)$ is universal for the coupling λ_C , so that condition (b) of Definition 8.6.4.1 is vacuous. □

04DK **Corollary 8.6.4.17.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a left fibration of simplicial sets. Then U is a cocartesian dual of itself.*

04DL **Example 8.6.4.18.** In the special case $\mathcal{C} = \Delta^0$, Corollary 8.6.4.17 asserts that every Kan complex $X = \mathcal{E}$ is homotopy equivalent to the opposite Kan complex X^{op} . This can also be deduced from Theorem 3.6.0.1, since the geometric realizations $|X|$ and $|X^{\text{op}}|$ are homeomorphic.

04DM **Proposition 8.6.4.19.** *Let $\mathcal{C}$ be a category, let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories, and let $\mathcal{F}' : \mathcal{C} \rightarrow \mathbf{Cat}$ be the functor given on objects by $C \mapsto \mathcal{F}(C)^{\text{op}}$. Then (the nerves of) the fibrations*

$$\int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C} \quad \int_{\mathcal{C}} \mathcal{F}' \rightarrow \mathcal{C}$$

are cocartesian dual to one another.

We will deduce Proposition 8.6.4.19 from a more precise result. To formulate it, we need to introduce a bit of notation.

04DN **Construction 8.6.4.20.** Let $\mathcal{C}$ be a category, let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories, and let $\int_{\mathcal{C}} \mathcal{F}$ denote the category of elements of $\mathcal{F}$ (Definition 5.6.1.1); we identify objects of $\int_{\mathcal{C}} \mathcal{F}$ with pairs (C, X) , where C is an object of $\mathcal{C}$ and X is an object of the category $\mathcal{F}(C)$. Let $\mathcal{F}' : \mathcal{C} \rightarrow \mathbf{Cat}$ denote the functor given on objects by $\mathcal{F}'(C) = \mathcal{F}(C)^{\text{op}}$. We define a functor

$$\mathcal{K} : \int_{\mathcal{C}} \mathcal{F}' \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F} \rightarrow \mathbf{Set}$$

as follows:

- On objects, $\mathcal{K}$ is given by the formula $\mathcal{K}((C, X'), (C, X)) = \text{Hom}_{\mathcal{F}(C)}(X', X)$.
- Let $f : (C, X) \rightarrow (D, Y)$ be a morphism in the category $\int_{\mathcal{C}} \mathcal{F}$ and let $f' : (C, X') \rightarrow (D, Y')$ be a morphism in the category $\int_{\mathcal{C}} \mathcal{F}'$ having the same image $u : C \rightarrow D$ in $\mathcal{C}$. Let us identify f and f' with morphisms $g : \mathcal{F}(u)(X) \rightarrow Y$ and $g' : Y' \rightarrow \mathcal{F}(u)(Y)$ in the category $\mathcal{F}(D)$. Then the function $\mathcal{K}(f', f) : \mathcal{K}((C, X'), (C, X)) \rightarrow \mathcal{K}((D, Y'), (D, Y))$ is given by the composition

$$\text{Hom}_{\mathcal{F}(C)}(X', X) \xrightarrow{\mathcal{F}(u)} \text{Hom}_{\mathcal{F}(D)}(\mathcal{F}(u)(X'), \mathcal{F}(u)(X)) \xrightarrow{g \circ \bullet \circ g'} \text{Hom}_{\mathcal{F}(D)}(Y', Y).$$

04DP **Proposition 8.6.4.21.** *Let $\mathcal{C}$ be a category and let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{Cat}$ be a functor of 2-categories. Then the functor*

$$N_{\bullet}(\mathcal{K}) : N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}') \times_{N_{\bullet}(\mathcal{C})} N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}) \rightarrow N_{\bullet}(\mathbf{Set}) \subset \mathcal{S}$$

of Construction 8.6.4.20 exhibits the projection map $U' : N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}') \rightarrow N_{\bullet}(\mathcal{C})$ as a cocartesian dual of the projection map $U : N_{\bullet}(\int_{\mathcal{C}} \mathcal{F}) \rightarrow N_{\bullet}(\mathcal{C})$.

Proof. For each object $C \in \mathcal{C}$, the restriction of $\mathcal{K}$ to the fiber over C is given concretely by the functor

$$\mathcal{K}_C : \mathcal{F}(C)^{\text{op}} \times \mathcal{F}(C) \rightarrow \text{Set} \quad (X', X) \mapsto \text{Hom}_{\mathcal{F}(C)}(X', X).$$

Example 8.3.3.4 implies that $N_{\bullet}(\mathcal{K}_C)$ is a Hom-functor for the ∞ -category $N_{\bullet}(\mathcal{F}(C))$ and is therefore a balanced profunctor (Proposition 8.3.3.8). Let $u : C \rightarrow D$ be a morphism in the category $\mathcal{C}$, and let $f : (C, X) \rightarrow (D, Y)$ and $f' : (C, X') \rightarrow (D, Y')$ be lifts of u to the categories $\int_{\mathcal{C}} \mathcal{F}$ and $\int_{\mathcal{C}} \mathcal{F}'$, respectively. We wish to show that, if f is U -cocartesian and f' is U' -cocartesian, then the induced map

$$\mathcal{K}(f, f') : \mathcal{K}_C(X', X) \rightarrow \mathcal{K}_D(Y', Y)$$

carries universal elements of $\mathcal{K}_C(X', X)$ to universal elements of $\mathcal{K}_D(Y', Y)$. Let us identify f and f' with morphisms $g : \mathcal{F}(u)(X) \rightarrow Y$ and $g' : Y' \rightarrow \mathcal{F}(u)(X)$ in the category $\mathcal{F}(D)$, so that $\mathcal{K}(f', f)$ is given by the composition

$$\text{Hom}_{\mathcal{F}(C)}(X', X) \xrightarrow{\mathcal{F}(u)} \text{Hom}_{\mathcal{F}(D)}(\mathcal{F}(u)(X'), \mathcal{F}(u)(X)) \xrightarrow{g \circ - \circ g'} \text{Hom}_{\mathcal{F}(D)}(Y', Y).$$

Our assumption that f is U -cocartesian guarantees that g is an isomorphism in the category $\mathcal{F}(D)$, and our assumption that f' is a U' -cocartesian guarantees that g' is an isomorphism in the category $\mathcal{F}(D)$. The desired result now follows from the observation that if $e : X' \rightarrow X$ is an isomorphism in the category $\mathcal{F}(C)$, then the composition $g \circ \mathcal{F}(u)(e) \circ g'$ is an isomorphism in the category $\mathcal{F}(D)$. $\square$

Proof of Proposition 8.6.4.19. Combine Propositions 8.6.4.15 and 8.6.4.21. $\square$

Let $\mathbf{QCat}$ be the (ordinary) category of ∞ -categories, which we regard as a full subcategory of Set_{Δ} . If $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ is a functor of ordinary categories, we let $N_{\bullet}^{\mathcal{F}}(\mathcal{C})$ denote the weighted nerve of Definition 5.3.3.1. According to Corollary 5.3.3.16, the projection map $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ is a cocartesian fibration, whose fiber over an object $C \in \mathcal{C}$ can be identified with the ∞ -category $\mathcal{F}(C)$. In this situation, it is easy to construct a cocartesian dual of U :

Proposition 8.6.4.22. *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a functor of ordinary categories, and let $04DQ$ $\mathcal{F}' : \mathcal{C} \rightarrow \mathbf{QCat}$ denote the functor given on objects by $C \mapsto \mathcal{F}(C)^{\text{op}}$. Then the fibrations*

$$N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C}) \leftarrow N_{\bullet}^{\mathcal{F}'}(\mathcal{C})$$

are cocartesian dual to one another.

Proposition 8.6.4.22 is an immediate consequence of the following more precise result:

04DR **Proposition 8.6.4.23.** *Let $\mathcal{F} : \mathcal{C} \rightarrow \mathbf{QCat}$ be a functor of ordinary categories and let $\mathcal{F}', \mathrm{Tw}(\mathcal{F}) : \mathcal{C} \rightarrow \mathbf{QCat}$ be the functors given on objects by the formulae $\mathcal{F}'(C) = \mathcal{F}(C)^{\mathrm{op}}$ and $\mathrm{Tw}(\mathcal{F})(C) = \mathrm{Tw}(\mathcal{F}(C))$. Then the tautological map*

$$\lambda = (\lambda_-, \lambda_+) : N_{\bullet}^{\mathrm{Tw}(\mathcal{F})}(\mathcal{C}) \rightarrow N_{\bullet}^{\mathcal{F}^{\mathrm{op}}}(\mathcal{C}) \times_{N_{\bullet}(\mathcal{C})} N_{\bullet}^{\mathcal{F}}(\mathcal{C})$$

exhibits the fibration $U^{\vee} : N_{\bullet}^{\mathcal{F}'}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ as a cocartesian dual of the fibration $U : N_{\bullet}^{\mathcal{F}}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$.

Proof. For each object $C \in \mathcal{C}$, Proposition 8.1.1.11 guarantees that the morphism

$$\lambda_C : \mathrm{Tw}(\mathcal{F}(C)) \rightarrow \mathcal{F}(C)^{\mathrm{op}} \times \mathcal{F}(C)$$

is a left fibration of ∞ -categories, which is a balanced coupling by virtue of Example 8.2.6.2. Applying Corollary 5.3.3.18, we deduce that λ is a left fibration of ∞ -categories. Let $U : N_{\bullet}^{\mathrm{Tw}(\mathcal{F})}(\mathcal{C}) \rightarrow N_{\bullet}(\mathcal{C})$ denote the projection map, and let $f : X \rightarrow Y$ be a morphism in the ∞ -category $N_{\bullet}^{\mathrm{Tw}(\mathcal{F})}(\mathcal{C})$ having image $u : C \rightarrow D$ in $\mathcal{C}$. To complete the proof, it will suffice to show that if X is universal for the coupling λ_C and f is U -cocartesian, then Y is universal for the coupling λ_D . Our assumption that f is U -cocartesian guarantees that Y is isomorphic to the image of X under the functor $\mathrm{Tw}(\mathcal{F}(u)) : \mathrm{Tw}(\mathcal{F}(C)) \rightarrow \mathrm{Tw}(\mathcal{F}(D))$. The desired result now follows from Example 8.2.1.5, since the functor $\mathcal{F}(u)$ carries isomorphisms in the ∞ -category $\mathcal{F}(C)$ to isomorphisms in the ∞ -category $\mathcal{F}(D)$. $\square$

8.6.5 Existence of Dual Fibrations

04DS The goal of this section is to prove the following:

04DT **Theorem 8.6.5.1.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Then U admits a cocartesian dual $U^{\vee} : \mathcal{E}^{\vee} \rightarrow \mathcal{C}$, which is uniquely determined up to equivalence.*

We will give the proof of Theorem 8.6.5.1 at the end of this section.

04DU **Corollary 8.6.5.2.** *For every simplicial set $\mathcal{C}$, the formation of cocartesian duals induces a bijection*

$$\begin{array}{c} \{\text{Cocartesian fibrations } U : \mathcal{E} \rightarrow \mathcal{C}\} / \text{Equivalence} \\ \downarrow \theta \\ \{\text{Cocartesian fibrations } U^{\vee} : \mathcal{E}^{\vee} \rightarrow \mathcal{C}\} / \text{Equivalence.} \end{array}$$

Proof. Theorem 8.6.5.1 implies that θ is well-defined, and Remark 8.6.4.3 implies that $\theta \circ \theta$ is the identity; in particular, θ is a bijection. $\square$

Variante 8.6.5.3 (Cartesian Duality). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U' : \mathcal{E}' \rightarrow \mathcal{C}$ be cartesian fibrations 04DV of simplicial sets. We say that U' is a *cartesian dual* of U if the cocartesian fibration $U'^{\text{op}} : \mathcal{E}'^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is a cocartesian dual of $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$. It follows from Theorem 8.6.5.1 that every cartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ admits a cartesian dual $U' : \mathcal{E}' \rightarrow \mathcal{C}$ which is uniquely determined up to equivalence. Moreover, Corollary 8.6.4.10 implies that the (contravariant) homotopy transport representation of U' is given by the composition

$$\text{h}\mathcal{C}^{\text{op}} \xrightarrow{\text{hTr}_{\mathcal{E}/\mathcal{C}}} \text{hQCat} \xrightarrow{\mathcal{A} \mapsto \mathcal{A}^{\text{op}}} \text{hQCat}.$$

In particular, for every vertex $C \in \mathcal{C}$, the fiber $\mathcal{E}'_C\{C\} \times_{\mathcal{C}} \mathcal{E}'$ is equivalent to the opposite of the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$.

Warning 8.6.5.4. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a morphism of simplicial sets which is both a cartesian 04DW fibration and a cocartesian fibration. Then U admits both a cocartesian dual $U' : \mathcal{E}' \rightarrow \mathcal{C}$ and a cartesian dual $U'' : \mathcal{E}'' \rightarrow \mathcal{C}$. For every vertex $C \in \mathcal{C}$, there are equivalences of ∞ -categories $\mathcal{E}'_C \simeq \mathcal{E}_C^{\text{op}} \simeq \mathcal{E}''_C$. Beware that the fibrations U' and U'' are generally not equivalent to one another (see Example 8.6.5.5).

Example 8.6.5.5. Let $U : \mathcal{E} \rightarrow \Delta^1$ be a cocartesian fibration of ∞ -categories. By virtue 04DX of Remark 5.2.4.3, the cocartesian fibration U can be recovered (up to equivalence) from its homotopy transport representation, which we can identify with the functor $F : \mathcal{E}_0 \rightarrow \mathcal{E}_1$ given by covariant transport along the nondegenerate edge of Δ^1 . The fibration U then has a cocartesian dual $U' : \mathcal{E}' \rightarrow \Delta^1$, whose covariant transport functor can be identified with the composition

$$\mathcal{E}'_0 \simeq \mathcal{E}_0^{\text{op}} \xrightarrow{F^{\text{op}}} \mathcal{E}_1^{\text{op}} \simeq \mathcal{E}'_1$$

(Corollary 8.6.4.10). Applying Proposition 6.2.5.6, we deduce the following:

- (a) The cocartesian fibration U is a cartesian fibration if and only if the functor $F : \mathcal{E}_0 \rightarrow \mathcal{E}_1$ admits a right adjoint.
- (b) The cocartesian fibration U' is a cartesian fibration if and only if the functor $F^{\text{op}} : \mathcal{E}_0^{\text{op}} \rightarrow \mathcal{E}_1^{\text{op}}$ admits a right adjoint: that is, if and only if the functor F admits a left adjoint.

Note that conditions (a) and (b) are not equivalent. If (a) is satisfied and (b) is not, then U admits a cartesian dual $U'' : \mathcal{E}'' \rightarrow \Delta^1$ which cannot be equivalent to U' (since U'' is a cartesian fibration and U' is not).

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Theorem 8.6.5.1 implies that U admits a cocartesian dual $U^{\vee} : \mathcal{E}^{\vee} \rightarrow \mathcal{C}$. To prove this, it will be convenient to use the formulation of cocartesian duality supplied by Definition 8.6.4.12. In the special case where $\mathcal{C} = \Delta^0$ and $\mathcal{E}$ is locally small, we wish to show that there exists an ∞ -category $\mathcal{E}^{\vee}$ and a

balanced profunctor $\mathcal{K} : \mathcal{E}^\vee \times \mathcal{E} \rightarrow \mathcal{S}$. This is a special case of Corollary 8.3.2.21: in fact, we can take $\mathcal{E}^\vee$ to be the ∞ -category $\text{Fun}^{\text{corep}}(\mathcal{E}, \mathcal{S})$ of corepresentable functors from $\mathcal{E}$ to $\mathcal{S}$, and $\mathcal{K}$ to be the evaluation functor

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E}, \mathcal{S}) \times \mathcal{E} \rightarrow \mathcal{S} \quad (\mathcal{F}, X) \mapsto \mathcal{F}(X).$$

To handle the general case we will use a variant of this construction, defined using the relative exponential introduced in §4.5.9.

04DY Construction 8.6.5.6. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, let κ be an uncountable cardinal, and let $\mathcal{S}_{<\kappa}$ denote the ∞ -category of essentially κ -small spaces. We let $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ denote the relative exponential of Construction 4.5.9.1. By construction, we can identify vertices of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ with pairs $(C, \mathcal{F}_C)$, where C is a vertex of $\mathcal{C}$ and $\mathcal{F}_C : \mathcal{E}_C \rightarrow \mathcal{S}_{<\kappa}$ is a functor of ∞ -categories. We let $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ denote the full simplicial subset of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ spanned by those vertices $(C, \mathcal{F}_C)$ where the functor $\mathcal{F}_C$ is corepresentable by an object of the ∞ -category $\mathcal{E}_C$. In what follows, we will generally write $\pi : \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ for the projection map, and $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ for the restriction of π to the simplicial subset $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \subseteq \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$.

04DZ Remark 8.6.5.7. Construction 8.6.5.6 is independent of the choice of the cardinal κ , provided that each of the ∞ -categories $\mathcal{E}_C$ is locally κ -small. If this condition is satisfied and $\lambda \geq \kappa$, then every corepresentable functor $\mathcal{F} : \mathcal{E}_C \rightarrow \mathcal{S}_{<\lambda}$ factors through $\mathcal{S}_{<\kappa}$. It follows that $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) = \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\lambda})$.

The existence assertion of Theorem 8.6.5.1 is a consequence of the following more precise result:

04E0 Proposition 8.6.5.8. *Let κ be an uncountable cardinal and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets which is locally κ -small (Variant 4.7.9.2). Then the evaluation map*

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa} \quad ((C, \mathcal{F}_C), X) \mapsto \mathcal{F}_C(X)$$

exhibits the projection map $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ as a cocartesian dual of U (in the sense of Variant 8.6.4.13).

Our first goal is to show that, in the situation of Proposition 8.6.5.8, the projection map π^{corep} is a cocartesian fibration of simplicial sets. We begin with some more general remarks.

04E1 Proposition 8.6.5.9. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets which is essentially κ -small, and let $\mathcal{D}$ be an ∞ -category which is κ -cocomplete. Then the projection map $\pi : \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) \rightarrow \mathcal{C}$ is a cocartesian fibration of simplicial sets.*

Proof. It follows from Corollary 5.3.6.8 that π is a cartesian fibration of simplicial sets. Let $e : C \rightarrow C'$ be an edge of the simplicial set $\mathcal{C}$, and let $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ be the functor given by covariant transport along e (for the cocartesian fibration U). Then precomposition with $e_!$ determines a functor

$$e^* : \{C'\} \times_{\mathcal{C}} \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) = \text{Fun}(\mathcal{E}_{C'}, \mathcal{D}) \xrightarrow{\circ e_!} \text{Fun}(\mathcal{E}_C, \mathcal{D}) = \{C\} \times_{\mathcal{C}} \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}).$$

Proposition 5.3.6.9 guarantees that the functor e^* is given by contravariant transport along e (for the cartesian fibration π). Using Proposition 6.2.5.6, we see that π is a cocartesian fibration if and only if the functor e^* has a left adjoint (for every edge e of $\mathcal{C}$). By virtue of Corollary 7.3.6.3, it will suffice to show that every functor $F : \mathcal{E}_C \rightarrow \mathcal{D}$ admits a left Kan extension along the functor $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$. This is a special case of Proposition 7.6.6.18, by virtue of our assumptions on the cardinal κ . $\square$

Remark 8.6.5.10. In the situation of Proposition 8.6.5.9, let $e : C \rightarrow C'$ be an edge of $\mathcal{C}$ and let

$$e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'} \quad e'_! : \text{Fun}(\mathcal{E}_C, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{E}_{C'}, \mathcal{D})$$

be functors given by covariant transport along e (for the cocartesian fibrations U and π , respectively). Then the functor $e'_!$ is given by left Kan extension along $e_!$.

Variant 8.6.5.11. Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an exponentiable inner fibration which is essentially κ -small, and let $\mathcal{D}$ be an ∞ -category which is κ -cocomplete. Then the projection map $\pi : \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D}) \rightarrow \mathcal{C}$ is a cocartesian fibration. Moreover, an edge $\tilde{e}$ of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ is π -cocartesian if and only if satisfies the following condition:

(*) Write $\tilde{e} = (e, F_e)$, where e is an edge of $\mathcal{C}$ and $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$ is a functor of ∞ -categories. Then F_e is left Kan extended from the full subcategory $\{0\} \times_{\mathcal{C}} \mathcal{E}$.

Proof. Corollary 4.5.9.19 guarantees that π is an isofibration, and Corollary 7.3.7.9 guarantees that every edge of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ which satisfies condition (*) is π -cocartesian. Suppose we are given a vertex $\tilde{C} = (C, F_C)$ of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$, where C is a vertex of $\mathcal{C}$ and $F_C : \mathcal{E}_C \rightarrow \mathcal{D}$ is a functor of ∞ -categories. If $e : C \rightarrow C'$ is an edge of $\mathcal{C}$, then Proposition 7.6.6.18 guarantees that F_C admits a left Kan extension $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$, which we can identify with an edge $\tilde{e}$ of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ satisfying $\pi(\tilde{e}) = e$. By construction, the morphism $\tilde{e}$ satisfies condition (*), and is therefore π -cocartesian by virtue of Corollary 7.3.7.9. Allowing $\tilde{C}$ and e to vary, we conclude that π is a cocartesian fibration. To complete the proof, it will suffice to show that every π -cocartesian edge $\tilde{e}'$ of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$ satisfies condition (*). Let us identify $\tilde{e}'$ with a pair (e, F'_e) , where e is an edge of $\mathcal{C}$ and $F'_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$ is a functor. Using the preceding argument, we see that the restriction $F'_e|_{\{0\} \times_{\mathcal{C}} \mathcal{E}}$ admits a left Kan extension $F_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{D}$, corresponding to another edge $\tilde{e}$ of $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{D})$. By construction, $\tilde{e}$

satisfies condition $(*)$ and is therefore π -cocartesian. Invoking the uniqueness of cocartesian lifts (Remark 5.1.3.8), we deduce that the functors F_e and F'_e are isomorphic. It follows that F'_e is also left Kan extended from $\{0\} \times_{\mathcal{C}} \mathcal{E}$ (Remark 7.3.3.17), so that $\tilde{e}'$ satisfies condition $(*)$ as desired. $\square$

04E4 Proposition 8.6.5.12. *Let κ be an uncountable regular cardinal and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets which is essentially κ -small. Then:*

- (1) *The projection map $\pi : \mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ is both a cartesian fibration and a cocartesian fibration.*
- (2) *Let $\tilde{e}$ be a π -cocartesian edge of the simplicial set $\mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}^{<\kappa})$. If the source of $\tilde{e}$ belongs to the simplicial subset $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$, then the target of $\tilde{e}$ also belongs to the simplicial subset $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$.*
- (3) *The morphism π restricts to a cocartesian fibration $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$. Moreover, an edge of $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ is π^{corep} -cocartesian if and only if it is π -cocartesian.*

Proof. Assertion (1) follows from Corollary 5.3.6.8 and Proposition 8.6.5.9 (since the ∞ -category $\mathcal{S}_{<\kappa}$ admits κ -small colimits; see Corollary 7.4.3.8). We will prove (2). Let $\tilde{e} : (C, \mathcal{F}_C) \rightarrow (C', \mathcal{F}_{C'})$ be an edge of the simplicial set $\mathrm{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ having image $e : C \rightarrow C'$ in $\mathcal{C}$. Let $e_! : \mathcal{E}_C \rightarrow \mathcal{E}_{C'}$ be given by covariant transport along e for the cocartesian fibration U . If $\tilde{e}$ is π -cocartesian, then we can identify $\mathcal{F}_{C'}$ with a left Kan extension of $\mathcal{F}_C$ along the functor $e_!$ (Remark 8.6.5.10). In particular, if the functor $\mathcal{F}_C : \mathcal{E}_C \rightarrow \mathcal{S}$ is corepresentable by an object $X \in \mathcal{E}_C$, then $\mathcal{F}_{C'}$ is corepresentable by the image $e_!(X) \in \mathcal{E}_{C'}$ (Corollary 8.3.1.9). This proves assertion (2), and assertion (3) is a formal consequence (see Proposition 5.1.4.17). $\square$

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. To show that the projection map $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ is a cocartesian fibration (at least for $\kappa \gg 0$), we used the fact that the collection of corepresentable functors is closed under the formation of left Kan extensions. To prove Proposition 8.6.5.8, we will need to characterize the collection of π^{corep} -cocartesian edges of the simplicial set $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ more explicitly.

