

PSC 407 MATHEMATICAL MODELING

Fall, 2017  
MW 10:00-11:50  
Harkness 112

Professor: John Duggan  
Office: Harkness 111A  
Email: dugg@ur.rochester.edu  
Phone: x34999  
Hours: by appointment

This course is the first half of a two-course sequence consisting of PSC 407 and PSC 408. The goal of the sequence is to give a rigorous introduction to the main concepts and results in positive political theory. At the same time, we will teach you the mathematical tools necessary to understand these results, to use them, and (if it suits you) to surpass them in your own research in political science. The sequence emphasizes rigorous logical and deductive reasoning — this skill will prove valuable, even to the student primarily interested in empirical analysis rather than modeling.

The sequence is designed to be both a rigorous foundation for students planning on taking further courses in the positive political theory field and serve as a self-contained overview of the field for students who do not intend to do additional coursework in the field. PSC 407 is mainly concerned with social choice applications and the mathematics behind them, drawing mainly on logic, real analysis, and calculus, whereas PSC 408 will focus on strategic interaction and game-theoretic analysis.

Students should have, at a minimum, a sound familiarity with basic algebra (solving equations, graphing functions, etc.) and a knowledge of basic calculus. Consistent with department policy, students are required (unless explicitly exempted) to attend the “math camp” offered in the weeks before the fall semester.

Homeworks, a midterm, and a final will be assigned to help develop and test your mathematical modelling skills. Students are allowed to collaborate on homework, but after discussion with others, each student is expected to write up his or her answers independently. The date and time of the final are set by the University Registrar: it will take place on **Tuesday, December 19, at 12:30**, and you will have three hours to complete it. This date is firm, so keep it in mind when making your travel plans for winter break.

The primary source for material covered in the lectures will be the following manuscript by Mark Fey and myself:

- Duggan and Fey (DF) *Analytical Methods for Political Economy*

In addition, I will assume students own or have access two textbooks for the course.

- Simon and Blume (SB), *Mathematics for Economists*
- Ordeshook (O), *Game Theory and Political Theory*

Simon and Blume is a valuable compendium of the mathematics used in the social sciences, but the applications are oriented toward economics. Nevertheless, it will be a valuable complement to the main text. Ordeshook is not a math book, but it draws together many of the social-choice theoretic applications we cover in class.

The teaching assistant for the course is Zuheir Desai, who will hold a weekly recitation and office hour. Tentatively, recitation will be held in [ROOM], [DAY & TIME]. Keep in mind that the TA's primary responsibility during recitation is to answer your questions, so come prepared.

An outline of the topics to be covered is as follows. Next to each, I list readings from the texts.

1. Logic, Set Theory, and Functions [DF 2–6]
  - logical connectives, necessary and sufficient conditions, direct proof, proof by contradiction, quantifiers, set operations, natural numbers, real numbers, maximum and supremum, relations, transitivity, weak orders, maximal elements, monotonicity, invertibility
2. Rational Choice Model and Social Choice [DF 7–9; O 1.1–1.2, 2.1–2.2]
  - strict and weak preference, utility functions, majority preference, core, Pareto dominance, Pareto optimality, aggregation rules, voting paradoxes, May's theorem, Arrow's Theorem
3. Real Line and Multidimensional Analysis [DF 11–16; SB 2–3, 5, 10, 13–15, 21, A2]
  - continuous/differentiable functions, vector addition, scalar multiplication, dot products and orthogonality, lines and hyperplanes, convex sets, Euclidean norm, open and closed sets, multivariate functions and level sets, concavity and quasi-concavity, gradients, maximization
4. Spatial Model [DF 17–19; O 1.3–1.4, 2.3, 4.6–4.7]
  - single-peakedness, median voter theorem, convex and continuous preferences, indifference curves, utility representations, Pareto optimality, Plott's theorem, McKelvey's theorem and the top cycle set