04E5 Lemma 8.6.5.13. *Let κ be an uncountable cardinal, let $\mathcal{E}$ be an ∞ -category which is locally κ -small, and let $\mathcal{F} : \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ be a functor. Suppose we are given a full subcategory $\mathcal{E}_0 \subseteq \mathcal{E}$, an object $X \in \mathcal{E}_0$, and a vertex $\eta \in \mathcal{F}(X)$. Then η exhibits the $\mathcal{F}$ as corepresented by the object X if and only if the following conditions are satisfied:*

- (a) *The vertex η exhibits $\mathcal{F}_0 = \mathcal{F}|_{\mathcal{E}_0}$ as corepresented by the object X .*
- (b) *The functor $\mathcal{F}$ is left Kan extended from $\mathcal{E}_0$.*

Proof. It follows immediately from the definition that if η exhibits $\mathcal{F}$ as corepresented by X , then it also exhibits $\mathcal{F}_0$ as corepresented by X . We may therefore assume without loss of generality that condition (a) is satisfied. In this case, the desired equivalence follows immediately by combining the criterion of Lemma 8.3.1.7 with the transitivity property of Kan extensions (Proposition 7.3.8.23). $\square$

Lemma 8.6.5.14. *Let κ be an uncountable cardinal, let $\mathcal{E}$ be an ∞ -category which is locally κ -small, and let $\mathcal{F} : \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ be a functor. Suppose we are given a functor $U : \mathcal{E} \rightarrow \Delta^1$ and a U -cocartesian morphism $e : X \rightarrow Y$ of $\mathcal{E}$ satisfying $U(X) = 0$ and $U(Y) = 1$. Write $\mathcal{E}_0 = \{0\} \times_{\Delta^1} \mathcal{E}$ and $\mathcal{E}_1 = \{1\} \times_{\Delta^1} \mathcal{E}$, and let $\eta \in \mathcal{F}(X)$ be a vertex which exhibits the functor $\mathcal{F}_0 = \mathcal{F}|_{\mathcal{E}_0}$ as corepresented by the object X . The following conditions are equivalent:* 04E6

- (1) *The functor $\mathcal{F}$ is left Kan extended from $\mathcal{E}_0$.*
- (2) *The vertex η exhibits the functor $\mathcal{F}$ as corepresented by X .*
- (3) *The vertex $\mathcal{F}(e)(\eta) \in \mathcal{F}(Y)$ exhibits the functor $\mathcal{F}_1 = \mathcal{F}|_{\mathcal{E}_1}$ as corepresented by the object $Y \in \mathcal{E}_1$.*

Proof. The equivalence of (1) and (2) follows from Lemma 8.6.5.13. We will show that (2) and (3) are equivalent. Fix an object $Z \in \mathcal{E}_1$. Then the diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Hom}_{\mathcal{E}_1}(Y, Z) & \xrightarrow{\circ[e]} & \mathrm{Hom}_{\mathcal{E}}(X, Z) \\ & \searrow & \swarrow \\ & \mathcal{F}(Z) & \end{array}$$

commutes up to homotopy, where the right vertical map is determined by $\eta \mathcal{F}(X)$ and the left vertical map is determined by $\mathcal{F}(e)(\eta) \in \mathcal{F}(Y)$. Our assumption that e is U -cocartesian guarantees that the horizontal map is a homotopy equivalence (Corollary 5.1.2.3). It follows that the left vertical map is a homotopy equivalence if and only if the right vertical map is a homotopy equivalence. The desired result now follows by allowing the object Z to vary. $\square$

Lemma 8.6.5.15. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let κ be an uncountable cardinal such that each fiber of U is locally κ -small. Let $\tilde{e}$ be an edge of the simplicial set $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$ corresponding to a pair $(e, \mathcal{F})$, where $e : C \rightarrow D$ is an edge of $\mathcal{C}$ and $\mathcal{F} : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ is a functor. The following conditions are equivalent:* 04E7

- (1) *The edge $\tilde{e}$ is π^{corep} -cocartesian (where $\pi^{\mathrm{corep}} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ denotes the projection map).*

- (2) *There exists an object $X \in \mathcal{E}_C$, a vertex $\eta \in \mathcal{F}(X)$ which exhibits $\mathcal{F}|_{\mathcal{E}_C}$ as corepresented by the object X , and a U -cocartesian morphism $\bar{e} : X \rightarrow Y$ such that $U(\bar{e}) = e$ and the vertex $\mathcal{F}(\bar{e})(\eta) \in \mathcal{F}(Y)$ exhibits $\mathcal{F}|_{\mathcal{E}_D}$ as corepresented by the object Y .*
- (3) *For every object $X \in \mathcal{E}_C$, every vertex $\eta \in \mathcal{F}(X)$ which exhibits $\mathcal{F}|_{\mathcal{E}_C}$ as corepresented by the object X , and every U -cocartesian morphism $\bar{e} : X \rightarrow Y$ satisfying $U(\bar{e}) = e$, the vertex $\mathcal{F}(\bar{e})(\eta) \in \mathcal{F}(Y)$ exhibits $\mathcal{F}|_{\mathcal{E}_D}$ as corepresented by the object Y .*

Proof. By virtue of Remark 8.6.5.7, we are free to enlarge the cardinal κ ; we may therefore assume without loss of generality that κ is regular and that the ∞ -category $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$ is essentially κ -small. In this case, Variant 8.6.5.11 shows that (1) is equivalent to the following:

- (1') The functor $\mathcal{F}$ is left Kan extended from the full subcategory $\mathcal{E}_C \subseteq \Delta^1 \times_{\mathcal{C}} \mathcal{E}$.

The equivalences $(1') \Leftrightarrow (2) \Leftrightarrow (3)$ now follow from Lemma 8.6.5.14. $\square$

Proof of Proposition 8.6.5.8. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let κ be an uncountable cardinal such that each fiber of U is locally κ -small. It follows from Proposition 8.6.5.12 that the projection map $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ is a cocartesian fibration of simplicial sets. We wish to show that the evaluation map

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa} \quad ((C, \mathcal{F}_C), X) \mapsto \mathcal{F}_C(X)$$

satisfies conditions (a) and (b) of Definition 8.6.4.12. Condition (a) asserts that, for each vertex $C \in \mathcal{C}$, the evaluation map

$$\text{ev}_C : \text{Fun}^{\text{corep}}(\mathcal{E}_C, \mathcal{S}_{<\kappa}) \times \mathcal{E}_C \rightarrow \mathcal{S}_{<\kappa} \quad (\mathcal{F}, X) \mapsto \mathcal{F}(X)$$

is a balanced profunctor; this follows from Corollary 8.3.2.21. Assertion (b) is a restatement of the implication $(1) \Rightarrow (3)$ of Lemma 8.6.5.15. $\square$

Proposition 8.6.5.8 immediately implies the existence assertion of Theorem 8.6.5.1. To establish uniqueness, it will be convenient to introduce some terminology.

04E8 Definition 8.6.5.16. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets and let κ be an uncountable cardinal. We will say that a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ is a *weak $\mathcal{C}$ -family of corepresentable profunctors* if, for every vertex $C \in \mathcal{C}$, the induced map

$$\mathcal{K}_C : \mathcal{E}_C^\vee \times \mathcal{E}_C \rightarrow \mathcal{S}_{<\kappa}$$

is a corepresentable profunctor (Definition 8.3.2.9). We say that $\mathcal{K}$ is a *$\mathcal{C}$ -family of corepresentable profunctors* if it is a weak $\mathcal{C}$ -family of corepresentable profunctors and satisfies the following additional condition:

- (*) Let $f : X \rightarrow Y$ be a U -cocartesian edge of $\mathcal{E}$ and let $f^\vee : X^\vee \rightarrow Y^\vee$ be a $U^\vee$ -cocartesian edge of $\mathcal{E}^\vee$ having the same image $u : C \rightarrow D$ in $\mathcal{C}$. Then the map of Kan complexes

$$\mathcal{K}(f^\vee, f) : \mathcal{K}_C(X^\vee, X) \rightarrow \mathcal{K}_D(Y^\vee, Y)$$

carries couniversal vertices of $\mathcal{K}_C(X^\vee, X)$ to couniversal vertices of $\mathcal{K}_D(Y^\vee, Y)$.

Example 8.6.5.17. In the situation of Definition 8.6.5.16, the morphism $\mathcal{K}$ exhibits $U^\vee$ 04E9 as a cocartesian dual of U (in the sense of Variant 8.6.4.13) if and only if it is a $\mathcal{C}$ -family of corepresentable profunctors having the further property that each of the profunctors $\mathcal{K}_C$ is *balanced*: that is, it is corepresentable by an equivalence of ∞ -categories $(\mathcal{E}_C^\vee)^{\text{op}} \rightarrow \mathcal{E}_C$ (see Corollary 8.3.2.20).

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a morphism of simplicial sets, let κ be an uncountable cardinal, and let $\pi : \text{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ denote the projection map. For any morphism of simplicial sets $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, we can identify morphisms $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ with morphisms $F : \mathcal{E}^\vee \rightarrow \text{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$ satisfying $\pi \circ F = U$.

Proposition 8.6.5.18. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets. Let κ be an uncountable cardinal such that U is locally κ -small. Fix a morphism $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$, which we identify with a morphism $F : \mathcal{E}^\vee \rightarrow \text{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$. Then: 04EA

- (1) The morphism $\mathcal{K}$ is a weak $\mathcal{C}$ -family of corepresentable profunctors if and only if F factors through the simplicial subset $\text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}^{<\kappa}) \subseteq \text{Fun}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$.
- (2) The morphism $\mathcal{K}$ is a $\mathcal{C}$ -family of corepresentable profunctors if and only if F factors through $\text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$ and carries $U^\vee$ -cocartesian edges of $\mathcal{E}^\vee$ to π^{corep} -cocartesian edges of $\text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$. Here $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ denotes the cocartesian fibration of Proposition 8.6.5.12.
- (3) The morphism $\mathcal{K}$ exhibits $U^\vee$ as a cocartesian dual of U if and only if $F : \mathcal{E}^\vee \rightarrow \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$ is an equivalence of cocartesian fibrations over $\mathcal{C}$.

Proof. Assertion (1) is immediate from the definitions and assertion (2) follows from Lemma 8.6.5.15. Assertion (3) follows by combining (2) with Example 8.6.5.17 (see Proposition 5.1.7.15). $\square$

Proof of Theorem 8.6.5.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Fix an uncountable cardinal κ such that U is locally κ -small. Proposition 8.6.5.8 implies that the projection map $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$ is a cocartesian dual of U , and Proposition 8.6.5.18 implies that any other cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is equivalent to π^{corep} . $\square$

Using Proposition 8.6.5.18, we can characterize the dual of a fibration by a universal mapping property.

04EB **Corollary 8.6.5.19.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$, $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$, and $V : \mathcal{D} \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, let κ be an uncountable cardinal, and let $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ exhibit $U^\vee$ as a cocartesian dual of U . Then:*

(1) *Composition with $\mathcal{K}$ induces a fully faithful functor*

$$\mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^\vee) \rightarrow \mathrm{Fun}(\mathcal{D} \times_{\mathcal{C}} \mathcal{E}^\vee, \mathcal{S}_{<\kappa}).$$

The essential image is spanned by the weak $\mathcal{C}$ -families of corepresentable profunctors.

(2) *A morphism $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^\vee)$ carries V -cocartesian edges of $\mathcal{D}$ to $U^\vee$ -cocartesian edges of $\mathcal{E}^\vee$ if and only if the composite map*

$$\mathcal{D} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{F \times \mathrm{id}} \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \xrightarrow{\mathcal{K}} \mathcal{S}_{<\kappa}$$

is a $\mathcal{C}$ -family of corepresentable profunctors.

(3) *A morphism $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{D}, \mathcal{E}^\vee)$ is an equivalence of cocartesian fibrations over $\mathcal{C}$ if and only if the composite map*

$$\mathcal{D} \times_{\mathcal{C}} \mathcal{E} \xrightarrow{F \times \mathrm{id}} \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \xrightarrow{\mathcal{K}} \mathcal{S}_{<\kappa}$$

exhibits V as a cocartesian dual of U

Proof. We can identify $\mathcal{K}$ with a morphism $G \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}^\vee, \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}))$. It follows from Proposition 8.6.5.18 that G is an equivalence of cocartesian fibrations over $\mathcal{C}$. We can therefore replace $\mathcal{E}^\vee$ by $\mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa})$ and $\mathcal{K}$ by the evaluation map $\mathrm{ev} : \mathrm{Fun}^{\mathrm{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$. In this case, assertions (1), (2), and (3) follow immediately from the corresponding assertions of Proposition 8.6.5.18. $\square$

8.6.6 Comparison of Dual and Conjugate Fibrations

04ET In this section, we show that the theory of conjugate fibrations (introduced in §8.6.1) can be regarded as a reformulation of cocartesian duality (introduced in §8.6.4). Our main result can be stated as follows:

04EU **Proposition 8.6.6.1.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets. Then U is a cocartesian dual of $U^\vee$ if and only if the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \mathcal{C}^{\mathrm{op}}$ is a cartesian conjugate of $U^\vee$.*

Before giving the proof of Proposition 8.6.6.1, let us collect some consequences.

04EV **Corollary 8.6.6.2 (Symmetry).** *Let $\mathcal{C}$ be a simplicial set, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration, and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration. Then $U^\dagger$ is a cartesian conjugate of U if and only if U^{op} is a cartesian conjugate of $U^{\dagger, \mathrm{op}}$.*

Proof. Combine Proposition 8.6.6.1 with Remark 8.6.4.3. $\square$

Corollary 8.6.6.3. *For every simplicial set $\mathcal{C}$, the formation of cartesian conjugates induces a bijection* 05JR

$$\begin{array}{c} \{\text{Cocartesian fibrations } U : \mathcal{E} \rightarrow \mathcal{C}\} / \text{Equivalence} \\ \downarrow \\ \{\text{Cartesian fibrations } U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}\} / \text{Equivalence.} \end{array}$$

Proof. Combine Proposition 8.6.6.1 with Corollary 8.6.5.2. $\square$

Example 8.6.6.4. Let $\mathcal{C}$ be an ∞ -category. Then the evaluation functor $\text{ev}_1 : \text{Fun}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ is a cocartesian fibration, which is cocartesian dual to the projection map $\lambda_+ : \text{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$ of Notation 8.1.1.6. This follows by combining Proposition 8.6.6.1 with Corollary 8.6.3.18 (applied to the opposite ∞ -category $\mathcal{C}^{\text{op}}$). 05JS

Corollary 8.6.6.5. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, let L be the collection of U -cocartesian edges of $\mathcal{E}$, and let $\mathcal{E}^\vee$ be the fiber product $\mathcal{C} \times_{\text{Cospan}(\mathcal{C})} \text{Cospan}^{L, \text{all}}(\mathcal{E})$. Then the projection map $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is a cocartesian fibration, which is a cocartesian dual of U .* 05JT

Proof. Combine Propositions 8.6.6.1 and 8.6.3.5. $\square$

Remark 8.6.6.6. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, and let $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ be the opposite fibration. By virtue of Theorem 8.6.5.1 and Corollary 8.6.3.14, U admits a cocartesian dual $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ and a cartesian conjugate $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$, which are uniquely determined up to equivalence and opposite to one another (Proposition 8.6.6.1). When $\mathcal{C}$ is an ∞ -category, all four of these fibrations can be realized as a suitable restriction of the projection map $\text{Cospan}(U) : \text{Cospan}(\mathcal{E}) \rightarrow \text{Cospan}(\mathcal{C})$. Let L denote the collection of all U -cocartesian morphisms of $\mathcal{E}$, and let R denote the collection of all morphisms f of $\mathcal{E}$ such that $U(f)$ is an isomorphism in $\mathcal{C}$. Then: 04F7

- Using Proposition 8.1.7.6, we can identify U with the map

$$\text{Cospan}^{\text{all}, L \cap R}(\mathcal{E}) = \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all}, \text{iso}}(\mathcal{C}).$$

- Using Variant 8.1.7.14, we can identify U^{op} with the map

$$\text{Cospan}^{L \cap R, \text{all}}(\mathcal{E}) = \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C}).$$

- Using Proposition 8.6.3.5 (and Remark 8.6.3.7), we can identify $U^\dagger$ with the projection map $\text{Cospan}^{R, L}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{iso}, \text{all}}(\mathcal{C})$.

- Using Corollary 8.6.6.5 (and Remark 8.6.3.7), we can identify $U^\vee$ with the map $\text{Cospan}^{L,R}(\mathcal{E}) \rightarrow \text{Cospan}^{\text{all,iso}}(\mathcal{C})$.

04EW **Corollary 8.6.6.7.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of ∞ -categories, let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a cartesian fibration of ∞ -categories, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow & & \downarrow U \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C}. \end{array}$$

The following conditions are equivalent:

- (1) The functor T exhibits $U^\dagger$ as a cartesian conjugate of U (in the sense of Definition 8.6.1.1).
- (2) The functor T exhibits $\mathcal{E}$ as a localization of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$ with respect to W , where W is the collection of all morphisms $w = (w', w'')$ where w' is a U' -cartesian morphism of $\mathcal{E}^\dagger$ and w'' is a morphism of $\text{Tw}(\mathcal{C})$ whose image in $\mathcal{C}$ is degenerate.

Proof. We will show that (2) implies (1); the reverse implication follows from Proposition 8.6.2.10. Using Corollary 8.6.6.3, we can choose a cocartesian fibration $U' : \mathcal{E}' \rightarrow \mathcal{C}$ and a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T'} & \mathcal{E}' \\ \downarrow & & \downarrow U' \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C} \end{array}$$

which exhibits $U^\dagger$ as a cartesian conjugate of U' . Assume that condition (2) is satisfied, so that we have a commutative diagram

$$\begin{array}{ccc} \text{Fun}(\mathcal{E}, \mathcal{E}') & \xrightarrow{T_\circ} & \text{Fun}((\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}))[W^{-1}], \mathcal{E}') \\ \downarrow U_\circ & & \downarrow U'_\circ \\ \text{Fun}(\mathcal{E}, \mathcal{C}) & \xrightarrow{T_\circ} & \text{Fun}((\mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}))[W^{-1}], \mathcal{C}), \end{array}$$

where the horizontal maps are equivalences of ∞ -categories and the vertical maps are isofibrations (Corollary 4.4.5.6). Applying Corollary 4.5.2.33, we deduce that the map

$$(\circ T) : \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}') \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \mathcal{E}')$$

is fully faithful, and that its essential image consists of those functors $\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{E}'$ which carry each morphism of W to an isomorphism in $\mathcal{E}'$. We may therefore assume without loss of generality that $T' = F \circ T$ for some functor $F \in \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$. Proposition 8.6.2.10 implies that T' exhibits $\mathcal{E}'$ as a localization of $\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C})$ with respect to W . It follows that F is an equivalence of ∞ -categories (Remark 6.3.1.20), so that T also exhibits $U^\dagger$ as a cartesian conjugate of U . $\square$

We now turn to the proof of Proposition 8.6.6.1. Consider first the special case where $\mathcal{C} = \Delta^0$. For any ∞ -category $\mathcal{E}$, the projection map $U : \mathcal{E} \rightarrow \Delta^0$ can be regarded as a cartesian conjugate of itself (Example 8.6.1.3). Consequently, Proposition 8.6.6.1 reduces to the assertion that U is dual to the opposite fibration $U^{\mathrm{op}} : \mathcal{E}^{\mathrm{op}} \rightarrow \Delta^0$: that is, that there exists a balanced profunctor $\mathcal{H} : \mathcal{E}^{\mathrm{op}} \times \mathcal{E} \rightarrow \mathcal{S}$. This is proved by taking $\mathcal{H}$ to be a Hom-functor for $\mathcal{E}$, in the sense of Definition 8.3.3.1. To prove Proposition 8.6.6.1, we will need a relative variant of this construction.

Definition 8.6.6.8. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets, so that the induced map 05JU

$$\lambda : \mathrm{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E}$$

is a left fibration (Proposition 8.1.1.15). Let κ be an uncountable cardinal. We say that a diagram

$$\mathcal{H} : \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$$

is a *relative Hom-functor for U* if it is a covariant transport representation for the left fibration λ (Definition 5.6.5.1).

Remark 8.6.6.9. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets and let 05JV

$$\lambda : \mathrm{Tw}(\mathcal{E}) \rightarrow \mathcal{E}^{\mathrm{op}} \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E}$$

be the left fibration of Proposition 8.1.1.15. If X and Y are vertices of $\mathcal{E}$ and $f : U(X) \rightarrow U(Y)$ is an edge of $\mathcal{C}$, then the fiber $\lambda^{-1}\{(X, f, Y)\}$ is a Kan complex, which is homotopy equivalent to the morphism space $\mathrm{Hom}_{\mathcal{E}_f}(X, Y)$, where we abuse notation by identifying X and Y with their preimages in the ∞ -category $\mathcal{E}_f = \Delta^1 \times_{\mathcal{C}} \mathcal{E}$. Consequently, if $\mathcal{H}$ is a relative Hom-functor for U , then we have homotopy equivalences $\mathcal{H}(X, f, Y) \simeq \mathrm{Hom}_{\mathcal{E}_f}(X, Y)$.

05JW **Remark 8.6.6.10** (Existence and Uniqueness). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets and let κ be an uncountable cardinal. Then U admits a relative Hom-functor

$$\mathcal{H} : \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$$

if and only if the inner fibration U is locally κ -small. Moreover, if this condition is satisfied, then $\mathcal{H}$ is unique up to isomorphism (Corollary 5.6.0.6).

05JX **Example 8.6.6.11.** Let $\mathcal{E}$ be a locally κ -small ∞ -category and let $\mathcal{H} : \mathcal{E}^{\text{op}} \times \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ be a Hom-functor for $\mathcal{E}$. Suppose we are given a functor $U : \mathcal{E} \rightarrow \mathcal{C}$, where $\mathcal{C} = \mathbf{N}_{\bullet}(J)$ is the nerve of a partially ordered set J . Then U is automatically an inner fibration (Proposition 4.1.1.10). Moreover, the iterated fiber product $\mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E}$ can be identified with the full subcategory of $\mathcal{E}^{\text{op}} \times \mathcal{E}$ spanned by those objects (X, Y) satisfying $U(X) \leq U(Y)$ (see Example 8.1.0.5). In this case, the restriction of $\mathcal{H}$ to this full subcategory is a relative Hom-functor for the inner fibration U , in the sense of Definition 8.6.6.8.

05JY **Remark 8.6.6.12.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories and let

$$\mathcal{H} : \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$$

be a relative Hom-functor for U . Then, for every vertex $C \in \mathcal{C}$, the restriction of $\mathcal{H}$ to

$$\mathcal{E}_C^{\text{op}} \times \mathcal{E}_C \simeq \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \{\text{id}_C\} \times_{\mathcal{C}} \mathcal{E}$$

is Hom-functor for the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$, in the sense of Definition 8.3.3.1.

05JZ **Notation 8.6.6.13** (Relative Yoneda Embeddings). Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets, let κ be an uncountable cardinal, and let

$$\mathcal{H} : \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}^{<\kappa}$$

be a relative Hom-functor for U . Then $\mathcal{H}$ can be identified with a morphism

$$T : \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}),$$

where $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ denotes the relative exponential of Construction 4.5.9.1. In this case, we will refer to T as the *relative Yoneda embedding* of the inner fibration U .

05K0 **Remark 8.6.6.14.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. Then the relative Yoneda embedding T of Notation 8.6.6.13 fits into a commutative diagram

$$\begin{array}{ccc} \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) & \xrightarrow{T} & \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \\ \downarrow & & \downarrow \\ \text{Tw}(\mathcal{C}) & \longrightarrow & \mathcal{C}. \end{array}$$

Consequently, for each vertex $C \in \mathcal{C}$, the restriction of T to $\mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \{\text{id}_C\}$ can be regarded as a functor

$$T_C : \mathcal{E}_C^{\text{op}} \rightarrow \text{Fun}(\mathcal{E}_C, \mathcal{S}_{<\kappa}),$$

which is a contravariant Yoneda embedding for the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$, in the sense of Definition 8.3.3.9. See Remark 8.6.6.12.

We now formulate a more precise version of Proposition 8.6.6.1.

Theorem 8.6.6.15. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets, let κ be an uncountable cardinal for which U is locally κ -small, and let*

$$T : \mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$$

be a relative Yoneda embedding for U (see Notation 8.6.6.13). Then:

- (a) *The morphism T factors through the simplicial subset $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ of Construction 8.6.5.6.*
- (b) *The morphism T exhibits $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ as a cartesian conjugate of the cocartesian fibration $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$.*

Proof. We first prove (a). Fix an edge $e : C_0 \rightarrow C_1$ of $\mathcal{C}$, let $\mathcal{E}_0$ denote the fiber $\{C_0\} \times_{\mathcal{C}} \mathcal{E}$, and define $\mathcal{E}_1$ similarly. Fix an object $Y \in \mathcal{E}_0$, so that we can identify the pair (Y, e) with a vertex of the fiber product $\mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C})$. Then $T(Y, e)$ can be regarded as a functor $F : \mathcal{E}_1 \rightarrow \mathcal{S}_{<\kappa}$, and we wish to show that F is corepresentable. Replacing U by the projection map $\Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \Delta^1$, we can reduce to the special case where $\mathcal{C} = \Delta^1$ is the standard 1-simplex (with $C_0 = 0$ and $C_1 = 1$). Our assumption that U is a cocartesian fibration guarantees that there exists a U -cocartesian morphism $f : Y \rightarrow X$ with $X \in \mathcal{E}_1$. Let $\mathcal{H} : \mathcal{E}^{\text{op}} \times \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ be a Hom-functor for $\mathcal{E}$. Using Example 8.6.6.11, we can identify F with the functor

$$\mathcal{E}_1 \hookrightarrow \mathcal{E} \xrightarrow{\mathcal{H}(Y, -)} \mathcal{S}_{<\kappa},$$

so that f can be identified with a vertex of $\eta \in F(X)$. Since f is U -cocartesian, the vertex η exhibits F as corepresented by the object X (see Lemma 8.6.5.14).

We now prove (b). For each vertex $C \in \mathcal{C}$, the restriction of T to the fiber $\mathcal{E}^{\text{op}} \times_{\mathcal{C}^{\text{op}}} \{\text{id}_C\}$ determines a functor $T_C : \mathcal{E}_C^{\text{op}} \rightarrow \text{Fun}^{\text{corep}}(\mathcal{E}_C, \mathcal{S}_{<\kappa})$ which is a contravariant Yoneda embedding for the ∞ -category $\mathcal{E}_C$ (Remark 8.6.6.14), and is therefore an equivalence of ∞ -categories (Theorem 8.3.3.13). We will complete the proof by showing that T satisfies conditions (2') and (2'') of Proposition 8.6.1.13. Both of these conditions make an assertion about an arbitrary edge $e : C_0 \rightarrow C_1$ of the simplicial set $\mathcal{C}$; let us denote these assertions by (2'_e) and (2''_e), respectively. To verify them, we can replace U by the projection map $\Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \Delta^1$ as

above, and thereby reduce to the special case where $\mathcal{C} = \Delta^1$ is the standard 1-simplex and e is the nondegenerate edge of $\mathcal{C}$. Let $\mathcal{H} : \mathcal{E}^{\text{op}} \times \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ be a Hom-functor for $\mathcal{E}$. Using Example 8.6.6.11 again and Variant 8.6.5.11, we can formulate the hypotheses of Proposition 8.6.1.13 more concretely as follows:

- (2'_e) For every object $Y \in \mathcal{E}_0$, the functor $\mathcal{H}(Y, -) : \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ is left Kan extended from $\mathcal{E}_0$.
- (2''_e) For every object $Y \in \mathcal{E}_0$ and every U -cocartesian morphism $f : Y \rightarrow X$ with $X \in \mathcal{E}_1$, the induced natural transformation $\mathcal{H}(X, -) \rightarrow \mathcal{H}(Y, -)$ is an isomorphism when restricted to the subcategory $\mathcal{E}_1$. In other words, for every object $W \in \mathcal{E}_1$, precomposition with f induces a homotopy equivalence $\mathcal{H}(X, W) \rightarrow \mathcal{H}(Y, W)$.

Assertion (2'_e) now follows from Lemma 8.6.5.13, and assertion (2''_e) from Corollary 5.1.2.3. $\square$

Proof of Proposition 8.6.6.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets. Fix an uncountable cardinal κ such that U and $U^\vee$ are locally κ -small. If U is a cocartesian dual of $U^\vee$, then Proposition 8.6.5.18 guarantees that $U^\vee$ is equivalent to the cocartesian fibration $\pi^{\text{corep}} : \text{Fun}^{\text{corep}}(\mathcal{E}/\mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$. Combining this observation with Theorem 8.6.6.15, we conclude that U^{op} is a cartesian conjugate of $U^\vee$.

We now prove the converse. Assume that U^{op} is a cartesian conjugate of $U^\vee$; we wish to show that U is a cartesian dual of $U^\vee$. Applying Theorem 8.6.5.1, we see that $U^\vee$ admits a cocartesian dual $U' : \mathcal{E}' \rightarrow \mathcal{C}$. The first part of the proof shows that the opposite fibration $U'^{\text{op}} : \mathcal{E}'^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is a cartesian conjugate of $U^\vee$, and is therefore equivalent to the cartesian fibration U^{op} (Corollary 8.6.3.14). It follows that the cocartesian fibrations U and U' are also equivalent, so that U is also a cocartesian dual of $U^\vee$. $\square$

8.6.7 The Opposition Functor

04F8 Recall that, for every ∞ -category $\mathcal{C}$, the opposite simplicial set $\mathcal{C}^{\text{op}}$ is also an ∞ -category (Proposition 1.4.2.6). Our goal in this section is to show that the construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$ can be promoted to a functor of ∞ -categories $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$, where $\mathcal{QC}$ denotes the ∞ -category of (small) ∞ -categories (Construction 5.5.4.1). Beware that this is not completely obvious from the definition. The ∞ -category $\mathcal{QC}$ was obtained as the homotopy coherent nerve $N_\bullet^{\text{hc}}(\text{QCat})$, where QCat denotes the simplicial category whose objects are ∞ -categories and whose morphism spaces are given by the formula $\text{Hom}_{\text{QCat}}(\mathcal{C}, \mathcal{D})_\bullet = \text{Fun}(\mathcal{C}, \mathcal{D})^\simeq$. The construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$ determines an automorphism of QCat as an ordinary category. However, this automorphism is *not* compatible with the simplicial enrichment of QCat : for ∞ -categories $\mathcal{C}$ and $\mathcal{D}$, the Kan complex $\text{Hom}_{\text{QCat}}(\mathcal{C}^{\text{op}}, \mathcal{D}^{\text{op}})_\bullet = \text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{D}^{\text{op}})^\simeq$ identifies with the *opposite* of the Kan complex $\text{Hom}_{\text{QCat}}(\mathcal{C}, \mathcal{D})_\bullet = \text{Fun}(\mathcal{C}, \mathcal{D})^\simeq$. To address this point, it is convenient to work with a slight variant of Construction 5.5.4.1.

Notation 8.6.7.1. Let $\mathcal{E}$ be a simplicial category. We define a new simplicial category $\mathcal{E}^\asymp$ 04F9 as follows:

- The objects of $\mathcal{E}^\asymp$ are the objects of $\mathcal{E}$.
- For every pair of objects $X, Y \in \mathcal{E}$, the simplicial set $\text{Hom}_{\mathcal{E}^\asymp}(X, Y)_\bullet$ is the twisted arrow construction $\text{Tw}(\text{Hom}_{\mathcal{E}}(X, Y)_\bullet)$.
- For every triple of objects $X, Y, Z \in \mathcal{E}$, the composition law

$$\circ : \text{Hom}_{\mathcal{E}^\asymp}(Y, Z)_\bullet \times \text{Hom}_{\mathcal{E}^\asymp}(X, Y)_\bullet \rightarrow \text{Hom}_{\mathcal{E}^\asymp}(X, Z)_\bullet$$

is obtained by applying the twisted arrow functor Tw to the composition law for the simplicial category $\mathcal{E}$.

The simplicial category $\mathcal{E}^\asymp$ is equipped with a simplicial functor $\pi : \mathcal{E}^\asymp \rightarrow \mathcal{E}$, which carries each object to itself and is given on morphism spaces by the projection map

$$\text{Hom}_{\mathcal{E}^\asymp}(X, Y)_\bullet = \text{Tw}(\text{Hom}_{\mathcal{E}}(X, Y)_\bullet) \rightarrow \text{Hom}_{\mathcal{E}}(X, Y)_\bullet$$

described in Notation 8.1.1.6.

Proposition 8.6.7.2. Let $\mathcal{E}$ be a locally Kan simplicial category. Then: 04FA

- (1) The simplicial category $\mathcal{E}^\asymp$ of Notation 8.6.7.1 is locally Kan.
- (2) The forgetful functor $\pi : \mathcal{E}^\asymp \rightarrow \mathcal{E}$ is a weak equivalence of simplicial categories (see Definition 4.6.8.7).
- (3) The functor π induces an equivalence of ∞ -categories $N_\bullet^{\text{hc}}(\mathcal{E}^\asymp) \rightarrow N_\bullet^{\text{hc}}(\mathcal{E})$.

Proof. Assertions (1) and (2) follow immediately from Corollary 8.1.2.3; assertion (3) then follows from Corollary 4.6.8.8. $\square$

Remark 8.6.7.3 (Comparison with the Conjugate). Let $\mathcal{E}$ be a simplicial category. Recall 04FB that the *conjugate* $\mathcal{E}^c$ is a simplicial category having the same objects, with morphism spaces given by $\text{Hom}_{\mathcal{E}^c}(X, Y)_\bullet = \text{Hom}_{\mathcal{E}}(X, Y)_\bullet^{\text{op}}$ (see Example 2.4.2.12). Then there is a canonical isomorphism of simplicial categories $\mathcal{E}^\asymp \xrightarrow{\sim} (\mathcal{E}^c)^\asymp$, which is the identity on objects and given on morphism spaces by the isomorphisms

$$\text{Hom}_{\mathcal{E}^\asymp}(X, Y)_\bullet = \text{Tw}(\text{Hom}_{\mathcal{E}}(X, Y)_\bullet) \simeq \text{Tw}(\text{Hom}_{\mathcal{E}}(X, Y)_\bullet^{\text{op}}) = \text{Hom}_{(\mathcal{E}^c)^\asymp}(X, Y)_\bullet$$

described in Remark 8.1.1.7. Composing this isomorphism with the forgetful functor $(\mathcal{E}^c)^\asymp \rightarrow \mathcal{E}^c$, we obtain a forgetful functor $\pi^c : \mathcal{E}^\asymp \rightarrow \mathcal{E}^c$. If $\mathcal{E}$ is locally Kan, then Proposition 8.6.7.2 guarantees that π^c is a weak equivalence of simplicial categories. We therefore obtain equivalences of ∞ -categories

$$N_\bullet^{\text{hc}}(\mathcal{E}) \xleftarrow{\sim} N_\bullet^{\text{hc}}(\mathcal{E}^\asymp) \xrightarrow{\sim} N_\bullet^{\text{hc}}(\mathcal{E}^c).$$

We now specialize to the case of interest to us.

04FC **Construction 8.6.7.4.** Let $\mathbf{QCat}$ denote the simplicial category whose objects are (small) ∞ -categories, with morphisms spaces given by $\mathrm{Hom}_{\mathbf{QCat}}(\mathcal{C}, \mathcal{D})_{\bullet} = \mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}$ (see Construction 5.5.4.1). We let $\mathbf{QCat}^{\simeq}$ denote the simplicial category described in Notation 8.6.7.1, and we let $\mathcal{QC}^{\simeq}$ denote the homotopy coherent nerve $N_{\bullet}^{\mathrm{hc}}(\mathbf{QCat}^{\simeq})$.

04FD **Proposition 8.6.7.5.** *The simplicial set $\mathcal{QC}^{\simeq}$ is an ∞ -category. Moreover, the forgetful functor $\mathbf{QCat}^{\simeq} \rightarrow \mathbf{QCat}$ of Notation 8.6.7.1 induces an equivalence of ∞ -categories $\pi : \mathcal{QC}^{\simeq} \rightarrow \mathcal{QC}$.*

Proof. Apply Proposition 8.6.7.2 to the locally Kan simplicial category $\mathcal{E} = \mathbf{QCat}$. $\square$

04FE **Construction 8.6.7.6** (The Opposite Functor). The simplicial category $\mathbf{QCat}^{\simeq}$ is equipped with an automorphism $\tilde{\sigma}$, given on objects by the construction $\mathcal{C} \mapsto \mathcal{C}^{\mathrm{op}}$ and on morphism spaces by the composition

$$\begin{aligned} \mathrm{Hom}_{\mathbf{QCat}^{\simeq}}(\mathcal{C}, \mathcal{D})_{\bullet} &= \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq}) \\ &\simeq \mathrm{Tw}((\mathrm{Fun}(\mathcal{C}, \mathcal{D})^{\simeq})^{\mathrm{op}}) \\ &\simeq \mathrm{Tw}(\mathrm{Fun}(\mathcal{C}^{\mathrm{op}}, \mathcal{D}^{\mathrm{op}})^{\simeq}) \\ &= \mathrm{Hom}_{\mathbf{QCat}^{\simeq}}(\mathcal{C}^{\mathrm{op}}, \mathcal{D}^{\mathrm{op}})_{\bullet}, \end{aligned}$$

where the isomorphism on the second line is supplied by Remark 8.1.1.7. It follows from Proposition 8.6.7.5 that there exists a functor of ∞ -categories $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ for which the diagram

$$\begin{array}{ccc} \mathcal{QC}^{\simeq} & \xrightarrow[\sim]{N_{\bullet}^{\mathrm{hc}}(\tilde{\sigma})} & \mathcal{QC}^{\simeq} \\ \downarrow \pi & & \downarrow \pi \\ \mathcal{QC} & \xrightarrow{\sigma} & \mathcal{QC} \end{array}$$

commutes up to isomorphism. Moreover, the functor σ is uniquely determined up to isomorphism. We will refer to σ as the *opposition functor* for the ∞ -category $\mathcal{QC}$.

The terminology of Construction 8.6.7.6 is justified by the following observation:

04FF **Proposition 8.6.7.7.** *Let $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. Then the diagram of ∞ -categories*

$$\begin{array}{ccc} N_{\bullet}(\mathbf{QCat}) & \xrightarrow{\sigma_0} & N_{\bullet}(\mathbf{QCat}) \\ \downarrow & & \downarrow \\ \mathcal{QC} & \xrightarrow{\sigma} & \mathcal{QC} \end{array}$$

commutes up to isomorphism, where the functor σ_0 is given by the construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$.

Proof. Let $\mathbf{QCat}^\circ$ denote the underlying category of the simplicial category $\mathbf{QCat}$, and let us abuse notation by viewing $\mathbf{QCat}^\circ$ as a *constant* simplicial category. We can then identify $\mathbf{QCat}^\circ$ with a simplicial subcategory of $\mathbf{QCat}$ having the same objects, with morphism spaces given by

$$\text{Hom}_{\mathbf{QCat}^\circ}(\mathcal{C}, \mathcal{D})_\bullet = \text{sk}_0(\text{Hom}_{\mathbf{QCat}}(\mathcal{C}, \mathcal{D})_\bullet).$$

Note that the inclusion map $\mathbf{QCat}^\circ \hookrightarrow \mathbf{QCat}$ factors as a composition

$$\mathbf{QCat}^\circ \xrightarrow{\iota} \mathbf{QCat}^\sim \xrightarrow{\pi} \mathbf{QCat},$$

where the functor $\iota : \mathbf{QCat}^\circ \rightarrow \mathbf{QCat}^\sim$ carries each ∞ -category $\mathcal{C}$ to itself and each functor of ∞ -categories $F : \mathcal{C} \rightarrow \mathcal{D}$ to the vertex

$$\text{id}_F \in \text{Tw}(\text{Fun}(\mathcal{C}, \mathcal{D})^\sim) = \text{Hom}_{\mathbf{QCat}^\sim}(\mathcal{C}, \mathcal{D})_\bullet.$$

We then have a diagram of ∞ -categories

$$\begin{array}{ccc} \mathbf{N}_\bullet(\mathbf{QCat}) & \xrightarrow{\sigma_0} & \mathbf{N}_\bullet(\mathbf{QCat}) \\ \downarrow \mathbf{N}_\bullet^{\text{hc}}(\iota) & & \downarrow \mathbf{N}_\bullet^{\text{hc}}(\iota) \\ \mathbf{QC}^\sim & \xrightarrow{\mathbf{N}_\bullet^{\text{hc}}(\tilde{\sigma})} & \mathbf{QC}^\sim \\ \downarrow & & \downarrow \\ \mathbf{QC} & \xrightarrow{\sigma} & \mathbf{QC}, \end{array}$$

where the upper square is strictly commutative and the lower square commutes up to isomorphism. It follows that the outer rectangle also commutes up to isomorphism. $\square$

Remark 8.6.7.8. Let $\sigma : \mathbf{QC} \rightarrow \mathbf{QC}$ be the opposition functor of Construction 8.6.7.6. 04FG
Passing to homotopy categories, we obtain a functor $\bar{\sigma} : \mathbf{hQCat} \rightarrow \mathbf{hQCat}$. It follows from Proposition 8.6.7.7 that, up to isomorphism, $\bar{\sigma}$ agrees with the automorphism of $\mathbf{hQCat}$ which is given on objects by the construction $\mathcal{C} \mapsto \mathcal{C}^{\text{op}}$, and on morphisms by the construction $[F] \mapsto [F^{\text{op}}]$; here $[F]$ denotes the isomorphism class of a functor $F : \mathcal{C} \rightarrow \mathcal{D}$ and $[F^{\text{op}}]$ the isomorphism class of the opposition functor $F^{\text{op}} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{D}^{\text{op}}$.

Proposition 8.6.7.9 (Involutivity). *Let $\sigma : \mathbf{QC} \rightarrow \mathbf{QC}$ be the opposition functor. Then 04FH
the composition $\sigma \circ \sigma$ is isomorphic to the identity functor $\text{id}_{\mathbf{QC}}$. In particular, σ is an equivalence of ∞ -categories.*

Proof. This follows from Proposition 8.6.7.5, since the composition $\tilde{\sigma} \circ \tilde{\sigma}$ is *equal* to the identity functor of the ∞ -category $\mathcal{QC}^\simeq$. $\square$

04FJ **Remark 8.6.7.10** (Uniqueness). Let $\text{Aut}(\mathcal{QC})$ denote the full subcategory of $\text{Fun}(\mathcal{QC}, \mathcal{QC})$ spanned by those functors $\mathcal{QC} \rightarrow \mathcal{QC}$ which are equivalences of ∞ -categories. A theorem of Toën ([60]) guarantees that $\text{Aut}(\mathcal{QC})$ is a Kan complex having exactly two connected components, each of which is contractible (see Corollary [?]). Consequently, the opposition functor $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ of Construction 8.6.7.4 is characterized (up to a contractible space of choices) by the fact that it is an equivalence of ∞ -categories which is not isomorphic to the identity functor $\text{id}_{\mathcal{QC}}$.

Recall that every Kan complex X is homotopy equivalent to its opposite X^{op} (Example 8.6.4.18). The following is a more precise statement:

04FK **Proposition 8.6.7.11.** *Let $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ be the opposition functor of Construction 8.6.7.6. Then the restriction $\sigma|_{\mathcal{S}}$ is isomorphic to the identity functor from $\mathcal{S} \subset \mathcal{QC}$ to itself.*

Proof. For every ∞ -category $\mathcal{C}$, the image $\sigma(\mathcal{C}) \in \mathcal{QC}$ is equivalent to the opposite ∞ -category $\mathcal{C}^{\text{op}}$ (Remark 8.6.7.8); in particular, $\mathcal{C}$ is a Kan complex if and only if $\sigma(\mathcal{C})$ is a Kan complex. It follows that σ restricts a functor $\sigma_0 : \mathcal{S} \rightarrow \mathcal{S}$, which is also an equivalence of ∞ -categories. We wish to show that σ_0 is isomorphic to the identity functor $\text{id}_{\mathcal{S}}$. This follows from Example 8.4.0.4, since $\sigma_0(\Delta^0)$ is homotopy equivalent to the Kan complex $(\Delta^0)^{\text{op}} \simeq \Delta^0$. $\square$

Using the classification of cocartesian fibrations given in §5.6, we can use the opposition functor $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ to give a reformulation of cocartesian duality.

04FL **Proposition 8.6.7.12.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets having transport representations $\text{Tr}_{\mathcal{E}/\mathcal{C}}, \text{Tr}_{\mathcal{E}^\vee/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{QC}$. Then $U^\vee$ is a cocartesian dual of U if and only if $\text{Tr}_{\mathcal{E}^\vee/\mathcal{C}}$ is isomorphic to $\sigma \circ \text{Tr}_{\mathcal{E}/\mathcal{C}}$, where $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ denotes the opposition functor of Construction 8.6.7.6.*

Proof. Assume that $\text{Tr}_{\mathcal{E}^\vee/\mathcal{C}}$ is isomorphic to $\sigma \circ \text{Tr}_{\mathcal{E}/\mathcal{C}}$; we will show that $U^\vee$ is cocartesian dual to U (the reverse implication then follows formally from the fact that cocartesian duals are unique up to equivalence; see Theorem 8.6.5.1). Let $\pi : \mathcal{QCat}^\simeq \rightarrow \mathcal{QCat}$ denote the forgetful functor, and let $\pi' : \mathcal{QCat}^\simeq \rightarrow \mathcal{QCat}$ be the composition of π with the automorphism $\tilde{\sigma} : \mathcal{QCat}^\simeq \simeq \mathcal{QCat}^\simeq$ described in Construction 8.6.7.6. By virtue of Proposition 8.6.7.5, we may assume without loss of generality that the covariant transport representation $\mathcal{F}_+ = \text{Tr}_{\mathcal{E}/\mathcal{C}}$ factors as a composition $N_\bullet^{\text{hc}}(\pi) \circ \mathcal{F}$ for some diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}^\simeq$. Set $\mathcal{F}_- = N_\bullet^{\text{hc}}(\pi') \circ \mathcal{F}$. Our assumption then guarantees that $\mathcal{F}_-$ is a covariant transport representation for $U^\vee$. We may therefore assume without loss of generality that U and $U^\vee$ coincide with the projection maps $\int_{\mathcal{C}} \mathcal{F}_+ \rightarrow \mathcal{C}$ and $\int_{\mathcal{C}} \mathcal{F}_- \rightarrow \mathcal{C}$, respectively.

We now proceed as in the proof of Proposition 8.6.4.23. Define a simplicial functor $\tau : \mathbf{QCat}^{\sim} \rightarrow \mathbf{QCat}$ as follows:

- On objects, τ is given by the construction $\mathcal{D} \mapsto \mathrm{Tw}(\mathcal{D})$.
- On morphism spaces, τ is given by the morphism of simplicial sets

$$\begin{aligned} \mathrm{Hom}_{\mathbf{QCat}^{\times}}(\mathcal{D}, \mathcal{D}')_{\bullet} &= \mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq}) \\ &\rightarrow \mathrm{Fun}(\mathrm{Tw}(\mathcal{D}), \mathrm{Tw}(\mathcal{D}'))^{\simeq} \\ &= \mathrm{Hom}_{\mathbf{QCat}}(\mathrm{Tw}(\mathcal{D}), \mathrm{Tw}(\mathcal{D}'))_{\bullet}. \end{aligned}$$

which classifies the composition

$$\mathrm{Tw}(\mathcal{D}) \times \mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^{\simeq}) \hookrightarrow \mathrm{Tw}(\mathcal{D} \times \mathrm{Fun}(\mathcal{D}, \mathcal{D}')) \xrightarrow{\mathrm{Tw}(\mathrm{ev})} \mathrm{Tw}(\mathcal{D}'),$$

where $\mathrm{ev} : \mathcal{D} \times \mathrm{Fun}(\mathcal{D}, \mathcal{D}') \rightarrow \mathcal{D}'$ is the evaluation map.

Let $\widetilde{\mathcal{F}} : \mathcal{C} \rightarrow \mathbf{QC}$ denote the diagram given by the composition $N_{\bullet}^{\mathrm{hc}}(\tau) \circ \mathcal{F}$, and set $\widetilde{\mathcal{E}} = \int_{\mathcal{C}} \widetilde{\mathcal{F}}$. There is a natural transformation of simplicial functors $\tau \rightarrow \pi' \times \pi$, which carries each ∞ -category $\mathcal{D}$ to the left fibration $\mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ of Proposition 8.1.1.11. Applying Corollary [?], see that this natural transformation induces a left fibration

$$\widetilde{\mathcal{E}} = \int_{\mathcal{C}} \widetilde{\mathcal{F}} \xrightarrow{\lambda} \int_{\mathcal{C}} (\mathcal{F}_{-} \times \mathcal{F}_{+}) \simeq \mathcal{E}^{\vee} \times_{\mathcal{C}} \mathcal{E}.$$

We will complete the proof by showing that λ exhibits $U^{\vee}$ as a cocartesian dual of U : that is, it satisfies conditions (a) and (b) of Definition 8.6.4.1.

(a) Fix a vertex $C \in \mathcal{C}$; we wish to show that the left fibration

$$\lambda_C : \{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \widetilde{\mathcal{F}} \rightarrow (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_{-}) \times (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_{+})$$

is a balanced coupling. Set $\mathcal{D} = \widetilde{\mathcal{F}}(C)$. Using Example 5.6.2.19, we obtain a commutative diagram

$$\begin{array}{ccc} \mathrm{Tw}(\mathcal{D}) & \xrightarrow{\quad} & \{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F} \\ \downarrow & & \downarrow \lambda_C \\ \mathcal{D}^{\mathrm{op}} \times \mathcal{D} & \xrightarrow{\quad} & (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_{-}) \times (\{C\} \times_{\mathcal{C}} \int_{\mathcal{C}} \mathcal{F}_{+}), \end{array}$$

where the horizontal maps are equivalences of ∞ -categories. The desired result now follows from the observation that the twisted arrow coupling $\mathrm{Tw}(\mathcal{D}) \rightarrow \mathcal{D}^{\mathrm{op}} \times \mathcal{D}$ is balanced (Example 8.2.6.2).

- (b) Let $U : \tilde{\mathcal{E}} \rightarrow \mathcal{C}$ denote the projection map, let $f : X \rightarrow X'$ be a U -cocartesian edge of $\tilde{\mathcal{E}}$, and let $\bar{f} : C \rightarrow C'$ denote the image of f in the simplicial set $\mathcal{C}$. The functor $\mathcal{F}$ carries the vertex C to an ∞ -category $\mathcal{D}$, C' to an ∞ -category $\mathcal{D}'$, and $\bar{f}$ to a vertex of the Kan complex $\mathrm{Tw}(\mathrm{Fun}(\mathcal{D}, \mathcal{D}')^\simeq)$, which we can identify with an isomorphism $u : F_- \rightarrow F_+$ between functors $F_-, F_+ : \mathcal{D} \rightarrow \mathcal{D}'$. We can then identify X with a morphism $e : D_- \rightarrow D_+$ in the ∞ -category $\mathcal{D}$ and X' with a morphism $e' : D'_- \rightarrow D'_+$ in the ∞ -category $\mathcal{D}'$, so that f determines a morphism in the ∞ -category $\mathrm{Tw}(\mathcal{D}')$ which we depict informally in the diagram $\mathcal{D}'$ which we depict informally in the diagram

$$\begin{array}{ccc} F_-(D_-) & \longleftarrow & D'_- \\ \downarrow u(e) & & \downarrow e' \\ F_+(D_+) & \longrightarrow & D'_+ \end{array}$$

Our assumption that X is universal for the coupling λ_C guarantees that e is an isomorphism in the ∞ -category $\mathcal{D}$ (Example 8.2.1.5), so that the left vertical map is an isomorphism in the ∞ -category $\mathcal{D}'$. Our assumption that f is U -cocartesian guarantees that the horizontal maps in the diagram are also isomorphisms (Remark 5.6.2.14). It follows that e' is also an isomorphism in $\mathcal{D}$, so that X' is universal for the coupling $\lambda_{C'}$ as desired.

□

04FM Remark 8.6.7.13. Let $\mathcal{QC}_{\mathrm{Obj}}$ denote the ∞ -category of pairs $(\mathcal{C}, X)$, where $\mathcal{C}$ is a small ∞ -category and X is an object of $\mathcal{C}$ (see Definition 5.5.6.10). Then the identity functor $\mathrm{id} : \mathcal{QC} \rightarrow \mathcal{QC}$ is a covariant transport representation for the universal cocartesian fibration

$$U : \mathcal{QC}_{\mathrm{Obj}} \rightarrow \mathcal{QC} \quad (\mathcal{C}, X) \mapsto \mathcal{C}.$$

Applying Proposition 8.6.7.12, we deduce that the opposition functor $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ is a covariant transport representation for a cocartesian dual of the fibration U . By virtue of Corollary 5.6.5.15, this property characterizes the functor σ up to isomorphism.

8.6.8 Contravariant Transport Representations

05WD Let $\mathcal{QC}$ denote the ∞ -category of (small) ∞ -categories (Construction 5.5.4.1) and let $\mathcal{C}$ be a simplicial set. In §5.6, we showed that the formation of covariant transport representations

determines a bijection

(Essentially small) cocartesian fibrations $U : \mathcal{E} \rightarrow \mathcal{C}\}/\text{Equivalence}$

$\{\text{Diagrams } \mathcal{C} \rightarrow \mathcal{QC}\}/\text{Isomorphism}$

(Theorem 5.6.0.2). Combined with the theory of conjugate fibrations, we obtain a similar classification for cartesian fibrations.

Definition 8.6.8.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets. We say that a diagram $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$ is a *contravariant transport representation for U* if U is a cartesian conjugate to the cocartesian fibration $V : \int_{\mathcal{C}^{\text{op}}} \mathcal{F} \rightarrow \mathcal{C}^{\text{op}}$ of Proposition 5.6.2.2. 019V

Remark 8.6.8.2. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets. Unwinding the definitions, we see that a diagram $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$ is a contravariant transport representation for U if and only if there exists a commutative diagram of simplicial sets 05WE

$$\begin{array}{ccc} \mathcal{E} \times_{\mathcal{C}} \text{Tw}(\mathcal{C}^{\text{op}}) & \xrightarrow{T} & \int_{\mathcal{C}^{\text{op}}} \mathcal{F} \\ & \searrow & \swarrow V \\ & \mathcal{C}^{\text{op}} & \end{array}$$

which exhibits U as a cartesian conjugate of V , in the sense of Definition 8.6.1.1. If this condition is satisfied, we say that T *exhibits $\mathcal{F}$ as a contravariant transport representation for U* . In this case, for every vertex $C \in \mathcal{C}$, we have equivalences of ∞ -categories $\mathcal{E}_C \xrightarrow{T_C} \{C\} \times_{\mathcal{C}^{\text{op}}} \int_{\mathcal{C}^{\text{op}}} \mathcal{F} \leftarrow \mathcal{F}(C)$ (see Example 5.6.2.19).

Proposition 8.6.8.3. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small cartesian fibration of simplicial sets. Then U admits a contravariant transport representation $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$, which is uniquely determined up to isomorphism. Moreover, the formation of contravariant transport representations induces a bijection 05WF

(Essentially small) cartesian fibrations $U : \mathcal{E} \rightarrow \mathcal{C}\}/\text{Equivalence}$

$\{\text{Diagrams } \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}\}/\text{Isomorphism}.$

Proof. Combine Theorem 5.6.0.2 with Corollary 8.6.6.3 □

05WG Variant 8.6.8.4. It will sometimes be useful to apply Definition 8.6.8.1 to cartesian fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$ which are not essentially small. Let κ be an uncountable cardinal. We say that a diagram $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}_{<\kappa}$ is a *contravariant transport representation for U* if U is cartesian conjugate to the cocartesian fibration $\int_{\mathcal{C}} \mathcal{F} \rightarrow \mathcal{C}^{\text{op}}$. Such a diagram exists if and only if the cartesian fibration U is essentially κ -small, in which case it is uniquely determined up to isomorphism. Moreover, the formation of contravariant transport representations induces a bijection

$$\begin{array}{c} \text{Essentially } \kappa\text{-small cartesian fibrations } U : \mathcal{E} \rightarrow \mathcal{C} \} / \text{Equivalence} \\ \downarrow \\ \{\text{Diagrams } \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}_{<\kappa}\} / \text{Isomorphism.} \end{array}$$

05WH Notation 8.6.8.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small cartesian fibration of simplicial sets. We will often write $\text{Tr}_{\mathcal{E}/\mathcal{C}}$ for a contravariant transport representation of U , regarded as an object of the ∞ -category $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{QC})$. Beware that this object is only well-defined up to isomorphism (any diagram $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$ which is isomorphic to $\text{Tr}_{\mathcal{E}/\mathcal{C}}$ is also a contravariant transport representation for U).

05WJ Warning 8.6.8.6. We have now attached two meanings to the notation $\text{Tr}_{\mathcal{E}/\mathcal{C}}$:

- If $U : \mathcal{E} \rightarrow \mathcal{C}$ is an (essentially small) cartesian fibration, then $\text{Tr}_{\mathcal{E}/\mathcal{C}}$ can denote the contravariant transport representation of U , regarded as an object of $\text{Fun}(\mathcal{C}^{\text{op}}, \mathcal{QC})$ (Notation 8.6.8.5).
- If $U : \mathcal{E} \rightarrow \mathcal{C}$ is an (essentially small) cocartesian fibration, then $\text{Tr}_{\mathcal{E}/\mathcal{C}}$ can denote the covariant transport representation of U , regarded as an object of $\text{Fun}(\mathcal{C}, \mathcal{QC})$ (Notation 5.6.5.16).

In the case where $U : \mathcal{E} \rightarrow \mathcal{C}$ is both a cartesian and cocartesian fibration, these usages are in conflict. However, in this case there is a simple relationship between the covariant and contravariant transport representations of U : see Remark 8.6.8.18.

05WK Remark 8.6.8.7. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small cartesian fibration of simplicial sets. and let $\text{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$ be its contravariant transport representation. Then the opposite functor $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is an essentially small cocartesian fibration which admits a covariant transport representation $\text{Tr}_{\mathcal{E}^{\text{op}}/\mathcal{C}^{\text{op}}} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$. In this case, we can identify $\text{Tr}_{\mathcal{E}/\mathcal{C}}$ with the composition $\sigma \circ \text{Tr}_{\mathcal{E}^{\text{op}}/\mathcal{C}^{\text{op}}}$, where $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ is the opposition functor introduced in Construction 8.6.7.6 (given on objects by the construction $\mathcal{D} \mapsto \mathcal{D}^{\text{op}}$). This follows by combining Propositions 8.6.6.1 and 8.6.7.12.

Example 8.6.8.8. Let $\mathcal{C}$ be a category, let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathbf{Cat}$ be a functor of 2-categories, and 05WL
let $\int^{\mathcal{C}} \mathcal{F}$ be the category of elements of $\mathcal{F}$ (Definition 5.6.1.4). Then the forgetful functor

$$U : \mathbf{N}_{\bullet}(\int^{\mathcal{C}} \mathcal{F}) \rightarrow \mathbf{N}_{\bullet}(\mathcal{C})$$

is a cartesian fibration of ∞ -categories (Corollary 5.6.1.16). The contravariant transport representation of U can be identified with the Duskin nerve of the functor $\mathcal{F}$, where we identify $\mathbf{N}_{\bullet}^{\text{D}}(\text{Pith}(\mathbf{Cat}))$ with a full subcategory of $\mathcal{QC}$ (see Remark 5.5.4.10). This follows by combining Example 8.6.1.9 with Proposition 5.6.3.4.

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small cartesian fibration of simplicial sets. Then the contravariant transport representation $\text{Tr}_{\mathcal{E}/\mathcal{C}}$ of Notation 8.6.8.5 can be regarded as a refinement of the homotopy transport representation $\text{hTr}_{\mathcal{E}/\mathcal{C}} : \text{h}\mathcal{C}^{\text{op}} \rightarrow \text{h}\mathcal{QC}$ introduced in Construction 5.2.5.7.

Proposition 8.6.8.9. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets, let $\mathcal{F} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$ be a diagram, and let $T : \mathcal{E} \times_{\mathcal{C}} \text{Tw}(\mathcal{C}^{\text{op}}) \rightarrow \int_{\mathcal{C}^{\text{op}}} \mathcal{F}$ exhibit $\mathcal{F}$ as a contravariant 05WM
transport representation for U (Remark 8.6.8.2). Then, for every edge $e : C \rightarrow C'$ of $\mathcal{C}$, the diagram of ∞ -categories

$$\begin{array}{ccccc} \mathcal{E}_{C'} & \xrightarrow[\sim]{T_{C'}} & \{C'\} \times_{\mathcal{C}^{\text{op}}} \int_{\mathcal{C}^{\text{op}}} \mathcal{F} & \xleftarrow[\sim]{} & \mathcal{F}(C') \\ \downarrow e^* & & \downarrow e_! & & \downarrow \mathcal{F}(e) \\ \mathcal{E}_C & \xrightarrow[\sim]{T_C} & \{C\} \times_{\mathcal{C}^{\text{op}}} \int_{\mathcal{C}^{\text{op}}} \mathcal{F} & \xleftarrow[\sim]{} & \mathcal{F}(C) \end{array}$$

commutes up to isomorphism. Here the horizontal maps are the equivalences of Remark 8.6.8.2, e^* is given by contravariant transport for the cartesian fibration U , and $e_!$ is given by covariant transport for the cocartesian fibration $\int_{\mathcal{C}^{\text{op}}} \mathcal{F} \rightarrow \mathcal{C}^{\text{op}}$.

Proof. The commutativity of the left square follows from Proposition 8.6.1.5, and the commutativity of the right square from Corollary 5.6.2.23. $\square$

Corollary 8.6.8.10. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets and let 05WN
 $\text{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}$ be a contravariant transport representation for U . Then the induced map of homotopy categories $\text{h}\mathcal{C}^{\text{op}} \rightarrow \text{h}\mathcal{QC}$ is isomorphic to the homotopy transport representation $\text{hTr}_{\mathcal{E}/\mathcal{C}}$ of Construction 5.2.5.7..

Recall that, if $U : \mathcal{E} \rightarrow \mathcal{C}$ is a cartesian fibration of simplicial sets, then $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ denotes the full subcategory of $\text{Fun}_{/\mathcal{C}}(\mathcal{C}, \mathcal{E})$ spanned by those sections $F : \mathcal{C} \rightarrow \mathcal{E}$ which carry each edge of $\mathcal{C}$ to a U -cartesian edge of $\mathcal{E}$ (Variant 5.3.1.11).

05WP **Proposition 8.6.8.11.** *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration between small simplicial sets. Then $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{Cart}}(\mathcal{C}, \mathcal{E})$ is a limit of the contravariant transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{QC}$.*

Proof. Let us identify $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{Cart}}(\mathcal{C}, \mathcal{E})$ with the opposite of the ∞ -category $\mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{CCart}}(\mathcal{C}^{\mathrm{op}}, \mathcal{E}^{\mathrm{op}})$ of cocartesian sections of U^{op} . By virtue of Remark 8.6.8.7 (and the fact that the opposition functor $\sigma : \mathcal{QC} \rightarrow \mathcal{QC}$ is an equivalence of ∞ -categories), it will suffice to show that $\mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{CCart}}(\mathcal{C}^{\mathrm{op}}, \mathcal{E}^{\mathrm{op}})$ is a limit of the covariant transport representation $\mathrm{Tr}_{\mathcal{E}^{\mathrm{op}}/\mathcal{C}^{\mathrm{op}}} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{QC}$, which is the content of Proposition 7.4.4.1. $\square$

05WQ **Remark 8.6.8.12.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\mathrm{op}}$ be a cartesian fibration which is conjugate to U . By definition, a diagram $\mathcal{F} : \mathcal{C} \rightarrow \mathcal{QC}$ is a contravariant transport representation for $U^\dagger$ if and only if it is a covariant transport representation for U . In this case:

- Proposition 7.4.4.1 asserts that the limit $\varprojlim(\mathcal{F})$ can be computed as the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ of cocartesian sections of U .
- Proposition 8.6.8.11 asserts that the limit $\varprojlim(\mathcal{F})$ can be computed as the ∞ -category $\mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{Cart}}(\mathcal{C}^{\mathrm{op}}, \mathcal{E}^\dagger)$ of cartesian sections of $\mathcal{E}^\dagger$.

To identify these conditions, it suffices to observe that the ∞ -categories $\mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E})$ and $\mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{Cart}}(\mathcal{C}^{\mathrm{op}}, \mathcal{E}^\dagger)$ are equivalent. In fact, we can be more precise. Assume for simplicity that $\mathcal{C}$ is an ∞ -category, and fix a functor $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ which exhibits $U^\dagger$ as a cartesian conjugate of U (Definition 8.6.1.1). Then T determines a canonical equivalence $\Theta : \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) \rightarrow \mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{Cart}}(\mathcal{C}^{\mathrm{op}}, \mathcal{E}^\dagger)$, which is characterized (up to isomorphism) by the requirement that the diagram of ∞ -categories

$$\begin{array}{ccc} \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{CCart}}(\mathcal{C}, \mathcal{E}) & \xrightarrow{\quad \Theta \quad} & \mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}^{\mathrm{Cart}}(\mathcal{C}^{\mathrm{op}}, \mathcal{E}^\dagger) \\ & \searrow & \swarrow \\ & \mathrm{Fun}_{/\mathcal{C}}(\mathrm{Tw}(\mathcal{C}), \mathcal{E}) & \end{array}$$

commutes up to isomorphism. Here the left vertical map is given by precomposition with the projection $\lambda_+ : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}$, and the right vertical map is given by pullback along the projection $\lambda_- : \mathrm{Tw}(\mathcal{C}) \rightarrow \mathcal{C}^{\mathrm{op}}$ followed by postcomposition with T . See Corollary 8.6.2.12 for a more general assertion.

For some applications, it will be convenient to have a more refined version of Proposition 8.6.8.11.

Proposition 8.6.8.13. *Let κ be an uncountable cardinal, let $\bar{U} : \bar{\mathcal{E}} \rightarrow \mathcal{C}^\triangleright$ be a cartesian 05WR
fibration of simplicial sets which is essentially κ -small. Set $\mathcal{E} = \mathcal{C} \times_{\mathcal{C}^\triangleright} \bar{\mathcal{E}}$, so that $\bar{U}$ restricts
to a cartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$. The following conditions are equivalent:*

- (1) *The contravariant transport representation $\mathrm{Tr}_{\bar{\mathcal{E}}/\mathcal{C}^\triangleright} : (\mathcal{C}^\triangleright)^{\mathrm{op}} \rightarrow \mathcal{QC}_{<\kappa}$ is a limit diagram.*
- (2) *The restriction functor*

$$\mathrm{Fun}_{/\mathcal{C}^\triangleright}^{\mathrm{Cart}}(\mathcal{C}^\triangleright, \bar{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}^{\mathrm{Cart}}(\mathcal{C}, \mathcal{E})$$

is an equivalence of ∞ -categories.

Proof. As in the proof of Proposition 8.6.8.11, this reduces immediately to the corresponding assertion for cocartesian fibrations, which follows from Theorem 7.4.4.6. $\square$

Let $F : \mathcal{C} \rightarrow \mathcal{D}$ and $F' : \mathcal{D} \rightarrow \mathcal{E}$ be functors of ∞ -categories. Recall that, if F and F' admit right adjoints $G : \mathcal{D} \rightarrow \mathcal{C}$ and $G' : \mathcal{E} \rightarrow \mathcal{D}$, then the composite functor $(F' \circ F) : \mathcal{C} \rightarrow \mathcal{E}$ also admits a right adjoint, which can be computed as the composition $G \circ G'$ (Remark 6.2.1.8). Stated more informally, the formation of adjoint functors is compatible with composition, at least up to homotopy. We now prove a more refined version of this statement, which shows that the formation of adjoints is compatible with composition up to *coherent* homotopy. To formulate this refinement, we will need some terminology.

Notation 8.6.8.14. Let $\mathcal{QC}$ be the ∞ -category of (small) ∞ -categories (Construction 05WS
5.5.4.1)). We define (non-full) subcategories $\mathcal{QC}_{\mathrm{LAdj}} \subset \mathcal{QC} \supset \mathcal{QC}_{\mathrm{RAAdj}}$ as follows:

- Every object of $\mathcal{QC}$ belongs to the subcategories $\mathcal{QC}_{\mathrm{LAdj}}$ and $\mathcal{QC}_{\mathrm{RAAdj}}$.
- Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a functor between (small) ∞ -categories, which we regard as a morphism in $\mathcal{QC}$. Then F belongs to $\mathcal{QC}_{\mathrm{LAdj}}$ if and only if F is a left adjoint: that is, there exists a functor $G : \mathcal{D} \rightarrow \mathcal{C}$ which is right adjoint to F . Similarly, F belongs to $\mathcal{QC}_{\mathrm{RAAdj}}$ if and only if F is a right adjoint.

Remark 8.6.8.15. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small cocartesian fibration of simplicial 05WT
sets. Then U is a cartesian fibration if and only if the covariant transport representation $\mathrm{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{QC}$ factors through the full subcategory $\mathcal{QC}_{\mathrm{LAdj}} \subset \mathcal{QC}$. Similarly, if $U' : \mathcal{E}' \rightarrow \mathcal{C}$ is an essentially small cartesian fibration, then U' is a cocartesian fibration if and only if its contravariant transport representation $\mathrm{Tr}_{\mathcal{E}'/\mathcal{C}} : \mathcal{C}^{\mathrm{op}} \rightarrow \mathcal{QC}$ factors through the subcategory $\mathcal{QC}_{\mathrm{RAAdj}} \subset \mathcal{QC}$. See Proposition 6.2.5.6.

Construction 8.6.8.16. Let $\mathcal{QC}_{\mathrm{Obj}}$ denote the ∞ -category introduced in Definition 5.5.6.10 05WU
(whose objects are given by pairs $(\mathcal{C}, C)$, where $\mathcal{C}$ is a small ∞ -category and $C \in \mathcal{C}$ is an object). Let $U : \mathcal{QC}_{\mathrm{Obj}} \rightarrow \mathcal{QC}$ be the forgetful functor, given on objects by the construction $(\mathcal{C}, C) \mapsto \mathcal{C}$. We let $\mathcal{QC}_{\mathrm{Obj}}^0 \subseteq \mathcal{QC}_{\mathrm{Obj}}$ denote the inverse image of the subcategory $\mathcal{QC}_{\mathrm{LAdj}} \subset \mathcal{QC}$. It follows

from Remark 8.6.8.15 that U restricts to a forgetful functor $U^0 : \mathcal{QC}_{\text{Obj}}^0 \rightarrow \mathcal{QC}_{\text{LAdj}}$ which is both a cartesian fibration and a cocartesian fibration. Applying Proposition 8.6.8.3 (and Remark 8.6.8.15), we deduce that U^0 admits a contravariant transport representation $\Psi : \mathcal{QC}_{\text{LAdj}}^{\text{op}} \rightarrow \mathcal{QC}_{\text{RAd}}$, which is uniquely determined up to isomorphism. We will refer to Ψ as the *formation-of-adjoints functor*.

05WV Remark 8.6.8.17. The formation-of-adjoints functor $\Psi : \mathcal{QC}_{\text{LAdj}}^{\text{op}} \rightarrow \mathcal{QC}_{\text{RAd}}$ induces a functor of homotopy categories $\mathbf{h}\Psi : \mathbf{h}\mathcal{QC}_{\text{LAdj}}^{\text{op}} \rightarrow \mathbf{h}\mathcal{QC}_{\text{RAd}} \subset \mathbf{h}\mathcal{QC}$, which is a homotopy transport representation for the cartesian fibration $\mathcal{QC}_{\text{Obj}}^0 \rightarrow \mathcal{QC}_{\text{LAdj}}$ (Corollary 8.6.8.10). By virtue of Proposition 6.2.5.6, this functor can be described more concretely as follows:

- The functor $\mathbf{h}\Psi$ carries every small ∞ -category $\mathcal{C}$ (viewed as an object of $\mathcal{QC}_{\text{LAdj}}$) to itself (viewed as an object of $\mathcal{QC}_{\text{RAd}}$).
- If $F : \mathcal{C} \rightarrow \mathcal{D}$ is a functor between small ∞ -categories which admits a right adjoint $G : \mathcal{D} \rightarrow \mathcal{C}$, then the functor $\mathbf{h}\Psi$ carries the isomorphism class $[F]$ (viewed as a morphism in the homotopy category $\mathbf{h}\mathcal{QC}_{\text{LAdj}}$) to the isomorphism class $[G]$ (viewed as a morphism in the homotopy category $\mathbf{h}\mathcal{QC}_{\text{RAd}}$).

05WW Remark 8.6.8.18. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small cocartesian fibration of simplicial sets, and let $\text{Tr}_{\mathcal{E}/\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{QC}$ denote the covariant transport representation for U . Assume that U is also a cartesian fibration, so that $\text{Tr}_{\mathcal{E}/\mathcal{C}}$ factors through the subcategory $\mathcal{QC}_{\text{LAdj}} \subset \mathcal{QC}$. Then the contravariant transport representation of U is given by the composition

$$\mathcal{C}^{\text{op}} \xrightarrow{\text{Tr}_{\mathcal{E}/\mathcal{C}}^{\text{op}}} \mathcal{QC}_{\text{LAdj}}^{\text{op}} \xrightarrow{\Psi} \mathcal{QC}_{\text{RAd}} \subset \mathcal{QC},$$

where Ψ is the formation-of-adjoints functor (Construction 8.6.8.16). The proof reduces to the universal case $\mathcal{C} = \mathcal{QC}_{\text{LAdj}}$, in which case it is immediate from the definition of Ψ .

05WX Proposition 8.6.8.19. *The formation-of-adjoints functor $\Psi : \mathcal{QC}_{\text{LAdj}}^{\text{op}} \rightarrow \mathcal{QC}_{\text{RAd}}$ is an equivalence of ∞ -categories.*

Proof. Let $\mathcal{C}$ be a simplicial set. We wish to show that composition with Ψ induces a bijection

$$\{\text{Diagrams } \mathcal{C} \rightarrow \mathcal{QC}_{\text{LAdj}}\} / \text{Isomorphism} \rightarrow \{\text{Diagrams } \mathcal{C}^{\text{op}} \rightarrow \mathcal{QC}_{\text{RAd}}\} / \text{Isomorphism}.$$

Using Theorem 5.6.0.2 and Remark 8.6.8.18, we can identify the left hand side with the set of equivalence classes of (essentially small) cocartesian fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$ which are also cartesian fibrations. Under this identification, the map is given by the formation of contravariant transport representations, and is therefore bijective by virtue of Proposition 8.6.8.3 (and Remark 8.6.8.17). $\square$

8.7 Fiberwise Cocompletions

Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. For each vertex $C \in \mathcal{C}$, the fiber $\mathcal{E}_C$ 05K8 is an ∞ -category. In §8.4, we proved that $\mathcal{E}_C$ admits a *cocompletion*: that is, an ∞ -category $\widehat{\mathcal{E}}_C$ which is universal among cocomplete ∞ -categories with a functor from $\mathcal{E}_C$ (Proposition 8.4.5.3). Our goal in this section is to show that the collection of ∞ -categories $\{\widehat{\mathcal{E}}_C\}_{C \in \mathcal{C}}$ can be regarded as the fibers of another inner fibration $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$, where $\widehat{\mathcal{E}}$ is an ∞ -category we refer to as the *fiberwise cocompletion of $\mathcal{E}$* . We begin by articulating the relationship between the fibrations U and $\widehat{U}$. To simplify the discussion, let us assume that the inner fibration U is essentially small (see Definition 8.7.1.5 for a more general discussion).

Definition 8.7.0.1. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small inner fibration of ∞ -categories. 05K9 We say that a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$ if the following conditions are satisfied:

- (1) For every object $C \in \mathcal{C}$, the map of fibers $H_C : \mathcal{E}_C \rightarrow \widehat{\mathcal{E}}_C$ exhibits $\widehat{\mathcal{E}}_C$ as a cocompletion of $\mathcal{E}_C$ (see Definition 8.4.0.1).
- (2) The functor H is fully faithful.
- (3) The functor $\widehat{U}$ is a locally cartesian fibration.
- (4) For every morphism $f : C \rightarrow D$ of $\mathcal{C}$, the contravariant transport functor $f^* : \widehat{\mathcal{E}}_D \rightarrow \widehat{\mathcal{E}}_C$ preserves small colimits.

One of our principal goals in this section is to prove the following:

Theorem 8.7.0.2. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially small inner fibration of ∞ -categories. 05KA Then there exists a commutative diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$. Moreover, the inner fibration $\widehat{U}$ is unique up to equivalence.

We begin by establishing the uniqueness assertion of Theorem 8.7.0.2. Recall that an inner fibration of ∞ -categories $U' : \mathcal{E}' \rightarrow \mathcal{C}$ is *cocomplete* if it satisfies the following pair of conditions for each $C \in \mathcal{C}$ (see Definition 7.6.6.27 and Example 7.6.6.33):

- (a) The ∞ -category $\mathcal{E}'_C = \{C\} \times_{\mathcal{C}} \mathcal{E}'$ is cocomplete.
- (b) Every small colimit diagram in $\mathcal{E}'_C$ is a U' -colimit diagram in the ∞ -category $\mathcal{E}'$

If U' is a locally cartesian fibration, then condition (b) is automatically satisfied (Example 7.6.6.29). In particular, if we are given a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$, then the inner fibration $\widehat{U}$ is cocomplete. In §8.7.1, we will show that $\widehat{U}$ enjoys a universal mapping property: if $U' : \mathcal{E}' \rightarrow \mathcal{C}$ is any other cocomplete inner fibration, then every functor $F : \mathcal{E} \rightarrow \mathcal{E}'$ satisfying $U' \circ F = U$ admits an essentially unique extension $\widehat{F} : \widehat{\mathcal{E}} \rightarrow \mathcal{E}'$ having the property that, for each object $C \in \mathcal{C}$, the map of fibers $\widehat{F}_C : \widehat{\mathcal{E}}_C \rightarrow \mathcal{E}'_C$ is cocontinuous (Theorem 8.7.1.14). It follows that $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$ is determined (up to equivalence) by the inner fibration U (Remark 8.7.1.15).

To complete the proof of Theorem 8.7.0.2, we must show that every (essentially small) inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ admits a fiberwise cocompletion $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$. We begin by treating some special cases:

- Assume that U is a cocartesian fibration. In §8.7.2 we show that there exists a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$. Moreover, $\widehat{U}$ is also a cocartesian fibration and the functor H carries U -cocartesian morphisms of $\mathcal{E}$ to $\widehat{U}$ -cocartesian morphisms of $\widehat{\mathcal{E}}$ (Theorem 8.7.2.1). Our proof uses the theory of dual fibrations

developed in §8.6. More precisely, we show that we can take $\widehat{\mathcal{E}}$ to be the relative exponential $\text{Fun}(\mathcal{E}^\vee / \mathcal{C}, \mathcal{S})$, where $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ is a cocartesian dual of U (Lemma 8.7.2.3).

- Assume that U is a cartesian fibration. In §8.7.3 we show that there exists a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$. Moreover, $\widehat{U}$ is also a cartesian fibration and the functor H carries U -cartesian morphisms of $\mathcal{E}$ to $\widehat{U}$ -cartesian morphisms of $\widehat{\mathcal{E}}$ (Theorem 8.7.3.1). Our strategy is to reduce to the cocartesian case, using the compatibility of fiberwise cocompletion with the formation of conjugate fibrations (Proposition 8.7.3.3).

In §8.7.4, we complete the proof of Theorem 8.7.0.2 by proving the existence of a fiberwise cocompletion for a general inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$. Our strategy is to embed $\mathcal{E}$ into the oriented fiber product $\mathcal{E} \tilde{\times}_{\mathcal{C}} \mathcal{C}$, and thereby reduce to the case where U is a cocartesian fibration (using the oriented fiber product $\mathcal{C} \tilde{\times}_{\mathcal{C}} \mathcal{E}$, we could instead reduce to the case where U is a cartesian fibration).

Recall that an inner fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$ is *exponentiable* if the pullback functor

$$(\text{Set}_\Delta)_{/\mathcal{C}} \rightarrow (\text{Set}_\Delta)_{/\mathcal{E}} \quad \mathcal{C}' \mapsto \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$$

preserves categorical equivalences (Definition 4.5.9.10). In §8.7.5, we introduce a closely related condition which has somewhat better formal properties. We say that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is *flat* if, for every 2-simplex σ of $\mathcal{C}$, the inclusion map

$$\Lambda_1^2 \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \Delta^2 \times_{\mathcal{C}} \mathcal{E}$$

is a categorical equivalence of simplicial sets (Definition 8.7.5.1). It follows immediately from the definitions that if U is an exponentiable inner fibration, then it is flat. In §8.7.5, we show that the converse holds if U is an isofibration (Corollary 8.7.5.30). The key observation is that that an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is flat if and only if the fiberwise cocompletion $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$ is a cartesian fibration (Lemma 8.7.5.13). In §8.7.7 we show that, under this assumption, we can give a concrete description of $\widehat{\mathcal{E}}$ in terms of the relative Yoneda embedding of U (Theorem 8.7.7.4).

8.7.1 Uniqueness of Fiberwise Cocompletions

05KB Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. Our goal in this section is to show that if there exists a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\quad} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$ (in the sense of Definition 8.7.0.1), then the inner fibration $\widehat{U}$ is uniquely determined up to equivalence. To prove this, we will show that the ∞ -category $\widehat{\mathcal{E}}$ can be characterized by a universal mapping property (Theorem 8.7.1.14). For future applications, it will be convenient to formulate this universal property in a more general context, where the fibers of $\widehat{\mathcal{E}}$ are obtained from the fibers of $\mathcal{E}$ by adjoining colimits of an arbitrary collection of diagrams. We begin by studying the case $\mathcal{C} = \Delta^1$.

05KK **Definition 8.7.1.1.** Let $\mathbb{K}$ be a collection of simplicial sets and suppose that we are given a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \Delta^1 & \end{array} \tag{8.75}$$

We say that the diagram (8.75) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$* if the following conditions are satisfied:

- (1) For $i \in \{0, 1\}$, the map of fibers $H_i : \mathcal{E}_i \rightarrow \widehat{\mathcal{E}}_i$ exhibits $\widehat{\mathcal{E}}_i$ as a $\mathbb{K}$ -cocompletion of $\mathcal{E}_i$ (Definition 8.4.5.1).
- (2) The functor H is fully faithful.
- (3) The inner fibration $\widehat{U}$ is $\mathbb{K}$ -cocomplete (Definition 7.6.6.27).
- (4) For every object $X \in \mathcal{E}_0$, the functor

$$\widehat{\mathcal{E}}_1 \rightarrow \mathcal{S} \quad Y \mapsto \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(X), Y)$$

preserves $\mathbb{K}$ -indexed colimits.

If κ is a regular cardinal, we say that (8.75) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$* if it exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, where $\mathbb{K}$ is the collection of all κ -small simplicial sets.

Remark 8.7.1.2. In condition (4) of Definition 8.7.1.1, we have implicitly assumed that the ∞ -category $\widehat{\mathcal{E}}$ is locally small and that each of the simplicial sets $K \in \mathbb{K}$ is (essentially) small. If these conditions are not satisfied, then we should replace the ∞ -category $\mathcal{S}$ by $\mathcal{S}_{<\lambda}$, where λ is some regular cardinal having the property that $\widehat{\mathcal{E}}$ is locally λ -small and each $K \in \mathbb{K}$ is essentially λ -small. 05KM

Remark 8.7.1.3. Let $\mathbb{K}$ be a collection of simplicial sets and let $H : \mathcal{C} \rightarrow \widehat{\mathcal{C}}$ be a functor of ∞ -categories which exhibits $\widehat{\mathcal{C}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{C}$. Then the diagram 05KN

$$\begin{array}{ccc} \mathcal{C} \times \Delta^1 & \xrightarrow{H \times \text{id}} & \widehat{\mathcal{C}} \times \Delta^1 \\ & \searrow & \swarrow \\ & \Delta^1 & \end{array}$$

exhibits $\widehat{\mathcal{C}} \times \Delta^1$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{C} \times \Delta^1$. Conditions (1) and (3) of Definition 8.7.1.1 are immediate, and conditions (2) and (4) follow from Variant 8.4.7.9.

Proposition 8.7.1.4. Let κ be an uncountable regular cardinal and suppose we are given a commutative diagram of ∞ -categories 05KP

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \Delta^1, & \end{array} \tag{8.76} \quad 05KQ$$

where $\mathcal{E}$ is essentially κ -small. Then (8.76) exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$ if and only if it satisfies conditions (1) and (2) of Definition 8.7.1.1, together with the following:

(3') The functor $\widehat{U}$ is a cartesian fibration.

(4') The contravariant transport functor $\widehat{\mathcal{E}}_1 \rightarrow \widehat{\mathcal{E}}_0$ preserves κ -small colimits.

Proof. Without loss of generality, we may assume that H satisfies conditions (1) and (2) of Definition 8.7.1.1. The implication (3') $\Rightarrow$ (3) is a special case of Example 7.6.6.29.

Moreover, if (3') is satisfied, then we can use condition (1) (together with Proposition 8.4.2.5) to identify the contravariant transport functor $\widehat{\mathcal{E}}_1 \rightarrow \widehat{\mathcal{E}}_0$ with the functor

$$\widehat{\mathcal{E}}_1 \rightarrow \mathrm{Fun}(\mathcal{E}_0^{\mathrm{op}}, \mathcal{S}_{<\kappa}) \quad \widehat{Y} \mapsto \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(-), \widehat{Y}).$$

In this case, the equivalence (4) $\Leftrightarrow$ (4') follows from the observation that κ -small colimits in the ∞ -category $\mathrm{Fun}(\mathcal{E}_0^{\mathrm{op}}, \mathcal{S}_{<\kappa})$ are computed levelwise (Proposition 7.1.8.2).

We will complete the proof by showing that if H satisfies conditions (3) and (4), then U is a cartesian fibration. Fix a regular cardinal λ having exponential cofinality $\geq \kappa$ such that $\widehat{\mathcal{E}}$ is locally λ -small. By virtue of Corollary 6.2.5.2, it will suffice to show that for each object $\widehat{Y} \in \widehat{\mathcal{E}}_1$, the functor

$$\mathcal{F} : \widehat{\mathcal{E}}_0^{\mathrm{op}} \rightarrow \mathcal{S}_{<\lambda} \quad \widehat{X} \mapsto \mathrm{Hom}_{\widehat{\mathcal{E}}}(\widehat{X}, \widehat{Y})$$

is representable by an object of $\widehat{\mathcal{E}}_0$. Condition (3) guarantees that $\mathcal{F}$ preserves κ -small limits. Using condition (1) and Corollary 8.4.3.9, we are reduced to showing that for each object $X \in \mathcal{E}_0$, the Kan complex $\mathcal{F}(H(X)) = \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y})$ is κ -small.

Let now us regard the object X as fixed. Condition (4) guarantees that the functor

$$\widehat{\mathcal{E}}_0 \rightarrow \mathcal{S}_{<\lambda} \quad \widehat{Y} \mapsto \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y})$$

preserves κ -small colimits. In particular, the collection of objects $\widehat{Y}$ for which $\mathrm{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y})$ is essentially κ -small is closed under κ -small colimits (Example 7.6.6.10). Since $\widehat{\mathcal{E}}_1$ is generated under κ -small colimits by the image of H , we can assume that $\widehat{Y} = H(Y)$ for some object $Y \in \mathcal{E}_1$. In this case, condition (2) supplies a homotopy equivalence

$$\mathrm{Hom}_{\mathcal{E}}(X, Y) \rightarrow \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(X), \widehat{Y}),$$

so the desired result follows from our assumption that $\mathcal{E}$ is essentially κ -small. $\square$

We now extend the scope of Definition 8.7.1.1.

05KR Definition 8.7.1.5. Let $\mathbb{K}$ be a collection of simplicial sets and suppose we are given a commutative diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C}, & \end{array} \quad (8.77)$$

05KS

where U and $\widehat{U}$ are inner fibrations. We will say that the diagram (8.77) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$* if, for every edge $e : \Delta^1 \rightarrow \mathcal{C}$, the induced map

$$H_e : \Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$$

exhibits $\Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$ (in the sense of Definition 8.7.1.1).

If κ is a regular cardinal, we say that the diagram (8.77) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$* if it exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, where $\mathbb{K}$ is the collection of all κ -small simplicial sets.

Remark 8.7.1.6. In the special case where $\mathcal{C} = \Delta^1$, Definition 8.7.1.5 reduces to Definition 8.7.1.1: see Remark 8.7.1.3. 05KT

Remark 8.7.1.7. In the situation of Definition 8.7.1.5, suppose that $\mathcal{C}$ is an ∞ -category. 05KU
Then H is fully faithful if and only if, for every morphism $\Delta^1 \rightarrow \mathcal{C}$, the induced map

$$\Delta^1 \times_{\mathcal{C}} \mathcal{E} \rightarrow \Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$$

is fully faithful (see Variant 4.8.6.19). In particular, if H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, then H is fully faithful.

Remark 8.7.1.8. Let $\mathbb{K}$ be a collection of simplicial sets and suppose we are given a 05KV
commutative diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Let $\mathcal{E}' \subseteq \widehat{\mathcal{E}}$ be the full simplicial subset spanned by those vertices which belong to the image of H . It follows from Remark 8.7.1.7 and Proposition 5.1.7.9 that the induced map $\mathcal{E} \rightarrow \mathcal{E}'$ is an equivalence of inner fibrations over $\mathcal{C}$, so that the inclusion map $\mathcal{E}' \hookrightarrow \widehat{\mathcal{E}}$ exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}'$.

Example 8.7.1.9 (Fiberwise idempotent-completion). Suppose we are given a commutative 05KY
diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C}, & \end{array} \tag{8.78} \quad \text{05KZ}$$

where U and $\widehat{U}$ are inner fibrations. We say that (8.78) *exhibits $\widehat{\mathcal{E}}$ as a fiberwise idempotent-completion of $\mathcal{E}$* if it exhibits $\widehat{\mathcal{E}}$ as a $\{\mathbf{N}_\bullet(\text{Idem})\}$ -cocompletion of $\mathcal{E}$, in the sense of Definition 8.7.1.5; here Idem is the category introduced in Construction 8.5.2.7.

06CD **Remark 8.7.1.10.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. We say that U is *idempotent-complete* if it satisfies either of the following equivalent conditions:

- (a) For each vertex $C \in \mathcal{C}$, the ∞ -category $\mathcal{E}_C = \{C\} \times_{\mathcal{C}} \mathcal{E}$ is idempotent-complete.
- (b) The inner fibration U is $\{\mathbf{N}_\bullet(\text{Idem})\}$ -cocomplete, where Idem is the category introduced in Construction 8.5.2.7.

The implication (b) $\Rightarrow$ (a) is immediate (see the proof of Proposition 8.5.5.3). To prove the converse, we may assume without loss of generality that $\mathcal{C} = \Delta^1$; in this case, the result follows from the observation that the inclusion map $\{0\} \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \mathcal{E}$ preserves $\mathbf{N}_\bullet(\text{Idem})$ -indexed colimits (Corollary 8.5.3.12).

05L0 **Proposition 8.7.1.11.** *Suppose we are given a commutative diagram of ∞ -categories*

05L1

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C}, & \end{array} \quad (8.79)$$

where U and $\widehat{U}$ are inner fibrations. Then (8.79) exhibits $\widehat{\mathcal{E}}$ as a fiberwise idempotent-completion of $\mathcal{E}$ if and only if it satisfies the following pair of conditions:

- (1) For each object $C \in \mathcal{C}$, the ∞ -category $\widehat{\mathcal{E}}_C$ is idempotent-complete.
- (2) The functor H is fully faithful.

Proof. As in Proposition 8.7.1.12, we can use Remark 8.7.1.7 to reduce to the case $\mathcal{C} = \Delta^1$; in this case, the result follows from Remark 8.7.1.10. $\square$

We now show that, in the special case where $\mathbb{K}$ is the collection of small simplicial sets and U is an essentially small inner fibration of ∞ -categories, Definition 8.7.1.5 reduces to Definition 8.7.0.1. Following the convention of Remark 4.7.0.5, this can be regarded as a special case of the following:

Proposition 8.7.1.12. *Let κ be an uncountable regular cardinal and suppose we are given* 05KW
a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C}, & \end{array} \quad (8.80) \quad 05KX$$

where U and $\widehat{U}$ are inner fibrations and U is essentially κ -small. Then (8.80) exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$ (in the sense of Definition 8.7.1.5) if and only if the following conditions are satisfied:

- (1) For each object $C \in \mathcal{C}$, the induced map of fibers $H_C : \mathcal{E}_C \rightarrow \widehat{\mathcal{E}}_C$ exhibits $\widehat{\mathcal{E}}_C$ as a κ -cocompletion of $\mathcal{E}_C$.
- (2) The functor H is fully faithful.
- (3) The inner fibration $\widehat{U}$ is locally cartesian.
- (4) For each morphism $f : C \rightarrow C'$ of $\mathcal{C}$, the contravariant transport functor $f^* : \widehat{\mathcal{E}}_{C'} \rightarrow \widehat{\mathcal{E}}_C$ is κ -cocontinuous.

Proof. Using Remark 8.7.1.7, we can reduce to the special case $\mathcal{C} = \Delta^1$, which follows from Proposition 8.7.1.4. $\square$

We can now formulate our main result.

Notation 8.7.1.13. Let $\mathbb{K}$ be a collection of simplicial sets, and let $U : \mathcal{E} \rightarrow \mathcal{C}$ and 05L2
 $U' : \mathcal{E}' \rightarrow \mathcal{C}$ be $\mathbb{K}$ -cocomplete inner fibrations of simplicial sets. We let $\text{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\mathcal{E}, \mathcal{E}')$
denote the full subcategory of $\text{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ spanned by those commutative diagrams

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{F} & \mathcal{E}' \\ & \searrow U & \swarrow U' \\ & \mathcal{C} & \end{array}$$

having the property that, for every vertex $C \in \mathcal{C}$, the induced map $F_C : \mathcal{E}_C \rightarrow \mathcal{E}'_C$ is $\mathbb{K}$ -cocontinuous.

05L3 **Theorem 8.7.1.14.** *Let $\mathbb{K}$ be a collection of simplicial sets. Suppose we are given a diagram of simplicial sets*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U \quad \swarrow \widehat{U} & \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Then, for every $\mathbb{K}$ -cocomplete inner fibration $U' : \mathcal{E}' \rightarrow \mathcal{C}$, precomposition with H induces an equivalence of ∞ -categories

$$\mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{E}}, \mathcal{E}') \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}').$$

05L4 **Remark 8.7.1.15** (Uniqueness). *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. It follows from Theorem 8.7.1.14 that if there exists a diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U \quad \swarrow \widehat{U} & \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, then the inner fibration $\widehat{U}$ is unique up to equivalence (in the sense of Definition 5.1.7.1). More precisely, suppose we are given another commutative diagram

05L5

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H'} & \widehat{\mathcal{E}}' \\ & \searrow U \quad \swarrow \widehat{U}' & \\ & \mathcal{C} & \end{array} \tag{8.81}$$

where $\widehat{U}'$ is a $\mathbb{K}$ -cocomplete inner fibration. Theorem 8.7.1.14 then guarantees the existence (and essential uniqueness) of a morphism $F \in \mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{E}}, \widehat{\mathcal{E}}')$ such that H' is isomorphic to $F \circ H$ (as an object of $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$). In this case, the diagram (8.81) exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$ if and only if F is an equivalence of inner fibrations over $\mathcal{C}$.

Example 8.7.1.16. Suppose we are given a commutative diagram of simplicial sets

05L6

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U \quad \swarrow \widehat{U} & \\ & \mathcal{C}, & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise idempotent-completion of $\mathcal{E}$. Then, for any idempotent-complete inner fibration $U' : \mathcal{E}' \rightarrow \mathcal{C}$, precomposition with H induces an equivalence of ∞ -categories

$$\mathrm{Fun}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}') \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}').$$

This follows by combining Theorem 8.7.1.14 with Corollary 8.5.3.12.

Our proof of Theorem 8.7.1.14 will require some preliminaries.

Lemma 8.7.1.17. *Let $\widehat{\mathcal{D}}$ be an ∞ -category and let $\mathcal{D} \subseteq \widehat{\mathcal{D}}$ be a full subcategory. Suppose that the inclusion functor $\mathcal{D} \hookrightarrow \widehat{\mathcal{D}}$ exhibits $\widehat{\mathcal{D}}$ as a $\mathbb{K}$ -cocompletion of $\mathcal{D}$, for some collection of simplicial sets $\mathbb{K}$. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a $\mathbb{K}$ -cocomplete inner fibration of ∞ -categories, let $C \in \mathcal{C}$ be an object, and let $F : \widehat{\mathcal{D}} \rightarrow \mathcal{E}_C$ be a functor. The following conditions are equivalent:*

- (1) *The functor F is $\mathbb{K}$ -cocontinuous.*
- (2) *The functor F is left Kan extended from $\mathcal{D}$.*
- (3) *When regarded as a functor from $\widehat{\mathcal{D}}$ to $\mathcal{E}$, the functor F is U -left Kan extended from $\mathcal{D}$.*

Proof. The equivalence (1) $\Leftrightarrow$ (2) follows from Lemma 8.4.5.10, and the implication (3) $\Rightarrow$ (2) is a special case of Corollary 7.3.3.23. We will complete the proof by showing that (1) implies (3). By virtue of Remark 7.3.3.24, we may assume that $\mathcal{C} = \Delta^1$ and that C is the initial vertex; in this case, we wish to show that F is left Kan extended from $\mathcal{D}$ (when regarded as a functor from $\widehat{\mathcal{D}}$ to $\mathcal{E}$). Fix an uncountable regular cardinal κ such that every simplicial set $K \in \mathbb{K}$ is essentially κ -small. Let λ be a cardinal of exponential cofinality $\geq \kappa$ such that $\mathcal{E}$ is locally λ -small. By virtue of Proposition 7.4.1.18, it will suffice to show that for every object $E \in \mathcal{E}$, the functor

$$\mathcal{F} : \widehat{\mathcal{D}} \rightarrow \mathcal{S}_{<\lambda}^{\mathrm{op}} \quad D \mapsto \mathrm{Hom}_{\mathcal{E}}(F(D), E)$$

is left Kan extended from $\mathcal{D}$. By Lemma 8.4.5.10, this is equivalent to $\mathbb{K}$ -cocontinuity of the functor $\mathcal{F}$, which follows from (1) together with our assumption that U is $\mathbb{K}$ -cocomplete. $\square$

05L8 **Lemma 8.7.1.18.** *Let $\mathbb{K}$ be a collection of simplicial sets and suppose we are given a commutative diagram of ∞ -categories*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C}, & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Let X be an object of $\widehat{\mathcal{E}}$ having image $C = \widehat{U}(X)$ and set $\mathcal{E}_{/X} = \mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X}$. If U is an isofibration, then the inclusion map

$$\{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} \mathcal{E}_{/X} \hookrightarrow \mathcal{E}_{/X}$$

is right cofinal.

Proof. Fix an object $\widetilde{Y} \in \mathcal{E}_{/X}$, which we identify with a pair (Y, v) where Y is an object of $\mathcal{E}$ and $v : H(Y) \rightarrow X$ is a morphism in $\widehat{\mathcal{E}}$. By virtue of Theorem 7.2.3.1, it will suffice to show that the ∞ -category $\mathcal{A} = \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{E}_{/C})_{\widetilde{Y}/}$ is weakly contractible. Since $\widehat{U}$ is an inner fibration, the map

$$\mathcal{E}_{/X} = \mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X} \rightarrow \mathcal{E} \times_{\mathcal{C}} \mathcal{C}_{/C}$$

is a right fibration (Proposition 4.3.6.8). Using our assumption that U is an isofibration, we deduce that the map $\mathcal{E}_{/X} \rightarrow \mathcal{C}_{/C}$ is also an isofibration. Let $\widetilde{D}$ denote the image of $\widetilde{Y}$ under this isofibration, which we identify with a morphism $f : D \rightarrow C$ in the ∞ -category $\mathcal{C}$ (so that $D = U(Y)$ and $f = \widehat{U}(v)$). Set $\mathcal{B} = \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{C}_{/C})_{\widetilde{D}/}$, so that U induces an isofibration

$$\mathcal{A} = \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{E}_{/X})_{\widetilde{Y}/} \rightarrow \{\mathrm{id}_C\} \times_{\mathcal{C}_{/C}} (\mathcal{C}_{/C})_{\widetilde{D}/} = \mathcal{B}.$$

Since id_C is final when viewed as an object of $\mathcal{C}_{/C}$ (Proposition 4.6.7.23), the simplicial set $\mathcal{B}$ is a contractible Kan complex. Let $B \in \mathcal{B}$ be the vertex which corresponds to the degenerate 2-simplex of $\mathcal{C}$ depicted in the diagram

$$\begin{array}{ccc} & C & \\ f \nearrow & & \searrow \mathrm{id}_C \\ D & \xrightarrow{f} & C, \end{array}$$

so that the inclusion map $\{B\} \hookrightarrow \mathcal{B}$ is an equivalence of ∞ -categories. Applying Corollary 4.5.2.31, we deduce that the inclusion map $\{B\} \times_{\mathcal{B}} \mathcal{A} \hookrightarrow \mathcal{A}$ is an equivalence of ∞ -categories.

In particular, it is a weak homotopy equivalence. Consequently, to show that $\mathcal{A}$ is weakly contractible, it will suffice to show that the fiber $\{B\} \times_{\mathcal{B}} \mathcal{A}$ is weakly contractible. Replacing $\mathcal{E}$ and $\widehat{\mathcal{E}}$ by the fiber products $\Delta^1 \times_{\mathcal{C}} \mathcal{E}$ and $\Delta^1 \times_{\mathcal{C}} \widehat{\mathcal{E}}$, respectively, we are reduced to proving that $\mathcal{A}$ is weakly contractible under the additional assumption that $\mathcal{C} = \Delta^1$, where $U(Y) = 0$ and $\widehat{U}(X) = 1$.

For $i \in \{0, 1\}$, set $\mathcal{E}_i = \{i\} \times_{\mathcal{C}} \mathcal{E}$ and $\widehat{\mathcal{E}}_i = \{i\} \times_{\mathcal{C}} \widehat{\mathcal{E}}$. Fix an uncountable regular cardinal κ such that $\widehat{\mathcal{E}}$ is locally κ -small and every simplicial set $K \in \mathbb{K}$ is essentially κ -small. Then the projection map $\widehat{\mathcal{E}}_{H(Y)/} \rightarrow \widehat{\mathcal{E}}$ admits a covariant transport representation $\mathcal{F} : \widehat{\mathcal{E}} \rightarrow \mathcal{S}_{<\kappa}$, given informally by the formula $\mathcal{F}(E) = \text{Hom}_{\widehat{\mathcal{E}}}(H(Y), E)$. Our assumption that H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$ guarantees that the restriction $\mathcal{F}|_{\widehat{\mathcal{E}}_1}$ is $\mathbb{K}$ -cocontinuous. Applying Corollary 8.4.5.12 (and our assumption that H is fully faithful), we conclude that H induces a left cofinal functor

$$\mathcal{E}_1 \times_{\mathcal{E}} \mathcal{E}_{Y/} \xrightarrow{\sim} \mathcal{E}_1 \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{H(Y)/} \rightarrow \widehat{\mathcal{E}}_1 \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{H(Y)/}.$$

By virtue of Theorem 7.2.3.1, this is a reformulation of the assertion that the ∞ -category $\mathcal{A}$ is weakly contractible (for every choice of object $X \in \widehat{\mathcal{E}}_1$). $\square$

Proposition 8.7.1.19. *Let $\mathbb{K}$ be a collection of simplicial sets. Suppose we are given a commutative diagram of ∞ -categories*

$$\begin{array}{ccc} \widehat{\mathcal{E}} & \xrightarrow{F} & \mathcal{E}' \\ & \searrow \widehat{U} & \swarrow U' \\ & \mathcal{C} & \end{array}$$

and let $\mathcal{E} \subseteq \widehat{\mathcal{E}}$ be a full subcategory. Assume that $U = \widehat{U}|_{\mathcal{E}}$ is an isofibration, that the inclusion map $\mathcal{E} \hookrightarrow \widehat{\mathcal{E}}$ exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, and that U' is a $\mathbb{K}$ -cocomplete inner fibration. The following conditions are equivalent:

- (1) The functor F is U' -left Kan extended from $\mathcal{E}$.
- (2) For each object $C \in \mathcal{C}$ and each $K \in \mathbb{K}$, the functor $F_C : \widehat{\mathcal{E}}_C \rightarrow \mathcal{E}'_C$ preserves K -indexed colimits.

Proof. Fix an object $C \in \mathcal{C}$, and let X be an object of $\widehat{\mathcal{E}}$ satisfying $\widehat{U}(X) = C$. Combining Lemma 8.7.1.18 with Corollary 7.2.2.2, we see that the following conditions are equivalent:

- (1_X) The functor F is U' -left Kan extended from $\mathcal{E}$ at the object $X \in \widehat{\mathcal{E}}$.
- (2_X) The functor F_C is U' -left Kan extended from $\mathcal{E}_C$ at the object $X \in \widehat{\mathcal{E}}_C$.

Allowing the object X to vary (with C fixed) and applying Lemma 8.7.1.17, we see that the following are equivalent:

- (1_C) For each object $X \in \widehat{\mathcal{E}}$ satisfying $\widehat{U}(X) = C$, the functor F is U' -left Kan extended from $\mathcal{E}$ at the object X .
- (2_C) For each $K \in \mathbb{K}$, the functor F_C preserves K -indexed colimits.

The equivalence (1) $\Leftrightarrow$ (2) now follows by allowing the object $C \in \mathcal{C}$ to vary. $\square$

05LA Variant 8.7.1.20. Let $\mathbb{K}$ be a collection of simplicial sets, let $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories, and let $\mathcal{E} \subseteq \widehat{\mathcal{E}}$ be a full subcategory. Assume that $U = \widehat{U}|_{\mathcal{E}}$ is an isofibration and that the inclusion functor $\mathcal{E} \hookrightarrow \widehat{\mathcal{E}}$ exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Let $U' : \mathcal{E}' \rightarrow \mathcal{C}$ be a $\mathbb{K}$ -cocomplete isofibration. Then every lifting problem

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{F^0} & \mathcal{E}' \\ \downarrow & \nearrow F & \downarrow U' \\ \widehat{\mathcal{E}} & \xrightarrow{\quad} & \mathcal{C} \end{array}$$

admits a solution, where the functor F is U' -left Kan extended from $\mathcal{E}$.

Proof. Fix an object $C \in \mathcal{C}$, so that F^0 restricts to a functor $F_C^0 : \mathcal{E}_C \rightarrow \mathcal{E}'_C$. Since the inclusion functor $\mathcal{E}_C \hookrightarrow \widehat{\mathcal{E}}_C$ exhibits $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$ -cocompletion of $\mathcal{E}_C$, the functor F_C^0 admits an (essentially unique) extension $F_C : \widehat{\mathcal{E}}_C \rightarrow \mathcal{E}'_C$ which preserves K -indexed colimits for each $K \in \mathbb{K}$. It follows from Lemma 8.7.1.17 that F_C is U' -left Kan extended from $\mathcal{E}_C$. In particular, for each object $X \in \widehat{\mathcal{E}}_C$, the composition

$$(\mathcal{E}_C \times_{\widehat{\mathcal{E}}_C} (\widehat{\mathcal{E}}_C)_{/X})^{\triangleright} \xrightarrow{F_C} \mathcal{E}'_C$$

is a U' -colimit diagram. Since the inclusion map

$$\mathcal{E}_C \times_{\widehat{\mathcal{E}}_C} (\widehat{\mathcal{E}}_C)_{/X} \hookrightarrow \mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X}$$

is right cofinal (Lemma 8.7.1.18), Proposition 7.2.2.9 guarantees that the lifting problem

$$\begin{array}{ccccc} \mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X} & \xrightarrow{\quad} & \mathcal{E} & \xrightarrow{F} & \mathcal{E}' \\ \downarrow & & & \nearrow & \downarrow U' \\ (\mathcal{E} \times_{\widehat{\mathcal{E}}} \widehat{\mathcal{E}}_{/X})^{\triangleright} & \xrightarrow{\quad} & \widehat{\mathcal{E}} & \xrightarrow{\widehat{U}} & \mathcal{C} \end{array}$$

admits a solution, where the dotted arrow is a U' -colimit diagram. The desired result now follows by allowing the object X to vary and applying the criterion of Proposition 7.3.5.5. $\square$

We now prove a special case of Theorem 8.7.1.14 (which is sufficient for most applications).

Lemma 8.7.1.21. *Let $\mathbb{K}$ be a collection of simplicial sets. Suppose we are given a diagram of ∞ -categories*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C}, & \end{array}$$

where U and $\widehat{U}$ are isofibrations and H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Then, for every $\mathbb{K}$ -cocomplete isofibration $U' : \mathcal{E}' \rightarrow \mathcal{C}$, precomposition with H induces an equivalence of ∞ -categories

$$\mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{E}}, \mathcal{E}') \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}').$$

Proof. Since the functor H is fully faithful (see Variant 4.8.6.19), we can assume without loss of generality that $\mathcal{E}$ is a replete full subcategory of $\widehat{\mathcal{E}}$ (and that H is the inclusion functor). In this case, Proposition 8.7.1.19 identifies $\mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{E}}, \mathcal{E}')$ with the full subcategory of $\mathrm{Fun}_{/\mathcal{C}}(\widehat{\mathcal{E}}, \mathcal{E}')$ spanned by those functors $F : \widehat{\mathcal{E}} \rightarrow \mathcal{E}'$ which are U' -left Kan extended from $\mathcal{E}$. Combining this observation with Theorem 7.3.6.14 and Variant 8.7.1.20, we see that the restriction functor $\mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\widehat{\mathcal{E}}, \mathcal{E}') \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \mathcal{E}')$ is a trivial Kan fibration. $\square$

Proof of Theorem 8.7.1.14. Let $\mathbb{K}$ be a collection of simplicial sets. Suppose we are given a diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C}, & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, and let $U' : \mathcal{E}' \rightarrow \mathcal{C}$ be a $\mathbb{K}$ -cocomplete inner fibration. For every morphism of simplicial sets $S \rightarrow \mathcal{C}$, we let $\mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(S \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}')$ denote the (replete) full subcategory of $\mathrm{Fun}_{/\mathcal{C}}(S \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}')$ spanned by those morphisms $F : S \times_{\mathcal{C}} \widehat{\mathcal{E}} \rightarrow \mathcal{E}'$ having the property that, for each vertex $s \in S$, the functor $F_s : \{s\} \times_{\mathcal{C}} \widehat{\mathcal{E}} \rightarrow \{s\} \times_{\mathcal{C}} \mathcal{E}'$ preserves K -indexed colimits for each $K \in \mathbb{K}$. We will prove the following:

(*) For every morphism of simplicial sets $S \rightarrow \mathcal{C}$, precomposition with H induces an equivalence of ∞ -categories

$$\theta_S : \mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(S \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \rightarrow \mathrm{Fun}_{/\mathcal{C}}(S \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}').$$

Writing S as the union of its skeleta $\mathrm{sk}_n(S)$, we can realize θ_S as the limit of a tower of comparison maps

$$\begin{array}{ccccc} \cdots & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\mathrm{sk}_1(S) \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(\mathrm{sk}_0(S) \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \\ & & \downarrow \theta_{\mathrm{sk}_1(S)} & & \downarrow \theta_{\mathrm{sk}_0(S)} \\ \cdots & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_1(S) \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}') & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}(\mathrm{sk}_0(S) \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}'), \end{array}$$

where the horizontal maps are isofibrations (Variant 4.4.5.11). Consequently, to show that θ_S is an equivalence of ∞ -categories, it will suffice to show that $\theta_{\mathrm{sk}_n(S)}$ is an equivalence of ∞ -categories for each $n \geq -1$. We may therefore assume without loss of generality that S has dimension $\leq n$, for some integer $n \geq -1$.

We now proceed by induction on n . Assume that $n \geq 0$ (otherwise, S is empty and there is nothing to prove). Let S' be the $(n-1)$ -skeleton of S , so that Proposition 1.1.4.12 supplies a pushout diagram

$$\begin{array}{ccc} T' & \longrightarrow & T \\ \downarrow & & \downarrow \\ S' & \longrightarrow & S \end{array}$$

where T is a coproduct of standard n -simplices (indexed by the nondegenerate n -simplices of S) and T' is the coproduct of their boundaries. It follows that θ_S can be realized as the horizontal limit of a diagram of comparison maps

$$\begin{array}{ccccc} \mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(S' \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(T' \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}^{\mathbb{K}\text{-cocont}}(T \times_{\mathcal{C}} \widehat{\mathcal{E}}, \mathcal{E}') \\ \downarrow \theta_{S'} & & \downarrow \theta_{T'} & & \downarrow \theta_T \\ \mathrm{Fun}_{/\mathcal{C}}(S' \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}') & \longrightarrow & \mathrm{Fun}_{/\mathcal{C}}(T' \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}') & \longleftarrow & \mathrm{Fun}_{/\mathcal{C}}(T \times_{\mathcal{C}} \mathcal{E}, \mathcal{E}'), \end{array}$$

where the horizontal maps on the right are isofibrations (Variant 4.4.5.11). Since the simplicial sets S' and T' have dimension $< n$, our inductive hypothesis guarantees that $\theta_{S'}$

and $\theta_{T'}$ are equivalences of ∞ -categories. Consequently, to show that θ_S is an equivalence of ∞ -categories, it will suffice to show that θ_T is an equivalence of ∞ -categories (Corollary 4.5.2.31). Replacing $\mathcal{C}$ by T , we are reduced to proving Theorem 8.7.1.14 in the special case where $\mathcal{C}$ is a coproduct of standard simplices. In this case, $\mathcal{C}$ is an ∞ -category and the inner fibrations $U : \mathcal{E} \rightarrow \mathcal{C}$, $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$, and $U' : \mathcal{E}' \rightarrow \mathcal{C}$ are automatically isofibrations (Example 4.4.1.6), so the desired result follows from Lemma 8.7.1.21. $\square$

8.7.2 Fiberwise Cocompletions of Cocartesian Fibrations

We now specialize our theory of fiberwise cocompletions to the setting of cocartesian 05LC
fibrations. In this case, Definition 8.7.1.5 can be reformulated:

Theorem 8.7.2.1. *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian 05LD
fibration of simplicial sets. Then a commutative diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array} \quad (8.82) \quad 05LE$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$ if and only if the following conditions are satisfied:

- (a) *For each vertex $C \in \mathcal{C}$, the functor $H_C : \mathcal{E}_C \rightarrow \widehat{\mathcal{E}}_C$ exhibits the ∞ -category $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$ -cocompletion of the ∞ -category $\mathcal{E}_C$ (Definition 8.4.5.1).*
- (b) *The morphism $\widehat{U}$ is a cocartesian fibration of simplicial sets.*
- (c) *For every edge $f : C \rightarrow C'$ of $\mathcal{C}$, the covariant transport functor $f_! : \widehat{\mathcal{E}}_C \rightarrow \widehat{\mathcal{E}}_{C'}$ is $\mathbb{K}$ -cocontinuous.*
- (d) *The morphism H carries U -cocartesian edges of $\mathcal{E}$ to $\widehat{U}$ -cocartesian edges of $\widehat{\mathcal{E}}$.*

Moreover, there exists a diagram (8.82) which satisfies these conditions.

Our proof of Theorem 8.7.2.1 will require some preliminaries.

Lemma 8.7.2.2. *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian 05LG*

fibration of simplicial sets, and suppose we are given a commutative diagram

05LH

$$\begin{array}{ccc}
 \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\
 & \searrow U & \swarrow \widehat{U} \\
 & \mathcal{C} &
 \end{array}
 \tag{8.83}$$

which satisfies the conditions of Theorem 8.7.2.1. Then H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$.

Proof. Without loss of generality, we may assume that $\mathcal{C} = \Delta^1$. For $i \in \{0, 1\}$, let $\mathcal{E}_i$ denote the fiber $\{i\} \times_{\Delta^1} \mathcal{E}$ and define $\widehat{\mathcal{E}}_i$ similarly, so that H restricts to a functor $H_i : \mathcal{E}_i \rightarrow \widehat{\mathcal{E}}_i$. By assumption, the functor H_i exhibits $\widehat{\mathcal{E}}_i$ as a $\mathbb{K}$ -cocompletion of $\mathcal{E}_i$, and is therefore fully faithful (Proposition 8.4.5.3). Since H carries U -cocartesian morphisms of $\mathcal{E}$ to $\widehat{U}$ -cocartesian morphisms of $\widehat{\mathcal{E}}$, it follows that H is fully faithful (Proposition 5.1.6.7). It follows from Example 7.6.6.31 that the cocartesian fibration $\widehat{U}$ is $\mathbb{K}$ -cocomplete.

Fix an uncountable regular cardinal κ such that $\widehat{\mathcal{E}}$ is locally κ -small and every simplicial set $K \in \mathbb{K}$ is essentially κ -small. To complete the proof, it will suffice to show that for every object $X \in \mathcal{E}_0$, the functor

$$\mathcal{F} : \widehat{\mathcal{E}}_1 \rightarrow \mathcal{S}_{<\kappa} \quad Y \mapsto \mathrm{Hom}_{\widehat{\mathcal{E}}}(H(X), Y)$$

commutes with K -indexed colimits, for each $K \in \mathbb{K}$. Since U is a cocartesian fibration, we can choose a U -cocartesian morphism $u : X \rightarrow X'$ of $\mathcal{E}$ with $X' \in \mathcal{E}_1$. By assumption, $H(u) : H(X) \rightarrow H(X')$ is a $\widehat{U}$ -cocartesian morphism in the ∞ -category $\widehat{\mathcal{E}}$, so the functor $\mathcal{F}$ is corepresented by the object $H(X')$. The desired result now follows from the characterization of $\mathbb{K}$ -cocompletions given in Variant 8.4.7.9. $\square$

Our next goal is to prove the existence assertion of Theorem 8.7.2.1. We begin by treating the case where $\mathbb{K}$ is the collection of κ -small simplicial sets for some uncountable regular cardinal κ , and the cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is essentially κ -small. In the special case $\mathcal{C} = \Delta^0$, Theorem 8.7.2.1 reduces to the assertion that there exists a functor $H : \mathcal{E} \rightarrow \widehat{\mathcal{E}}$ which exhibits $\widehat{\mathcal{E}}$ as a κ -cocompletion of $\mathcal{E}$. In §8.4, we proved this using an explicit construction: we can take $\widehat{\mathcal{E}}$ to be the ∞ -category $\mathrm{Fun}(\mathcal{E}^{\mathrm{op}}, \mathcal{S})$ and H to be the covariant Yoneda embedding (Theorem 8.4.0.3). We now extend this construction to the relative setting, using the duality theory developed in §8.6 (see Exercise [?] for an alternative approach).

05LJ Lemma 8.7.2.3. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ be essentially κ -small cocartesian fibrations of simplicial sets, and let $\mathrm{Fun}(\mathcal{E}^\vee / \mathcal{C}, \mathcal{S}_{<\kappa})$ be*

the relative exponential of Construction 4.5.9.1. Suppose we are given a morphism

$$\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa},$$

which exhibits $U^\vee$ as a cocartesian dual of U (see Variant 8.6.4.13). Then $\mathcal{K}$ is classified by a commutative diagram with a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \text{Fun}(\mathcal{E}^\vee / \mathcal{C}, \mathcal{S}_{<\kappa}) \\ & \searrow U & \swarrow \hat{U} \\ & \mathcal{C} & \end{array} \quad (8.84) \quad \text{05LK}$$

which satisfies the conditions of Theorem 8.7.2.1.

Proof. It follows from Proposition 8.6.5.12 that $\hat{U}$ is both a cartesian and cocartesian fibration, so that condition (b) of Theorem 8.7.2.1 is satisfied and condition (c) is automatic (Corollary 7.1.4.23). Condition (d) follows from Proposition 8.6.5.18, and condition (a) from Theorem 8.4.3.2. $\square$

Example 8.7.2.4. Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian 05LL
fibration of simplicial sets which is essentially κ -small, and let $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ be as in
Construction 8.6.5.6. It follows from Proposition 8.6.5.8 that the evaluation functor

$$\text{ev} : \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa} \quad ((C, \mathcal{F}_C), X) \mapsto \mathcal{F}_C(X)$$

exhibits U as a cocartesian dual of the projection map $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \rightarrow \mathcal{C}$. Applying
Lemma 8.7.2.3 (with the roles of $\mathcal{E}$ and $\mathcal{E}^\vee$ switched) and Lemma 8.7.2.2, we conclude that
the diagram

$$\begin{array}{ccc} \text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) & \xrightarrow{\quad} & \text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa}) \\ & \searrow & \swarrow \\ & \mathcal{C} & \end{array}$$

exhibits $\text{Fun}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$ as a fiberwise κ -cocompletion of $\text{Fun}^{\text{corep}}(\mathcal{E} / \mathcal{C}, \mathcal{S}_{<\kappa})$.

Lemma 8.7.2.5. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian 05LM
fibration of simplicial sets. Then there exists a commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \hat{\mathcal{E}} \\ & \searrow U & \swarrow \hat{U} \\ & \mathcal{C} & \end{array} \quad (8.85) \quad \text{05LN}$$

which satisfies the conditions of Theorem 8.7.2.1.

Proof. Choose an uncountable regular cardinal κ such that U is essentially κ -small and each $K \in \mathbb{K}$ is κ -small. Using Theorem 8.6.5.1 (and Proposition 8.6.4.15), we can choose a cocartesian fibration $U^\vee : \mathcal{E}^\vee \rightarrow \mathcal{C}$ and a diagram $\mathcal{K} : \mathcal{E}^\vee \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{S}_{<\kappa}$ which exhibits $U^\vee$ as a cocartesian dual of U . Let $\mathbb{K}'$ be the collection of all κ -small simplicial sets and set $\widehat{\mathcal{E}}' = \text{Fun}(\mathcal{E}^\vee / \mathcal{C}, \mathcal{S}_{<\kappa})$, so that Lemma 8.7.2.3 supplies a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H'} & \widehat{\mathcal{E}}' \\ & \searrow U & \swarrow \widehat{U}' \\ & \mathcal{C} & \end{array}$$

which satisfies the conditions of Theorem 8.7.2.1 with respect to $\mathbb{K}'$.

For each object $C \in \mathcal{C}$, let $\widehat{\mathcal{E}}_C$ denote smallest full subcategory of $\widehat{\mathcal{E}}$ which contains the essential image of the functor $H'_C : \mathcal{E}_C \rightarrow \widehat{\mathcal{E}}'_C$ and is closed under K -indexed colimits for each $K \in \mathbb{K}$. For each edge $f : C \rightarrow D$ of the simplicial set $\mathcal{C}$, Remark 5.2.2.14 guarantees that the diagram

$$\begin{array}{ccc} \mathcal{E}_C & \xrightarrow{\quad} & \mathcal{E}_D \\ \downarrow H'_C & & \downarrow H'_D \\ \widehat{\mathcal{E}}'_C & \xrightarrow{f_!} & \widehat{\mathcal{E}}'_D \end{array}$$

commutes up to isomorphism, where the horizontal maps are given by covariant transport along f . In particular, the covariant transport functor $f_! : \widehat{\mathcal{E}}'_C \rightarrow \widehat{\mathcal{E}}'_D$ carries the essential image of H'_C into the essential image of H'_D . Since $f_!$ preserves κ -small colimits, it carries $\widehat{\mathcal{E}}_C$ into $\widehat{\mathcal{E}}_D$.

Let $\widehat{\mathcal{E}}$ denote the full simplicial subset of $\widehat{\mathcal{E}}'$ spanned by those vertices X which belong to $\widehat{\mathcal{E}}_C$, where $C = \widehat{U}'(X)$. Applying Proposition 5.1.4.17, we see that $\widehat{U} = \widehat{U}'|_{\widehat{\mathcal{E}}}$ is a cocartesian fibration from $\widehat{\mathcal{E}}$ to $\mathcal{C}$, and that an edge of $\widehat{\mathcal{E}}$ is $\widehat{U}$ -cocartesian if and only if it is $\widehat{U}'$ -cocartesian when regarded as an edge of $\widehat{\mathcal{E}}'$. It follows that the commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

automatically satisfies conditions (b) and (d) of Theorem 8.7.2.1. Moreover, for each edge $f : C \rightarrow D$ of $\mathcal{C}$, the associated covariant transport functor $\hat{\mathcal{E}}_C \rightarrow \hat{\mathcal{E}}_D$ can be identified with the restriction of $f_!$ to $\hat{\mathcal{E}}_C$, and therefore preserves K -indexed colimits for each $K \in \mathbb{K}$. To complete the proof, it will suffice to show that for every vertex $C \in \mathcal{C}$, the induced map $H_C : \mathcal{E}_C \rightarrow \hat{\mathcal{E}}_C$ exhibits $\hat{\mathcal{E}}_C$ as a $\mathbb{K}$ -cocompletion of $\mathcal{E}_C$. This follows from Proposition 8.4.5.8. $\square$

Proof of Theorem 8.7.2.1. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cocartesian fibration of simplicial sets. Using Lemma 8.7.2.5, we can choose a commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \hat{\mathcal{E}} \\ & \searrow U & \swarrow \hat{U} \\ & \mathcal{C} & \end{array} \quad \begin{array}{l} \text{05LP} \\ (8.86) \end{array}$$

which satisfies conditions (a), (b), (c), and (d) of Theorem 8.7.2.1. Lemma 8.7.2.2 guarantees any such diagram (8.86) exhibits $\hat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Conversely, if we are given another diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \hat{\mathcal{E}}' \\ & \searrow U & \swarrow \hat{U}' \\ & \mathcal{C} & \end{array} \quad \begin{array}{l} \text{05LQ} \\ (8.87) \end{array}$$

which exhibits $\hat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, then Remark 8.7.1.15 guarantees that there is an equivalence $F : \hat{\mathcal{E}} \rightarrow \hat{\mathcal{E}}'$ of inner fibrations over $\mathcal{C}$ such that H' is isomorphic to $F \circ H$ as an object of $\text{Fun}_{/\mathcal{C}}(\mathcal{E}, \hat{\mathcal{E}}')$. It then follows that (8.87) also satisfies conditions (a), (b), (c), and (d) of Theorem 8.7.2.1. $\square$

8.7.3 Fiberwise Cocompletion of Cartesian Fibrations

We now study fiberwise cocompletion in the setting of cartesian fibrations. Here the main result is the following: 05LR

05LS **Theorem 8.7.3.1.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets. Then a commutative diagram*

05LT

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array} \quad (8.88)$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$ if and only if the following conditions are satisfied:

- (a) *For each vertex $C \in \mathcal{C}$, the functor $H_C : \mathcal{E}_C \rightarrow \widehat{\mathcal{E}}_C$ exhibits the ∞ -category $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$ -cocompletion of the ∞ -category $\mathcal{E}_C$ (Definition 8.4.5.1).*
- (b) *The morphism $\widehat{U}$ is a cartesian fibration of simplicial sets.*
- (c) *For every edge $f : C \rightarrow C'$ of $\mathcal{C}$, the contravariant transport functor $f^* : \widehat{\mathcal{E}}_{C'} \rightarrow \widehat{\mathcal{E}}_C$ is $\mathbb{K}$ -cocontinuous.*
- (d) *The morphism H carries U -cartesian edges of $\mathcal{E}$ to $\widehat{U}$ -cartesian edges of $\widehat{\mathcal{E}}$.*

Moreover, there exists a diagram (8.88) which satisfies these conditions.

Our strategy is to reduce Theorem 8.7.3.1 from its counterpart for cocartesian fibrations (Theorem 8.7.2.1), which was proved in §8.7.2. To carry out the reduction, we show that fiberwise cocompletion is compatible with the formation of conjugate fibrations (Proposition 8.7.3.3). As a first step, we record the easy direction of Theorem 8.7.3.1:

05LU **Lemma 8.7.3.2.** *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which satisfies the conditions of Theorem 8.7.3.1. Then H exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$.

Proof. Without loss of generality, we may assume that $\mathcal{C} = \Delta^1$. For $i \in \{0, 1\}$, let $\mathcal{E}_i$ denote the fiber $\{i\} \times_{\Delta^1} \mathcal{E}$ and define $\widehat{\mathcal{E}}_i$ similarly, so that H restricts to a functor $H_i : \mathcal{E}_i \rightarrow \widehat{\mathcal{E}}_i$. By assumption, the functor H_i exhibits $\widehat{\mathcal{E}}_i$ as a $\mathbb{K}$ -cocompletion of $\mathcal{E}_i$, and is therefore fully faithful (Proposition 8.4.5.3). Since H carries U -cartesian morphisms of $\mathcal{E}$ to $\widehat{U}$ -cartesian morphisms of $\widehat{\mathcal{E}}$, it follows that H is fully faithful (Proposition 5.1.6.7). Moreover, Example 7.6.6.29 shows that the fibration $\widehat{U}$ is $\mathbb{K}$ -cocomplete.

Fix an uncountable regular cardinal κ such that $\widehat{\mathcal{E}}$ is locally κ -small and every simplicial set $K \in \mathbb{K}$ is essentially κ -small. To complete the proof, it will suffice to show that for every object $X \in \mathcal{E}_0$, the functor

$$\mathcal{F} : \widehat{\mathcal{E}}_1 \rightarrow \mathcal{S}_{<\kappa} \quad Y \mapsto \operatorname{Hom}_{\widehat{\mathcal{E}}}(H(X), Y)$$

is $\mathbb{K}$ -cocontinuous. Since $\widehat{U}$ is a cartesian fibration, $\mathcal{F}$ factors as a composition $\widehat{\mathcal{E}}_1 \xrightarrow{f^*} \widehat{\mathcal{E}}_0 \xrightarrow{\mathcal{G}} \mathcal{S}_{<\kappa}$, where f^* is given by contravariant transport along the nondegenerate edge of $\mathcal{C}$ and the functor $\mathcal{G}$ is corepresented by $H(X)$. We are therefore reduced to showing that the functor $\mathcal{G}$ is $\mathbb{K}$ -cocontinuous, which follows from the recognition principle of Variant 8.4.7.9. $\square$

Proposition 8.7.3.3. *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \rightarrow \mathcal{C}$ and $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$ be cocartesian fibrations of simplicial sets, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ and $\widehat{U}^\dagger : \widehat{\mathcal{E}}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be cartesian fibrations, and let

$$T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \operatorname{Tw}(\mathcal{C}) \rightarrow \mathcal{E} \quad \widehat{T} : \widehat{\mathcal{E}}^\dagger \times_{\mathcal{C}^{\text{op}}} \operatorname{Tw}(\mathcal{C}) \rightarrow \widehat{\mathcal{E}}$$

be morphisms which exhibit $U^\dagger$ and $\widehat{U}^\dagger$ as cartesian conjugates of U and $\widehat{U}$, respectively. Then there exists a morphism $H^\dagger : \mathcal{E}^\dagger \rightarrow \widehat{\mathcal{E}}^\dagger$ satisfying $\widehat{U}^\dagger \circ H^\dagger = U^\dagger$, and for which the diagram

$$\begin{array}{ccc} \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \operatorname{Tw}(\mathcal{C}) & \xrightarrow{T} & \mathcal{E} \\ \downarrow H^\dagger \times \operatorname{id} & & \downarrow H \\ \widehat{\mathcal{E}}^\dagger \times_{\mathcal{C}^{\text{op}}} \operatorname{Tw}(\mathcal{C}) & \xrightarrow{\widehat{T}} & \widehat{\mathcal{E}} \end{array} \tag{8.89}$$

05LV

(8.89)

commutes up to isomorphism (in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}^\dagger \times_{\mathcal{C}^{\mathrm{op}}} \mathrm{Tw}(\mathcal{C}), \widehat{\mathcal{E}})$). In this case, the diagram

05LX

$$\begin{array}{ccc}
 \mathcal{E}^\dagger & \xrightarrow{H^\dagger} & \widehat{\mathcal{E}}^\dagger \\
 & \searrow U^\dagger & \swarrow \widehat{U}^\dagger \\
 & \mathcal{C}^{\mathrm{op}} &
 \end{array} \tag{8.90}$$

satisfies the hypotheses of Theorem 8.7.3.1, and therefore exhibits $\widehat{\mathcal{E}}^\dagger$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}^\dagger$.

Proof. By virtue of Corollary 5.6.7.3, we may assume that $\mathcal{C}$ is an ∞ -category. It follows from the criterion of Theorem 8.7.2.1 that the functor H carries U -cocartesian morphisms of $\mathcal{E}$ to $\widehat{U}$ -cocartesian morphisms of $\widehat{\mathcal{E}}$. Invoking Example 8.6.2.13, we deduce that there is an object $H^\dagger \in \mathrm{Fun}_{/\mathcal{C}^{\mathrm{op}}}(\mathcal{E}^\dagger, \widehat{\mathcal{E}}^\dagger)$ for which the diagram (8.89) commutes up to isomorphism (moreover, $H^\dagger$ is unique up to isomorphism). We complete the proof by showing that the diagram (8.90) satisfies the conditions of Theorem 8.7.3.1:

- (a) Fix an object $C \in \mathcal{C}$; we wish to show that the functor $H_C^\dagger$ exhibits the ∞ -category $\widehat{\mathcal{E}}_C^\dagger$ as a $\mathbb{K}$ -cocompletion of the ∞ -category $\mathcal{E}_C^\dagger$. Using (8.89), we obtain a diagram of ∞ -categories

$$\begin{array}{ccc}
 \mathcal{E}_C^\dagger & \xrightarrow{T_C} & \mathcal{E}_C \\
 \downarrow H_C^\dagger & & \downarrow H_C \\
 \widehat{\mathcal{E}}_C^\dagger & \xrightarrow{\widehat{T}_C} & \widehat{\mathcal{E}}_C
 \end{array}$$

which commutes up to isomorphism, where the horizontal maps are equivalences. The desired result now follows from our assumption that H_C exhibits the ∞ -category $\widehat{\mathcal{E}}_C$ as a $\mathbb{K}$ -cocompletion of $\mathcal{E}_C$.

- (b) The morphism $\widehat{U}^\dagger$ is a cartesian fibration by assumption.
- (c) Fix a morphism $f : C \rightarrow C'$ of $\mathcal{C}$; we wish to show that the contravariant transport functor $f^* : \widehat{\mathcal{E}}_C^\dagger \rightarrow \widehat{\mathcal{E}}_{C'}^\dagger$ is $\mathbb{K}$ -cocontinuous. Proposition 8.6.1.5 then guarantees that

the diagram of ∞ -categories

$$\begin{array}{ccc} \widehat{\mathcal{E}}_C^\dagger & \xrightarrow{f^*} & \widehat{\mathcal{E}}_{C'}^\dagger \\ \downarrow \widehat{T}_C & & \downarrow \widehat{T}_{C'} \\ \widehat{\mathcal{E}}_C & \xrightarrow{f_!} & \widehat{\mathcal{E}}_{C'} \end{array}$$

commutes up to isomorphism, where $f_!$ is given by covariant transport along f for the cocartesian fibration $\widehat{U}$. Since the vertical maps are equivalences of ∞ -categories, we are reduced to proving that the functor $f_!$ is $\mathbb{K}$ -cocontinuous, which follows from Theorem 8.7.2.1.

- (d) The morphism $H^\dagger$ carries $U^\dagger$ -cartesian edges of $\mathcal{E}^\dagger$ to $\widehat{U}^\dagger$ -cartesian edges of $\widehat{\mathcal{E}}^\dagger$: this follows from Example 8.6.2.13.

□

Corollary 8.7.3.4. *Let $\mathbb{K}$ be a collection of simplicial sets and let $U^\dagger : \mathcal{E}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ be a 05LY cartesian fibration of simplicial sets. Then there exists a diagram*

$$\begin{array}{ccc} \mathcal{E}^\dagger & \xrightarrow{H^\dagger} & \widehat{\mathcal{E}}^\dagger \\ & \searrow U^\dagger & \swarrow \widehat{U}^\dagger \\ & \mathcal{C}^{\text{op}} & \end{array} \quad \begin{array}{l} \text{05LZ} \\ (8.91) \end{array}$$

which satisfies the conditions of Theorem 8.7.3.1.

Proof. Using Corollary 8.6.6.3, we can choose a cocartesian fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ and a morphism $T : \mathcal{E}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \mathcal{E}$ which exhibits $U^\dagger$ as a cartesian conjugate of U . Applying Theorem 8.7.2.1, we can choose a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, where $\widehat{U}$ is a cocartesian fibration. Using Proposition 8.6.2.3, we can choose a cartesian fibration $\widehat{U}^\dagger : \widehat{\mathcal{E}}^\dagger \rightarrow \mathcal{C}^{\text{op}}$ and a morphism

$\widehat{T} : \widehat{\mathcal{E}}^\dagger \times_{\mathcal{C}^{\text{op}}} \text{Tw}(\mathcal{C}) \rightarrow \widehat{\mathcal{E}}$ which exhibits $\widehat{U}^\dagger$ as a cartesian conjugate of $\widehat{U}$. The desired result now follows from Proposition 8.7.3.3. $\square$

Proof of Theorem 8.7.3.1. Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets. Using Corollary 8.7.3.4, we can choose a commutative diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which satisfies the conditions of Theorem 8.7.3.1, and therefore exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$ (Lemma 8.7.3.2). Conversely, if we are given another diagram

05M0

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}}' \\ & \searrow U & \swarrow \widehat{U}' \\ & \mathcal{C} & \end{array}$$

(8.92)

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$, then Remark 8.7.1.15 guarantees that there is an equivalence $F : \widehat{\mathcal{E}} \rightarrow \widehat{\mathcal{E}}'$ of inner fibrations over $\mathcal{C}$ such that H' is isomorphic to $F \circ H$ as an object of $\text{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$. It then follows that (8.92) the conditions of Theorem 8.7.2.1. $\square$

8.7.4 Existence of Fiberwise Cocompletions

05M1 Our goal in this section is to prove the following existence result for fiberwise cocompletions:

05M2 **Theorem 8.7.4.1.** *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. Then there exists a commutative diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$ (in the sense of Definition 8.7.1.5).

Our strategy for proving Theorem 8.7.4.1 is to reduce to the special case where U is a cocartesian fibration, which was treated in §8.7.2 (see Theorem 8.7.2.1). To carry out the reduction, we will need the following relative version of Corollary 8.4.7.10:

Lemma 8.7.4.2. *Let $\mathbb{K}$ be a collection of simplicial sets, let $U' : \mathcal{E}' \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets, and suppose we are given a commutative diagram* 05M3

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{H'} & \widehat{\mathcal{E}}' \\ & \searrow U' & \swarrow \widehat{U}' \\ & \mathcal{C} & \end{array} \quad (8.93) \quad 05M4$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}'$. Let $\mathcal{E}$ be a full simplicial subset of $\mathcal{E}'$ and let $\widehat{\mathcal{E}} \subseteq \widehat{\mathcal{E}}'$ be the full simplicial subset spanned by those vertices Y with the following property:

- If $C = \widehat{U}'(Y)$, then Y belongs to the smallest full subcategory of $\widehat{\mathcal{E}}'_C$ which contains the essential image of $H|_{\mathcal{E}_C}$ and is closed under K -indexed colimits, for each $K \in \mathbb{K}$.

Set $H = H'|_{\mathcal{E}}$, $U = U'|_{\mathcal{E}}$, and $\widehat{U} = \widehat{U}'|_{\widehat{\mathcal{E}}}$. Then the diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array} \quad (8.94) \quad 05M5$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$.

Proof. Without loss of generality, we may assume that $\mathcal{C} = \Delta^1$; in this case, we must show that the diagram (8.94) satisfies conditions (1) through (4) of Definition 8.7.1.1. Condition (1) follows from Corollary 8.4.7.10, and the remaining conditions follow immediately from the corresponding conditions on the diagram (8.93) $\square$

We now prove a special case of Theorem 8.7.4.1, which is already sufficient for most applications:

Lemma 8.7.4.3. *Let $\mathbb{K}$ be a collection of simplicial sets and let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an isofibration* 05M6

of ∞ -categories. Then there exists a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$ (in the sense of Definition 8.7.1.5). Moreover, $\widehat{U}$ is also an isofibration.

Proof. Choose a factorization of U as a composition $\mathcal{E} \xrightarrow{F} \mathcal{E}' \xrightarrow{U'} \mathcal{C}$, where U' is a cocartesian fibration of ∞ -categories and F is fully faithful. For example, we can take $\mathcal{E}'$ to be the oriented fiber product $\mathcal{E} \tilde{\times}_{\mathcal{C}} \mathcal{C}$, $U' : \mathcal{E}' \rightarrow \mathcal{C}$ be the projection onto the second factor (which is a cocartesian fibration by virtue of Corollary 5.3.7.3), and F to be the inclusion map

$$\mathcal{E} \simeq \mathcal{E} \times_{\mathcal{C}} \mathcal{C} \hookrightarrow \mathcal{E} \tilde{\times}_{\mathcal{C}} \mathcal{C}$$

(which is fully faithful by virtue of Corollary 4.5.2.23). Let $\mathcal{E}'_0 \subseteq \mathcal{E}'$ be the essential image of F . Since U' is an isofibration (Proposition 5.1.4.9), it restricts to an isofibration $\mathcal{E}'_0 \rightarrow \mathcal{C}$. Applying Proposition 5.1.7.5, we see that the functor $F : \mathcal{E} \rightarrow \mathcal{E}'_0$ is an equivalence of inner fibrations over $\mathcal{C}$. We may therefore replace $\mathcal{E}$ by $\mathcal{E}'_0$ and thereby reduce to the special case where $\mathcal{E}$ is a replete full subcategory of $\mathcal{E}'$.

Applying Theorem 8.7.2.1, we deduce that there is a commutative diagram

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{H'} & \widehat{\mathcal{E}}' \\ & \searrow U' & \swarrow \widehat{U}' \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}'$. Moreover, the morphism $\widehat{U}'$ is a cocartesian fibration (and therefore an isofibration; see Proposition 5.1.4.9). Define $\widehat{\mathcal{E}} \subseteq \widehat{\mathcal{E}}'$ as in the statement of Lemma 8.7.4.2. Then $\widehat{\mathcal{E}}$ is a replete full subcategory of $\widehat{\mathcal{E}}'$, so the restriction map $\widehat{U} = \widehat{U}'|_{\widehat{\mathcal{E}}}$ is an isofibration. Moreover, Lemma 8.7.4.2 guarantees that the diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H'|_{\mathcal{E}}} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. □

We now prove a relative version of Theorem 8.7.4.1.

Lemma 8.7.4.4. *Let $\mathbb{K}$ be a collection of simplicial sets, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets, and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a simplicial subset. Set $\mathcal{E}_0 = \mathcal{C}_0 \times_{\mathcal{C}} \mathcal{E}$, let $U_0 : \mathcal{E}_0 \rightarrow \mathcal{C}_0$ be the projection onto the first factor, and suppose we are given a diagram*

$$\begin{array}{ccc} \mathcal{E}_0 & \xrightarrow{H_0} & \widehat{\mathcal{E}}_0 \\ & \searrow U_0 & \swarrow \widehat{U}_0 \\ & \mathcal{C}_0 & \end{array}$$

which exhibits $\widehat{\mathcal{E}}_0$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}_0$. Then there exists a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise cocompletion of $\mathcal{E}$ and an isomorphism $\widehat{\mathcal{E}}_0 \simeq \mathcal{C}_0 \times_{\mathcal{C}} \widehat{\mathcal{E}}$ which carries H_0 to the map $(U_0, H) : \mathcal{E}_0 \rightarrow \mathcal{C}_0 \times_{\mathcal{C}} \widehat{\mathcal{E}}$.

Proof. Using Proposition 1.1.4.12, we can reduce to the case where $\mathcal{C} = \Delta^n$ is a standard simplex and $\mathcal{C}_0 = \partial\Delta^n$ is its boundary. In this case, U is an isofibration of ∞ -categories (Example 4.4.1.6). Applying Lemma 8.7.4.3, we deduce that there exists a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H'} & \widehat{\mathcal{E}}' \\ & \searrow U & \swarrow \widehat{U}' \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}'$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. Set $\widehat{\mathcal{E}}'_0 = \mathcal{C}_0 \times_{\mathcal{C}} \widehat{\mathcal{E}}'$, so that $H'_0 = H'|_{\mathcal{E}_0}$ exhibits $\widehat{\mathcal{E}}'_0$ as a fiberwise $\mathbb{K}$ -completion of $\mathcal{E}_0$. Applying Remark 8.7.1.15, we deduce that there exists an isomorphism $H'_0 \simeq F_0 \circ H_0$ in the ∞ -category $\text{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}'_0)$, where $F_0 : \widehat{\mathcal{E}}_0 \rightarrow \widehat{\mathcal{E}}'_0$ is an equivalence of inner fibrations over $\mathcal{C}_0$. Using Lemma 5.6.7.1, we can choose an inner fibration $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$ and an equivalence $F : \widehat{\mathcal{E}} \rightarrow \widehat{\mathcal{E}}'$ satisfying $F_0 = F|_{\widehat{\mathcal{E}}_0}$.

Composition with F induces an equivalence of ∞ -categories $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$. We can therefore choose a functor $H : \mathcal{E} \rightarrow \widehat{\mathcal{E}}$ such that $F \circ H$ is isomorphic to H' in the ∞ -category $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}')$. It follows that $F_0 \circ H|_{\mathcal{E}_0}$ is isomorphic to $F_0 \circ H_0$ as objects of the ∞ -category $\mathrm{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}'_0)$. Since F_0 is an equivalence of inner fibrations over $\mathcal{C}_0$, it follows that H_0 and $H|_{\mathcal{E}_0}$ are isomorphic as objects of the ∞ -category $\mathrm{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}_0)$. Since the restriction functor $\mathrm{Fun}_{/\mathcal{C}}(\mathcal{E}, \widehat{\mathcal{E}}) \rightarrow \mathrm{Fun}_{/\mathcal{C}_0}(\mathcal{E}_0, \widehat{\mathcal{E}}_0)$ is an isofibration (Proposition 4.1.4.1), we can arrange (after replacing H by an isomorphic functor if necessary) that $H|_{\mathcal{E}_0} = H_0$. We conclude by observing that the diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

exhibits $\widehat{\mathcal{E}}$ as a fiberwise $\mathbb{K}$ -cocompletion of $\mathcal{E}$. □

Proof of Theorem 8.7.4.1. Apply Lemma 8.7.4.4 in the special case $\mathcal{C}_0 = \emptyset$. □

8.7.5 Application: Flat Inner Fibrations

05ML Recall that an inner fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$ is *exponentiable* if the pullback functor

$$(\mathrm{Set}_{\Delta})_{/\mathcal{C}} \rightarrow (\mathrm{Set}_{\Delta})_{/\mathcal{E}} \quad \mathcal{C}' \mapsto \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$$

preserves categorical equivalences of simplicial sets (Definition 4.5.9.10). In this section, we study a weaker version of this condition.

05MM **Definition 8.7.5.1.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. We say that U is *flat* if, for every 2-simplex σ of $\mathcal{C}$, the inclusion map

$$\Lambda_1^2 \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \Delta^2 \times_{\mathcal{C}} \mathcal{E}$$

is a categorical equivalence of simplicial sets.

05MN **Example 8.7.5.2.** Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. If U is exponentiable, then it is flat.

Remark 8.7.5.3 (Homotopy Invariance). Suppose we are given a commutative diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{F} & \mathcal{E}' \\ & \searrow U & \swarrow U' \\ & \mathcal{C} & \end{array}$$

where the vertical maps are inner fibrations and F is an equivalence of inner fibrations over $\mathcal{C}$ (see Definition 5.1.7.1). Then U is flat if and only if U' is flat.

Remark 8.7.5.4. Suppose we are given a pullback diagram of simplicial sets

05MQ

$$\begin{array}{ccc} \mathcal{E}' & \xrightarrow{\quad} & \mathcal{E} \\ \downarrow U' & & \downarrow U \\ \mathcal{C}' & \xrightarrow{F} & \mathcal{C} \end{array}$$

If U is a flat inner fibration, then U' is a flat inner fibration. The converse holds if F is surjective on 2-simplices.

Remark 8.7.5.5. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. Then U is flat if and only if the opposite inner fibration $U^{\text{op}} : \mathcal{E}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ is flat.

05MR

Our first goal in this section is to establish a weak converse to Example 8.7.5.2. Recall that a morphism of simplicial sets $\mathcal{C}' \rightarrow \mathcal{C}$ is a *Morita equivalence* if it induces an equivalence of ∞ -categories $\text{Fun}(\mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(\mathcal{C}', \mathcal{D})$ whenever the ∞ -category $\mathcal{D}$ is idempotent-complete (Definition 8.5.6.1).

Theorem 8.7.5.6. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a flat inner fibration of simplicial sets. Then, for every Morita equivalence of simplicial sets $\mathcal{C}' \rightarrow \mathcal{C}$, the projection map $\mathcal{C}' \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{E}$ is also a Morita equivalence.

05MS

Corollary 8.7.5.7. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets. The following conditions are equivalent:

05MT

(1) The pullback functor

$$(\text{Set}_{\Delta})_{/\mathcal{C}} \rightarrow (\text{Set}_{\Delta})_{/\mathcal{E}} \quad \mathcal{C}' \mapsto \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$$

preserves Morita equivalences of simplicial sets. That is, if $F : \mathcal{C}'' \rightarrow \mathcal{C}'$ is a Morita equivalence in $(\text{Set}_{\Delta})_{/\mathcal{C}}$, then the induced map $F_{\mathcal{E}} : \mathcal{C}'' \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$ is also a Morita equivalence.

- (2) If $F : \mathcal{C}'' \rightarrow \mathcal{C}'$ is a categorical equivalence in $(\mathbf{Set}_\Delta)_{/\mathcal{C}}$, then $F_{\mathcal{E}}$ is a Morita equivalence.
- (3) If $F : \mathcal{C}'' \rightarrow \mathcal{C}'$ is a categorical equivalence in $(\mathbf{Set}_\Delta)_{/\mathcal{C}}$ which is surjective on vertices, then $F_{\mathcal{E}}$ is a categorical equivalence.
- (4) The inner fibration U is flat.

Proof. The implications $(1) \Rightarrow (2) \Rightarrow (3) \Rightarrow (4)$ are immediate from the definitions (see Corollary 8.5.6.12), and the implication $(4) \Rightarrow (1)$ is a reformulation of Theorem 8.7.5.6. $\square$

05MU Corollary 8.7.5.8. *Let $V : \mathcal{E} \rightarrow \mathcal{D}$ and $U : \mathcal{D} \rightarrow \mathcal{C}$ be flat inner fibrations of simplicial sets. Then the composite map $(U \circ V) : \mathcal{E} \rightarrow \mathcal{C}$ is also a flat inner fibration.*

Our proof of Theorem 8.7.5.6 will make use of the following flatness criterion:

05MV Proposition 8.7.5.9. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets which is essentially κ -small, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$. Then U is flat if and only if $\widehat{U}$ is a cartesian fibration.

05MW Example 8.7.5.10. Suppose we are given a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{F} & \mathcal{E}' \\ & \searrow U & \swarrow U' \\ & \mathcal{C}, & \end{array}$$

where F is fully faithful and induces a Morita equivalence $F_C : \mathcal{E}_C \rightarrow \mathcal{E}'_C$, for each object $C \in \mathcal{C}$. If κ is an uncountable regular cardinal such that U' is essentially κ -small, then any fiberwise κ -cocompletion of $\mathcal{E}'$ can also be regarded as a fiberwise κ -cocompletion of $\mathcal{E}$ (see Proposition 8.5.6.13). Applying the criterion of Proposition 8.7.5.9, we conclude that U is flat if and only if U' is flat. In particular, an inner fibration $U : \mathcal{E} \rightarrow \mathcal{C}$ is flat if and only if its fiberwise idempotent-completion is flat.

The proof of Proposition 8.7.5.9 will require some preliminaries.

Lemma 8.7.5.11. *Let K be a simplicial set and let $\widehat{U} : \widehat{\mathcal{E}} \rightarrow \mathcal{C}$ be a cartesian fibration of simplicial sets having the property that, for each vertex $C \in \mathcal{C}$, the ∞ -category $\widehat{\mathcal{E}}_C = \{C\} \times_{\mathcal{C}} \widehat{\mathcal{E}}$ admits K -indexed colimits. Let $\mathcal{D}$ be an ∞ -category which admits K -indexed colimits, let $F : \mathcal{E} \rightarrow \mathcal{D}$ be a diagram, and let S be the collection of vertices $C \in \mathcal{C}$ for which the functor $F_C = F|_{\mathcal{E}_C}$ preserves K -indexed colimits. Then S is closed under retracts in the homotopy category $\mathrm{h}\mathcal{C}$.*

Proof. Using Corollary 5.6.7.3, we can reduce to the case where $\mathcal{C}$ is an ∞ -category. Fix objects $C, C' \in \mathcal{C}$ such that C is a retract of C' , and assume that $F_{C'}$ preserves K -indexed colimits; we wish to show that F_C also preserves K -indexed colimits. Choose a colimit diagram $\bar{u} : K^{\triangleright} \rightarrow \widehat{\mathcal{E}}_C$; we will show that $F_C \circ \bar{u}$ is a colimit diagram in the ∞ -category $\mathcal{D}$. Set $u = \bar{u}|_K$. It follows from Theorem 5.2.1.1 that $\widehat{U}$ induces a cartesian fibration $\mathrm{Fun}(K, \widehat{\mathcal{E}}) \rightarrow \mathrm{Fun}(K, \mathcal{C})$. Applying Remark 8.5.1.23, we deduce that there is a diagram $u' : K \rightarrow \widehat{\mathcal{E}}_{C'}$ having the property that u is a retract of u' in the ∞ -category $\mathrm{Fun}(K, \widehat{\mathcal{E}})$. Since $\widehat{\mathcal{E}}_{C'}$ admits K -indexed colimits, we can extend u' to a colimit diagram $\bar{u}' : K^{\triangleright} \rightarrow \widehat{\mathcal{E}}_{C'}$. Since $\widehat{U}$ is a cartesian fibration, $\bar{u}$ and $\bar{u}'$ are $\widehat{U}$ -colimit diagrams in the ∞ -category $\widehat{\mathcal{E}}$ (Corollary 7.3.3.23). Using Theorem 7.3.6.14, we see that any diagram which exhibits u as a retract of u' can be extended to a diagram which exhibits $\bar{u}$ as a retract of $\bar{u}'$. It follows that $F_C \circ \bar{u}$ is a retract of $F_{C'} \circ \bar{u}'$ (in the ∞ -category $\mathrm{Fun}(K^{\triangleright}, \mathcal{D})$). Consequently, to show that $F_C \circ \bar{u}$ is a colimit diagram in $\mathcal{D}$, it will suffice to show that $F_{C'} \circ \bar{u}'$ is a colimit diagram in $\mathcal{D}$ (Corollary 8.5.1.12). This follows from our assumption that $F_{C'}$ preserves K -indexed colimits. $\square$

Lemma 8.7.5.12. *Let κ be an uncountable regular cardinal, let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of simplicial sets which is essentially κ -small, and suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$. Let $\overline{F} : \mathcal{C}' \rightarrow \mathcal{C}$ be a Morita equivalence of simplicial sets. If $\widehat{U}$ is a cartesian fibration, then the projection map $\mathcal{C}' \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{E}$ is also a Morita equivalence of simplicial sets.

Proof. Set $\mathcal{E}' = \mathcal{C}' \times_{\mathcal{C}} \mathcal{E}$ and $\widehat{\mathcal{E}}' = \mathcal{C}' \times_{\mathcal{C}} \widehat{\mathcal{E}}$, so that $\overline{F}$ induces projection maps $F : \mathcal{E}' \rightarrow \mathcal{E}$ and $\widehat{F} : \widehat{\mathcal{E}}' \rightarrow \widehat{\mathcal{E}}$. We wish to show that, for every idempotent-complete ∞ -category $\mathcal{D}$, precomposition with F induces an equivalence of ∞ -categories $\mathrm{Fun}(\mathcal{E}, \mathcal{D}) \rightarrow \mathrm{Fun}(\mathcal{E}', \mathcal{D})$.

By virtue of Proposition 8.5.6.13, we may assume without loss of generality that $\mathcal{D}$ is κ -cocomplete (in fact, we can assume that $\mathcal{D} = \mathcal{S}_{<\lambda}$ for some uncountable regular cardinal $\lambda \geq \kappa$). Let $\text{Fun}^\kappa(\widehat{\mathcal{E}}, \mathcal{D})$ denote the full subcategory of $\text{Fun}(\widehat{\mathcal{E}}, \mathcal{D})$ spanned by those diagrams $G : \widehat{\mathcal{E}} \rightarrow \mathcal{D}$ having the property that, for each vertex $C \in \mathcal{C}$, the functor $G_C = G|_{\widehat{\mathcal{E}}_C}$ preserves κ -small colimits, and define $\text{Fun}^\kappa(\widehat{\mathcal{E}}', \mathcal{D}) \subseteq \text{Fun}(\widehat{\mathcal{E}}, \mathcal{D})$ similarly. We then have a commutative diagram of ∞ -categories

$$\begin{array}{ccc} \text{Fun}^\kappa(\widehat{\mathcal{E}}, \mathcal{D}) & \xrightarrow{\circ \widehat{F}} & \text{Fun}^\kappa(\widehat{\mathcal{E}}', \mathcal{D}) \\ \downarrow & & \downarrow \\ \text{Fun}(\mathcal{E}, \mathcal{D}) & \xrightarrow{\circ F} & \text{Fun}(\mathcal{E}', \mathcal{D}), \end{array}$$

where the vertical maps are equivalences by virtue of the universal property of fiberwise κ -cocompletions (Theorem 8.7.1.14). It will therefore suffice to show that precomposition with $\widehat{F}$ induces an equivalence of ∞ -categories $\text{Fun}^\kappa(\widehat{\mathcal{E}}, \mathcal{D}) \rightarrow \text{Fun}^\kappa(\widehat{\mathcal{E}}', \mathcal{D})$. Since $\overline{F}$ is a Morita equivalence and $\widehat{U}$ is a cartesian fibration, the morphism $\widehat{F}$ is also a Morita equivalence (Proposition 8.5.6.14). In particular, precomposition with $\widehat{F}$ induces an equivalence of ∞ -categories $\text{Fun}(\widehat{\mathcal{E}}, \mathcal{D}) \rightarrow \text{Fun}(\widehat{\mathcal{E}}', \mathcal{D})$. To complete the proof, it will suffice to show that an object $G \in \text{Fun}(\widehat{\mathcal{E}}, \mathcal{D})$ belongs to the subcategory $\text{Fun}^\kappa(\widehat{\mathcal{E}}, \mathcal{D})$ if and only if $G \circ \widehat{F}$ belongs to $\text{Fun}^\kappa(\widehat{\mathcal{E}}', \mathcal{D})$. This follows from Lemma 8.7.5.11. $\square$

05MZ Lemma 8.7.5.13. *Let κ be an uncountable regular cardinal, let $\mathcal{E}$ be an ∞ -category which is essentially κ -small, and suppose we are given a commutative diagram of ∞ -categories*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \Delta^2 & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$. The following conditions are equivalent:

- (1) *The inclusion map $\Lambda_1^2 \times_{\Delta^2} \mathcal{E} \hookrightarrow \mathcal{E}$ is a categorical equivalence of simplicial sets.*
- (2) *The functor $\widehat{U}$ is a cartesian fibration.*

Proof. The implication (2) $\Rightarrow$ (1) follows from Lemma 8.7.5.12 and Corollary 8.5.6.12. Conversely, suppose that condition (1) is satisfied. Set $\mathcal{E}_0 = \Lambda_1^2 \times_{\Delta^2} \mathcal{E}$ and $\widehat{\mathcal{E}}_0 = \Lambda_1^2 \times_{\Delta^2} \widehat{\mathcal{E}}$.

Using Proposition 5.6.7.2, we can choose a pullback diagram

$$\begin{array}{ccc} \widehat{\mathcal{E}}_0 & \longrightarrow & \widehat{\mathcal{E}}' \\ \downarrow \widehat{U}_0 & & \downarrow \widehat{U}' \\ \Lambda_1^2 & \longrightarrow & \Delta^2, \end{array}$$

where $\widehat{U}'$ is a cartesian fibration. Let us abuse notation by identifying $\widehat{\mathcal{E}}_0$ with its image in $\widehat{\mathcal{E}}'$. It follows from Proposition 5.3.6.1 that the inclusion map $\widehat{\mathcal{E}}_0 \hookrightarrow \widehat{\mathcal{E}}'$ is a categorical equivalence of simplicial sets, so there exists a functor $F : \widehat{\mathcal{E}}' \rightarrow \widehat{\mathcal{E}}$ which is the identity on $\widehat{\mathcal{E}}_0$. We will complete the proof by showing that F is an equivalence of inner fibrations over Δ^2 , so that $\widehat{U}$ is also a cartesian fibration (Proposition 5.1.7.14).

Note that the inner $\widehat{U}$ and $\widehat{U}'$ are κ -cocomplete. It will therefore suffice to show that, for every κ -cocomplete inner fibration $V : \mathcal{D} \rightarrow \Delta^2$, precomposition with F induces an equivalence of ∞ -categories

$$\mathrm{Fun}_{/\Delta^2}^\kappa(\widehat{\mathcal{E}}, \mathcal{D}) \rightarrow \mathrm{Fun}_{/\Delta^2}^\kappa(\widehat{\mathcal{E}}', \mathcal{D}).$$

Since the inclusion $\widehat{\mathcal{E}}_0 \hookrightarrow \widehat{\mathcal{E}}'$ is a categorical equivalence, this is equivalent to the statement that the restriction map

$$\mathrm{Fun}_{/\Delta^2}^\kappa(\widehat{\mathcal{E}}, \mathcal{D}) \rightarrow \mathrm{Fun}_{/\Lambda_1^2}^\kappa(\widehat{\mathcal{E}}_0, \mathcal{D}_0)$$

is an equivalence, where $\mathcal{D}_0 = \Lambda_1^2 \times_{\Delta^2} \mathcal{D}$. Invoking the universal property of fiberwise cocompletion (Theorem 8.7.1.14), we are reduced to showing that the restriction map $\mathrm{Fun}_{/\Delta^2}(\mathcal{E}, \mathcal{D}) \rightarrow \mathrm{Fun}_{/\Delta^2}(\Lambda_1^2 \times_{\Delta^2} \mathcal{E}, \mathcal{D})$ is an equivalence of ∞ -categories, which follows immediately from assumption (1). $\square$

Proof of Proposition 8.7.5.9. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an essentially κ -small inner fibration and let

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \mathcal{C} & \end{array}$$

be a diagram which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$. It follows from Corollary 5.1.5.11 that $\widehat{U}$ is a cartesian fibration if and only if, for every 2-simplex σ of $\mathcal{C}$, the projection map $\widehat{U}_\sigma : \Delta^2 \times_{\mathcal{C}} \widehat{\mathcal{E}} \rightarrow \Delta^2$ is a cartesian fibration. By virtue of Lemma 8.7.5.13, this is equivalent to the requirement that U is flat. $\square$

Proof of Theorem 8.7.5.6. Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be a flat inner fibration of simplicial sets and let $\mathcal{C}' \rightarrow \mathcal{C}$ be a Morita equivalence; we wish to show that the projection map $\mathcal{C}' \times_{\mathcal{C}} \mathcal{E} \rightarrow \mathcal{E}$ is also a Morita equivalence. Choose an uncountable regular cardinal κ such that U is essentially κ -small. Using Theorem 8.7.4.1, we can choose a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \Delta^1 & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$. By virtue of Lemma 8.7.5.12, it will suffice to show that $\widehat{U}$ is a cartesian fibration, which is a reformulation of our assumption that U is flat (Proposition 8.7.5.9). $\square$

We record another consequence of Proposition 8.7.5.9.

05N0 **Corollary 8.7.5.14.** *Every functor of ∞ -categories $U : \mathcal{E} \rightarrow \Delta^1$ is a flat inner fibration.*

Proof. Choose an uncountable regular cardinal κ for which $\mathcal{E}$ is essentially κ -small. Using Theorem 8.7.4.1, we can choose a diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{H} & \widehat{\mathcal{E}} \\ & \searrow U & \swarrow \widehat{U} \\ & \Delta^1 & \end{array}$$

which exhibits $\widehat{\mathcal{E}}$ as a fiberwise κ -cocompletion of $\mathcal{E}$. It follows from Proposition 8.7.1.4 that $\widehat{U}$ is a cartesian fibration, so that U is flat by virtue of Proposition 8.7.5.9. $\square$

05N1 **Remark 8.7.5.15.** By definition, an inner fibration of simplicial sets $U : \mathcal{E} \rightarrow \mathcal{C}$ is flat if, for every 2-simplex σ of $\mathcal{C}$, the inclusion map

$$\Lambda_1^2 \times_{\mathcal{C}} \mathcal{E} \hookrightarrow \Delta^2 \times_{\mathcal{C}} \mathcal{E}$$

is a categorical equivalence of simplicial sets. It follows from Corollary 8.7.5.14 that it suffices to check this condition in the case where σ is nondegenerate.

05N2 **Corollary 8.7.5.16.** *A functor of ∞ -categories $U : \mathcal{E} \rightarrow \Delta^2$ is a flat inner fibration if and only if the inclusion map $\Lambda_1^2 \times_{\Delta^2} \mathcal{E} \hookrightarrow \mathcal{E}$ is a categorical equivalence of simplicial sets.*

Proposition 8.7.5.17. *Let $U : \mathcal{E} \rightarrow \mathcal{C}$ be an inner fibration of ∞ -categories. Then U is 05N3 exponentiable if and only if it is a flat isofibration.*

Proof. Assume that U is a flat isofibration; we will show that U is exponentiable (the converse follows from Remark 4.5.9.12 and Example 8.7.5.2). Suppose we are given a commutative diagram of simplicial sets

$$\begin{array}{ccccc} \mathcal{E}'' & \xrightarrow{F} & \mathcal{E}_0 & \xrightarrow{G} & \mathcal{E} \\ \downarrow & & \downarrow & & \downarrow U \\ \mathcal{C}_1 & \xrightarrow{\overline{F}} & \mathcal{C}_0 & \xrightarrow{\overline{G}} & \mathcal{C} \end{array}$$
